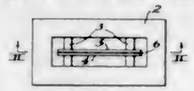
1. A weatherstrip comprising a pliable member of materially greater longitudinal dimension than its thickness, a continuous strip of wire bent into connected loops in a substantially flat plane partially within the area of said member, and extending longitudinally thereof, and securing means carried by said strip within the area of said member.

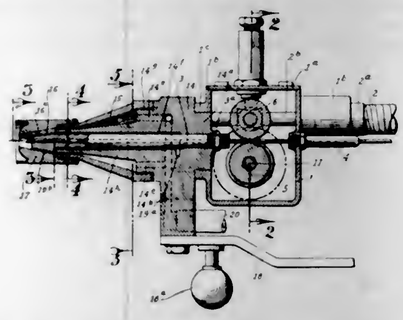


2,102,393
WEATHER STRIP
Clark A. Tea, Detroit, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Application March 27, 1936, Serial No. 71,127
2 Claims. (Cl. 20—69)

2. A weatherstrip comprising a tubular resilient portion, a flat securing portion projecting radially from said tubular portion, and looped

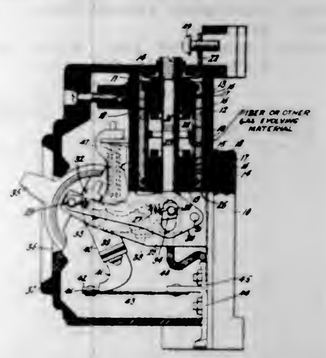
wire within both portions alternately contacting the opposite faces of the inner periphery of said tubular portion.

2,102,394
METHOD OF MAKING COMPOSITE FERROUS METAL ARTICLES
Max R. Trembour, Beaver, Pa., assignor to Jessop Steel Company, Washington, Pa., a corporation of Pennsylvania
Application December 3, 1931, Serial No. 578,661
15 Claims. (Cl. 29—189)



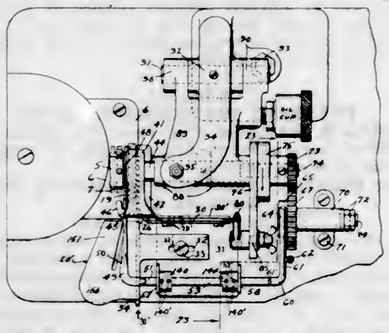
1. A method of making ply metal comprising supporting in a mold an insert formed of chromium alloy steel, the insert having a clean roughened weldable surface and a surface provided with a weld-preventing coating, casting steel other than said chromium steel around the insert to envelop it and form a composite ingot in which said insert is completely enclosed within said cast metal, rolling said ingot while heated to working temperature to press the surfaces together and cause welding between said steel and the weldable surface of said insert and to effect a desired change in section, then cropping off excess steel to expose the edges of the insert, and separating along the parting plane formed by said weld-preventing coating to form said ply metal.

2,102,395
METAL SPRAYING APPARATUS
Thomas G. Valentine and Edward J. Brennan, San Diego, Calif.
Application May 12, 1934, Serial No. 725,370
3 Claims. (Cl. 91—12.2)



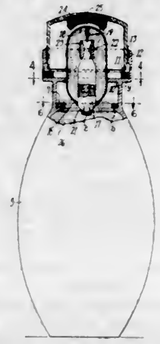
1. In a metal spraying apparatus, a gear casing, wire feeding means positioned in said gear casing, a single piece manifold secured in the one side of said gear casing and provided with a forwardly extending tapered contracted portion extending to near the nozzle end of said spraying apparatus and provided with separate fuel and air conducting conduits in said manifold, a wire guide mounted in said manifold and extending through said contracted extended portion and provided with an integral nozzle on its one end adapted to seat against the extended end of said contracted portion and its other end extending into said gear casing, a nut on said wire guide in said gear casing for drawing the nozzle end of said wire guide against the extended end of said manifold, a fuel conduit in said manifold its inner wall formed by the exterior surface of said wire guide, its one end communicating with the fuel conduit in said manifold and its other end communicating with a plurality of fuel conduits in the nozzle end of said wire guide, air conduits outwardly of said

fuel conduits in said nozzle end of said wire guide and communicating with the air conduits in said manifold, and a hood secured to said manifold



and extending in spaced relation over said extended portion of said manifold forming an air conduit with said extended portion.

2,102,396
CIRCUIT BREAKER
Ludwig S. Walle, Lansdowne, Pa., assignor to General Electric Company, a corporation of New York
Application May 29, 1936, Serial No. 82,486
5 Claims. (Cl. 200—144)



1. A circuit interrupting device comprising a pair of relatively movable contacts having a predetermined range of movement between open and closed circuit positions, walls of pressure resistant material surrounding said contacts to form a substantially gas-tightly sealed compression chamber, and a gas evolving member disposed within said chamber adjacent the point of separation of said contacts and entirely within said range of movement, said member being formed of a cellulose material containing no substantial amount of kerosene whereby substantial quantities of gas are evolved when said member is heated by the arc between said contacts, the proportions of said gas evolving member and the volume of said chamber being so related that upon operation of said contacts to an open circuit position and the consequent formation of an arc in proximity to said gas evolving member, pressures are quickly generated within said chamber of sufficient magnitude to extinguish the arc.

2,102,397
METHOD OF MAKING SEAMED ARTICLES AND APPARATUS THEREFOR
John P. Weis, Nyack, N. Y., assignor to Willcox & Gibbs Sewing Machine Co., New York, N. Y., a corporation of New York
Application July 31, 1934, Serial No. 737,704
57 Claims. (Cl. 112—124)

1. Apparatus to produce articles with a trimmed margin and stitched seam, comprising a sewing mechanism adapted to feed multiple plies of material and to form a line of stitching; a trimming mechanism adapted to form trimmed margins on the plies relative to the line of stitching; means for driving said sewing and trimming mechanisms synchronously; and means adapted to control and move one or more of said multiple plies to vary the margin thereof relative to the line of and at the time of stitching.

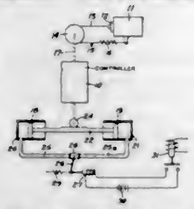
2,102,398
MEANS FOR PREPARING A LIQUID
Jacob Wetstein, deceased, late of New York, N. Y., by Florence W. Winters and Erna Korn, executrices, New York, N. Y.
Original application March 31, 1932, Serial No. 602,378, which is a continuation of Serial No. 498,095, November 25, 1930. Divided and this application November 21, 1935, Serial No. 50,954. In Canada and Great Britain November 25, 1931
6 Claims. (Cl. 225—18)

5. In a device of the character described, a liquid container having positioned therein a refill member including a gas cartridge and a drink ingredient holder in which the cartridge is positioned, said holder being movable relatively to the cartridge to open a discharge outlet for the contents of both, a cover on the container, a gasket

carried by the cover, said cover and gasket having a vent opening therein, means for moving the gasket into and out of contact with the refill member, the continued movement of the said gasket after contact causing movement of the cartridge and holder whereby the drink ingredient and gas from the cartridge may charge liquid in the container, and said gasket movement out of contact causing release of the gas pressure in the top of the container after the liquid in said container has been charged with the gas and the drink ingredient.

2,102,399
TREATING HECTOGRAPH BANDS

William B. Whitmore, Oak Park, Ill., assignor to Ditto, Incorporated, Chicago, Ill., a corporation of West Virginia



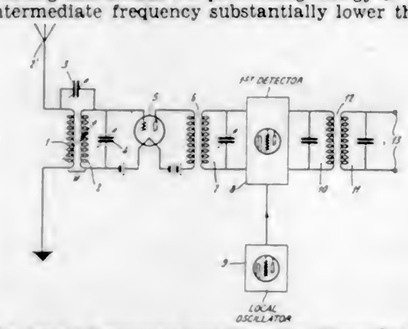
No Drawing. Application December 9, 1935, Serial No. 53,616
12 Claims. (Cl. 41—31.6)

1. A hectograph pad capable of being stacked or wound without sticking to an adjacent pad or adjacent convolutions of the same pad comprising a coating of gelatinous duplicating material and an integral non-adhesive film of a water-soluble compound of the class consisting of the polyhydric alcohols and ethers thereof on the duplicating surface of said pad.

2,102,400
CONTROLLER APPARATUS

Otto Wünsche, Berlin-Friedenau, Germany, assignor to General Electric Company, a corporation of New York

Application January 9, 1935, Serial No. 1,044
In Germany January 29, 1934
12 Claims. (Cl. 175—355)



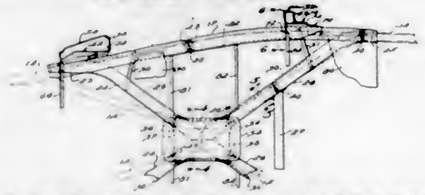
1. In combination a circuit controller operable through a plurality of circuit controlling positions for controlling a driven device, operating means therefor, retarding means for said controller comprising cylinder means for a damping fluid, a conduit connected to said cylinder means, piston means slidably mounted within said cylinder means and operable by said controller to move said fluid through said conduit, a coil spring, means mounting said coil spring in the path of said fluid, the flow of said fluid being through the spaces between the turns of said spring, and means responsive to a condition of operation of the driven device and including a plunger for compressing said spring to control the speed of movement of said piston means and said controller.

2,102,401
SUPERHETERODYNE RECEIVER

Jon Joseph Yolles, also known as Jack Yolles or Jacob Yolles, Paris, France, assignor to Radio Corporation of America, a corporation of Delaware

Application February 18, 1935, Serial No. 7,078
4 Claims. (Cl. 250—20)

1. In a superheterodyne receiver, the combination of an input circuit including a radio frequency transformer having an untuned primary winding and a secondary winding, a single condenser having its opposite sides directly connected to the ends of said secondary winding to tune said secondary winding to the signal frequency, a source of signal energy connected to said primary winding and means for preventing energy of the intermediate frequency substantially lower than

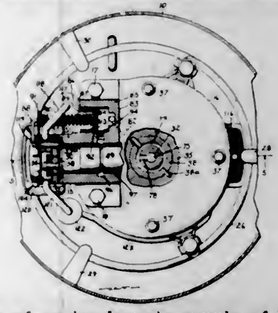


the signal frequency from passing through said secondary winding comprising a capacity coupling between said primary and secondary windings said capacity coupling being in opposed phase to the inductive coupling between said windings and the value of said capacity coupling being substantially less than the maximum value of said single condenser.

2,102,402
MOTOR VEHICLE

James C. Zeder, Detroit, Mich., assignor to Chrysler Corporation, Detroit, Mich., a corporation of Delaware

Application January 30, 1935, Serial No. 3,997
12 Claims. (Cl. 296—28)



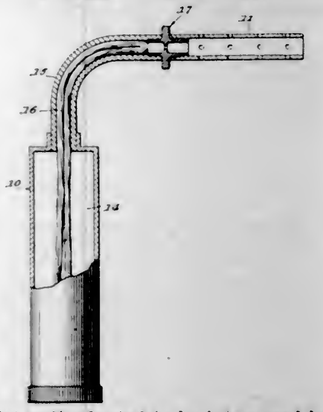
3. In an open type body structure of the character described having a forward cowl section and a rear section providing a driver's compartment therebetween, a chassis structure having longitudinally extending rails, a body frame structure connecting said body sections as a unit, means for securing said unit to said chassis structure, said chassis structure including an X-brace below said compartment, and said body frame structure including an X-brace supported by said chassis X-brace.

2,102,403
REFRIGERATING MACHINE

Harley H. Bixler, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application January 11, 1935, Serial No. 1,337
26 Claims. (Cl. 230—30)

1. A refrigerating machine comprising a refrigerant compressor, a plurality of parts having contacting relatively moving surfaces, a lubricant reservoir, means including a closed series lubricant circuit for recirculating lubricant from said reservoir to said relatively moving surfaces to lubricate the same, means connected in said series lubricant circuit for controlling the loading and unloading of said compressor, and means for causing said loading and unloading controlling means to unload said compressor in response to

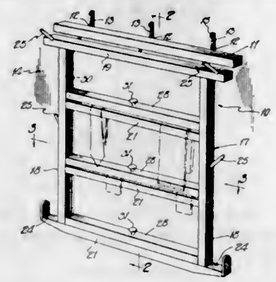


the supply of an inadequate supply of lubricant to said relatively moving surfaces and including a sharp edged orifice for causing said loading and unloading controlling means to be unresponsive to changes in viscosity of said lubricant.

2,102,404
AUTOMATIC BLAST TORCH

Samuel C. Brody, Brighton, Mass.

Application August 10, 1936, Serial No. 95,220
8 Claims. (Cl. 158—35)



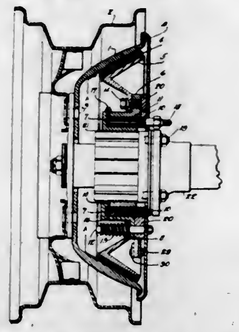
1. A jet unit adapted to be interposed between the pressure generating unit and the combustion burner of a self-generating blast torch, comprising a member having a portion projecting into the inner end of the combustion burner so as to be heated thereby and providing an expansion chamber in communication with the pressure generating unit and open to the interior of the burner within which chamber the gases emitted from said pressure generating unit enter and expand into contact with the heated inner wall surface of said chamber to absorb the heat therefrom and thereby enter the combustion burner in expanded and highly volatilized form.

2,102,405
UTILITY HANGER

Gioacchino Coggiola, Union City, N. J.

Application April 28, 1937, Serial No. 139,410
4 Claims. (Cl. 211—89)

1. A utility hanger for attachment to a wall or other like vertical supporting structure comprising a rectangular shape frame, spaced parallel horizontal supporting rails fixedly mounted in said frame, vertical rods fixedly supported by said frame and extending adjacent the inner sides of the side rails of the same and for the



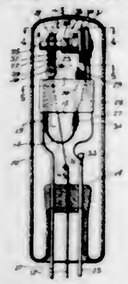
height thereof, complementary clamping rails for the respective supporting rails and superposed relative thereto, and pairs of guide pins carried by opposite ends of said clamping rails between which said rods extend.

2,102,406
BRAKING APPARATUS

Abraham Cohen, New Haven, Conn.

Application April 11, 1935, Serial No. 15,851
8 Claims. (Cl. 188—71)

1. In a fluid pressure brake, a brake drum, a base member, a brake shoe slidably supported on said base member, means for applying fluid pressure to said brake shoe, said last named means including a stationary annular piston fastened to said base member cooperating with a movable annular cylinder located directly on said brake shoe.



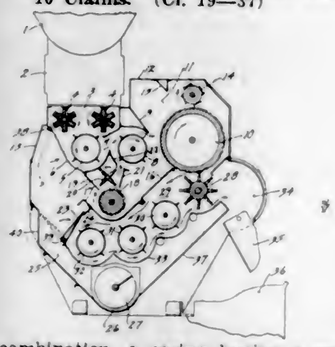
2,102,407
CONTROL DEVICE AND THE PRODUCTION THEREOF

Charles W. Dann, East Orange, N. J., assignor, by mesne assignments, to Thomas A. Edison, Incorporated, West Orange, N. J., a corporation of New Jersey

Application April 28, 1934, Serial No. 722,960
36 Claims. (Cl. 200—138)

1. In a device of the class described, a sealed container, a switching structure mounted within said container and comprising a thermo-sensitive member and a plurality of electrical contacts, at least one of said contacts being movable under the influence of said member, and at least one of said contacts being mounted for adjustment in

respect to said movable contact, and means for effecting the locking of said adjustable contact



in adjustment with the seal of said container intact.

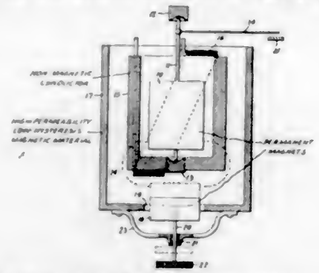
2,102,408

CLEANER AND HULL EXTRACTING FEEDER FOR COTTON

Frank E. Deems, Birmingham, Ala., assignor to Continental Gin Company, a corporation of Delaware

Application July 15, 1935, Serial No. 31,371
10 Claims. (Cl. 19—37)

7. In combination, a casing having a cotton inlet and a cotton discharge, a hull extractor mechanism on the cotton discharge side of the casing, an after-cleaner compartment disposed across the casing in position to deliver cotton into said discharge and comprising a series of cleaner rolls and a bottom screen bed, means to deliver the cotton stream directly from said inlet into the inner end of said after-cleaner compartment for a single traverse thereof to the cotton discharge, and means to deliver the cotton stream from said extractor mechanism into the outer end of said compartment in position to engage said cleaner rolls and be driven thereby for a double traverse of said compartment in its passage to said discharge, and means to discharge the hulls and trash removed from the cotton stream in its selected traverse of said casing.



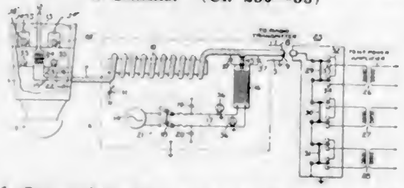
2,102,409

ELECTRICAL-MEASURING INSTRUMENT

Harold T. Faus, Lynn, Mass., assignor to General Electric Company, a corporation of New York

Application June 19, 1936, Serial No. 86,109
7 Claims. (Cl. 171—95)

3. A direct current electrical measuring instrument having a movable armature consisting of a magnetic cylinder of sintered oxide material of about half the weight of steel and polarized across a diameter thereof through its axis of rotation, stationary energizing winding means surrounding the armature for directly producing flux across the axis of rotation of said armature



and a magnetic shield of high-permeability low-hysteresis magnetic material surrounding the flux axes of said coil and armature for protecting the instrument from stray fluxes and serving as a magnetic return for fluxes of the instrument.

2,102,410

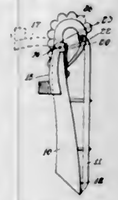
ANTENNA SYSTEM

George W. Fyler, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application April 20, 1935, Serial No. 17,451
4 Claims. (Cl. 250—33)

1. In combination, an antenna tower insulated from ground except through capacitance, a source of oscillations connected between ground and said antenna tower, an inductance coil connected in series between said tower and said source, the inductance of said coil being so proportioned relative to said capacitance that the voltage on said tower is substantially greater than that of said source, a power load arranged on said tower, a power source, a conductor extending from said load to said source along the turns of said coil throughout the length of said turns, and a drainage connection for static charges on said tower, said connection comprising said conductor, a connection from the tower end thereof to said tower and a connection from the source end thereof to ground.

2,102,411



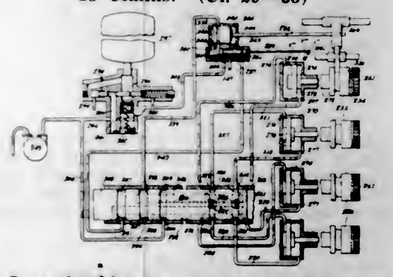
CLIP PIN FLOWER HOLDER

Robert Graillat, New York, N. Y., assignor to George Schuler & Co., Inc., New York, N. Y., a corporation of New York

Application July 22, 1937, Serial No. 154,978
2 Claims. (Cl. 24—6)

2. A clip pin flower holder, comprising a body portion and means pivoted to its under side at one end for attaching the holder to a garment, and a U-shape member pivoted at its open end to said body portion at said end with a portion extending over the upper surface of the body portion and adapted for contact therewith, said

member having extensions beyond its fulcrum with squared surfaces at right angles to each other, and springs attached at one end to the



underside of the body portion and having free ends respectively adapted to bear alternatively upon one or the other of said surfaces.

2,102,412

CHUCKING MACHINE

George O. Gridley, New Britain, Donald H. Montgomery, Hartford, and Earl H. Wheeler, New Britain, Conn., assignors, by mesne assignments, to The New Britain Machine Company, New Britain, Conn., a corporation of Connecticut

Original application July 16, 1931, Serial No. 551,136. Patent No. 2,055,435, dated September 22, 1936. Divided and this application May 29, 1936, Serial No. 82,424. Renewed July 30, 1937
15 Claims. (Cl. 29—38)

1. In a chucking machine, a rotatable spindle, a chuck carried thereby, a fluid pressure actuated means for actuating said chuck, means for driving said spindle, a clutch controlling the same, a fluid pressure actuated means for actuating said clutch, and a single valve for controlling the flow of pressure fluid for both said fluid pressure actuated means.

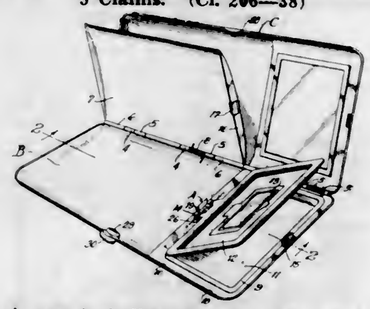
2,102,413

ANALEMMIC TELLURIAN GLOBE

William H. Hall, Cicero, Ill.

Application April 27, 1934, Serial No. 722,616
20 Claims. (Cl. 35—46)

1. In a tellurian apparatus, a terrestrial globe, meridian indicating means on the globe, means for mounting the globe for rotation about its polar axis, means supporting said globe and its mounting for rotation about a vertical axis intersecting the center of the globe and the axis of the globe at an angle of 23°—27 minutes, a stationary arch surrounding the greater portion of the globe having a margin whose plane so intersects the equator of the globe as to divide it into two parts of approximately 178°—7½ minutes and 181°—52½ minutes, a time band mounted for oscillation bearing hour indicia encircling the globe in a plane parallel to its equator, and means for positioning said band relatively to the arch to show correctly the mean solar time hour angles for the meridians of the globe for any position of the



globe's polar axis relatively to the plane of said arch.

2,102,414

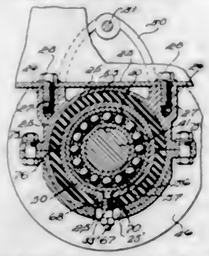
COMBINATION VANITY AND CIGARETTE CASE

Charles J. Hannings, Elgin, Ill., assignor to Illinois Watch Case Company, Elgin, Ill., a corporation of Illinois

Application August 29, 1936, Serial No. 98,535
5 Claims. (Cl. 206—38)

1. A case including a two-compartment body to which is hinged a lid fitting over one compartment and a cover overlying the lid, a partition wall for the case compartments, and a one-piece spring catch having a pivotal mounting adjacent the partition wall and bearing yieldingly thereagainst adapted to releasably engage the lid when in closed position.

2,102,415



PROPELLER SHAFT BEARING

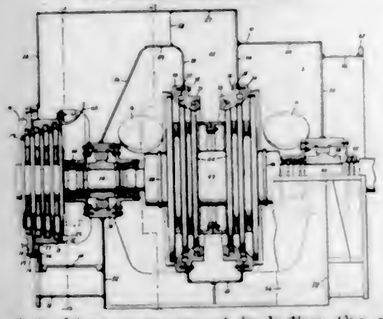
Alexander G. Herreshoff, Grosse Pointe, Mich., assignor to Chrysler Corporation, Detroit, Mich., a corporation of Delaware

Application January 25, 1934, Serial No. 708,223
3 Claims. (Cl. 308—26)

1. A bearing for supporting in suspended relationship to a frame a propeller shaft having a plurality of universal joints, including a non-yieldable radial bearing rotatably journaling said shaft therein at a point intermediate two of said universal joints, a rigid support member fixed to said frame and provided with an opening therein, a rigid bearing holder enclosing said bearing and closely fitting the periphery thereof, a rubber annulus having cross sectional convex inner and outer peripheral surfaces, said holder and support member being provided with recesses complementary with the inner and outer peripheral surfaces, respectively, of said annulus

for receiving the latter, said rubber annulus being disposed in said recesses and intermediate said holder and support member to take up varia-

tions in the length of said propeller shaft and yieldably to oppose angular misalignment of said propeller shaft.



2,102,416

ELASTIC FLUID TURBINE ARRANGEMENT

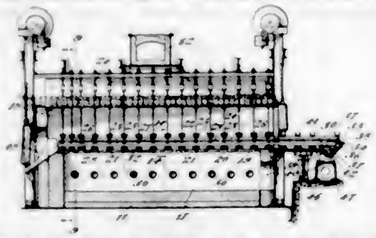
Oscar Junggren, deceased, late of Schenectady, N. Y., by the Schenectady Trust Company of Schenectady, N. Y., executor, assignor to General Electric Company, a corporation of New York

Application June 26, 1936, Serial No. 87,556

7 Claims. (Cl. 253—69)

1. A turbine arrangement including the combination of a high pressure turbine, a low pressure turbine, shaft means for the turbines, a bearing for supporting the shaft means, said bearing having one side disposed in the exhaust space of the high pressure turbine and another side disposed in the exhaust space of the low pressure turbine, and packing means on each side of the bearing to reduce leakage of exhaust fluid from the high pressure turbine into the bearing and from the latter into the low pressure turbine.

2,102,417



APPARATUS FOR MANUFACTURING BOLTS AND SIMILAR ARTICLES

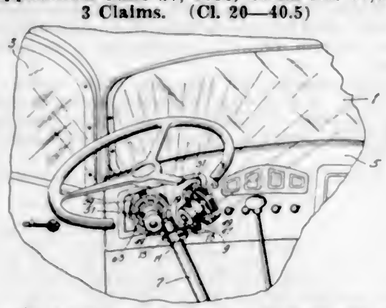
James A. Kinney, Lebanon, Pa., assignor to Bethlehem Steel Company, a corporation of Pennsylvania

Application April 12, 1935, Serial No. 15,975

27 Claims. (Cl. 263—6)

1. A furnace of the class described, comprising a combustion chamber and a heating chamber, a plurality of pusher-bars in the heating chamber adapted to receive one end of articles to be heat treated, having their inner ends arranged in stepped relation to each other, stationary guide-bars arranged in pairs above each pusher-bar for supporting the opposite ends of the articles suspended in a vertically inclined position, and means for reciprocating the pusher-bars to

advance the articles being heat treated through the heating chamber.



2,102,418

AUTOMOTIVE AIR CIRCULATOR

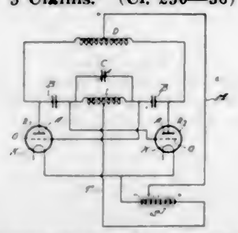
Benjamin Kirsch, Chicago, Ill., assignor to Auto Radiator Manufacturing Co., Chicago, Ill., a corporation of Illinois

Application June 27, 1936, Serial No. 87,681

3 Claims. (Cl. 20—40.5)

1. An air circulator for automotive use comprising a single fixed support within a vehicle body, a bracket on said support, adjusting means between the bracket and the support, and a plurality of fans adjustably mounted on the bracket and forming a bracketed cluster.

2,102,419



OSCILLATION GENERATOR

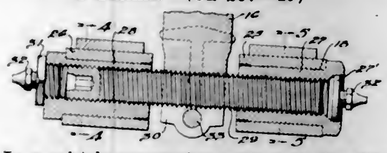
Fritz Klutke, Berlin-Johannisthal, Germany, assignor to Allegemeine Elektricitatz Gesellschaft, Berlin, Germany, a corporation of Germany

Application February 12, 1936, Serial No. 63,486

In Germany April 6, 1935

5 Claims. (Cl. 250—36)

1. A regenerative oscillator comprising an electron discharge device having within an envelope, an anode, a cathode and a grid, a feed-back circuit between said anode and grid, and means for maintaining said anode at a positive direct current potential relative to said cathode and said grid at a direct current potential at least as positive as said anode with respect to said cathode, whereby there is obtained substantial constancy of amplitude of oscillation.



2,102,420

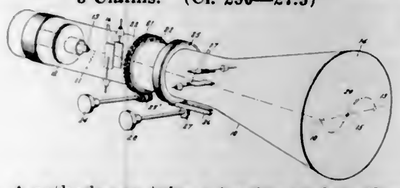
VEHICLE SUSPENSION SYSTEM

Axel W. Kogstrom, Highland Park, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware

Application February 13, 1936, Serial No. 63,717

8 Claims. (Cl. 267—19)

1. In a vehicle suspension system, a plurality of weight supporting springs, each of said springs having an eye portion, a bushing disposed in each of said eye portions, a shaft extending through said bushings for connecting the adjacent ends of said springs together, at least one of said bushings provided for an adjustment of said shaft relative to the axis of one of said spring eye portions.



2,102,421

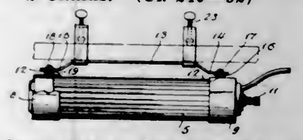
CATHODE RAY OSCILLOGRAPH

Hans P. Kuehni, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application July 12, 1934, Serial No. 734,784

3 Claims. (Cl. 250—27.5)

1. A cathode ray tube, a tracing surface therefor, means for projecting a cathode ray through said tube onto said surface, two sets of deflecting means at different axial positions in said tube, one set for deflecting the ray along one axis, and the other set for deflecting the ray along a different axis, and means located external to the tube for producing an adjustable but substantially uniform magnetic field through said tube in any desired direction in a plane at right angles to the normal direction of the ray between said two sets of deflecting means.



2,102,422

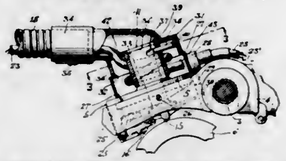
SUPPORT FOR LAMPS

Max Lager, New York, N. Y.

Application April 12, 1937, Serial No. 136,358

2 Claims. (Cl. 240—52)

1. In a lamp, the combination of a light permeable body adapted to enclose a source of light, removable end caps for said body, a connecting member joining said end caps and having its ends offset from the intermediate portion thereof, with one of said ends provided with a slot open at the adjacent extremity of said connecting member, means to secure the other end of said connecting member to one of said caps, a fastener extending through the slot in the first named end of the connecting member and into the associated end cap, and means on said strap for mounting the lamp on a support.



2,102,423

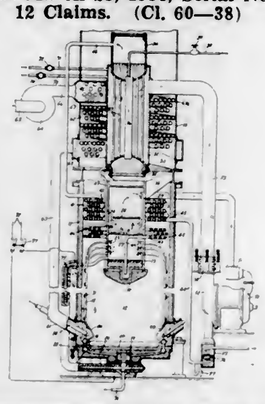
PHONOGRAPH

Sam G. Langley, Maplewood, N. J., assignor to Thomas A. Edison, Incorporated, West Orange, N. J., a corporation of New Jersey

Application September 14, 1934, Serial No. 743,949

15 Claims. (Cl. 274—17)

8. The combination with a phonograph including a record rotating device, sound translating means movable to engage various surface portions of a record rotated by said device, a sound transmitting tube, an electric circuit for controlling the operation of said rotating device, and a switch carried by said tube and adapted to be connected into and to govern said circuit; of means coupling said tube to said translating means and comprising a part in fixed relation to said translating means and a relatively swivellable part; an interior tubular element comprised in said swivellable part and forming with said fixed part an annular recess; and electric leads connecting said switch into said circuit, said leads passing from said switch longitudinally of said tube and into said recess, having a slack portion disposed within said recess, and passing from said recess outwardly through said fixed part of said coupling means.



2,102,424

MERCURY POWER PLANT

Anthony J. Larrecq, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

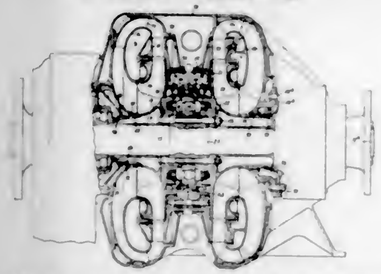
Application March 23, 1934, Serial No. 717,125

12 Claims. (Cl. 60—38)

1. In a mercury power plant, the combination of a boiler, a condenser connected to the boiler being located at a level above the boiler, a turbine receiving mercury vapor from the boiler being located at the level of the boiler, a conduit for conducting exhaust vapor from the turbine

into the condenser whereby a part of the energy content in the exhaust vapor is utilized in conveying the exhaust vapor to a higher level, and an evaporator connected to the turbine exhaust for receiving liquid particles exhausted from the turbine and evaporating them.

4. In a mercury power plant, the combination of a boiler having a cylindrical outer casing, a wall of heat resisting material lining the interior of a lower portion of the casing to define a combustion space, a drum and heating elements being at least partly disposed within said space, a turbine for receiving vapor from the drum, a condenser boiler diposed within and supported on the cylindrical casing above the drum for receiving exhaust vapor from the turbine, and means for conducting condensate from the condenser to the drum comprising a liquid heater having a plurality of series-connected layers of spirally wound tubes encircling the drum and exposed to the fire gases discharged from the combustion space.



9. In the operation of a power plant comprising a boiler for generating and superheating mercury vapor using a mixture of mercury and a substance in the mercury for increasing the superheat of the mercury at the operating temperature of the plant, the method of increasing the relative amount of said substance to increase the superheat of the mercury at the operating temperature of the plant as the load on the power plant decreases.

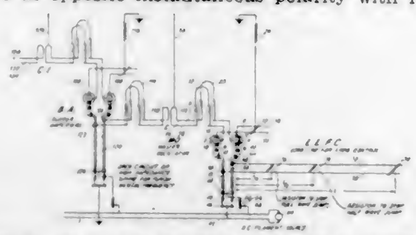
2,102,425

FÖTTINGER DRIVE

Walter Lenz, Berlin-Reinickendorf-West, Germany, assignor to General Electric Company, a corporation of New York

Application March 23, 1936, Serial No. 70,503
In Germany April 25, 1935
2 Claims. (Cl. 60—54)

1. A multiple hydraulic gear of the Föttinger type with a plurality of separate liquid circuits comprising the combination of a single drive shaft having a collar, at least two gears, each gear having a pump wheel, the two pump wheels arranged back to back, and means flanging the back to back arranged pump wheels to the collar.



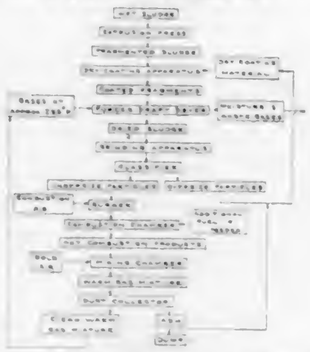
2,102,426

FREQUENCY CONTROL

Nils E. Lindenblad, Port Jefferson, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Original application April 5, 1932, Serial No. 603,310, now Patent No. 2,052,576, dated September 1, 1936. Divided and this application November 23, 1933, Serial No. 699,372. Renewed March 8, 1937
17 Claims. (Cl. 250—36)

1. A high frequency oscillation generator comprising a pair of push-pull connected electron discharge devices each having an anode, a cathode and a control electrode, a high frequency circuit connecting said anodes together, a high frequency circuit connecting said control electrodes together, and a high frequency circuit connecting said cathodes together, whereby said anodes are at opposite instantaneous polarity with respect to each other and said grids are at opposite instantaneous polarity with respect to each other, a frequency stabilizing circuit consisting of a pair of conductors having uniformly distributed inductance and capacity connected between said cathodes, and means for producing standing waves on said frequency stabilizing circuit.

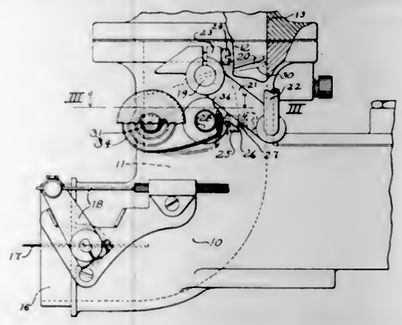


2,102,427

METHOD OF TREATING WASTE WET ORGANIC MATERIAL

Richard L. Lloyd, Great Neck, N. Y., and Henry J. Stehli, Cedar Grove, N. J.; Stella Warde Lloyd executrix of said Richard L. Lloyd, deceased

Application June 22, 1932, Serial No. 618,676
2 Claims. (Cl. 110—8)



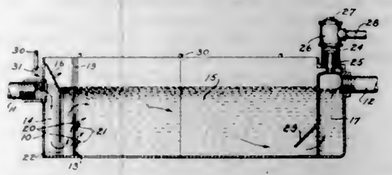
1. The method of treating sewage sludge which comprises dividing a wet mass of said sludge into small fragments, coating the surface of each fragment with dry powdered material to such an extent as to prevent adjacent fragments from adhering one to the other, forming a layer of the coated fragments with air passageways extending from top to bottom of the said layer, passing a current of warm drying gases through the said passageways until the said fragments are substantially dry, the temperature of said gases being not in excess of about 225° F., grinding the dry fragments, classifying the ground material to sized and oversized portions, mixing the sized portion of the ground material with air and projecting the mixture into a combustion zone maintained at a temperature at least in excess of red heat, separating the dust from the resultant gases of combustion, drying other coated fragments with the cleaned gases, and coating other wet fragments with dry powdered material formed of a mixture of said ash and the oversized portion of the ground material.

2,102,428

INTERNAL COMBUSTION ENGINE FUEL SYSTEM

John B. Macauley, Jr., Grosse Pointe, and Andre J. Roualet, Detroit, Mich., assignors to Chrysler Corporation, Detroit, Mich., a corporation of Delaware

Application December 13, 1932, Serial No. 647,006
6 Claims. (Cl. 123—119)



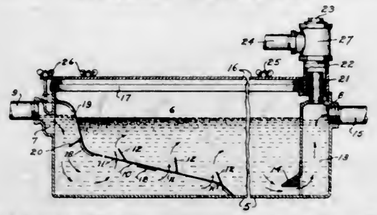
1. In a carburetor including a fuel mixture passage having a variable choke valve, means for controlling only the quantity of fuel mixture passing through the latter including a variable throttle valve, a stop engageable by said means for holding said throttle valve against closing beyond one predetermined partially open position, and means including a temperature responsive element operable irrespective of the position of said variable choke valve only when subjected to temperatures below a predetermined temperature for holding said throttle valve against closing to said predetermined partially open position and beyond another predetermined partially open position.

2,102,429

GREASE TRAP

Arthur M. McLeod, Madison, Wis., assignor to D. J. Murray Manufacturing Co., Wausau, Wis., a corporation of Wisconsin

Application July 3, 1936, Serial No. 88,729
8 Claims. (Cl. 210—56)



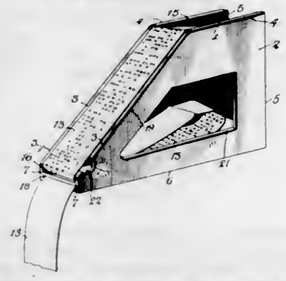
1. A grease trap comprising, a casing forming a separating chamber, a dam spanning said chamber and having an opening therethrough beneath its crest, said dam having a louvre adjacent said opening extending upwardly away from the dam in the direction of flow of liquid through said opening, and means for maintaining the liquid level in said chamber considerably above the crest of said dam.

2,102,430

GREASE TRAP

Arthur M. McLeod, Madison, Wis., assignor to D. J. Murray Manufacturing Co., Wausau, Wis., a corporation of Wisconsin

Application July 23, 1936, Serial No. 92,096
12 Claims. (Cl. 210—56)



1. A grease trap comprising, means forming a separating chamber having an inlet and an outlet, and a dam spanning said chamber and having a series of through openings located progressively nearer said outlet, each of said openings having a wall for deflecting the flow through the opening upwardly therefrom.

2,102,431

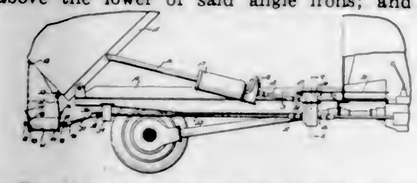
COPY HOLDER FOR STENOTYPE STRIPS

Jay McNamara, New York, N. Y.

Application September 4, 1936, Serial No. 99,339
2 Claims. (Cl. 120—29)

1. A holder for stenotype record strips comprising a chamber to receive the folded strips and defined by a bottom wall, a rear wall, a top wall inclined upwardly from the rear wall, an inclined table extending from the forward end of the top wall to the forward end of the bottom wall and side walls projecting above the top wall and acting as a guide for the strip exteriorly and interiorly of the chamber, spaced cleats below the bottom wall acting as guides for the previously read portion of the strip, one of the cleats and the lower end of the table being spaced from the forward end of said bottom wall to provide outlet passages for the ends of the strip.

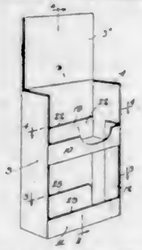
2,102,432



COMBINATION TRUCK AND CONVEYER

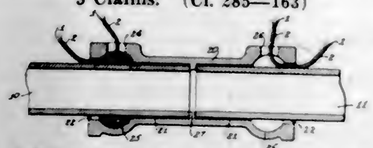
Clifford A. Nesseth, Detroit, Mich.

Application June 5, 1935, Serial No. 25,033
3 Claims. (Cl. 214—83)



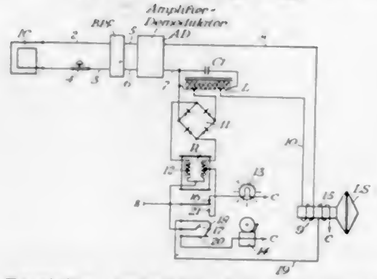
1. In a device of the class described, a conveyer comprising: a pair of spaced, oppositely disposed side plates; an angle iron mounted on the inner face of each of said side plates, adjacent the upper and lower edges thereof, and extending longitudinally thereof; a transversely extending plate connecting said side plates at their opposite ends, said transversely extending side plate being

positioned below and spaced from the lower of said angle irons; a roller rotatably mounted between said side plates at each end thereof, said rollers being located to position the periphery thereof above the upper of said angle irons and above the lower of said angle irons; and an



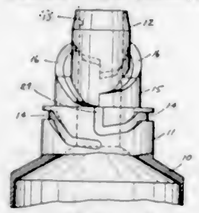
endless belt passing around said rollers, the upper portion of said belt passing above the upper of said angle irons and the lower portion of said belt passing above the lower of said angle irons, said transversely extending plates assisting the lower of said angle irons in preventing sagging of the lower portion of said endless belt.

2,102,433
BOX
Matthew J. Nevins, Jr., Glen Ridge, N. J., assignor to The Nevins-Church Press, New York, N. Y., a corporation of New Jersey
Application April 13, 1937, Serial No. 136,545
3 Claims. (Cl. 229—27)



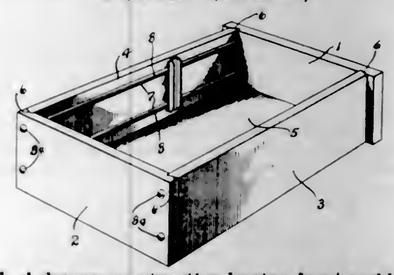
1. A box formed of paper, pasteboard or similar material comprising a back, a pair of side walls and a pair of folding structures, one independent folding structure extending from one of said side walls being at the bottom of the box and the other intermediate of the height, each of said folding structures including a front wall, a side panel cemented to the other of said side walls, a bottom and a back wall frictionally engaging the back wall of the box, and a tab extending from the back wall of the box for supporting the bottom of the intermediate folding structure.

2,102,434
PIPE JOINT
Alden E. Osborn, New York, N. Y.
Application November 11, 1936, Serial No. 110,196
5 Claims. (Cl. 285—163)



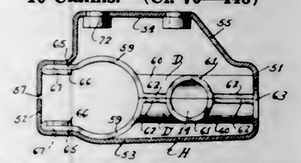
1. A fitting having a channel and provided with an aperture intersecting said channel and a means for retaining a member within said fitting and for preventing leakage adjacent said means of retention, comprising a cord embodying a wire of relatively hard material and a wire of relatively soft material, both said wires being normally fastened together and adapted to be simultaneously wound thru said aperture and into said channel by relative rotation between said fitting and said member.

2,102,435
RECEIVING APPARATUS FOR COMMUNICATION SYSTEMS
Willard P. Place, Wilkinsburg, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application March 26, 1937, Serial No. 133,214
12 Claims. (Cl. 179—82)



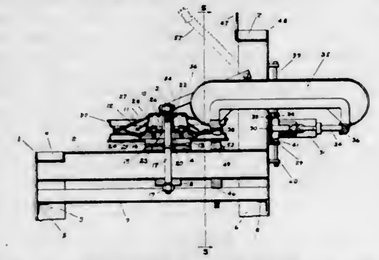
1. Receiving apparatus for communication systems comprising, a demodulator capable of demodulating a carrier telephone current and a signaling current equivalent to the carrier modulated by a predetermined frequency, a parallel resonant circuit proportioned for resonance at said predetermined frequency, a loud speaker, a first winding associated with the loud speaker, means to connect said resonant circuit and said first winding across the output terminals of the demodulator to form an output circuit for the demodulator, a relay, means to connect a winding of the relay with said resonant circuit to energize the relay in response to such signaling current supplied to the demodulator, and circuit means including a back contact of the relay and a second winding associated with the loud speaker as well as a current source to condition the loud speaker as required for reproducing the voice frequencies of the current flowing in said first winding in response to such telephone current supplied to the demodulator.

2,102,436
CLOSURE FOR CONTAINERS
Frank I. Remy, Syracuse, and Benjamin P. Remy, Indianapolis, Ind.; Margaret Wood Remy executrix of said Benjamin P. Remy, deceased
Application January 14, 1933, Serial No. 651,776
2 Claims. (Cl. 221—60)



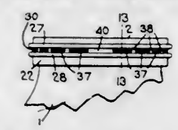
1. A closure for containers having a discharge spout provided with an orifice, said spout including a neck having a cam surrounding the same, a second cam surrounding said spout, a rotatable cap mounted over said neck and embracing said spout movable longitudinally of said neck by said first-mentioned cam upon rotation, a valve pivotally mounted in said cap having a head movable over said orifice for closing the same, and means associated with said valve and operable by said second-mentioned cam for moving said valve to closing position when said cap is rotated in one direction and into open position when said cap is rotated in the opposite direction.

2,102,437
KNOCK-DOWN DRAWER
Bayard E. Richardson and Richard W. Willey, Grand Rapids, Mich.
Application February 18, 1936, Serial No. 64,442
2 Claims. (Cl. 45—7)



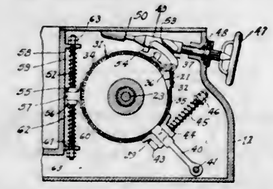
1. A drawer construction having front and back and spaced apart vertical sides, horizontal rods extending lengthwise of each of said sides connecting the front and back of the drawer, and vertically positioned channel shaped partition guides each having clips attached at its rear side, said clips slidably connecting with said rods.

2,102,438
AUTOMOBILE LOCK STRUCTURE
Ray A. Sandberg, Waukegan, Ill., assignor to Oakes Products Corporation, North Chicago, Ill., a corporation of Michigan
Application June 11, 1936, Serial No. 84,601
10 Claims. (Cl. 70—448)



1. In a steering post lock body, an integral oblong housing comprising top, side, and end walls, said top wall having a steering column receiving opening adjacent one end thereof and a lock cylinder structure receiving opening at the other end thereof, a structure within said housing extending longitudinally thereof and composed of similar integral halves comprising each a semi-tubular longitudinal wall with a semi-tubular lateral wall extending therefrom and an arcuate wall extending from one end, said halves being secured together edge to edge whereby said longitudinal walls form a cylindrical bore for a shiftable steering post locking bolt structure and said lateral walls form a bore in registration with the lock cylinder structure receiving opening in the housing top, said arcuate walls being in alignment with the housing top opening for receiving the steering column.

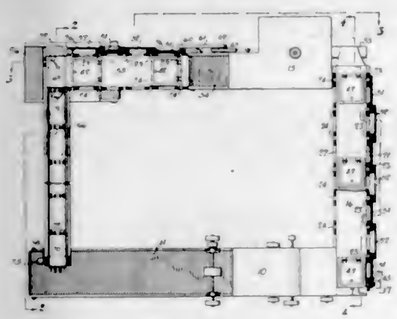
2,102,439
WHEEL REPAIRING MECHANISM
Henry C. Schildmeier, Indianapolis, Ind.
Application May 1, 1935, Serial No. 19,227
8 Claims. (Cl. 153—32)



6. In a wheel repairing mechanism, a frame, a wheel support on said frame for supporting a wheel in position for repair, a standard forming part of and rising from said frame, said standard having an opening therein, a jack seat mounted on said standard adjacent to said opening, a jack on said seat, and a C bar adapted to be disposed in said opening with one jaw engaged with the rim of a wheel on said support, and the other engaged by said jack.

2,102,440
CONTAINER
Harry Sebell, Boston, Mass., assignor of one-half to Arthur H. Parker, Lexington, Mass.
Application July 20, 1935, Serial No. 32,389
7 Claims. (Cl. 215—46)

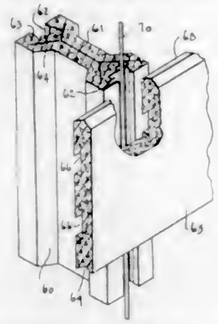
3. A container presenting an open-top body portion provided with a bead at its upper edge and a closure of sheet metal having a skirt portion encircling and crimped to said bead, said skirt portion being formed with two annular ribs and the zone between said ribs being provided with a line of weakness whereby when the ribs are pried apart the closure is torn along the line of weakness.



2,102,441
DRIVE MECHANISM
William W. Sloane, Chicago, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application July 5, 1935, Serial No. 29,791
Renewed August 14, 1936
20 Claims. (Cl. 188—77)

1. In a power transmission device, a driven member, geared drive means for driving said

member including a rotatable member, and means under the control of friction for automatically releasing said drive means upon a predetermined torque load on said driven member including a friction member engageable with said rotatable member, manually operable means for engaging said friction member with said rotatable member, a rocking member engageable with said friction member and having connection with said means for manually engaging said friction member with said rotatable member, and a yieldable member engaging said friction member and adapted to yield upon a predetermined torque load on said shaft and drum to permit said friction member to rock said rocking member and release said manual engaging means.

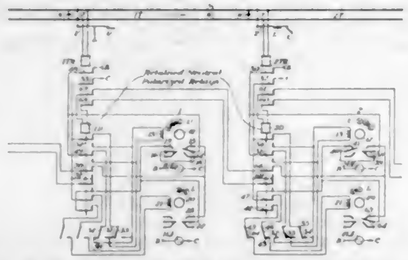


2,102,442
COTTON CONVEYER
William H. Suttenfield, Statesville, and Olin L. York and Van Buren A. Howard, Longisland, N. C., assignors to Superior Yarn Mills, Incorporated, Statesville, N. C., a corporation of North Carolina
Application June 8, 1934, Serial No. 729,692
1 Claim. (Cl. 19—67)

Fiber preparation machinery comprising a bale breaker, an opener, and a picker, a horizontally disposed endless belt for feeding fibers into the bale breaker, a tube disposed between the bale breaker and the opener and having a series of grates forming upper and lower horizontal compartments extending for the length of the tube, the interior of the tube being exposed to atmospheric pressure, said tube having a plurality of driven beaters disposed transversely thereof for driving the fibers from the bale breaker to the opener, a second tube disposed between the opener and the picker and having a series of grates therein forming upper and lower compartments, the upper compartment having a plurality of transversely disposed driven beaters therein for forcing the fibers from the opener to the picker, a second endless belt for conveying any surplus fibers which are not fed into the picker back and onto the top of said first endless belt whereby the surplus fibres are again introduced into the bale breaker.

2,102,443
BUILDING CONSTRUCTION
Lawrence T. Thorn, Memphis, Tenn.
Application January 17, 1935, Serial No. 2,211
1 Claim. (Cl. 72—115)

A unit for building construction, comprising a precast concrete member having an undercut groove formed in a face thereof, the outer portion of said groove having sides extending inward substantially at right angles to the face of said

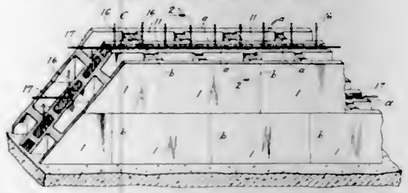


member for substantially one half its depth, and thence diverging to the bottom of said groove.

2,102,444
INVESTMENT COMPOSITION
George Clyde Van Allen, Maplewood, N. J., assignor to Baker & Company, Inc., a corporation of New Jersey
No Drawing. Application July 2, 1936, Serial No. 88,595
10 Claims. (Cl. 22—188)

1. An investment composition comprising a major portion of a siliceous filler and gypsum, and a relatively small proportion of a titanium compound.

2,102,445
RAILWAY SIGNALING
James J. Vanhorn, Swissvale, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application February 15, 1936, Serial No. 64,095
14 Claims. (Cl. 246—50)

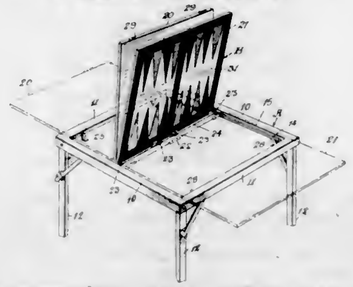


1. A railway signal system comprising, a plurality of successive sections of railway track, each such section having a track circuit including a track relay, a signal for each section, each such signal having a mechanism responsive to the polarity of the current supplied thereto, a line circuit for each section governed by the associated track relay, a polarized line relay for each section connected to the line circuit for that section, contacts of each line relay for reversibly governing the line circuit for the section next in rear of the associated section and for reversibly governing the mechanism of the associated signal, and means including front contacts of each track relay for supplying current to said contacts of the associated line relay if and only if such track relay is energized.

2,102,446
RIBBON REEL
Henry Wallace, New York, N. Y.
Application March 11, 1937, Serial No. 130,286
2 Claims. (Cl. 242—70)

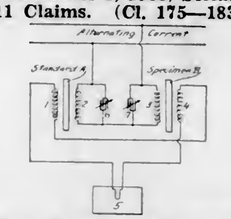
1. A ribbon reel, comprising two separable parts, one part comprising a disc and a tubular hub extending therefrom, and the other part comprising a disc and a part-cylindrical spring sheath extending therefrom adapted to be forced on to the hub by relative edgewise movement of the discs, the longitudinal edges of the sheath being turned outward and the side portions of the sheath adjacent its longitudinal edges being free of the disc to flex outwardly to receive the hub, and the sheath being of a size to fit closely about the hub to grip the ribbon between the sheath and the hub.

2,102,447
BUILDING CONSTRUCTION
Donald D. Whitacre, Waynesburg, Ohio
Application April 1, 1935, Serial No. 13,994
12 Claims. (Cl. 72—68)



10. In a load-bearing structure the combination of a plurality of blocks adapted to sustain load in compression having load-bearing engagement with each other through substantially planar surfaces presented by adjacent blocks in load-bearing contact, and longitudinally disposed tension means extending transversely of said contacting surfaces and secured to blocks longitudinally spaced in said structure and positioned in the region of tension of said structure and holding adjacent blocks in load-bearing contact on said contacting surfaces.

2,102,448
PROCESS OF PREPARING ALUMINUM ALLOYS
Henry L. Whitman, Los Angeles, Calif.
No Drawing. **Original application August 26, 1936, Serial No. 98,076. Divided and this application March 13, 1937, Serial No. 130,677**
1 Claim. (Cl. 75—140)

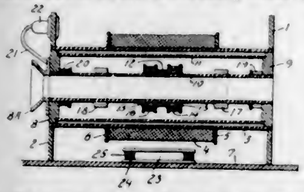


The process of preparing an aluminum alloy consisting in melting together 5.31% of copper, .88% of nickel, 1.66% of manganese; adding this when thoroughly melted to 88.23% of aluminum fused in a separate crucible, then adding to this melted mass 2.65% of tin, .88% of magnesium, stirring the same thoroughly and while in a thoroughly fluid and melted condition finally adding .39% of silver, making up the total 100%, stirring and mixing thoroughly.

2,102,449
COMBINATION TABLE
Leo Zimmerman, New York, N. Y.
Application January 21, 1937, Serial No. 121,454
4 Claims. (Cl. 311—67)

1. A combination table, including an open frame, a reversible top comprising two leaves hingedly connected, each leaf of a size to fit within the frame, a cross rod secured to one leaf adjacent its hinged end, and slotted rails secured to the inner faces of opposite sides of the frame and receiving the ends of the rod, said rails extending throughout the length of the inner faces of the sides of the frame and permitting the rod to move in the slots so as to position the hinged ends of the leaves at either end of the frame to reverse the top in the frame.

2,102,450
MAGNETIC ANALYSIS
Theodor Zuschlag, Englewood, N. J., assignor to Magnetic Analysis Corporation, Long Island City, N. Y., a corporation of New York
Application November 1, 1933, Serial No. 696,220
11 Claims. (Cl. 175—183)

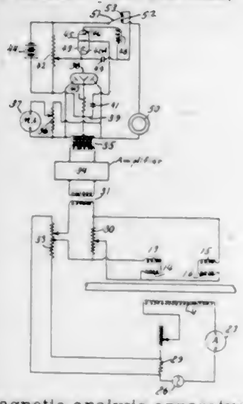


1. A method of testing a magnetizable body which comprises, simultaneously establishing a magnetic flux in a standard of known magnetism affecting properties and in said body respectively by means of alternating current exciter coils placed in inductive relationship to said standard and said body respectively, emphasizing the difference in the two fluxes set up by tuning the exciter coils to a harmonic of the exciter current, and producing for inspection a representation of the instantaneous value variations of a cycle unit of a secondary current produced by the emphasized difference in said magnetic fluxes due to a difference in a magnetism affecting property of said standard and said body.

2,102,451
MAGNETIC ANALYSIS
Theodor Zuschlag, West Englewood, N. J., assignor to Magnetic Analysis Corporation, a corporation of New York
Application April 23, 1936, Serial No. 75,943
7 Claims. (Cl. 175—183)

1. In a magnetic analysis apparatus the combination which comprises an exciter coil disposable in inductive relationship with a magnetizable

body, a source of alternating current for energizing the exciter coil, one or more secondary coils disposed in inductive relationship with the exciter coil, means for indicating an electrical potential induced in the secondary coils, and met-



al rings disposed co-axially at both ends of the exciter coil to reduce the potential change in the secondary coil when a magnetizable body is removed from inductive relationship with the exciter coil.

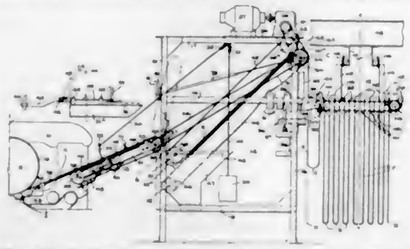
2,102,452

DETECTION OF FLAWS IN MAGNETIZABLE BODIES

Theodor Zuschlag, West Englewood, N. J., assignor to Magnetic Analysis Corporation, a corporation of New York

Application April 23, 1936, Serial No. 75,944
9 Claims. (Cl. 175—183)

1. In a magnetic analysis apparatus the combination which comprises an exciter coil, means for supplying alternating current to the exciter coil, two pairs of secondary coils disposed in inductive relationship with the exciter coil, one coil of each pair being disposed closer to the exciter coil than the other coil of the pair, a bridge network in which the coils of each pair are connected in series opposition with each other and the pairs are also connected in series opposition with each other, and means for detecting the presence of a potential in said network.



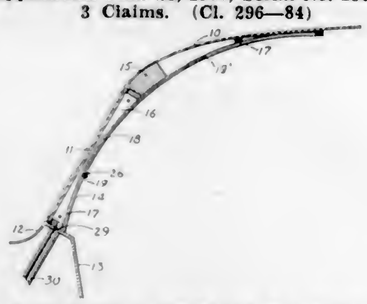
2,102,453

AUTOMATIC STOCK TAKE-OFF MACHINE

Winthrop W. Benner, Ithan, and Frederick Leopold, Jr., Harmonville, Pa., assignors to Lee Rubber & Tire Corporation, Conshohocken, Pa., a corporation of New York

Application May 28, 1935, Serial No. 23,862
10 Claims. (Cl. 271—2.2)

1. In an apparatus of the character described, in combination, a conveying mechanism arranged to continuously convey a relatively long strip of stock to a predeterminedly located point of discharge, a stock receiving unit shiftable laterally to either side of the path of movement of the strip of stock, means for locking said unit in position to receive the strip of stock discharged from the conveying mechanism, and means operative automatically to shift successive portions



of the stock discharged from the conveying mechanism to and upon the said stock receiving unit, said last-mentioned means being operative to arrange the successive portions of the stock so shifted upon the receiving unit therefor in the form of a series of longitudinally spaced similarly formed looped sections.

2,102,454

CLEAR-VISION ANTIGLARE WINDSHIELD

William Bennett, Westbury, N. Y.

Application June 25, 1937, Serial No. 150,255
3 Claims. (Cl. 296—84)

1. A clear-vision windshield for automobiles and the like comprising, a fixed, flat, transparent sheet of "Safety" glass, a transparent, concave, tinted member spaced from and aligned with said glass, tracks curved to correspond to the arc formed by the concave member and wherein said member is adapted to be slid out of alignment with the glass, air-heating means, means for conducting and delivering heated air to the space between the glass and transparent member, and means for releasing said transparent member from said tracks.

2,102,455

CAR ROOF

Charles David Bonsall, Pittsburgh, Pa., assignor to P. H. Murphy Company, New Kensington, Pa., a corporation of Pennsylvania

Application March 14, 1936, Serial No. 68,939
7 Claims. (Cl. 108—5.4)

1. In a car roof, a seam construction comprising a carline having a hollow longitudinal rib, roof sheets below said carline and provided along their adjacent margins with flanges that extend into said rib, and a weld of added metal located against the inside top surface of said rib above the general surface of the sheets and securing

said flanges to said rib whereby said weld metal increases the capacity of the seam construction

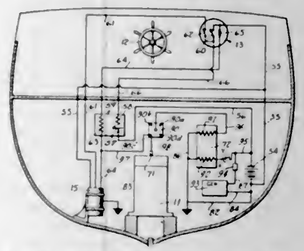
for resisting compression stress due to vertical load.

2,102,456

TREATMENT OF RUBBER ARTICLES

Abraham K. Brill and Walter A. Wake, Youngstown, Ohio, assignors to The Republic Rubber Company, Youngstown, Ohio, a corporation of Ohio

No Drawing. Application August 17, 1935, Serial No. 36,753
7 Claims. (Cl. 260—1)



1. A method for surface-conditioning an article formed at least partially of rubber which consists in subjecting the rubber surface of the article to the action of a solution containing nitric acid for a length of time sufficient to form a hard polishable skin thereon.

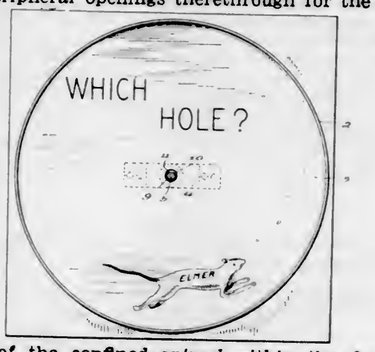
2,102,457

GAS DETECTING APPARATUS

Raymond Alfred Gandy, Stamford, Conn.

Application January 15, 1935, Serial No. 1,975
8 Claims. (Cl. 177—311)

1. In a gas detecting apparatus, in combination, an explosion chamber, a circuit including a source of current, an indicator connected to the circuit, igniting means positioned within the explosion chamber and connected to the circuit, switch means for closing the circuit to supply current to said igniting means and said indicator, and a second switch means connected in parallel with said first switch responsive to the occurrence of an explosion within the explosion chamber whereby the circuit will remain closed after the opening of said first named switch if an explosion has occurred.



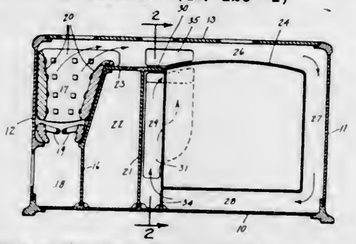
2,102,458

AMUSEMENT DEVICE

Carter Gibson, San Angelo, Tex.

Application April 13, 1936, Serial No. 74,197
3 Claims. (Cl. 273—143)

1. An amusement device comprising a base having a surface to receive an animal thereon, a bracket attached thereto, a spindle fixed to the bracket and extending upwardly therefrom, a sleeve journaled on the spindle, a drum having a top fixed to the upper end of the sleeve, said drum being adapted to confine the animal between the top and base, means connected with the spindle for detachably holding the sleeve in place on the spindle, said drum having a plurality of peripheral openings therethrough for the es-



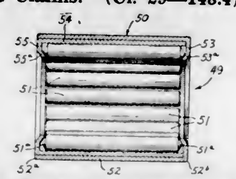
cape of the confined animal within the drum following rotation thereof.

2,102,459

COOK STOVE

William Dow Harvey and Alden P. Chester Kokomo, Ind., assignors to Globe American Corporation, Kokomo, Ind., a corporation

Application February 27, 1936, Serial No. 65,993
2 Claims. (Cl. 126—1)



1. In a cook stove, the combination of a firebox, an oven, a warming chamber between the firebox and oven, and means spaced from the oven and forming passages conducting products of combustion from the firebox across the top of the oven, thence downwardly along the side of the oven remote from the firebox, thence across the bottom of the oven and thence upwardly along the side of the oven nearest the firebox between the oven and warming chamber.

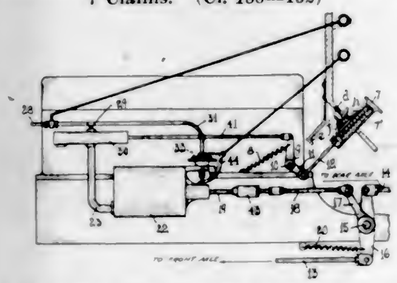
2,102,460

METHOD OF MAKING ROLLER BEARINGS

Lewis R. Heim, Mount Dora, Fla.

Application July 18, 1934, Serial No. 735,802
16 Claims. (Cl. 29—148.4)

15. The method of making a roller bearing which consists in forming from sheet metal a cylindrical sleeve having at one end thereof an inwardly directed retaining flange with the free edge thereof bent axially of said sleeve and having at the other end thereof a substantially simi-



lar flange, placing in contact with a part of said sleeve a plurality of small diameter cylindrical rollers having reduced ends, with one reduced end of each roller disposed within said first-mentioned flange, and subjecting the second-mentioned flange to substantial axial pressure to force said flange into a relative position wherein its free edge overlies the adjacent reduced end of each of said rollers and contacts with said reduced ends, whereby to hold said rollers and sleeve as a unit.

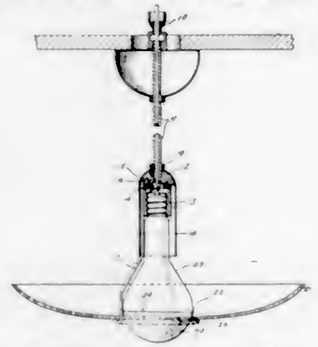
2,102,461

BRAKE CONTROLLING APPLIANCE

Bernard E. Howell and Walter S. McKnight, Council Bluffs, Iowa

Application July 29, 1935, Serial No. 33,700
7 Claims. (Cl. 188—152)

1. In brake rod appliances for a motor vehicle, said motor having an intake manifold and a control-valve for fuel, resilient means normally maintaining the brake rods in inoperative position, a spring controlled bell-crank provided centrally with an operating-shaft, a link connected with the control-valve and having a connection with the operating-shaft, a valve housing, a suction-control valve in the valve housing having a rod mounted on the bell-crank, a brake-cylinder having a suction pipe communicating with the intake manifold subject to the control of the suction-control valve, a piston in the brake-cylinder having a rod connected with the brake rods, a vacuum chamber having a suction pipe in communication with the intake manifold, a spring-controlled piston in said chamber having a rod secured thereto, a latch-pin pivoted to said rod and normally engaging the rod of the first named piston, and a treadle connected and movable in one direction for moving the bell-crank to cause opening of the fuel control valve and to permit a movement of said spring-controlled piston to cause disengagement of the latch-pin from the piston rod of said first named piston, said treadle being movable in a reverse direction for actuating the bell-crank and suction-control valve to permit actuation of the piston in the brake cylinder, by force of suction, for moving the brake rods to operative position, the fuel control-valve moving to closed position.



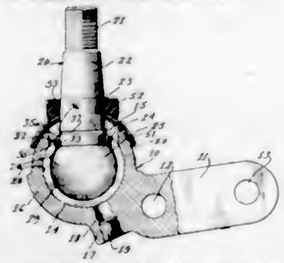
2,102,462

HANGER

Theodore L. Howell, New York, N. Y., assignor to Kurt Versen, New York, N. Y.

Application July 25, 1932, Serial No. 624,372
7 Claims. (Cl. 240—78)

1. A lighting fixture comprising a tubular supporting shaft adapted to carry electrical conductors, a supporting block secured to the bottom of said shaft provided with vertical holes in its top and radical grooves leading therefrom down the sides at spaced points about said shaft for reception of suspension wires, a lamp socket secured to the bottom of said supporting block, a lamp mounted in said lamp socket having the portion of the glass thereof below the level of the filament silvered to provide a spherical reflector, a plurality of suspension wires each having its ends turned back to a U shape, the upper ends being inserted in the spaced holes of the supporting block and the lower ends lying close to the bulb of said lamp slightly below the upper border of the silvered portion, a ring held in the bottom U's of said wires, a light-permeable bowl supported on said ring and having a central



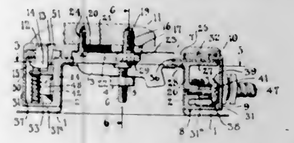
opening approximately the size of the central opening in said ring adapted to permit the lamp bulb and the suspension wires to project therethrough, whereby the silvered portion of the bulb forms a visible part of the fixture when viewed from below, said bowl being shaped to follow approximately the photometric curve of the lamp, whereby the bowl will be uniformly illuminated, but will intercept only a very small proportion of the light from the lamp, a husk slidable on said shaft adapted to fit over the supporting block and lamp socket so as to hold the suspension wires, the holes and grooves of the supporting block, and a fastening means adapted to secure said husk in position upon said shaft.

2,102,463

BALL JOINT FOR FRONT WHEEL SUSPENSIONS

George H. Hufferd, Detroit, Mich., assignor to Thompson Products Incorporated, Cleveland, Ohio, a corporation of Ohio

Application October 19, 1936, Serial No. 106,341
8 Claims. (Cl. 287—90)



1. A joint comprising a housing having a cylindrical bore therein, a pair of complementary seating elements rotatable in said bore and having inner bearing surfaces therein, an integral headed stud member having the integral head thereof seated on the inner bearing surfaces of the seating elements in tiltable and rotatable relation therewith and means associated with said stud to transmit tilting movements thereof in planes at right angles to the axis of the bore to the seating elements.

2,102,464

CLOSURE CAP LOCK

Clarence M. Hurd, Huntington, N. Y.

Application April 21, 1936, Serial No. 75,519
12 Claims. (Cl. 292—144)

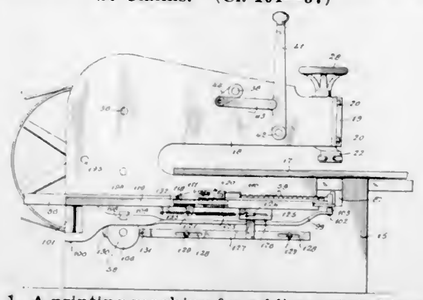
1. A closure cap construction for the filler neck of a gasoline tank comprising a housing member adapted to be secured to said filler neck, a lid hinged to the housing member and adapted to close the opening in said filler neck, slidable means mounted on said lid for engaging with said housing member when the lid is in a closed position, locking means positioned within said housing for normally holding said engaging means of the lid in locked relation to said housing member when said lid is closed, and electromagnetic means within said housing for effecting the release of said locking means from its locking position with respect to said slidable engaging means of the lid upon the closing of an electrical circuit.

2,102,465

LAMP SOCKET

Gustaf A. Johnson, New Bedford, Mass.

Application November 17, 1933, Serial No. 698,462
12 Claims. (Cl. 173—355)



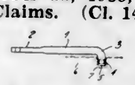
1. In a lamp socket, the combination of an insulating body recessed in its top face to afford space for knotting lead wires and in its bottom face to form a switch chamber, a slotted opening connecting said two recesses, said opening having an interior shoulder at each end adjacent said first recess, a pair of fixed contacts mounted in said switch chamber, a U-shaped rocker member pivotally mounted on said interior shoulders and having arms extending into said switch chamber, said arms being resilient permitting them to move inwardly toward each other when said rocker member is thrown between said fixed contacts, an operating member and an actuating spring intermediate said rocker member and said operating member for rocking said rocker member to turn said resilient arms into or out of sliding engagement between said fixed contacts whenever said operating member is actuated.

2,102,466

PRINTING MACHINE

Harry L. Latz, New York, N. Y., and Stephen H. Plum, 2d, Madison, N. J., assignors to Harry Latz Service Inc., New York, N. Y., a corporation of New York

Application January 4, 1936, Serial No. 57,464
20 Claims. (Cl. 101—57)



1. A printing machine for adding printed items to previously printed matter comprising a support for a plurality of slugs each provided with type constituting the item to be added to said previously printed matter, printing mechanism having a linearly movable printing member normally in receiving relation to said support, means for shifting said slugs successively to a position on said support for delivery to said printing member, means for intermittently transferring said slugs in sequence from said support to said printing member for movement therewith and for removing each next previous slug therefrom, and mechanism for operating said printing mechanism in the intervals between the transferring and removal of successive slugs to and from said printing member.

2,102,467

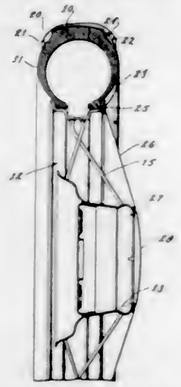
MANUFACTURE OF KEYS FOR PRESERVE CANS

Erik Ljungström, Stockholm, Sweden, assignor to Aktiebolaget Transitoria, Stockholm, Sweden, a corporation of Sweden

Application October 22, 1935, Serial No. 46,090
18 Claims. (Cl. 140—1)

1. A method of manufacturing tearing members or keys for preserve cans from a metal string, which comprises stepwisely feeding the string through predetermined equal lengths while subjecting each of said lengths to the following operations in the order named: cleaving an end portion of the string length in its longitudinal direction to form two shanks while shaping the remaining portion of the string length to adapt same for fixation to the can, bending said shanks outwardly in opposite directions to form gripping hooks, and severing the string length thus treated from the following string.

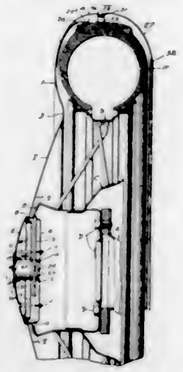
2,102,468



COMBINATION TIRE COVER AND HUB GUARD

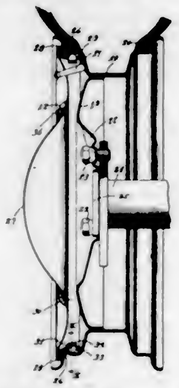
George Albert Lyon, Allenhurst, N. J., assignor to Lyon Incorporated, Asbury Park, N. J., a corporation of Delaware

Application January 2, 1932, Serial No. 584,561
4 Claims. (Cl. 150—54)



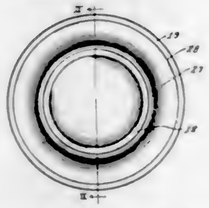
1. As an article of manufacture, a side plate part for use in a multi-part tire cover including

a convexly curved ring-like portion for disposition over the outer side wall of a spare tire and an inwardly extending and outwardly slanting disc-like portion for covering the spokes of the



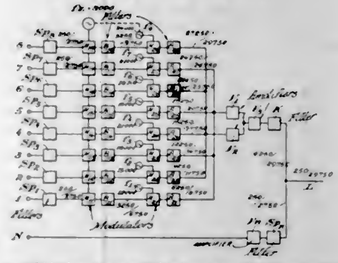
wheel carrying the tire to which the cover is applied, said disc-like portion having a central opening defined by a marginal turned edge formed to engage under a wheel hub cap.

2,102,469
TIRE COVER
George Albert Lyon, Detroit, Mich., assignor to Lyon Incorporated, Detroit, Mich., a corporation of Delaware
Application August 21, 1933, Serial No. 686,027
4 Claims. (Cl. 150—54)



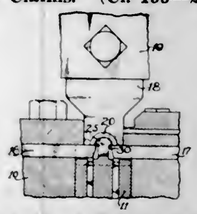
1. In a spare wheel and tire cover assembly: a drum-like member shaped to substantially conform to the outer side of the spare wheel and spare tire carried thereby and to be shoved axially into cooperative relation thereto, resilient means carried by said member and engageable with the tread of the tire to yieldably support the member from the tire, said means being provided at a plurality of spaced points at the outer periphery of the member to hold the member in substantially coaxial relation to the tire, and locking means arranged substantially centrally of said member and formed to interlock with the wheel hub to prevent unauthorized removal of the cover, said resilient means serving to center said locking means with the hub to enable said locking means to readily interlock with said hub.

2,102,470
ORNAMENTAL RING FOR DISK WHEELS
George Albert Lyon, Detroit, Mich.
Application September 20, 1934, Serial No. 744,758
7 Claims. (Cl. 41—10)



1. In combination in a vehicle wheel, a front shell, an outwardly smooth surfaced tire rim on said shell, spaced lugs projecting from said shell adjacent the jointure between the shell and rim, and an ornamental band having underturned means disposed at an angle to the outer portion of the band and designed for engagement with said lugs, said band being compressible to vary the angle between the outer portion thereof and said underturned means to cause complete engagement between said underturned means and said lugs, and said band being shaped to extend outwardly adjacent the rim and conceal said jointure.

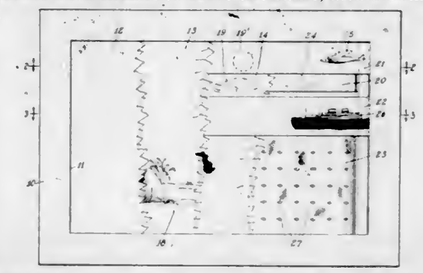
2,102,471
VEHICLE WHEEL AND COVER PLATE
George Albert Lyon, Allenhurst, N. J.
Original application September 20, 1934, Serial No. 744,758. Divided and this application September 9, 1935, Serial No. 39,709
4 Claims. (Cl. 301—37)



1. In combination, a vehicle wheel, and an ornamental disc of a size to cover the major portion of the side face of the wheel inside the tire rim and carrying retaining means for snap-on engagement with a part of the wheel adjacent the outer periphery thereof, said retaining means cooperating with means on the rim to prevent relative rotation therebetween and eliminate sidewise pressure against a tire valve stem member.

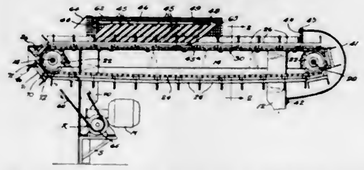
2,102,472
MULTICHANNEL CARRIER TRANSMISSION SYSTEM
Hans Mayer, Berlin-Charlottenburg, Germany, assignor to Siemens & Halske, Aktiengesellschaft, Siemensstadt, near Berlin, Germany, a corporation of Germany
Application December 12, 1933, Serial No. 701,963
In Germany December 22, 1932
9 Claims. (Cl. 179—15)

1. A multiple transmission system comprising a circuit having a plurality of transmission branches, means for supplying to each of said branches, carrier currents of the same intermediate frequency, means for supplying to each of said branches, branch carrier currents the frequencies of which are different from said intermediate frequency but are entire multiples of said intermediate frequency, and means for passing through said branches, transmission currents in frequency bands each of which is narrower than the interval between two successive entire multiples of said intermediate frequency.



2,102,473
METHOD OF MAKING RETAINER LOCKS
Eugene A. McBride, Cleveland, Ohio, assignor to Thompson Products, Incorporated, Cleveland, Ohio, a corporation of Ohio
Application October 8, 1936, Serial No. 104,619
2 Claims. (Cl. 153—2)

1. In the method of making valve spring retainer locks from a metal strip, the steps which comprise severing a blank from said strip of a length slightly greater than the length of a finished lock, forming said blank to the shape of a finished lock between forming dies and severing opposite edges of said blank while supported between said dies to produce a lock of the desired finished dimensions.

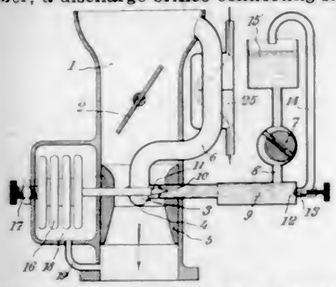


2,102,474
ANIMATED LUMINOUS DISPLAY DEVICE
Vincent McKenna, Walter McKenna, and Sydney Rouss, New York, N. Y., assignors to McKenna Glo-Life Corporation, New York, N. Y., a corporation of New York
Application June 26, 1937, Serial No. 150,430
9 Claims. (Cl. 40—132)

8. An illuminated device, comprising a housing having an opening and a translucent screen closing the same, a transparency located behind said screen and bearing display matter, a travelling band of foraminous material provided with light apertures and located behind the screen, together with means to drive the same, and a source

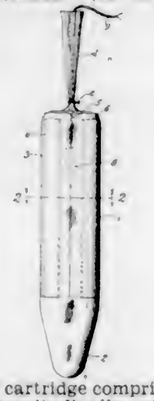
of light within the housing behind said transparency and band, rays therefrom passing through the band and its apertures onto the screen to cooperate with the matter of said transparency projected upon said screen by further rays of said light.

2,102,475
SLICING MACHINE
Willard C. McNitt, Winnetka, Ill.
Application December 6, 1934, Serial No. 756,195
Renewed May 10, 1937
5 Claims. (Cl. 146—163)



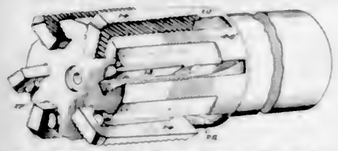
3. A conveyor comprising an endless chain, a plurality of rectangularly spaced open topped containers mounted upon separated links thereof, each of said containers comprising flat spacers and flat finger members assembled together in alternate relation, each of said finger members comprising a base portion with upstanding fingers at each end thereof forming horizontal bottom and vertical front and rear wall portions of the container, flat plates at each end of the assembly forming end closures for the container and a pair of bolts upon which the end plates, flat spacers and base portions of the finger members are threaded and clamp together in contacting relation.

2,102,476
FLOATLESS CARBURETOR
Marcel Mennesson, Neuilly-sur-Seine, France, assignor to "Société Anonyme Solex" Neuilly-sur-Seine, France, a society of France
Application December 28, 1936, Serial No. 117,953
In France January 3, 1936
14 Claims. (Cl. 123—119)



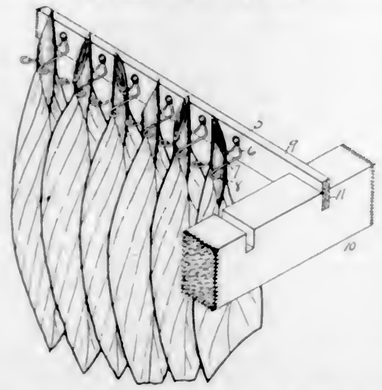
1. A floatless carbureting system for an internal combustion engine comprising a suction pipe, a throttling member in said suction pipe, a fuel-air mixing chamber communicating with said suction pipe through a passage having a small effective area, air inlet means having a large effective area and communicating with said mixing chamber, a fuel reservoir, a feed chamber communicating with said mixing chamber, a rotary pump connected to said reservoir and driven

by said engine for delivering fuel to said feed chamber, a discharge orifice connecting said feed



and mixing chambers, and conduit means connecting said feed chamber to said fuel reservoir.

2,102,477
BLASTING CARTRIDGE
George A. Merchant, Chicago, and Roland Milan, Pinckneyville, Ill., assignors to Binkley Coal Company, Chicago, Ill., a corporation of Illinois
Application April 8, 1935, Serial No. 15,198
12 Claims. (Cl. 102—6)

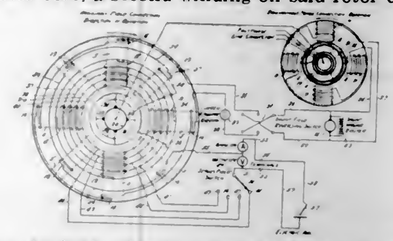


1. A blasting cartridge comprising, a fabric bag, a plurality of longitudinally extending peripherally disposed and spaced reinforcing members contained therein, the combined width of which is materially less than the peripheral length of the bag, a carbonaceous filler for the bag, the filler and the reinforcing members being both impregnated with liquid oxygen.

2,102,478
CUTTING TOOL
Frank P. Miller, Meadville, Pa.
Application May 17, 1934, Serial No. 726,145
6 Claims. (Cl. 29—105)

1. In an inserted blade cutter, a body having a slot provided with parallel side walls, a blade in said slot and having a cutting end portion, said blade being formed with means cooperating with said side walls in defining an adjusting angle at an acute angle to the longitudinal axis of the blade, said blade being diminished in wall thickness from the outer forward portion thereof to the inner rear portion thereof on a line parallel to the said adjusting angle and means for locking said blade in adjusted position.

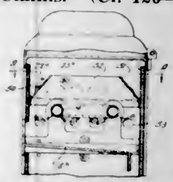
2,102,479
TOBACCO HANGER
Albert Newfield, Hartford, Conn.
Application December 16, 1935, Serial No. 54,681
1 Claim. (Cl. 131—21)



A tobacco hanger formed from a piece of wire doubled at substantially its lengthwise center and thereat shaped into a substantially closed eye constituting a firm seat extending substantially fully around the under side of the head of a screw, branches extending straight from said eye in the plane thereof in divergent directions to properly space spring arms and constituting with said eye a flat base, and spring arms extending straight from the ends of said branches at substantially right angles thereto in substantially parallel relation to receive the stems of tobacco leaves.

2,102,480
ROAD COVERING
Hans Peter Karl Theodor Nielsen, Aabyhøj, Denmark, assignor to De jydake Skaervefabriker, Aarhus, Denmark
No Drawing. Application May 31, 1935, Serial No. 24,424. In Denmark November 14, 1934
4 Claims. (Cl. 106—31)

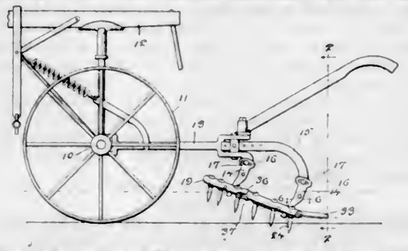
1. A process for the manufacture of a covering composition adapted to be deposited in cold state as a covering for roads and floors, comprising mixing a stone material with dry humin substances and with a bituminous binding agent, the melting-point of which measured by the ball and ring method lies below 40° C.



2,102,481
DYNAMO MOTOR
Clay W. Noel, Mansfield, Ohio, assignor to The Ideal Electric and Manufacturing Company, Mansfield, Ohio, a corporation of Ohio
Application September 26, 1934, Serial No. 745,636
14 Claims. (Cl. 171—123)

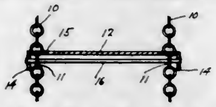
1. A combined dynamo and synchronous motor to supply current to a current consuming load comprising a stator, a set of pole pieces and an exciting winding for the synchronous motor carried by said stator, a magnetically independent set of pole pieces carried by said stator adapted to provide a dynamo exciting field, a rotor, independent motor and dynamo cores carried by said rotor, an alternating current fed winding on said motor core, a second winding on said rotor com-

mon to both of said cores, said second rotor winding being conductively insulated from said other rotor winding but inductively coupled thereto, a plurality of tapped windings associated with the dynamo exciting field pole pieces, and means for serially connecting said tapped windings with said second core winding and the current consuming load.



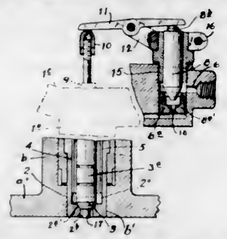
2,102,482
BURNER MECHANISM FOR GASEOUS FUEL STOVES
Claude E. Parker, Chicago, Ill., assignor to Skoop-A Corporation, Chicago, Ill., a corporation of Illinois
Application August 7, 1936, Serial No. 94,825
8 Claims. (Cl. 126—41)

1. In a gaseous fuel cook stove, a closed lower combustion chamber having upright side walls and a top wall, an outlet in said top wall spaced inwardly from opposite side walls, a food support in said chamber arranged generally horizontally in downwardly spaced relation to said top wall, an inlet for admitting secondary air to said chamber, a burner overlying said food support and adapted to apply heat downwardly toward the support, an upper combustion chamber communicating downwardly with the lower chamber through said outlet and having a top plate disposed horizontally a short distance above said outlet from the lower chamber, and an outlet from said upper chamber disposed laterally of the outlet from the lower chamber, one of said outlets being of restricted capacity to effect the retention in said lower chamber of a slowly rising body of highly heated gases radiating heat downwardly toward said food support.



2,102,483
CULTIVATOR
Fred F. Powell, La Valle, Mo.
Application January 26, 1937, Serial No. 122,458
3 Claims. (Cl. 97—179)

1. A cultivator attachment including the combination with the shanks of a cultivator, of brackets secured at the upper ends to the shanks for adjustment in an arc downwardly from the shanks, said brackets being bifurcated, a tooth bearing bar, bolts passed through the bar and



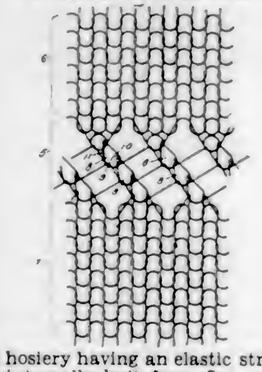
adjustably secured between the branches of the brackets whereby the bar may be elevated at either end from the horizontal, and a blade carried by the bar and disposed in rear of the bar.

2,102,484
EMERGENCY FIRE ESCAPE
Arnold C. Rapp, Covington, Va.
Application March 27, 1936, Serial No. 71,218
2 Claims. (Cl. 228—40)

2. A portable collapsible fire escape comprising hanger chains including open links, and a plurality of steps, each step being provided with depending flanges and connecting rods, passing through the flanges and the link to join the chains to the steps, said flanges supporting the plates in spaced relation when the plates are in a stacked collapsed position to enclose the chain and rods between the plates.

2,102,485
FUEL INJECTION MEANS FOR MOTORS
Olaf Leonhard Augustinus Riegels, Cleveland, Ohio
Application April 26, 1935, Serial No. 18,395
5 Claims. (Cl. 123—32)

1. A fuel injection apparatus for internal combustion engines, which includes a source of fuel supply under high pressure, a normally closed spring-controlled injection means comprising a valve seat having a discharge opening of predetermined size governed by the desired discharges into the engine cylinder, and a movable element co-operating with such valve seat, a by-pass means for periodically by-passing fuel to said source of supply and comprising a valve seat having a discharge opening and a movable valve element cooperating with said seat, the related surfaces of said last mentioned valve seat and valve element serving gradually to open or close the discharge opening through the valve seat during the movement of said valve element, the



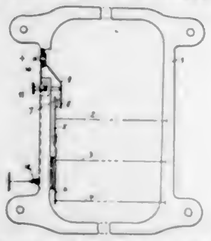
discharge opening through said last mentioned valve seat being smaller than the discharge opening through said injection means valve seat and said openings being proportioned to the relative pressures respectively beyond the same, the higher pressure being beyond the injection valve where it discharges into the engine cylinder, and means for operating said movable valve elements for effecting the opening of one valve simultaneously with the closing of the other, said means being co-ordinated with the relative sizes of said discharge openings to insure equal volumetric flow through said openings.

2,102,486

HOSIERY WITH STRAIN ABSORBING ZONE REINFORCED AGAINST CURLING

Richard H. Scheer, New Holland, Pa., assignor to Vanity Fair Silk Mills, Reading, Pa., a corporation of Pennsylvania

Application December 24, 1936, Serial No. 117,591
5 Claims. (Cl. 66—172)



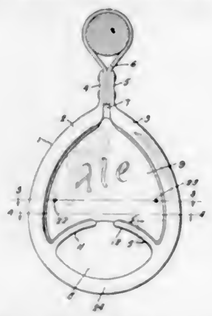
2. Knit hosiery having an elastic strain absorbing zone integrally knit from fine gage covered rubber elastic yarn, of such width as to have an inherent tendency to objectionable curling, the elastic rubber fabric in said zone being formed with thickened portions resisting the tendency to curl comprising short bars extending transversely with respect to the width of said zone and arranged in a band spaced from the top and bottom edges of said zone extending circumferentially of said zone.

2,102,487

DEFROSTING SCREEN

Alfred Schwarz, Eisenach, Marienhohe, Germany; Sophie Schwarz, née Kuhlhoff, sole heir of said Alfred Schwarz, deceased, assignor to Metallwerk Alfred Schwarz, G. m. b. H., of Germany

Application September 27, 1935, Serial No. 42,541
In Germany December 30, 1933
3 Claims. (Cl. 219—19)



1. A defrosting device for windshields and the like, including a wire designed to be energized for the development of heat, and a switch controlling the energization of said heating wire, said switch being opened and closed by the variations in the length of the wire incident to a heated or non-heated condition thereof.

2,102,488

ADVERTISING STRAP HANGER

Abel Garcia Sirera, New York, N. Y.

Application May 11, 1937, Serial No. 142,015
6 Claims. (Cl. 105—354)

1. Advertising strap hanger comprising a frame formed as a loop having its free ends confronting, in slightly spaced relation, to receive the suspending element to which it is adapted to be secured, the sides of said frame having sufficient resiliency to permit said free ends to be slightly warped to spread or contract the space between said ends to fit suspending means of different thickness, the lower part of the space within said frame providing room for the hand when gripping said frame, a plate for advertising matter fitting the upper part of said frame with some small clearance toward the top, said frame being formed with slotted lugs extending into said space with the slots elongated in the general direction of the movement of the sides of said frame when warped, and fastening means passing through said plate and lugs permitting freedom of movement between said plate and the sides of said frame, so that the frame can be clamped together upon the suspending means without impediment from said plate.

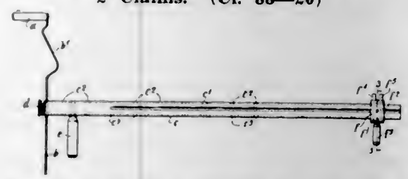
2,102,489

SELF-LOCKING NUT AND METHOD OF MAKING THE SAME

Oliver Edwin Simmonds, London, England, assignor to Simmonds Development Corporation Limited, London, England

Application March 23, 1936, Serial No. 70,497
In Great Britain April 16, 1935
9 Claims. (Cl. 10—86)

1. The method of making a self-locking screw-threaded nut, which comprises forming in the nut a recess the walls of which form a complete figure of revolution, forming in the axially-extending wall of the said recess an inwardly-extending projection, and forcing within said recess in axial alignment an elastic inset which has a peripheral surface that forms a complete figure of revolution and which has a hole therein of less diameter than the maximum interior diameter of the screw-threaded portion of the nut.



9. A self-locking nut having a screw-threaded bore, a recess the walls of which form a complete figure of revolution, an elastic inset that is housed within said recess, that has a peripheral surface forming a complete figure of revolution and that has a hole therein in axial alignment with the said bore and of less diameter than the maximum interior diameter of said bore, and a projecting part on the base wall of said recess interlocked directly into said inset to prevent relative movement between the said inset and nut.

2,102,490

MEANS FOR INVESTIGATING, CORRECTING, AND DEVELOPING THE POWER OF HUMAN VISION

Robert Brooks Simpkins, Edgbaston, Birmingham, England

Application September 4, 1934, Serial No. 742,678
In Great Britain September 6, 1933
2 Claims. (Cl. 88—20)

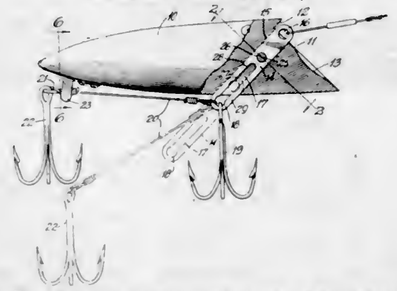
1. Apparatus for investigating, correcting and developing the power of human vision, comprising a tube of circular cross-section provided in its outer periphery at diametrically opposite sides with longitudinally extending grooves, positioning means of strip form carried by said tube having vertical and horizontal components conforming in shape to and adapted to fit a part of a patient's face for definitely and accurately locating the tube relatively to the eyes without obstruction of vision, a rod depending from said tube forwardly of said positioning means, and a traversable member on the tube to support a device for detecting an abnormality of vision and onto which patients are encouraged to train the eyes and perform exercises calculated to remedy a detected abnormality, said traversable member having ball bearings adapted to run in the said longitudinal grooves in said tube.

2,102,491

WINDOW CONSTRUCTION

Schley E. Smith, Rock Island, Ill.

Application September 16, 1935, Serial No. 40,803
1 Claim. (Cl. 189—64)



A window construction comprising channel guides, sash frames including vertical and horizontal rungs and having the vertical rungs thereof slidably supported by said guides, cushion friction blocks carried by the vertical rungs and engaging walls of the guides, said vertical rungs having entrances, panel supporting frames abutting the sash frames, and channel guides formed on the panel supporting frames and extending into the entrances of the vertical rungs of the sash frames.

2,102,492

FISH LURE

William A. Stolley, Dowagiac, Mich., assignor to James Heddon's Sons, Dowagiac, Mich., a corporation of Michigan

Application December 6, 1935, Serial No. 53,180
5 Claims. (Cl. 43—46)

1. In a fish lure, the combination of a body provided with a slot therethrough, a link entered through said slot and configured at its upper end to afford a line tie and configured at its lower end to afford a hook connection, a leader connected to the lower end of the link, a hook connected to the rear end of the leader, a clip on the rear portion of the body adapted to normally engage and hold the leader and hook elevated in contiguous relation to the body and adapted to permit disengagement of the leader and hook to swing free of the body, and a cross pin entered transversely through the link and through the adjacent portion of the body.

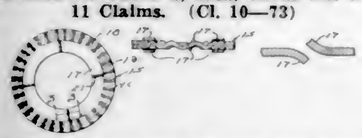
2. In a fish lure, the combination of a body, a slot extending through the body, a link slidably entered through said slot and configured at its upper end to afford a line tie and provided in its lower portion with an elongated slot affording a hook connection at its lower end, one of the arms of the slotted portion of the link being disconnected from the body of the link at one end and adapted when the link is withdrawn from the slot in the body to project laterally from the plane of the link to provide for the insertion of a hook and adapted, when the link is normally positioned within the slot in the body, to be held closed within the plane of the link, releasable means for normally holding the link within the slot, and a hook secured to the lower end of the link.

2,102,493

METHOD FOR THE PRODUCTION OF FAN-SHAPED SCREW LOCKS

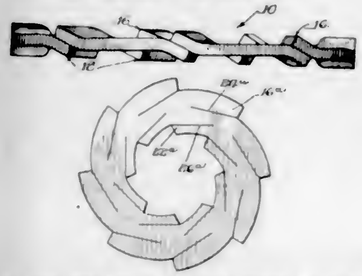
Adolf Thode, Hamburg-Billbrook, Germany, assignor to Illinois Tool Works, Chicago, Ill., a corporation of Illinois

Application August 19, 1932, Serial No. 629,428
In Germany April 25, 1932
36 Claims. (Cl. 10—86)



1. A lock washer comprising a flat disc of metal including an inner contracted band, there being a central opening in said disc, and an outer band having radial slits therein whereby to provide flaps, which latter are overlapped at their adjoining edges, said flaps being of the original thickness of the disc.

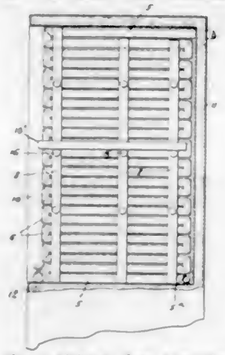
19. The method of making lock washers which includes the steps of providing a section of stock



having a plurality of separate adjacent marginal prongs and a continuous portion to which said prongs are joined; and reducing the diameter of said portion to effect an overlapping of adjacent prongs.

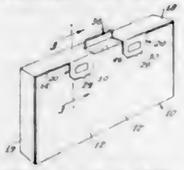
2,102,494
LOCK WASHER
James J. Connell, Detroit, Mich., assignor, by mesne assignments, to Illinois Tool Works, Chicago, Ill., a corporation of Illinois
Application November 2, 1932, Serial No. 640,853
11 Claims. (Cl. 10—73)

8. The method of making lock washers of the type for application between parallel work surfaces which includes forming a plurality of radial slits along one margin of an annular washer blank whereby to provide a blank having a plurality of adjacent marginal prongs and a continuous circular portion to which said prongs are attached, warping said prongs so as to provide work engaging teeth thereon on opposite sides of the blank, and transversely working the metal of said continuous portion to effect an overlapping of adjacent prongs, radially contiguous parts of said continuous portion being maintained in parallel planes during the working operation.



2,102,495
LOCK WASHER
Frank W. England, Chicago, Ill., assignor to Illinois Tool Works, Chicago, Ill., a corporation of Illinois
Application August 8, 1935, Serial No. 35,257
15 Claims. (Cl. 151—35)

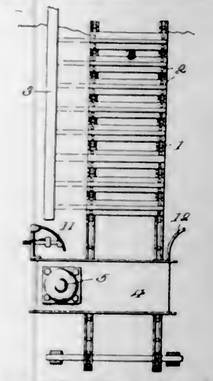
6. A lock washer of spring stock including a plurality of inner and outer annularly disposed prongs, certain of said prongs having work engaging edges positioned on one side of the medial plane of the washer and other prongs presenting edges on the opposite side of said medial plane, each prong overlapping a section of washer stock different in shape from said prongs.



2,102,496
WATER COOLER FOR USE IN REFRIGERATORS
William Floyd Thompson and Russell Whitten, Alton, Ill., assignors of thirty-three and one-third percent to A. W. Tiska and Mary Tiska, Alton, Ill.
Application June 4, 1936, Serial No. 83,560
2 Claims. (Cl. 62—89)

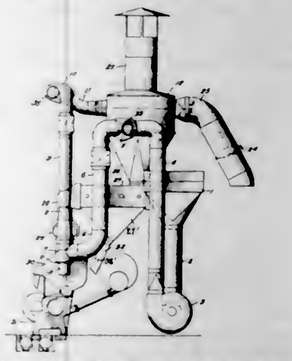
1. In a refrigerator, the combination with a cabinet including a compartment of a water cooling coil therein, said coil comprising a plurality of spaced parallel tubes disposed one above the other and in the same vertical plane, and relatively short vertical tubes connecting the horizontal tubes in alternation at opposite ends of the horizontal tubes to provide for a through circulation of water through the tubes, the uppermost horizontal tube of said coil extending through

the wall of the cabinet for association with a source of water supply, the lowermost horizontal tube of the coil having a part extending through a wall of the cabinet and equipped with a spigot, and a supporting stand for the coil including vertical strips disposed at opposite sides of the horizontal tubes, and spacer strips connecting said vertical strips and arranged in alternate spaces between the horizontal tubes of the coil.



2,102,497
BOX
William Trogman, Chicago, Ill.
Application June 8, 1936, Serial No. 84,083
8 Claims. (Cl. 229—52)

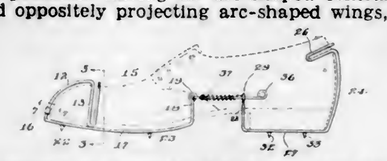
7. A box having a cover with a wall portion adapted to overlie a surface of the box, said surface having a slit formed therein and a handle loop passed outwardly therethrough and having end formations engageable with the inner surface of the box adjacent said slit to limit outward movement of the handle, the aforementioned overlying wall of the cover having latch-tab means engageable with latch formations in a wall of said box adjoining the wall in which the slit is formed, said overlying cover wall further having a tongue-like formation insertible into said slit when the box is closed.



2,102,498
MACHINE FOR SQUARING THE ENDS OF CAKES OF ICE
Migiel J. Uline, Washington, D. C.
Application November 25, 1935, Serial No. 51,527
3 Claims. (Cl. 125—13)

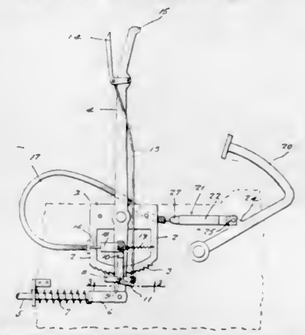
1. In a machine for squaring the ends of cakes of ice, an endless conveyor provided with means for supporting and holding the cakes of ice on edge, said conveyor being arranged at an angle, a bumper arranged to one side of said conveyor, a frame bridging said conveyor, an obliquely arranged cylindrical cutter mounted in said frame

and means for guiding the cake of ice on said conveyor in engagement with said cutter for gnawing off the end of the cake of ice.



2,102,499
COTTON HANDLING APPARATUS
Jeffrey John Wallace, Amite, La., assignor to Gullett Gin Company, Amite, La.
Application April 28, 1936, Serial No. 76,870
1 Claim. (Cl. 19—72)

Cotton drying and feeding apparatus comprising a cotton cleaner, a cyclone dropper connected to said cleaner and having a wall thereof provided with a screen, a discharge pipe extending from said wall around said screen, a valve in said discharge pipe, a dust box connected to said cleaner, a valve controlled discharge pipe connected to said dust box, means for forcing air under pressure through said dropper and cleaner, means for heating said air, said valves being adjustable to regulate the pressure of the air through said apparatus.



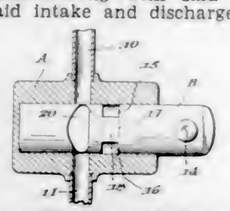
2,102,500
ANTISKID DEVICE FOR SHOES OR THE LIKE
William A. Walthers, Dalton, Wis.
Application March 9, 1937, Serial No. 129,945
7 Claims. (Cl. 36—7.6)

1. An anti-skid device for use with human footwear comprising a toe section and a heel section, means adjustably connecting the sections, the toe section including a substantially T-shaped toe protector having an arc-shaped central leg and oppositely projecting arc-shaped wings, the

extremities of which are adapted to rest against the edges of a shoe sole.

2,102,501
BRAKE RELEASE
Leo F. Wendel, Ellinwood, Kans.
Application June 27, 1936, Serial No. 87,767
3 Claims. (Cl. 192—13)

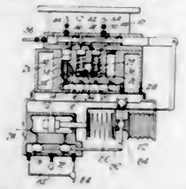
1. In a brake release for motor vehicles of the type including a clutch pedal, a ratchet, a hand brake lever, and a pawl pivotally mounted on said hand brake lever and engageable with the ratchet for securing said hand brake lever in set position, a releasing lever pivotally mounted on the hand lever, means operatively connecting said releasing lever to the pawl for disengaging said pawl from the ratchet, and means operatively connecting the releasing lever to the clutch pedal for actuation thereby when said clutch pedal is depressed.



2,102,502
MAKING RIMMED STEEL
Rufus E. Zimmerman, Short Hills, N. J., and Clarence D. King, Brooklyn, N. Y.
No Drawing. Application January 8, 1937, Serial No. 119,630
3 Claims. (Cl. 75—53)

1. The method of making rimmed steel ingots which comprises the addition of about two to three ounces of dehydrated borax per ton of metal to the molten steel while pouring the ingot.

2,102,503
FAUCET
Joe Auger, Elk Lake, Ontario, Canada
Application November 17, 1934, Serial No. 753,518
In Canada December 21, 1933
7 Claims. (Cl. 251—104)

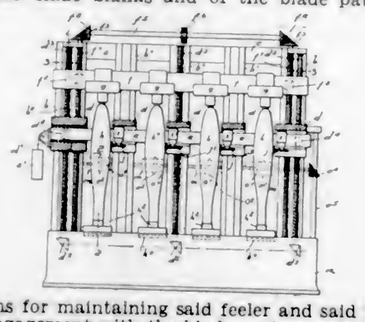


1. A faucet comprising a casing, hot and cold liquid conduits communicating with the casing, a valve plug rotatably mounted within the casing, said plug having opposed passageways formed therein opening on the surface of the plug in enlarged intake ducts in a plane registering with the liquid conduits, said plug including opposed

passageways terminating in enlarged discharge ducts opening on the surface of the plug in a plane registering with the said spout and commonly communicating with said passageways whereby said intake and discharge ducts may

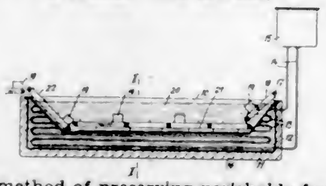
communicate with the conduits and discharge spout to discharge hot or cold liquid or a mixture of both first in full flow from one conduit and subsequently in increasing amounts from the other conduit without at first reducing the flow from the first conduit.

2,102,504
MIXTURE CONTROL
Guy E. Beardsley, Jr., Hartford, and Wright A. Parkins, West Hartford, Conn., assignors, by mesne assignments, to United Aircraft Corporation, a corporation of Delaware
Application May 25, 1934, Serial No. 727,508
21 Claims. (Cl. 261—39)



5. In a carburetor, mixture control means, comprising, in combination, means for regulating the flow of fuel, and means for operating said regulating means, said operating means comprising a pressure and temperature responsive device, a fluid pressure operated piston, a resilient connection between said piston and said device, a valve controlling the fluid to operate said piston, a connection between said valve and said device adapted to operate said valve in response to movements of said device, and a connection between said piston and said regulating means.

12. In a carburetor having a fuel nozzle fed by a plurality of fuel jets, means for controlling the quantity of fuel fed to said nozzle by said jets comprising a plurality of independent, fluid pressure operated, jet controlling plungers.

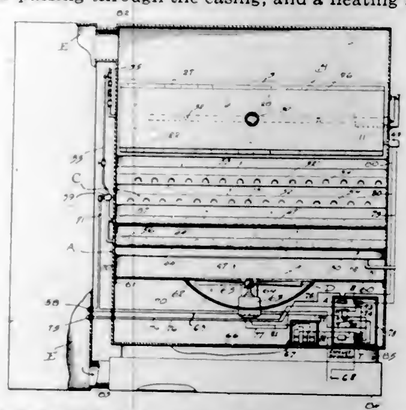


2,102,505
MACHINE FOR THE TOOLING OF METALLIC SCREW PROPELLER BLADES
Charles William Berthiez, Paris, France, assignor to "Compagnie de Fives-Lille", Paris, France, a corporation of France
Application March 26, 1937, Serial No. 133,257
In France April 2, 1936
2 Claims. (Cl. 90—136)

1. A machine for the tooling of metallic screw propeller blades according to a blade serving as a pattern, comprising a blade pattern and a set of blade blanks to be tooled arranged with their axis in a vertical position, means for giving to the blade pattern and to the blade blanks synchronous movements of rotation around their parallel vertical axes, a feeler adapted to engage with the blade pattern to be reproduced, a set of cutting tools adapted to engage with the blade blanks to be tooled, means for displacing the feeler along the blade pattern and means for giving to the tools displacements corresponding to those of the feeler, perpendicular to the axes of rotation of the blade blanks and of the blade pattern,

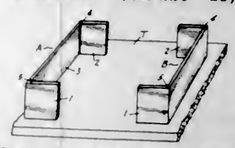
means for maintaining said feeler and said tools in engagement with the blade pattern and blade blanks respectively, during said displacements, in combination with means for maintaining each of the blade blanks and the blade pattern under axial tension during tooling, and with means for driving each of the blade blanks and the blade pattern at both ends during its movement of rotation.

2,102,506
FREEZING MEDIUM, METHOD OF PRODUCTION AND APPLICATION FOR FREEZING PURPOSES
Frederick Oliver Smith Bland, Hamburg, Germany
Application March 27, 1936, Serial No. 71,328
In Great Britain February 25, 1935
4 Claims. (Cl. 99—192)



1. A method of preserving perishable foodstuff which consists in immersing said foodstuff directly in a liquid chilling medium, cooled to at least —30° C., consisting of 20 to 40% pure glycerine, 20 to 40% ethyl alcohol and 25 to 45% water, to freeze the said foodstuff rapidly.

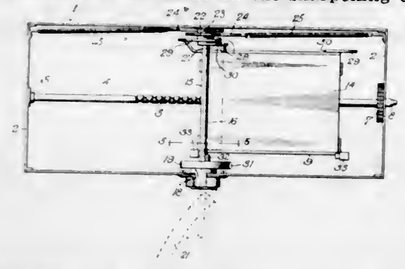
2,102,507
AIR CONDITIONING SYSTEM AND APPARATUS
Robert A. Brand, Washington, D. C., assignor of one-half to James A. Perley, Washington, D. C.
Application April 30, 1934, Serial No. 723,251
4 Claims. (Cl. 237—7)



1. An air conditioning apparatus comprising a casing having an inlet and an outlet, blower means within the casing for producing a circulation of air through said casing situated adjacent said inlet, a scrubbing and humidifying apparatus intercepting the path of said air, said apparatus including a series of open-faced water tubes and means for circulating water through the tubes for

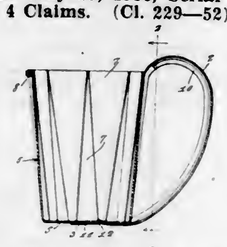
surface contact with the air, an eliminator disposed to the rear of the water tubes and in the path of the air leaving said tubes, said eliminator including a plurality of open-faced evaporating and cleaning tubes adapted to be impinged by the air passing through the casing, and a heating ap-

paratus within the casing and to the rear of the eliminator to heat said tubes and the air after it has passed thereover and prior to its discharge through said outlet, and means for effecting intermittent operation of said blower means in accordance with temperature requirements.



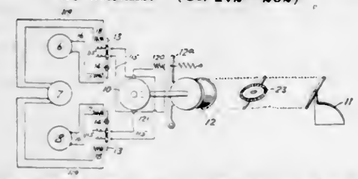
2,102,508
PACKAGE FOR DRY GOODS, AND METHOD AND APPARATUS FOR MAKING THE SAME
Alfred J. Brooks, Jamaica Plain, Mass.,
Application April 29, 1935, Serial No. 18,718
6 Claims. (Cl. 226—18)

1. A method of making a package from a preformed paper tube and two U-shaped blanks, consisting of the steps of placing the blanks on edge on a horizontal surface with their corresponding legs in alinement and extending toward each other and leaving an open space between said legs, inserting the articles to be wrapped within the space between the two blanks, inserting the assembly of blanks and articles within the paper tube and finally sealing the tube.



2,102,509
RAZOR BLADE SHARPENER
William A. Campbell, Youngstown, Ohio
Application July 7, 1936, Serial No. 89,439
5 Claims. (Cl. 51—65)

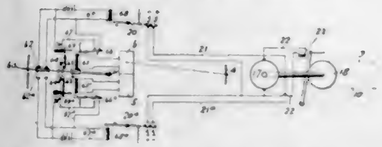
1. A razor sharpener comprising a casing, a carriage slidably mounted in said casing, a continuously rotatable feed shaft journaled in said casing and having double threads reversely arranged to each other thereon, a feed nut carried by the carriage for reciprocating the same, a sharpening element carried by the carriage, a holder journaled to the casing for supporting a blade at a proper angle to the sharpening element, automatic means for rotating the holder in either direction for the purpose of changing the position of the blade to present first one side thereof to the sharpening element and then the other side, said last-named means acting when the carriage reaches substantially the limit of its movement in either direction to bring about a reversing of the blade on the sharpening ele-



ment when the carriage reaches the limit of its movement in one direction and starts to move in an opposite direction, and stop means carried by the holder and carriage coacting adjacent to the ends of the reciprocatory movements of the carriage for maintaining the blade elevated above the sharpening element during reversing movements of the carriage.

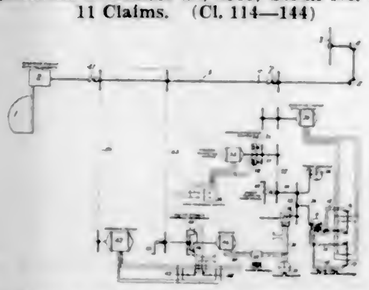
2,102,510
PAPER DRINKING CUP
Walter W. Cecil II, Harrison, Ark.
Application July 29, 1936, Serial No. 93,277
4 Claims. (Cl. 229—52)

1. A paper cup comprising a pleated body, a bottom therefor, a reinforcing bead about the upper end of the body, a handle having one end integral with the body and its opposite end connected to the bottom, and a reinforcing bead about the edge of the handle and merging into the bead of the body.



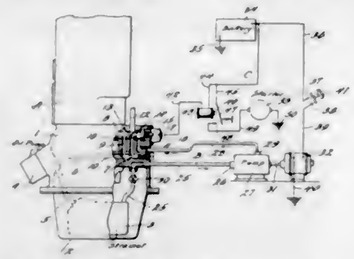
2,102,511
AUTOMATIC STEERING MEANS
Britton Chance, Haverford, Pa.
Application June 21, 1934, Serial No. 731,640
16 Claims. (Cl. 172—282)

5. In steering gear the combination of a source of light, a directionally fixed element axially



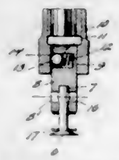
aligned with said light source, and a reflector mounted in the axis of said element and adapted to reflect a beam of light from said source in a direction fixed with the respect to said element.

2,102,512
AUTOMATIC STEERING MEANS
Britton Chance, Mantoloking, N. J.
Application May 4, 1935, Serial No. 19,822
5 Claims. (Cl. 172—282)



1. Apparatus for controllably actuating an element on a dirigible craft, such as a rudder, comprising means for providing a beam of radiant energy, means responsive to said beam movable relative to the beam in response to deviation of said craft from its course, means controllable by said beam-responsive means for actuating said element, means for maintaining said actuating means operative, follow-back means operable by said actuating means for relatively changing the position of said beam-responsive means and the incidence of the beam thereon to restore the normal relation therebetween, and means immediately responsive to the first restoration of said normal relation for rendering said maintaining means ineffective.

2,102,513
STEERING MEANS
Britton Chance, Mantoloking, N. J.
Application December 24, 1935, Serial No. 55,975
11 Claims. (Cl. 114—144)

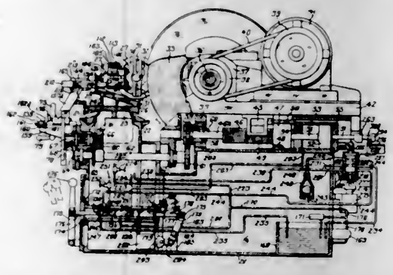


1. Apparatus for steering a dirigible craft having a rudder, comprising means for providing a beam of radiant energy, a plurality of devices selectively responsive to said beam, means for effecting relative movement between said beam and said devices in response to change of the course of said craft, whereby one of said devices is selectively activated, a motor, means controllable by said devices for actuating said motor, means actuated by said motor for effecting follow-back relative movement between said beam and said devices, manually operable mechanism for actuating said rudder, means whereby said motor may be connected at will to said mechanism to actuate said rudder automatically, a second motor, means actuated by said first motor for controlling said second motor, and means whereby said second motor may be connected at will to said mechanism.

2,102,514
AUXILIARY OILING DEVICE
Marion C. Clarkson, Atlanta, Ga.
Application November 21, 1936, Serial No. 112,132
8 Claims. (Cl. 184—6)

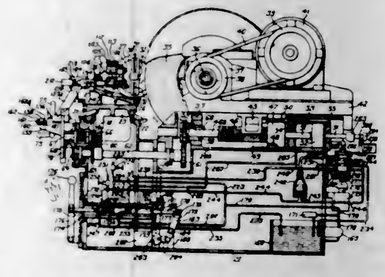
1. In combination with an internal combustion engine including a primary and an auxiliary oiling system, of an electrical starter mechanism for the engine, an electro-mechanical pumping mechanism for rendering the auxiliary oiling system operative until a predetermined oil pressure has been attained, an electro-mechanical means controlled by the pressure existing in the primary and auxiliary systems and co-acting with the starter to effect operation of the latter, when said predetermined oil pressure has been reached.

2,102,515
TOOL CARRIER
Robert L. Connell, Rome, Ga.
Application April 20, 1935, Serial No. 17,530
1 Claim. (Cl. 224—5)



In combination with a belt adapted to be worn by a lineman, said belt being formed with a plurality of longitudinal aligned openings, a rectangular socket plug swivelly mounted at one end in each of said openings and adapted to detachably support a socket wrench at the other end, the first mentioned end of said plug being formed with a longitudinal bore and a transverse opening intersecting said bore, the swivel mounting comprising a shank having a head, said shank adapted to extend through said belt opening and within said longitudinal bore and having an enlargement within said transverse opening of a cross-section such as to prevent its rotation in and displacement from said longitudinal bore.

2,102,516
FLEXIBLE CHEESE COATING
Henri Jan Coster, The Hague, Netherlands, assignor to Special Products Company, Chicago, Ill., a corporation of Delaware
No Drawing. Application September 26, 1936, Serial No. 102,699
3 Claims. (Cl. 134—1)

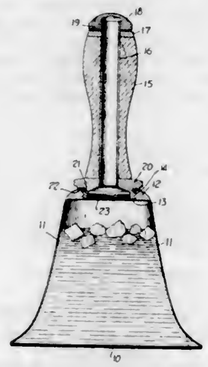


1. A composition of matter particularly adapted for use as a coating for cheese, comprising a uniform mixture of 50 to 85 percent white scale wax having a melting point of 120°–130° F. and 15 to 50 percent petroleum wax having a melting point of 130°–140° F., said composition in thin layers being flexible at ordinary storage temperatures, and having a melting point of about 130°–140° F.

2,102,517
GRINDING MACHINE
George Crompton, Jr., Flushing, N. Y., and Clarence J. Green, Worcester, Mass., assignors to Norton Company, Worcester, Mass., a corporation of Massachusetts
Application January 23, 1936, Serial No. 60,479
18 Claims. (Cl. 51—165)

1. In a grinding machine, a grinding wheel, means to support a work piece for rotation, feeding means to feed the work piece and the grinding wheel one with relation to the other, an electrode, means urging the electrode towards the work piece, means contacting the work piece to limit movement of the electrode, electrical means controlling the feeding means, and an electrical circuit governing said electrical means including in said circuit the work piece and the electrode and which circuit is complete when the work piece and the electrode are in contact.

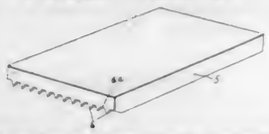
2,102,518
GRINDING MACHINE
Franklin E. Johnson, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts
Application October 12, 1936, Serial No. 105,157
8 Claims. (Cl. 51—165)



1. In a grinding machine, a grinding wheel, means supporting a work piece in position to be operated upon by the grinding wheel, a pair of gauges, a support for both of said gauges, means urging said support towards the work piece, a second support for one gauge mounted upon said first support whereby the gauges may measure the work piece to different sizes, and means for withdrawing the first named support.

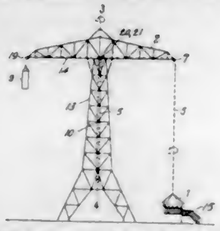
2,102,519
PICTURE MOUNT OR THE LIKE AND METHOD FOR MAKING THE SAME
Carroll N. Cross, Middleboro, Mass.
Application August 14, 1936, Serial No. 96,075
5 Claims. (Cl. 40—152)

4. A picture mount or frame comprising a backboard, a cut-out face-board, a spacing member extending inwardly beyond the edges of the cut-out in said face-board interposed between said backboard and said face-board, a flexible binding member disposed over the marginal edges of said backboard, face-board, and spacing member whereby said members are sealed about their edges, a picture receiving well in said spacing member, a picture window inlay lying in the facial plane of said face-board and having its outer margins overlying the inwardly extending portions of said spacing member and its inner margins overlying a portion of said picture receiving well, said backboard, spacing member and face-board having coincident outer marginal edges, and means securing said members together.



2,102,520
COCKTAIL SHAKER
Bruce de Montmorency, Pelham, N. Y., assignor to National Silver Deposit Ware Co., Inc., New York, N. Y., a corporation of New York
Application July 15, 1937, Serial No. 153,757
6 Claims. (Cl. 220—1)

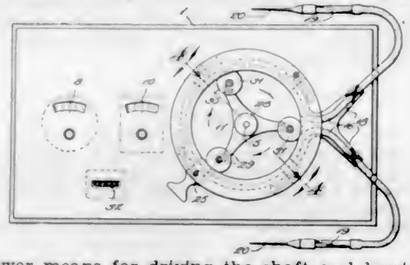
1. A cocktail shaker comprising a container for the ingredients to be mixed, said container having a top wall with a relatively large central filling aperture, the side walls converging upwards to impart to the container a shape like the body of a bell, and a relatively long and narrow pouring member projecting axially from said container and removably secured to the top of the container in sealing relation to said aperture, said member having a relatively narrow longitudinal passage through which the contents of the container may be poured, and a removable closure for the outer end of said passage,



said member being graspable as a handle for swinging the container to mix the contents thereof.

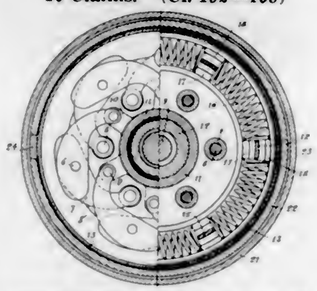
2,102,521
DIFFRACTION GRATING TOOL
Ralph Douglas Doner, Auburn, Ala.
Application September 29, 1936, Serial No. 103,197
6 Claims. (Cl. 33—41)

1. A diffraction grating comb comprising a bar having one edge formed with a multiplicity of microscopic pyramidal teeth whose bases are spaced apart.



2,102,522
LATTICE TOWER WITH LIFT FOR PEOPLE IN PARKS, EXHIBITIONS, AND THE LIKE
Martin Eichelgrün, London, England
Application April 15, 1936, Serial No. 74,504
In Germany April 16, 1935
2 Claims. (Cl. 272—6)

1. In a lattice tower of the kind described and in combination, an upper circular platform rotatably mounted on said tower and having a toothed edge, a jib carried by said platform, and a lower platform, similar to the first, rotatably mounted in said tower, a winch carried by the lower platform, a vertical shaft carrying pinions meshing with the toothed edges of the upper and lower platform, two ropes wound from opposite sides upon the drum of said winch, a cage attached to the free end of one rope and a countershaft attached to the free end of the other rope, guide rollers extending said ropes from the winch over the ends of the jib to the cage and to the counterweight and a landing stage on even ground located to meet the cage in its lowered position.

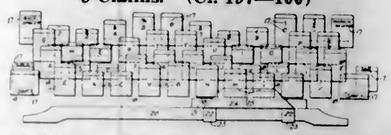


2,102,523
BLOOD TRANSFUSION MACHINE
Samuel J. Ferrara and William E. Deen, Peru, Ind.
Application March 23, 1936, Serial No. 70,462
2 Claims. (Cl. 103—149)

1. In a blood transfusion machine including intake and discharge means connected by a flexible hose, a casing, a pump housing supported by said casing and including an annular portion having an annular groove for receiving a portion of said flexible hose, a retaining member removably mounted to the annular portion and having an annular groove cooperating with the first-named groove in forming an annular seat, a driven shaft extending into the pump housing from said casing, a spider secured to said shaft, rollers pivotally and rotatably secured to the spider and contacting the hose within the annular seat for forcing blood through the hose, and

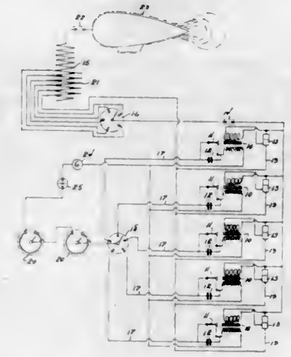
power means for driving the shaft and located in the casing.

2,102,524
CENTRIFUGAL CLUTCH
Jean Fleux, Paris, France, assignor of one-half to Schneider & Cie, Paris, France, a joint-stock company of France
Application April 9, 1936, Serial No. 73,568
In France April 16, 1935
10 Claims. (Cl. 192—105)



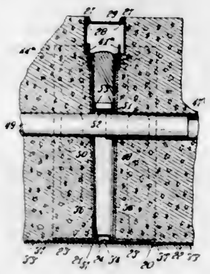
1. A torque limiting friction clutch of the type adapted to automatically connect and disconnect rotatable driving and driven members at a predetermined speed of rotation of the driving member comprising a drum secured to the driven member, a helical coupling band disposed within said drum normally out of contact with the inner surface thereof but adapted to be expanded into frictional engagement therewith to couple the driving and driven members together, a clutch actuating member mounted on said driving member and capable of rotation relatively thereto, said coupling band being anchored at its ends relatively to said driving and actuating members respectively, centrifugally actuatable weighted members operatively connecting said driving and actuating members in such a manner that movement of said weighted members under the influence of centrifugal force produces relative rotation between said driving and actuating members and expansion or contraction of said coupling band, a plurality of peripherally arranged, coil springs each bearing at both of its ends against stop members carried by one of said driving and actuating members, and means carried by the other of said driving and actuating members and cooperative with said stop members for effecting compression of each of said springs in either direction, whereby said springs may be compressed at one end for automatic operation of the clutch and at the other end for absorption and cushioning of the shocks resulting from movement of the driving member forwardly relative to the actuating member.

2,102,525
SEPARATION OF SOLID PARTICLES FROM FLUIDS
Horace Freeman, Three Rivers, Quebec, Canada, assignor to Nichols Engineering & Research Corporation, New York, N. Y., a corporation of Delaware
Continuation of applications Serial No. 68,667, March 13, 1936, and Serial No. 111,578, November 19, 1936. This application August 24, 1937, Serial No. 160,578. In Canada March 11, 1936
18 Claims. (Cl. 92—28)



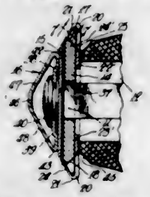
3. Apparatus for separating relatively heavy particles from fluid, comprising an upstanding substantially cylindrical chamber, a closure for the top thereof, means for forcing a stream of the fluid of such dimensions and pressure into the upper end of said chamber as to establish a downwardly flowing outer vortex occupying the peripheral zones thereof, the fluid of said vortex returning as an upwardly flowing inner vortex confined within and by the downward vortex, an outlet for withdrawing the fluid of said upward vortex upwardly from within the upper end of said outer vortex, a partition extending across said chamber at a point spaced substantially from both the upper and lower ends of said chamber, said partition having a central aperture whereby said vortices are greatly restricted in passing concentrically therethrough, a second partition extending across said chamber in the neighborhood of the lower end thereof and being apertured to permit a relatively gentle current of fluid to carry particles from said downward vortex to a point below said second partition, and permitting such current to return to the upward vortex, and means normally enclosing the space below said second partition against other escape of fluid therefrom.

2,102,526
TYPEWRITING MACHINE
Frederick M. Guilfoyle, Denfield, Ontario, Canada, assignor to Remington Typewriter Company, Ilion, N. Y., a corporation of New York
Application January 18, 1934, Serial No. 707,176
5 Claims. (Cl. 197—100)



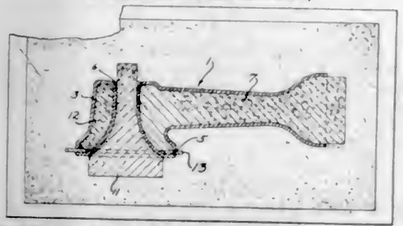
1. A key board for typewriting and like machines provided with four transverse rows of keys in which there is a difference in the height of the keys in each transverse row, the height of the alphabet keys in the first or front row being generally less relative to those in the second row than the difference in height between the alphabet keys in the second and third transverse rows of keys.

2,102,527
AIR RESISTANCE REDUCER
Everett M. Hadley, Riverside, Calif.
Application June 14, 1937, Serial No. 148,239
4 Claims. (Cl. 244—1)



1. An air resistance reducer for aircraft of approximately pear-shaped cross section comprising means for supplying a charge of high potential electric energy to the surface of said aircraft.

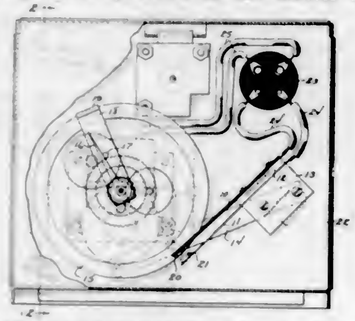
2,102,528
EXPANSION JOINT
Eric E. Hall, Chicago, Ill., assignor to James H. O'Brien, Chicago, Ill.
Application October 27, 1933, Serial No. 695,470
Renewed March 1, 1937
19 Claims. (Cl. 94—18)



1. In apparatus of the class described, the combination with a metallic form having recesses in its bottom to accommodate dowels, of a series of members adapted to fit in said recesses and having their upper portions complementary to the cross sections of the dowels to prevent concrete from entering the form through the recesses while permitting the withdrawal of the form leaving the dowels and members in place.

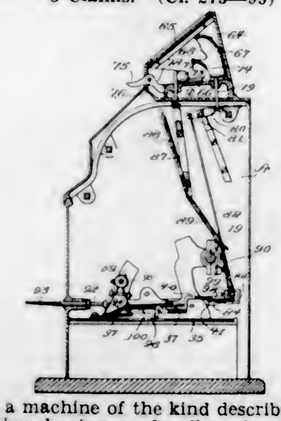
2,102,529
HAIR CLIPPER
John A. Hanley, Stamford, Conn., assignor, by mesne assignments, to Clipshave Inc., a corporation of New York
Application February 7, 1935, Serial No. 5,319
25 Claims. (Cl. 30—43)

1. Hair clipping apparatus comprising a plate having parallel faces and a beveled margin, serrations across said margin, the wider face of said plate being undercut in registry with said serrations, an outer and thinner sheet metal shear plate straddling said beveled margin and slots transversely of said straddling edge, closed at both ends and determining shearing edges coacting with the portions of the serrations exposed at said beveled margin.



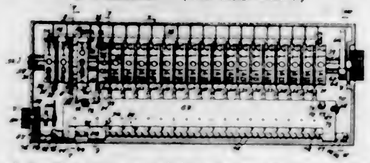
2,102,530
METHOD OF MAKING BURNERS
Christopher L. Hardwick, Cleveland, Tenn.
Application May 29, 1936, Serial No. 82,604
3 Claims. (Cl. 22—200)

1. The method of casting round burners having a hollow body and a relatively thin annular combustion slot comprising the steps of forming a baked sand core having the outline of said body, placing a ring-shaped auxiliary core member of strong non-combustible material on said baked sand core and inserting said baked sand core and said auxiliary core in a previously prepared mold whereby, when metal is cast in said mold, the space occupied by said auxiliary core will constitute said slot.



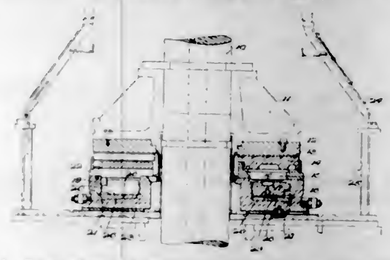
2,102,531
AUTOMATIC CONTROL FOR AUTOMATIC TALKING MACHINES
Harry H. Hoke, Jr., Washington, D. C.
Application October 7, 1936, Serial No. 104,531
3 Claims. (Cl. 194—15)

1. In a talking machine adapted to play one or more of a plurality of records and in which there is a Ferris wheel provided with record tables arranged in a circular series and on each of which a record is carried, a motor for rotating the Ferris wheel, a motor for driving each record table as the latter is brought into operative position with respect to it, a master switch controlling the motors, record governed means for operating the master switch, and a coin controlled switch operatively connected with the last said means to render the latter operative, the combination of a time controlled switch in parallel with the coin controlled switch to automatically effect positive operation of the master switch



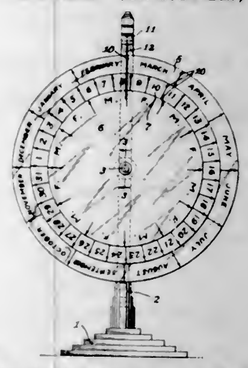
at fixed time intervals independently of the coin controlled switch.

2,102,532
COIN CONTROLLED MACHINE
Harry H. Hoke, Jr., Washington, D. C.
Application November 25, 1936, Serial No. 112,818
5 Claims. (Cl. 273—95)



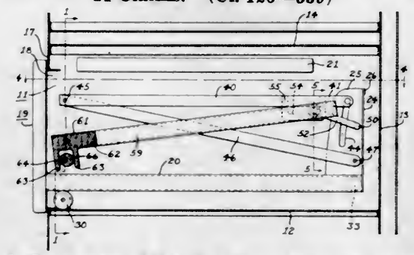
1. In a machine of the kind described, vending mechanism having a plurality of rotary driven display reels, motive means for rotating the reels, manually operated means for stopping the rotation of the reels during a cycle of operation of the said mechanism, means for staying the completion of the cycle of operation of the said mechanism, a ball-throwing device manually actuated for releasing the third-named means, and an adjustable image for receiving and directing a ball for said device into position for releasing the third-named means.

2,102,533
REGISTER
Bry E. Hovey, Huntington, W. Va.
Application February 16, 1934, Serial No. 711,605
9 Claims. (Cl. 235—117)



1. A register comprising a group of independent counter wheels, a series of pawls one for each wheel in the group, a common carrier for all of the pawls and supporting means movably supporting the carrier, and a selector operable along said supporting means and so shiftable along the common carrier thereby to render any one of the series of pawls operative.

2,102,534
THRUST BEARING
Harry A. S. Howarth, Philadelphia, Pa., assignor to Kingsbury Machine Works, Inc., Philadelphia, Pa., a corporation of Delaware
Application January 13, 1936, Serial No. 58,941
14 Claims. (Cl. 308—160)



1. In a thrust bearing employing a plurality of tiltable bearing shoes, a support, means for distributing the pressure between said shoes comprising a series of bridged tiltable leveling plates, alternate plates of which series support the respective shoes and intermediate plates of which series are mounted on said support, and adjustable wedges individual to said shoe-supporting plates and mounted in slots in said support, said slots having inclined bottom faces, said wedges having their faces toward said plates in planes substantially at right angles to the axis of said bearing and their opposite faces inclined to conform with the inclination of the bottom of said slots, and said wedges being movable in said slots to support rigidly said shoe-supporting plates.

2,102,535
GAME APPARATUS
Loren E. Johnson and Benedict C. Bordonaro, Olean, N. Y.
Application January 25, 1937, Serial No. 122,282
1 Claim. (Cl. 273—142)

A game apparatus for selecting a prize winner according to date of birth and sex which comprises a base, a standard supported thereon, a shaft projecting therefrom, dials mounted on said shaft, said dials being individually, independently and selectively rotatable thereon, means for individually and independently stopping the rotation of each dial and indicia carried by said dials so arranged as to indicate a month, date and sex adjacent said stopping means when said dials come to rest.

2,102,536
STOVE
Bertrand B. Kahn, Cincinnati, Ohio, assignor to The Estate Stove Company, Hamilton, Ohio, a corporation of Ohio
Application June 1, 1936, Serial No. 82,710
11 Claims. (Cl. 126—339)

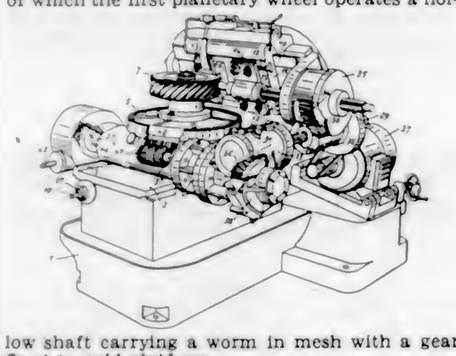
1. In a stove of the character described having a broiler compartment, a food supporting frame, a carriage for supporting said frame providing for the withdrawal thereof from said compartment, means mounted on said carriage for adjusting the elevation of said food supporting mechanism throughout a range of positions, a control member positioned on a fixed wall of said compartment, and automatically detachable connections between said control member and said adjusting means for positioning said food supporting mechanism at any selected elevation.

2,102,537
OVERHEAD RAIL CLEANER
Louis W. Kahn, Cincinnati, Ohio
Application February 4, 1936, Serial No. 62,327
8 Claims. (Cl. 15—21)

1. A cleaning device for the side faces of an overhead rail which is normally out of reach of an operator, comprising in combination, a carriage including means for suspending it from such rail, a power actuated cleaning means supported by the carriage, a depending hand piece

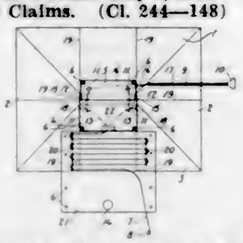
of such length as to be within easy reach of an operator, said hand piece being rigidly connected with the carriage whereby movement of the carriage along the rail may be effected by the operator from a position beneath the rail, and a control means on the hand piece for control of the power actuated cleaning means.

2,102,538
ARMATURE UNIT
Charles Ray Kinkaid, Nashville, Tenn.
Application February 3, 1936, Serial No. 62,190
2 Claims. (Cl. 171—206)



1. In combination with a generator armature having an armature shaft and a commutator, a self-contained thermostatically operated circuit breaker comprising an insulated disc having a slot and a centrally arranged opening, a contact ring mounted in said opening and frictionally engaging said armature shaft, an insulated block mounted in said slot, a fixed contact strip carried by said block and disposed within said slot, a bimetal contact strip fixed to said block and in said slot, means for electrically connecting said fixed contact strip to said contact ring, and means for electrically connecting said bimetal contact strip to said commutator.

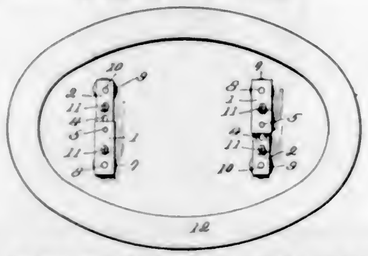
2,102,539
PROCESS OF TREATING METAL
Carl F. Lauenstein and Paul F. Ulmer, Indianapolis, Ind., assignors to Link-Belt Company, Chicago, Ill., a corporation of Illinois
No Drawing. Application March 7, 1936, Serial No. 67,703
5 Claims. (Cl. 91—70.1)



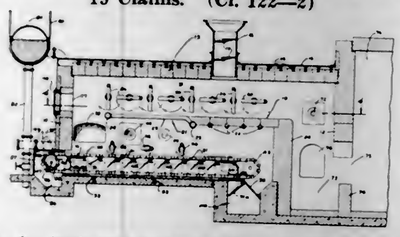
1. The method of coating and alloying a ferrous metal, of the group consisting of iron and steel, with manganese, which includes the steps of placing the ferrous metal, together with common salt and a source of manganese, in a container, heating said container and contents to a point sufficient to break down the salt to chlorine and sodium and cause direct combination of the chlorine and manganese and free the sodium for action as a reducing agent on the ferrous metal, whereby the surface of the ferrous metal is alloyed and coated with manganese.

2,102,540
MACHINE FOR HOBBING THE TEETH OF WORM WHEELS
Gabriel Lechesne, Montreuil-sous-Bois, France, assignor to Paul Durand, Neuilly-sur-Seine, France
Application July 7, 1936, Serial No. 89,407
In Great Britain July 29, 1935
4 Claims. (Cl. 90—4)

1. A machine for cutting worm gears comprising a horizontal rotary platform for receiving the blank, a horizontal rotary tool support for the cutting tool, a principal shaft actuated by a motor for controlling the said platform and said support, a worm keyed on the motor shaft meshing with a gear keyed on the tool support, a second worm keyed on said motor shaft and meshing with a gear keyed to a second shaft perpendicular to the motor shaft, this second shaft actuating the planetary wheels of a differential of which the first planetary wheel operates a hollow shaft carrying a worm in mesh with a gear fixed to said platform.

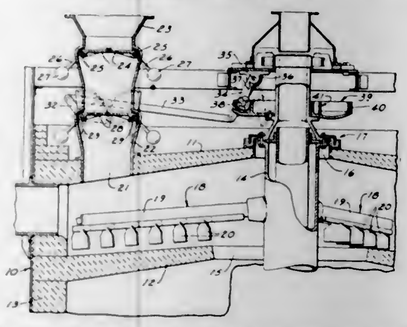


2,102,541
PARACHUTE PACK
Carl Herman Lundholm, Stockholm, Sweden
Application February 10, 1937, Serial No. 125,038
In Sweden May 7, 1936
9 Claims. (Cl. 244—148)



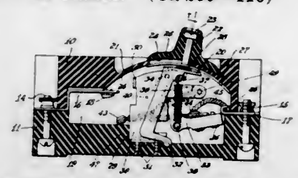
1. A parachute pack, comprising a plurality of flaps, manually operable means including a locking pin to lock and release the flaps, automatically operable means including another locking pin to lock and release the flaps, either locking pin in locked position to the pack being independent of and being operable without releasably affecting the other, a loose locking member independent of the pack and adapted in combination with said locking pins to connect at least three of the flaps substantially at one point, said locking member and said locking pins being situated, in closed position of the pack, on the outer surface thereof and substantially on the same level.

2,102,542
DEVICE FOR HOLDING FOWLS AND THE LIKE
George B. Markle, Jr., Hazleton, Pa.
Application February 11, 1937, Serial No. 125,290
4 Claims. (Cl. 65—15)



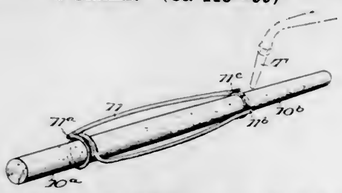
1. A device of the kind described comprising a pair of flat members, one member being provided with flanges between which the other member is slidably mounted, means for locking said members in adjusted position in respect to each other, a knurled pin secured in each member and a vacuum cup arranged under each member and secured thereto.

2,102,543
INCINERATION OF SEWAGE SCREENINGS AND THE LIKE
William Raisch, New York, Joseph C. Woodman, Flushing, John R. Buffington, New York, and John E. Morris, Flushing, N. Y., assignors to Decarie Incinerator Corporation, a corporation of New York
Application February 11, 1936, Serial No. 63,290
15 Claims. (Cl. 122—2)



1. An incinerator comprising a furnace chamber, a drying hearth therein, a grate forming an extension of the hearth, stoking means operable from the outside of the incinerator without opening the same for moving matter deposited on the hearth in one direction along the same to the grate and along the grate to fall off the free edge thereof, and means, including a grate at a lower level, to support the dried material for burning and to move the burning material in the opposite direction beneath said grate and hearth.

2,102,544
FURNACE
William Raisch, New York, N. Y., assignor to Underpinning & Foundation Co., Inc., New York, N. Y., a corporation of New York
Application September 5, 1936, Serial No. 99,627
12 Claims. (Cl. 110—12)

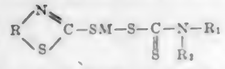


2. In an apparatus of the character described, the combination with a hearth, a charging device to drop material on said hearth and a rabbling device traveling so as to pass between the charging device and the hearth, of means for controlling the charging device to prevent the dropping of material therefrom while the rabbling device is beneath the charging device.

2,102,545
ELECTRIC SWITCH
Raymond N. Rowe, Plainville, Conn., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a corporation of Connecticut
Application May 9, 1936, Serial No. 78,818
11 Claims. (Cl. 200—116)

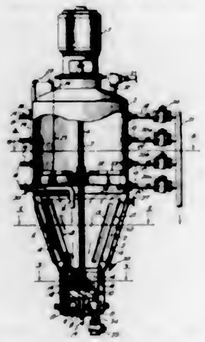
1. In a circuit breaker of the type having a sealed compression chamber and contacts movable relative to one another located within said chamber, the volume of said chamber being such that the entrapped gases, when heated by the arc drawn between said contacts on heavy overload, will expand and create pressure sufficient to extinguish the arc rapidly without the assistance of any escaping gas, that improvement which includes a switch mechanism for moving said contacts into and out of engagement with each other mounted entirely within said compression chamber, electro-responsive means for opening said switch mechanism upon overload also mounted entirely within said chamber, and means for actuating said switch mechanism, said actuating means being manipulative from outside of said chamber, and means preventing the escape of gas under pressure from said casing at the location of said actuating means.

2,102,546
FINGER-RING WELDING APPLIANCE
Charles Schatz, Los Angeles, Calif., assignor of one-half to Jean P. Spitzel, Los Angeles, Calif.
Application March 11, 1935, Serial No. 10,535
2 Claims. (Cl. 113—99)



1. A mandrel for finger-ring welding and the like, having a portion on which the finger-ring is fitted composed of heat-resisting and relatively non-heat-conductive molded pressed carbon, said portion being of full circular cross section to constitute a support and backing for the entire inner peripheral extent of the ring at all points and to provide a maximum of frictional engagement with the ring, whereby the ring is held secure for the welding operation.

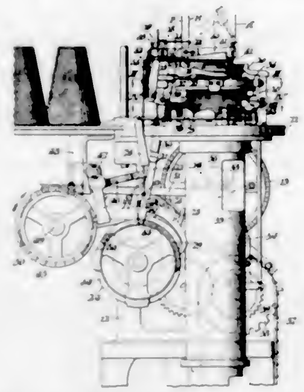
2,102,547
ACCELERATOR OF VULCANIZATION
Lorin B. Sebrell, Silver Lake, Ohio, assignor to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware
No Drawing. Application October 6, 1933, Serial No. 692,427
20 Claims. (Cl. 18—53)



5. A method of treating rubber which com-

prises subjecting it to vulcanization in the presence of a material having the formula

in which R is an arylene group of the benzene series, R_1 and R_2 are hydrocarbon groups and M is a metal.

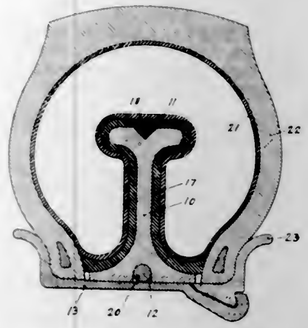


2,102,548
APPARATUS FOR TREATING HYDROCARBON OILS
Charles W. Stratford, Kansas City, Mo., assignor to Stratford Development Corporation, Kansas City, Mo., a corporation of Delaware
Application March 27, 1935, Serial No. 13,219
7 Claims. (Cl. 196—46)

1. In an apparatus for contacting a treating agent with a hydrocarbon oil, a shell comprising an upper cylindrical portion and a lower conical portion, a conical baffle within said lower portion and spaced therefrom to define an annular passageway of progressively increasing cross-sectional area, an impeller mounted within said shell adapted to circulate liquid from within said baffle and to discharge the same through said annular passageway, a floating dam within said cylindrical portion, an inlet to said shell for the treating agent and the oil, a plurality of drawoff connections communicating with the interior of said shell at a plurality of vertically spaced points and means for controlling said drawoffs.

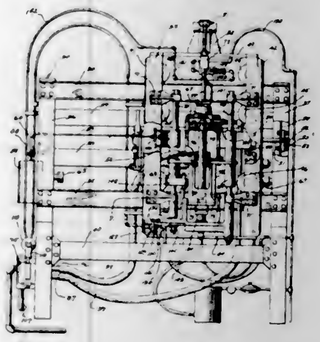
2,102,549
KNITTING MACHINE
George C. Szabo, Knoxville, Tenn., assignor to Holston Manufacturing Company, Knoxville, Tenn., a corporation of Tennessee
Application June 21, 1934, Serial No. 731,632
1 Claim. (Cl. 66—42)

In a circular stocking knitting machine, a pair of pivoted feed fingers for serving two differently-colored yarns in plating relation to the needles; an associated normally-inoperative pivoted finger for serving a heel and toe yarn to the needles; thrust rods for controlling the aforesaid feed fingers; a rotary drum for actuating the thrust rods; means to cooperate with the needles to produce ornamental effects in the fabric by prescribed reversal of the plating yarns; means for actuating the needles to knit the plating yarns; an auxiliary feed for serving a third contrasting yarn to the needles during each rotation of the machine; a separate auxiliary stitch cam for actuating the needles to knit the auxiliary yarn, with formation from the latter, of plain single loop fabric courses in alternation with the double loop fabric courses produced with the plating yarns; connections from the auxiliary yarn feed aforesaid to the actuating thrust rod for the heel and toe yarn feed; connections from the auxiliary stitch cam with the cam drum aforesaid; and



peripheral cam lugs on said drum respectively to effect the withdrawal of the auxiliary stitch cam, and for operating the thrust bar controlling the heel and toe yarn feed to concurrently effect withdrawal of the auxiliary yarn feed from action and placement of the heel and toe yarn feed into action for the knitting of the heel and toe pockets.

2,102,550
REVOLVING SIGN
Morrison C. Treesh, East St. Louis, Ill., assignor of one-half to Commodore Carr, East St. Louis, Ill.
Application August 1, 1936, Serial No. 93,892
1 Claim. (Cl. 40—77)

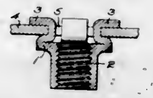


A rotary sign including a supporting member, upper and lower rotary members thereon each including a hub, radial arms and a rim having an inwardly extended flange, a sleeve secured upon and rotatable with the hub of the lower member, a housing fixed on and rotatable with the sleeve, a gear fixedly secured to the supporting member and positioned within the housing, speed reduction gearing within the housing, a supporting element mounted on the flange of the lower member, a motor mounted thereon, said speed reduction gearing constituting means for transmitting motion from the motor to the gear on the support, a housing surrounding and carried by the upper and lower rotatable members, lamps carried by the housing, and means on the supporting member for distributing electric current to the motor and lamp during the rotation of the flange about the supporting member.

2,102,551
SAFETY RING FOR PNEUMATIC TIRES
Alva W. Woodward, Kent, Ohio, assignor to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware
Application November 30, 1934, Serial No. 755,289
19 Claims. (Cl. 152—10)

2. In combination with a pneumatic tire, a tire rim mounting said tire, a safety ring consisting of a plurality of sections resting on said tire rim within the tire, an annular rubber flap enclosing and holding the ring sections in firm position by bead wire reinforcements vulcanized to the inside of the outer portion of the circumference of the rubber flap which rests against the portion of said ring on which the tire rests when the same is deflated and under load.

2,102,552
MOLD BREAKER
John F. Campbell, Cuyahoga Falls, Ohio, assignor to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware
Application October 29, 1935, Serial No. 47,243
27 Claims. (Cl. 18—2)

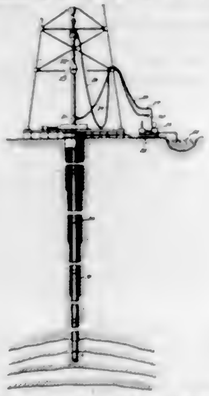


1. In a mold breaker, the combination with a frame, of a carriage slidable along said frame, a mold conveyor moving in the general direction of movement of said carriage along said frame, relatively movable elements on said carriage for engaging the mold sections of a split mold for separating same, and means actuated by said mold as said mold arrives adjacent said elements for operating said elements and to move said carriage in the direction of mold movement.

2,102,553
GREETING CARD
Sol D. Cohen, New York, N. Y., assignor to Paper Novelty Manufacturing Co., New York, N. Y., a corporation of New York
Application August 14, 1936, Serial No. 96,013
3 Claims. (Cl. 46—36)

1. A greeting card of the class described comprising a strip of cardboard divided by a score line extending vertically throughout its width, a strip of paper carrying a design and secured to said cardboard and a figure integral with said strip and extending therefrom, adapted to be animated by folding and unfolding the two portions of the cardboard strip, such animation consisting of the movement in a plane substantially parallel to the cardboard strip of such figure so as to disappear behind said superimposed paper strip upon the folding of the two portions of such cardboard strip.

2,102,554
THREADED NUT DEVICE
Wilmer H. Churchill, Saugus, Mass., assignor to United-Carr Fastener Corporation, Cambridge, Mass., a corporation of Massachusetts
Application October 24, 1936, Serial No. 107,414
2 Claims. (Cl. 85—32)



1. A sheet metal nut formed from a single piece of metal and having a flange portion, a hollow threaded shank extending from said flange and a plurality of bendable fingers extending from the periphery of said flange inwardly parallel to the plane of said flange and then outwardly at right angles thereto for the purpose described.

2,102,555
METHOD OF DRILLING WELLS
Joseph G. Dyer, Ponca City, Okla., assignor to Continental Oil Company, Ponca City, Okla., a corporation of Delaware
Application July 2, 1936, Serial No. 88,563
3 Claims. (Cl. 255—24)

1. A method of drilling oil and gas wells into the earth through a subterranean formation of caving nature, including the steps of drilling in a conventional manner until a region in the vicinity of the caving formation is reached, withdrawing the drilling string, setting a casing in the hole thus formed, continuing the drilling through the casing while maintaining continuous circulation of a drilling mud containing a silicate, adding sections of drilling pipe to the drilling string as drilling proceeds, while maintaining continuous circulation of said drilling mud until the caving

formation has been penetrated, converting the drilling pipe into a well casing without removing

the same from the drill hole and then continuing the drilling until the desired objective is reached.

2,102,556

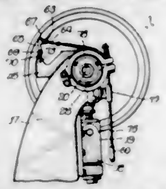
PROCESS OF PRODUCING CYCLOPROPANE

Henry B. Hass, West Lafayette, Ind., and Earl W. Gluesenkamp, Dayton, Ohio, assignors to Purdue Research Foundation, West Lafayette, Ind., a corporation of Indiana

No Drawing. Original application June 13, 1936, Serial No. 85,048. Divided and this application November 2, 1937, Serial No. 172,316

8 Claims. (Cl. 260—167)

2. The process of producing cyclopropane, which consists in bringing 1,3-dichloropropane and zinc together in the presence of iodide ions and of a compound capable of increasing the effective concentration of iodide ions.



2,102,557

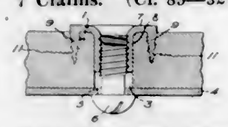
SAFETY MECHANISM

Jacob Hoffman, Chicago, Ill., assignor of one-half to Willy Dumke, Chicago, Ill.

Application November 16, 1934, Serial No. 753,321

17 Claims. (Cl. 192—131)

1. In a machine of the character described, a reciprocable impact element operable through a given working cycle including substantial movement from an initial position to an impact position, a prime mover for driving said impact element at a predetermined speed, selectively operable connecting means including a driven member intermediate said prime mover and said impact element, means normally acting to effect a driving connection between said driven member and the prime mover, and control means requiring the simultaneous use of both of the operator's hands for operating said connecting means and arranged normally to release said driving connection to halt operation of the machine if the operator removes either hand before said impact member has moved beyond a given intermediate position between said initial and impact positions whereafter the speed of the impact element will carry the latter from said intermediate position to impact position before the operator can move a hand from said control means into the path of the element.



2,102,558

NUT AND INSTALLATION THEREOF

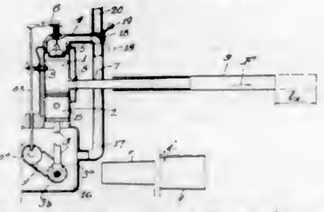
Gustav Johnson, West Roxbury, Mass., assignor to United-Carr Fastener Corporation, Cambridge, Mass., a corporation of Massachusetts

Application September 26, 1935, Serial No. 42,298

7 Claims. (Cl. 85—32)

1. A one piece metal nut comprising a base flange, a tubular threaded shank drawn from the base, and a plurality of locking prongs cut from the flange metal along lines within the outer edges of the flange, said prongs being bent at right angles, and being of greater length than the spacing between the prongs and the outer wall of the shank.

2,102,559



EXPLOSION OR INTERNAL COMBUSTION ENGINE

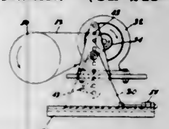
Michel Kadenacy, Paris, France

Application August 1, 1934, Serial No. 738,014

In France August 1, 1933

9 Claims. (Cl. 60—32)

1. Method of controlling two-stroke cycle internal combustion engines, which comprises establishing communication between the cylinder and exhaust system during the firing stroke, maintaining permanent open communication between the cylinder and the atmosphere while the exhaust port is open, providing for the issuance of the burnt gases from the cylinder substantially as a mass in an interval of time shorter than that which would be required for the burnt gases to expand down to the ambient pressure by adiabatic flow, whereby the mass of gases moves outward and thereafter returns toward the cylinder, preventing the entrance of fresh charging air until the said issuance of the burnt gases is in full progress, admitting fresh charging air into the cylinder when the said issuance of the burnt gases is in full progress and causes a suction effect to be exerted in the cylinder, while the exhaust port is still open, and providing for the said fresh charge to occupy the cylinder in the interval elapsing between the said exit of the burnt gases and the instant when the pressure of the returning gases becomes effective within the cylinder, whereby the re-entry of the said burnt gases into the cylinder will be opposed by the fresh charge contained therein.



2,102,560

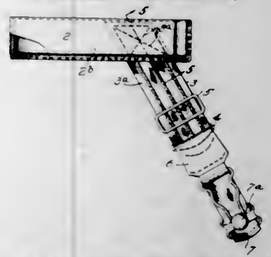
BELT DRIVE

Elmer G. Kimmich, Akron, Ohio, assignor to Wingfoot Corporation, Wilmington, Del., a corporation of Delaware

Application June 22, 1935, Serial No. 28,007

7 Claims. (Cl. 248—23)

7. In combination, a support, a motor-supporting bracket pivotally mounted on said support, said bracket having a portion on which the motor is mounted, a motor mounted on said portion to one side of the vertical axis through said pivotal mounting whereby the weight of the motor on said support may be utilized to tension a belt, and means for adjusting the pivotal mounting to various positions along a line substantially parallel with the direction of action of the weight of the motor on said bracket, whereby to bring the pivotal mounting substantially in the plane of that side of a belt driven by said motor which receives the driving torque.



2,102,561

GARTER

Edgar O. Loeber, Cleveland, Ohio, assignor to William W. Taylor, East Cleveland, Ohio, as Trustee

Application December 4, 1934, Serial No. 755,920

1 Claim. (Cl. 241—6)

A garter or hose support comprising a resilient, curvilinear member formed of a relatively thin flat strip of metal shaped to provide a front portion arranged to engage the front portion of the wearer's leg and rearwardly extending side portions the ends of which yieldingly engage the sides of the leg and connectors adjustable endwise and consisting of flat elastic strips secured to said side portions inwardly of the ends thereof and extending therefrom at a rearwardly downwardly inclined angle and provided at their free ends with attaching devices for attachment with spaced portions of the hose rearwardly of the leg and serving to exert tension between said member and hose at an angle to the normal axis of the wearer's leg, whereby the resulting pressure or pull to support the hose is transmitted against the front portion of the wearer's leg.

2,102,562

YARN CARRIER CONTROL MECHANISM

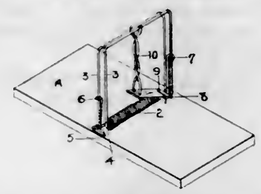
Christian F. Meyer, Wyomissing, Pa., assignor to Textile Machine Works, Wyomissing, Pa., a corporation of Pennsylvania

Application December 17, 1936, Serial No. 116,389

12 Claims. (Cl. 66—127)

12. In a straight knitting machine, the combination with carrier bars, stops for the bars, a friction rod, and a rod reciprocable at a speed less than the speed of the friction rod, of a stationary rod, a plurality of friction boxes each connected to one of the carrier bars and each including means for alternately clamping the box to, and releasing it from, the friction rod simultaneously with releasing it from and clamping it to, said stationary rod, and means for operating said clamping and releasing means of the

several boxes in a predetermined cycle and effecting operative relation between the boxes and the reduced speed rod for reducing shocks of impact of the cyclically operated bars with the corresponding stops when the boxes are clamped to the friction rod and preventing operative relation between the boxes and the reduced-speed rod when the boxes are clamped to the stationary rod.



2,102,563

TRAP FOR ANIMALS

Ira A. Shanton, St. Petersburg, Fla.

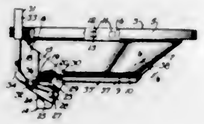
Application December 18, 1936, Serial No. 116,455

1 Claim. (Cl. 43—82)

A spring trap for animals, having in combination, wire trapping members, substantially square shaped, the lower portions forming a supporting means for a spring actuating member for said trapping members and arranged to throw said trapping members in opposite directions, a suitably hinged bait holder centrally located and having attached at its inner end a trigger member which is forked at its outer end to permit sensitive engagement with the trapping members when trap is set, and a base member upon which said trapping means are mounted.

2,102,564

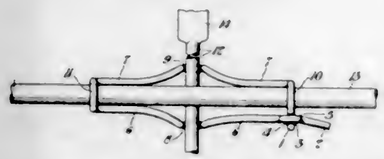
INSECTICIDES AND FUNGICIDES



Robert J. Bonstein, Scranton, Pa.

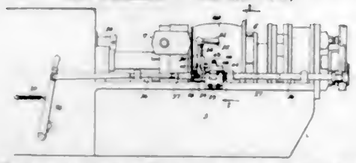
No Drawing. Application November 27, 1933, Serial No. 700,015

15 Claims. (Cl. 167—33)



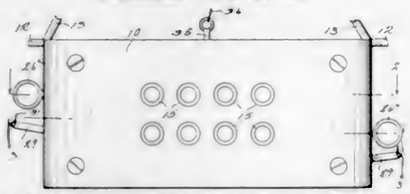
13. An insecticide and fungicide comprising a water-dispersible condensation product of an inorganic salt, selected from the group consisting of inorganic sulfides and inorganic selenides, with an organic halogen compound selected from the group consisting of aliphatic carbon compounds containing two halogen atoms on adjacent carbon atoms, and aliphatic carbon compounds containing a halogen atom and a hydroxyl group on adjacent carbon atoms.

2,102,565
SMOKER'S ACCESSORY
Roland T. Booth, Buffalo, N. Y., assignor to McDonald Products Corporation, Buffalo, N. Y.
Application February 11, 1937, Serial No. 125,261
11 Claims. (Cl. 131—51)



3. A smoker's accessory, comprising a receptacle, a cover for said receptacle having a depressed central portion formed with a discharge opening, a supporting bracket mounted on the under side of said cover and depending laterally therefrom, a closure plate pivoted on said bracket for edgewise movement in opening and closing said discharge opening, and a guide member secured at one end to said bracket, having a pair of curved sections following the marginal portions of said discharge opening below said closure plate and having the opposite end attached to said cover at the side of said discharge opening opposite to said bracket, said guide member cooperating with said bracket to provide a rigid support and guide for said closure plate.

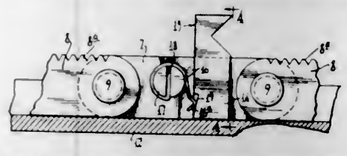
2,102,566
BAR MAT CLIP
Alan E. Brickman and George A. Gleason, Worcester, Mass., assignors to The American Steel and Wire Company of New Jersey, a corporation of New Jersey
Application January 30, 1936, Serial No. 61,603
2 Claims. (Cl. 94—8)



1. A clip for interfastening right-angularly crossed bars, said clip comprising a piece of spring wire in the form of an elongated loop of approximately rectangular outline, the respective end portions of said piece being arranged so they can be crossed at the side of one end of said loop and being respectively crimped in opposite directions to form interlocking surfaces when so crossed, the portions of said piece forming the sides of said loop being looped at their centers in planes at right angles to the plane of said loop so as to provide a pair of alined bar-seats that open in similar directions and the portions of said piece forming the ends of said loop being looped at their centers in planes also at right-angles to the plane of said loop so as to provide a pair of alined bar-seats which likewise open in similar directions, said pairs of bar-seats respectively opening in opposite directions so that said clip can be wrapped around said crossed bars and said portions forming the sides of said loop angling apart in the plane of the latter towards their respective centers so as to spread the first named pair of bar-seats.

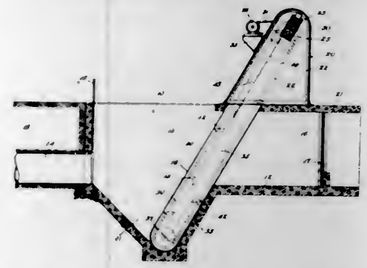
2,102,567
SAFETY FEED KNOCK-OUT
Robert S. Brown, New Britain, Conn., assignor to The New Britain Machine Company, New Britain, Conn., a corporation of Connecticut
Application September 12, 1936, Serial No. 100,517
15 Claims. (Cl. 29—38)

1. In a machine of the character indicated, an indexible chuck carrier, means for securing the same in indexed position between indexing movements thereof, a feed clutch, a plurality of chucks carried by said chuck carrier, chuck actuating means, a control member for said chuck actuating means, and means controlled by said means for securing said chuck carrier in indexed position and timed to act just prior to indexing of said chuck carrier for disengaging said feed clutch when said chuck control member is in open chuck position.



2,102,568
CHEST SUPPORTED FIREARM
Melvin A. Elkins, Tucumcari, N. Mex., assignor of one-half to Nesby W. Sharp, Conchas Dam, N. Mex.
Application March 9, 1937, Serial No. 129,911
7 Claims. (Cl. 42—1)

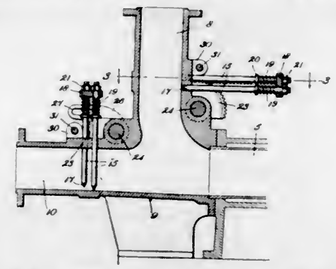
1. A firearm of the character described, including a body adapted to be supported on the chest, a cartridge holding chamber formed in the body and opening toward the front of the body, a firing pin disposed behind the chamber, a plunger disposed behind the rear end of the cartridge chamber and having a cam projection engaging with the firing pin to project it, a sear operatively engaging said plunger and holding it with its cam projection out of engagement with the firing pin, a spring urging the plunger in a direction to engage the cam projection with the firing pin, and a cord operatively engaged with the sear and adapted to be connected to the arm of the wearer, an upward movement of the arm placing the cord under tension, releasing said sear and allowing the projection of the firing pin.



2,102,569
CONVEYER CHAIN WITH READILY DETACHABLE FEED-LUG
Roy E. Johnson, Minneapolis, Minn., assignor to Mereen-Johnson Machine Co., Minneapolis, Minn., a corporation of Minnesota
Application May 22, 1935, Serial No. 22,755
6 Claims. (Cl. 198—175)

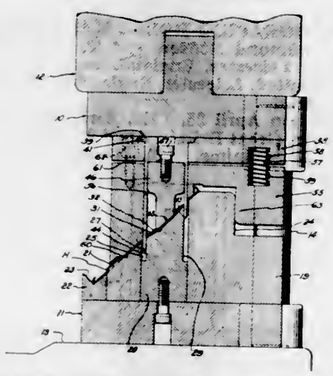
1. In a conveyer chain made up of pivotally connected links, transversely extended parallel slots in opposite sides of a chain link, a feed-lug having laterally spaced parallel legs, said lug legs being slidably seated in the transverse slots of said chain link, and yielding means for locking

the lug against accidental displacement from the chain, said yielding means being automatically releasable by pull exerted on the lug.



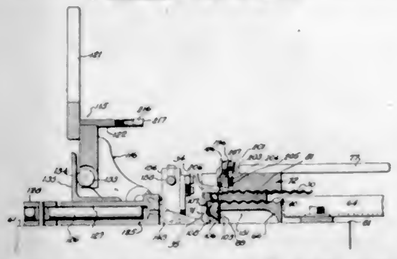
2,102,570
SCREENING APPARATUS FOR LIQUIDS
Arthur C. Lind, Milwaukee, Wis., assignor to Chain Belt Company, Milwaukee, Wis., a corporation of Wisconsin
Application August 12, 1936, Serial No. 95,652
6 Claims. (Cl. 210—176)

1. In screening apparatus for liquids, a framework adapted to extend downwardly into a liquid conduit; an inclined screen carried by said framework across the conduit; an endless conveyor including an adjustable slack take-up head shaft mounted in said framework above said screen, said conveyor having a run disposed in co-operative relationship to said screen, and being provided with means arranged to remove settled solids from the conduit, and also to remove debris from said screen; and an inclined apron extending upwardly from said screen to said head shaft, said apron being slidably mounted in said framework for movements relative to the screen, and arranged to be moved with said head shaft to at all times close the space between the screen and head shaft and thereby prevent material spilling from said removing means from passing to the screened liquid.



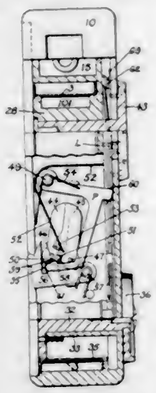
2,102,571
VALVE FOR CONTROLLING PLASTIC CONCRETE MIXTURES
John C. Merwin and Rudolph F. Lindow, Milwaukee, Wis., assignors to Chain Belt Company, Milwaukee, Wis., a corporation of Wisconsin
Application November 18, 1933, Serial No. 698,716
3 Claims. (Cl. 83—73)

1. In a valve for controlling the flow of plastic concrete mixtures embodying substantial proportions of coarse aggregates which give to such mixtures a strong tendency to stow at restrictions, a housing having a mixture passage; a plurality of spaced prongs movable through a wall of said housing into said passage transversely thereof to partially obstruct the same and thereby produce stowing of the mixture to stop its flow; a cross-head exterior of said housing; yieldable connections between each prong and said cross-head, whereby any prong encountering a piece of aggregate which prevents its full travel



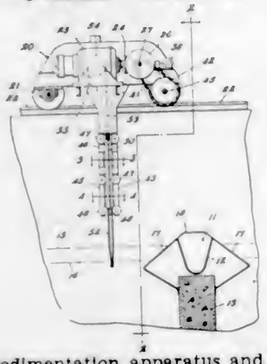
into said passage may yield; a rack carried by said cross-head; a gear meshing with said rack; and means for actuating said gear to move the rack and cross-head to cause said prongs to enter into and be withdrawn from said passage.

2,102,572
METAL FORMING TOOL
Frank J. Minkel, Buffalo, N. Y., assignor to Fedders Manufacturing Company, Inc., Buffalo, N. Y.
Application February 26, 1935, Serial No. 8,325
3 Claims. (Cl. 153—21)



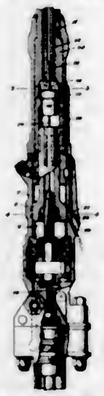
2. In a die mechanism for providing elliptical flanged holes in sheet metal blanks, a tool comprising a tubular punch having an outside diameter substantially equal to the minor axis of the hole to be formed and having an inside cutting edge and an outside forming edge for forming the flange in the blank, a second tool comprising a die block having a cylindrical forming die opening for cooperation with the forming edge of the tubular punch, and a cylindrical punch mounted concentrically within the die block opening and adapted to cooperate with the cutting edge of the tubular punch, means for mounting said tools for relative movement toward each other with the punch and die formations disposed in coaxial alignment, said die block having a supporting surface for the blank inclined at an angle to the axis of the formations, said punches being also formed with angular faces parallel to the supporting surface of the die block.

2,102,573
MACHINE FOR FORMING RADIATOR RIBBONS
Stanislaus Przyborowski, Buffalo, N. Y., assignor to Fedders Manufacturing Company, Inc., Buffalo, N. Y.
Application January 28, 1935, Serial No. 3,796
7 Claims. (Cl. 113—1)



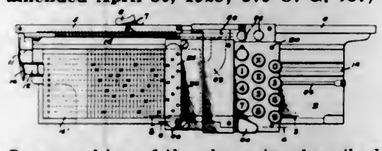
1. The combination with a joint forming mechanism for radiator ribbons having a bending die mechanism including a holding jig for the ribbons and bending dies for forming the joint, of a mechanism for feeding a predetermined length of solder wire, cooperative means on the holding jig and bending dies for operating said feeding mechanism in timed relation therewith, and solder shearing and positioning means on the jig and dies for inserting the wire lengths in the joint during the formation thereof.

2,102,574
PHOTOGRAPHIC ROLL-FILM CAMERA
Richard Edmund Reason and Thomas William Clifford, Leicester, England, assignors to Kapella Limited, Leicester, England, a corporation of England
Application April 25, 1935, Serial No. 18,148
In Great Britain April 26, 1934
9 Claims. (Cl. 242—71)



1. In a film camera having a spool for the film, a stop or stops connected with the spool at equal angular distances, a winder for the spool, a movable detent co-operating with the stop or stops so as to permit and determine successive constant angular movements of the spool, a film finger adapted to engage a hole in the film and thereby cause the movable detent to engage said stop or one of said stops to position the film for the first exposure, and a controlling cam movable intermittently by the winder and adapted to position the film finger alternatively in or out of engagement with the film.

2,102,575
SCUMMER FOR SETTLING TANKS AND THE LIKE
Samuel Shafer, Jr., Milwaukee, Wis., assignor to Chain Belt Company, Milwaukee, Wis., a corporation of Wisconsin
Application August 7, 1935, Serial No. 35,187
3 Claims. (Cl. 210—3)

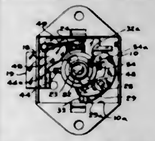


1. In sedimentation apparatus and the like, a plurality of tanks arranged side by side; scum receiving troughs carried by the division walls of said tanks; and a reciprocating scumming device arranged to transversely traverse all of said tanks, and to successively pass over and deposit scum in said troughs.

2,102,576
ROCK DRILL SLUDGE EJECTOR
Arthur H. Skaer, Los Angeles, Calif., assignor to Independent Pneumatic Tool Company, Chicago, Ill., a corporation of Delaware
Application May 6, 1936, Serial No. 78,238
3 Claims. (Cl. 121—10)

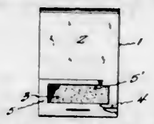
1. In a pneumatic rock drill for overhead drilling, having a socket-like chuck, a working cylinder, and an exhaust passage, means for removing sludge from the chuck, comprising a passage entering the chuck at its most rearward point and at its other end opening into the exhaust passage in the direction of flow of the exhaust.

2,102,577
VERIFYING MACHINE
Oluf L. Cleven, Washington, D. C.
Application July 20, 1937, Serial No. 154,527
8 Claims. (Cl. 73—51)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



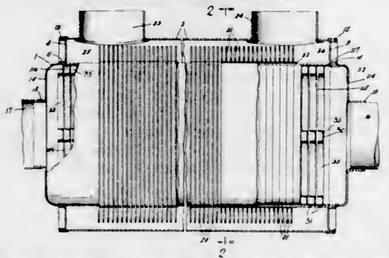
1. In a machine of the character described including an escapement mechanism and a card carrier whose movement is controlled with a step-by-step movement by said escapement mechanism, an analyzing means arranged to sense, by passage therethrough, perforations in a record, and permit the operation of the escapement mechanism only upon verification of said perforations, and marking means independent of the analyzing means and operable to simultaneously mark the card and cause a movement of the escapement mechanism when the analyzing means detects an error.

2,102,578
SEALING STRIP
George W. Gail, Ruxton, Md., assignor to G. W. Gail, Inc., Baltimore, Md.
Application January 22, 1937, Serial No. 121,877
7 Claims. (Cl. 20—69)



1. In a sealing strip, the combination with a flexible strip of semi-cylindrical form provided with an anchoring flange along each side edge, of a base member comprising inner and outer longitudinal parallel flanges defining slots adapted to receive the flanges on said flexible member and fastenings for securing said assembled strip in operative position, the heads of said fastenings engaging the upper faces of said inner flanges.

2,102,579
COMBINATION LOCK
Frederic K. Heyer, Stamford, Conn., assignor to The Yale & Towne Mfg. Co., Stamford, Conn., a corporation of Connecticut
Application December 5, 1933, Serial No. 700,995
35 Claims. (Cl. 70—285)



1. In a combination lock, a bolt, a bolt operating member, a series of tumblers having gatings, an actuator for rotating said tumblers, a tumbler fence member cooperable with said tumblers and adapted to enter their gatings when aligned, an actuator fence adapted to engage said actuator as said tumbler fence member enters the tumbler gatings, and means whereby said actuator fence is thereafter operable to actuate said bolt operating member to retract and throw said bolt.

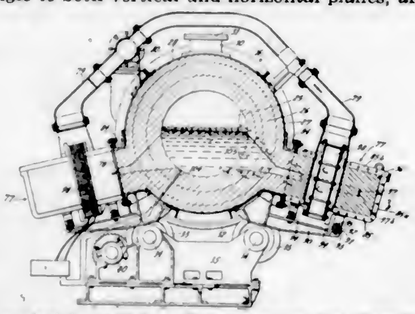
2,102,580
MATCH FOLDER
Robert F. Mahon, Lake Geneva, Wis., assignor of one-half to Florence E. Macdonald, Lake Geneva, Wis.
Application October 16, 1936, Serial No. 105,967
1 Claim. (Cl. 206—29)

A match package comprising, a group of fibre matches, an envelop fitted over the same, and secured to the bottom edge thereof, the envelop being folded over the front edge of the match group to form a locking tongue having a rectangular opening therein, a striking strip carried by the envelop flap conforming to the contour of the opening in the tongue, whereby when the flap is closed said striking strip is nested in the opening with its outer surface flush with the outer surface of the tongue, said strip forming an interlocking engagement with the walls opening to hold the package closed at the free end of the envelop flap during a scratching operation for igniting a segregated match.

2,102,581
AUTOMOBILE HEATER
Arthur W. McNeish, Detroit, Mich.
Application August 19, 1936, Serial No. 96,726
1 Claim. (Cl. 257—241)

An automobile heater of the exhaust type comprising an inner sheet metal casing adapted for passage of exhaust gases therethrough and an outer sheet metal casing surrounding the inner casing in spaced relation therewith for passage of the air to be heated, spaced inlet and outlet openings in each of the said casings, a plurality of heat radiating sheet metal fin members each consisting of a closed ring of approximately L cross section, one leg of the L section of each fin member forming a continuous heat radiating fin lying in a plane approximately normal to the longitudinal axis of the casing and extending about the entire outer circumference of the inner casing and spaced from the inside wall of the outer casing, the second leg of the L section of each fin member forming an integral flange in the form of a continuous ring in continuous contact with the outside circumference of the inner casing and abutting the adjacent fin member to space each fin from the next adjacent fin whereby the flange of each fin is adapted for

joining to said casing by copper brazing, the said legs of each fin in section forming an approximately right angled external corner extending completely around said ring, the second leg of each fin along its free edge contacting the adjacent fin along said external corner with a surface contact whereby under the condition of relatively rapid heating at brazing temperature, and with the inner casing at a lower temperature than the fin members, such surface contact serves to retain melted copper in place in the joint until the inner casing is heated to the approximate temperature of the fin members.



2,102,582

ELECTRIC INDUCTION FURNACE AND METHOD OF OPERATING THE SAME

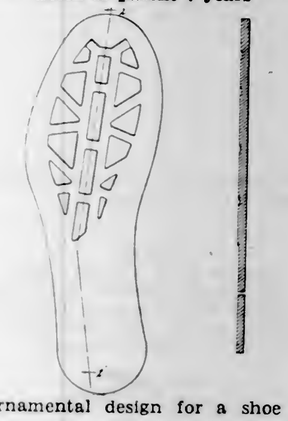
David L. Summey, Waterbury, Conn.; The Colonial Trust Company and Richard P. Weeks Summey, executors of said David L. Summey, deceased, assignors to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut

Application April 14, 1932, Serial No. 605,147
Renewed June 18, 1935
35 Claims. (Cl. 13—29)

1. An electric induction furnace comprising in combination, a horizontal cylindrical-bottomed hearth, a plurality of induction heating units thereon some of which are on each side of a vertical plane through the axis of the hearth, said heating units each including a secondary metal channel loop the plane of which is parallel to the axis of the hearth and normally inclined at an angle to both vertical and horizontal planes, and

a pocket in said hearth connecting the chamber thereof with the secondary channel loop, said pocket being rectangular in section where said loop enters it and spreading as it approaches the hearth chamber until it becomes circular in section with a diameter equal to the length of the major axis of the rectangular section.

DESIGNS



DECEMBER 14, 1937

107,400

DESIGN FOR A SHOE SOLE

Allen S. Bannister, Teaneck, N. J., assignor to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware

Application August 18, 1937, Serial No. 71,163
Term of patent 7 years

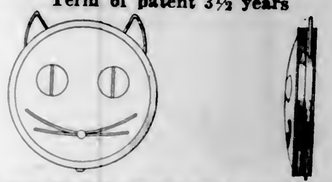
The ornamental design for a shoe sole, as shown.

107,401

DESIGN FOR A CLOCK CASE

Jacques Martial Bars, New York, N. Y., assignor to Warren Telechron Company, a corporation of Maine

Application October 19, 1937, Serial No. 72,296
Term of patent 14 years



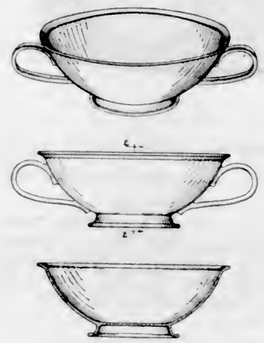
The ornamental design for a clock case as shown.

107,402

DESIGN FOR A COMPACT OR THE LIKE

Arthur Bates, North Attleboro, Mass., assignor to Evans Case Company, a corporation of Massachusetts

Application November 16, 1937, Serial No. 72,936
Term of patent 3½ years



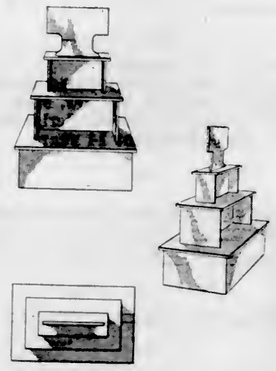
The ornamental design for a compact or the like as shown.

107,403

DESIGN FOR A SOUP CUP OR SIMILAR ARTICLE

Karl Bayreuther, Selb, Germany, assignor to The Rosenthal China Corporation, New York, N. Y., a corporation of New York

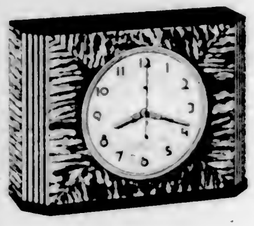
Application August 1, 1936, Serial No. 64,170
Term of patent 14 years



The ornamental design for a soup cup or similar article as shown and described.

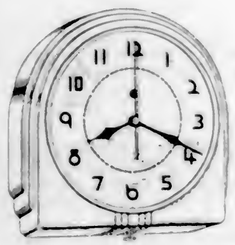
107,404

DESIGN FOR A DISPLAY STAND



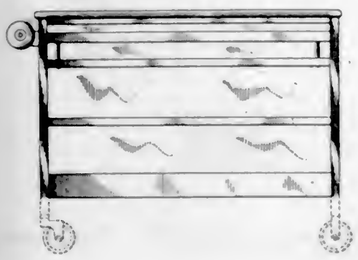
James M. Brooks, Winnetka, Ill., assignor to Story, Brooks & Finley, Incorporated, New York, N. Y., a corporation of New York

Application April 5, 1937, Serial No. 68,551
Term of patent 3½ years



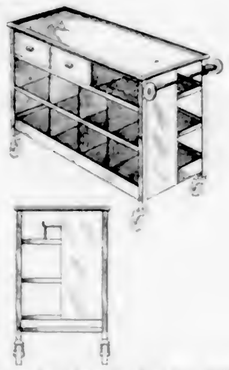
The ornamental design for a display stand, as shown and described.

107,405
DESIGN FOR A CLOCK CASE
Ivan Bruce, Framingham, Mass., assignor to Warren Telechron Company, a corporation of Maine
Application October 27, 1937, Serial No. 72,467
Term of patent 14 years



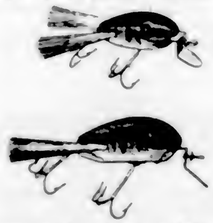
The ornamental design for a clock case as shown.

107,406
DESIGN FOR A CLOCK CASE
Ivan Bruce, Framingham, Mass., assignor to Warren Telechron Company, a corporation of Maine
Application October 28, 1937, Serial No. 72,472
Term of patent 14 years

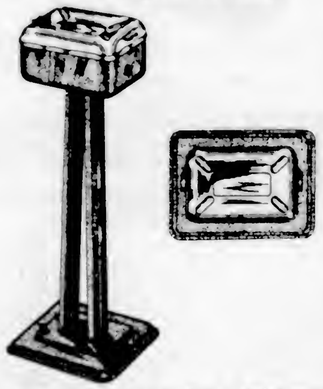


The ornamental design for a clock case as shown.

107,407
DESIGN FOR AN ORTHOPEDIC CARRIAGE
Amy J. Daniels, Palmer, Mass.
Application October 19, 1936, Serial No. 65,346
Term of patent 14 years

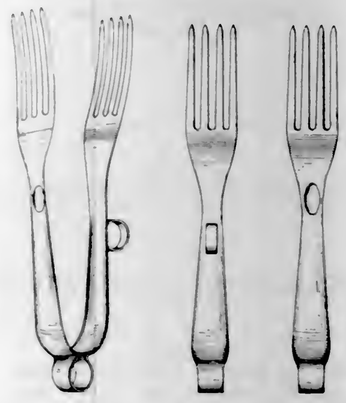


107,407—Continued



The ornamental design for an orthopedic carriage substantially as shown.

107,408
DESIGN FOR A FISH LURE
Sam F. Davenport, Garrett, Ind., assignor to Creek Chub Bait Company, Garrett, Ind.
Application June 5, 1937, Serial No. 69,703
Term of patent 14 years



The ornamental design for a fish lure as shown.

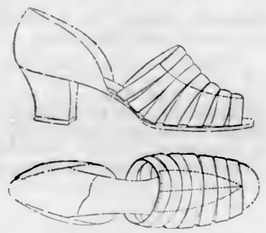
107,409
DESIGN FOR A TOBACCO ASH RECEPTACLE
Talbert M. Dick and Maurice J. Fletcher, Des Moines, Iowa
Application April 27, 1937, Serial No. 69,002
Term of patent 14 years

The ornamental design for a tobacco ash receptacle substantially as shown.

107,410
DESIGN FOR A FOOD TONGS
Alexander A. Eliopoulos, Los Angeles, Calif.
Application October 5, 1937, Serial No. 71,973
Term of patent 14 years

The ornamental design for a food tongs as shown.

107,411
DESIGN FOR A MUSICAL CHIME
Evan G. Evans, Cincinnati, Ohio, assignor to Nutone Chimes Inc., New York, N. Y., a corporation of New York
Application October 7, 1937, Serial No. 72,048
Term of patent 3½ years

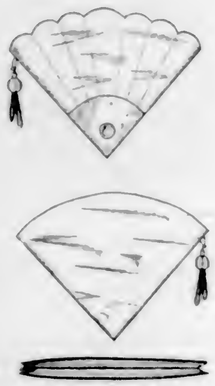


The ornamental design for a musical chime as shown.

107,412
DESIGN FOR A PLATTER OR THE LIKE
Louis Farber, Yonkers, N. Y.
Application April 30, 1937, Serial No. 69,081
Term of patent 3½ years

The ornamental design for a platter or the like, substantially as shown.

107,413
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Bernard Feldman, Newton Centre, Mass., assignor to Banner Shoemakers, Inc., West Peabody, Mass., a corporation of Massachusetts
Application October 9, 1936, Serial No. 65,214
Term of patent 3½ years

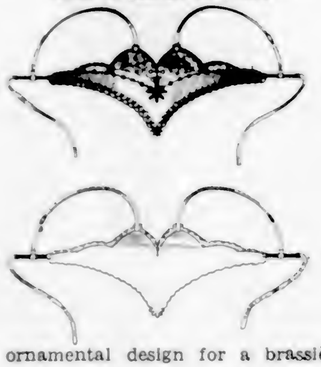


The ornamental design for a shoe or similar article substantially as shown and described.

107,414
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Bernard Feldman, Newton Centre, Mass., assignor to Banner Shoemakers, Inc., West Peabody, Mass., a corporation of Massachusetts
Application October 9, 1936, Serial No. 65,215
Term of patent 3½ years

The ornamental design for a shoe or similar article substantially as shown and described.

107,415
DESIGN FOR A HANDBAG
Henri Felmann, Chicago, Ill.
Application November 16, 1937, Serial No. 72,920
Term of patent 3½ years

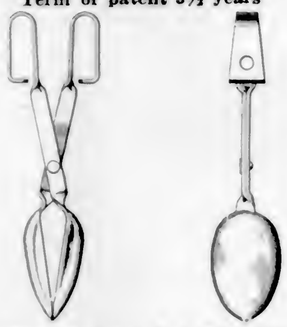


The ornamental design for a handbag, substantially as shown and described.

107,416
DESIGN FOR A HANDBAG
Henri Felmann, Chicago, Ill.
Application November 18, 1937, Serial No. 72,975
Term of patent 3½ years

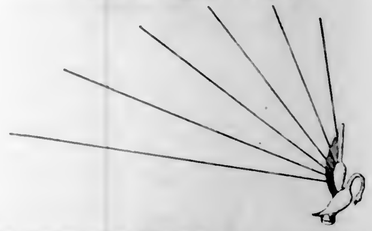
The ornamental design for a handbag, substantially as shown and described.

107,417
DESIGN FOR A BRASSIÈRE
Elizabeth B. Haines Fisher, Mount Pleasant, Mich.
Application November 6, 1937, Serial No. 72,660
Term of patent 14 years



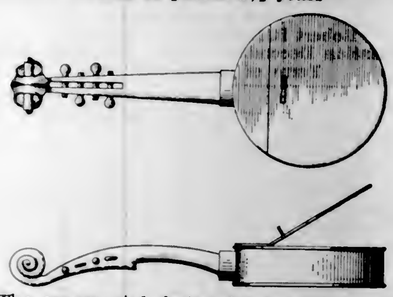
The ornamental design for a brassière, as shown.

107,418
DESIGN FOR A FISHING SINKER
John E. Ganaway, Fort Smith, Ark.
Application June 21, 1937, Serial No. 69,967
Term of patent 3½ years



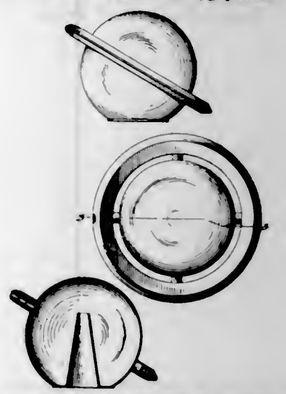
The ornamental design for a fishing sinker, as shown and described.

107,419
DESIGN FOR A TRANSPLANTING TOOL
George W. Gasser, College, Territory of Alaska
Application July 12, 1937, Serial No. 70,380
Term of patent 3½ years



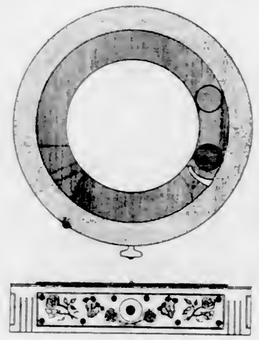
The ornamental design for a transplanting tool as shown.

107,420
DESIGN FOR AN AUTOMOBILE RADIO ANTENNA
John L. Gilmore, Kansas City, Mo.
Application October 25, 1937, Serial No. 72,426
Term of patent 7 years



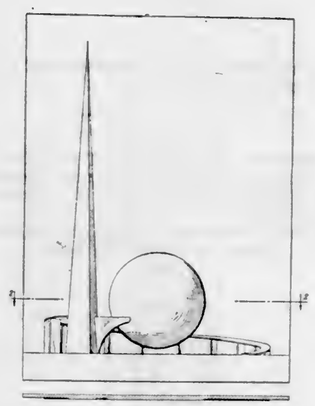
The ornamental design for an automobile radio antenna substantially as shown and described.

107,421
DESIGN FOR A SERVING TRAY OR SIMILAR ARTICLE
Edward San Giovanni, Jackson Heights, N. Y.
Application October 18, 1937, Serial No. 72,252
Term of patent 3½ years



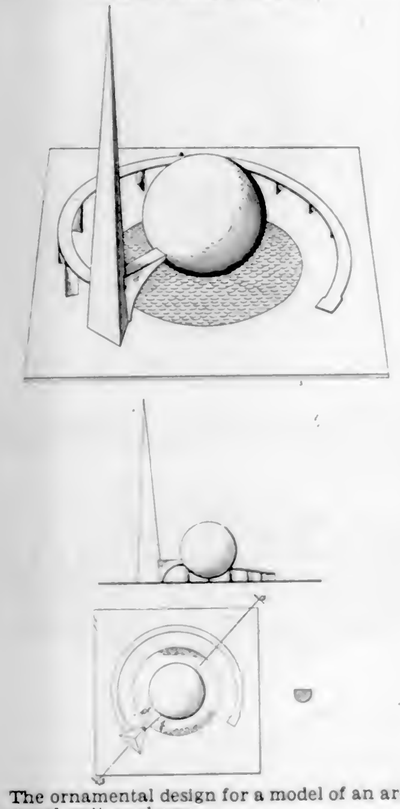
The ornamental design for a serving tray or similar article, as shown.

107,422
DESIGN FOR A TEAPOT
Edward San Giovanni, Jackson Heights, N. Y.
Application October 18, 1937, Serial No. 72,253
Term of patent 3½ years



The ornamental design for a teapot, as shown.

107,423
DESIGN FOR A COMBINED COLOR DIAL AND DISPLAY STAND
Mary Gorelick, New York, N. Y.
Application October 4, 1937, Serial No. 71,947
Term of patent 3½ years

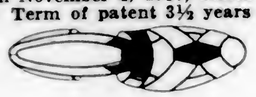


The ornamental design for a combined color dial and display stand, substantially as shown, and described.

107,424
DESIGN FOR A PLAQUE
Wallace K. Harrison, New York, N. Y., and Jacques Andre Fouilhoux, Short Hills, N. J., assignors to New York World's Fair 1939, Incorporated, New York, N. Y., a corporation of New York
Application August 10, 1937, Serial No. 70,971
Term of patent 3½ years

The ornamental design for a plaque as shown.

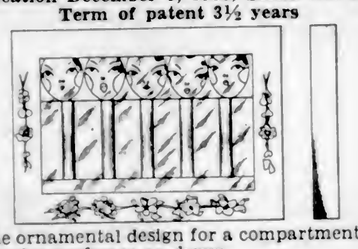
107,425
DESIGN FOR A MODEL OF AN ARCHITECTURAL UNIT
Wallace K. Harrison, New York, N. Y., and Jacques Andre Fouilhoux, Short Hills, N. J., assignors to New York World's Fair 1939, Incorporated, New York, N. Y., a corporation of New York
Application August 10, 1937, Serial No. 70,972
Term of patent 3½ years



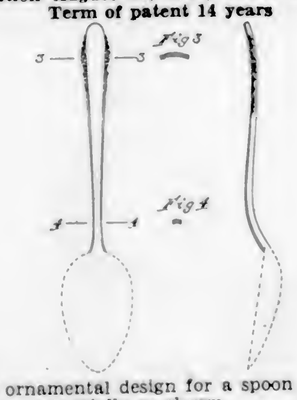
The ornamental design for a model of an architectural unit as shown.

107,426
DESIGN FOR A TOILET BOTTLE
René Honnorat, Grasse, France, assignor to Molinard, Inc., New York, N. Y., a corporation of New York
Application September 10, 1937, Serial No. 71,550
Term of patent 3½ years

The ornamental design for a toilet bottle, as shown and described.

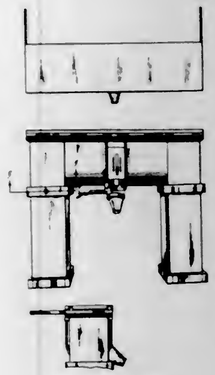


107,427
DESIGN FOR A SHOE
Morris Kalmon, St. Louis, Mo.
Application November 4, 1937, Serial No. 72,607
Term of patent 3½ years



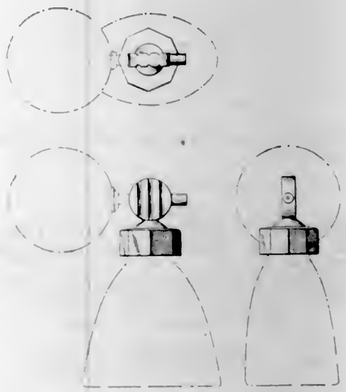
The ornamental design for a shoe substantially as shown.

107,428
DESIGN FOR A COMPARTMENT CONTAINER FOR PERFUMES
Robert B. Karoff, New York, N. Y.
Application December 9, 1936, Serial No. 66,405
Term of patent 3½ years



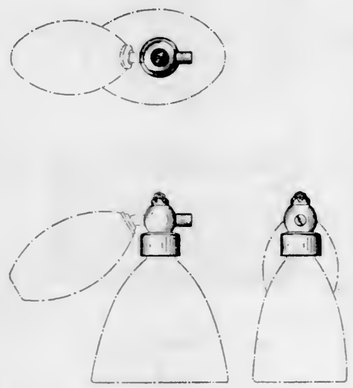
The ornamental design for a compartment container for perfumes as shown.

107,429
DESIGN FOR A SPOON OR SIMILAR ARTICLE
Frederick W. Koonz, Bernardston, Mass., assignor to Rogers, Lunt & Bowlen Company, Greenfield, Mass., a corporation of Massachusetts
Application August 18, 1937, Serial No. 71,156
Term of patent 14 years



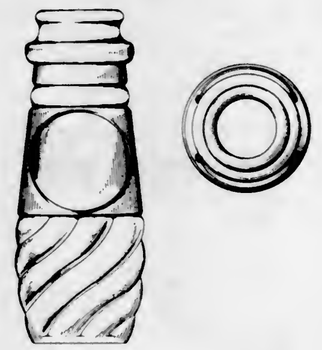
The ornamental design for a spoon or similar article, substantially as shown.

107,430
DESIGN FOR AN X-RAY APPARATUS
William M. Lee, Covington, Ky.
Application November 1, 1937, Serial No. 72,557
Term of patent 7 years



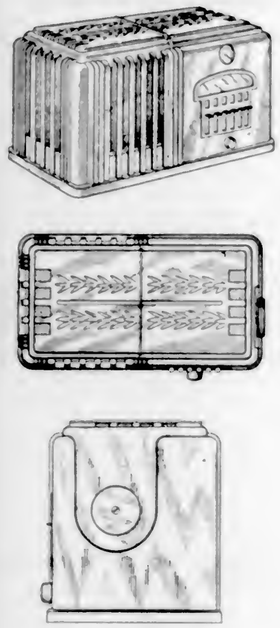
The ornamental design for an X-ray apparatus, substantially as shown.

107,431
DESIGN FOR AN ATOMIZER
Frederick W. Lohse, Attleboro, Mass., assignor to T. J. Holmes Company, Inc., Norton, Mass., a corporation of Massachusetts
Application April 13, 1937, Serial No. 68,721
Term of patent 7 years



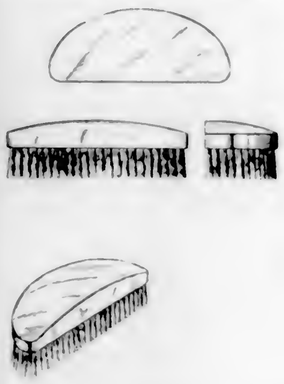
The ornamental design for an atomizer as shown and described.

107,432
DESIGN FOR AN ATOMIZER
Frederick W. Lohse, Attleboro, Mass., assignor to T. J. Holmes Company, Inc., Norton, Mass., a corporation of Massachusetts
Application April 13, 1937, Serial No. 68,726
Term of patent 7 years



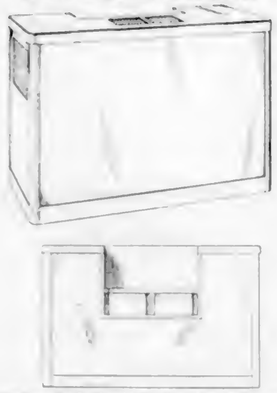
The ornamental design for an atomizer as shown and described.

107,433
DESIGN FOR A BOTTLE
Arnold I. Lorenzen, Toledo, Ohio, assignor to Owens-Illinois Glass Company, Toledo, Ohio, a corporation of Ohio
Application October 19, 1937, Serial No. 72,297
Term of patent 14 years



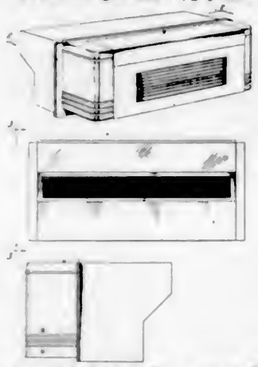
The ornamental design for a bottle substantially as shown.

107,434
DESIGN FOR A RADIO CABINET
Clarence J. Manning, Lake Bluff, Ill.
Application October 7, 1937, Serial No. 72,049
Term of patent 7 years



The ornamental design for a radio cabinet as shown.

107,435
DESIGN FOR A BRUSH
Leo Marder, Brooklyn, N. Y.
Application March 8, 1937, Serial No. 68,071
Term of patent 3½ years

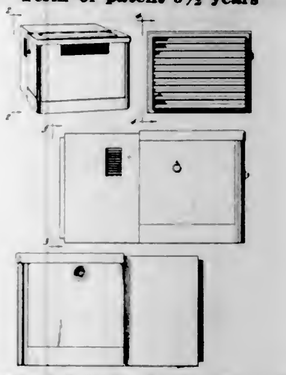


The ornamental design for a brush substantially as shown.

107,436
DESIGN FOR AN AIR CONDITIONING APPARATUS
Fred C. McClellan, Oak Park, Ill.
Application September 28, 1937, Serial No. 71,850
Term of patent 3½ years

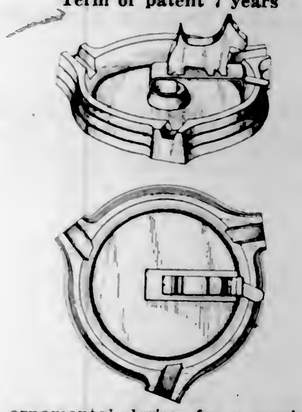
The ornamental design for an air conditioning apparatus, as shown and described.

107,437
DESIGN FOR AN AIR FILTERING DEVICE
Fred C. McClellan, Oak Park, Ill.
Application September 28, 1937, Serial No. 71,851
Term of patent 3½ years



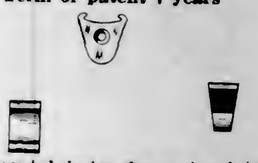
The ornamental design for an air filtering device, as shown.

107,438
DESIGN FOR A COMBINED FOUNTAIN PEN AND CHECK PROTECTOR OR SIMILAR ARTICLE
Charles J. MacNally, Jamaica, N. Y.
Application October 19, 1937, Serial No. 72,311
Term of patent 14 years



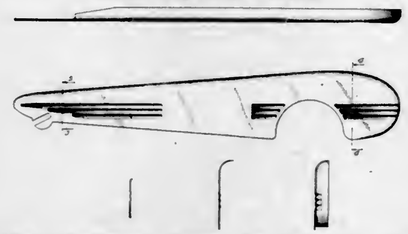
The ornamental design for a combined fountain pen and check protector or similar article, substantially as shown and described.

107,439
DESIGN FOR AN AIR CONDITIONING APPARATUS
Fred C. McClellan, Oak Park, Ill.
Application September 28, 1937, Serial No. 71,852
Term of patent 3½ years



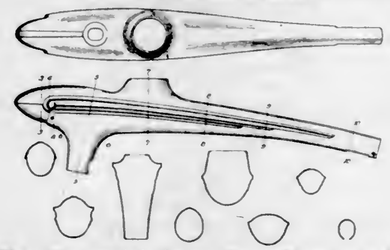
The ornamental design for an air conditioning apparatus, as shown.

107,440
DESIGN FOR A COMBINED ASHTRAY AND CIGARETTE EXTINGUISHING DEVICE
John Thomas McCreary, Chicago, Ill.
Application May 6, 1937, Serial No. 69,208
Term of patent 7 years



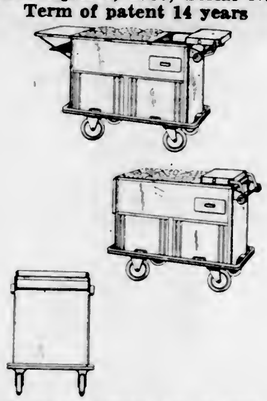
The ornamental design for a combined ashtray and cigarette extinguishing device, as shown.

107,441
DESIGN FOR AN INSULATED SWITCH HANDLE
Thomas J. Newman, Canton, Ohio
Application October 6, 1937, Serial No. 72,034
Term of patent 7 years



The ornamental design for an insulated switch handle, substantially as shown.

107,442
DESIGN FOR A BICYCLE CHAIN GUARD
John R. Morgan, Oak Park, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application October 8, 1937, Serial No. 72,071
Term of patent 7 years

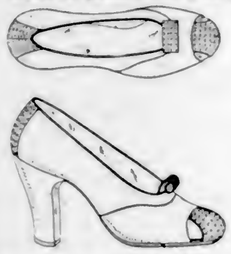


The ornamental design for a bicycle chain guard, as shown.

107,443
DESIGN FOR A BICYCLE TANK
John R. Morgan, Oak Park, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application October 8, 1937, Serial No. 72,072
Term of patent 7 years

The ornamental design for a bicycle tank as shown.

107,444
DESIGN FOR A FOOD CONVEYER
Harold J. O'Brien, Toledo, Ohio, assignor to The Swartzbaugh Manufacturing Company, Toledo, Ohio, a corporation of Ohio
Application April 8, 1937, Serial No. 68,634
Term of patent 14 years

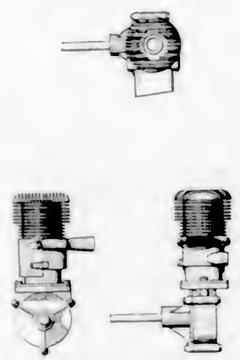


The ornamental design for a food conveyer, substantially as shown, and described.

107,445
DESIGN FOR A SHOE
Henning Odencrants, St. Louis, Mo., assignor to Valley Shoe Corporation, St. Louis, Mo., a corporation of Missouri
Application November 8, 1937, Serial No. 72,675
Term of patent 3½ years

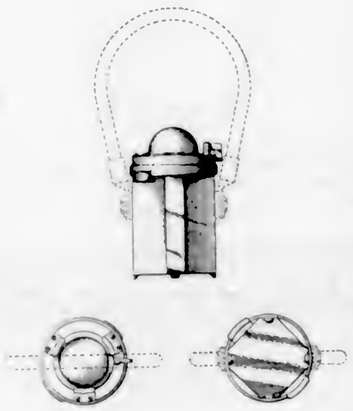
The ornamental design for a shoe, substantially as shown.

107,446
DESIGN FOR A SHOE
Henning Odencrants, St. Louis, Mo., assignor to Valley Shoe Corporation, St. Louis, Mo., a corporation of Missouri
Application November 8, 1937, Serial No. 72,677
Term of patent 3½ years



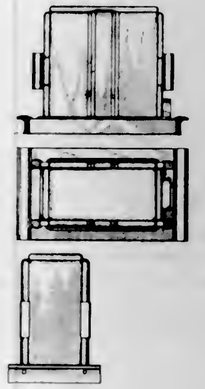
The ornamental design for a shoe, substantially as shown.

107,447
DESIGN FOR A SHOE
Henning Odencrants, St. Louis, Mo., assignor to Valley Shoe Corporation, St. Louis, Mo., a corporation of Missouri
Application November 8, 1937, Serial No. 72,678
Term of patent 3½ years



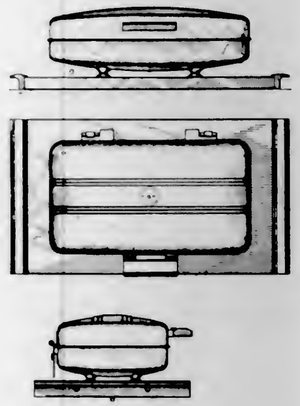
The ornamental design for a shoe substantially as shown and described.

107,448
DESIGN FOR A MINIATURE AIRPLANE ENGINE
Irwin G. Ohlsson, Los Angeles, and Henry T. Rice, San Gabriel, Calif.
Application June 28, 1937, Serial No. 70,100
Term of patent 7 years



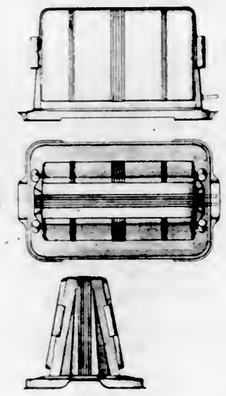
The ornamental design for a miniature airplane engine as shown.

107,449
DESIGN FOR AN ELECTRIC LANTERN
Judson S. Pixley, Astoria, N. Y.
Application October 25, 1937, Serial No. 72,408
Term of patent 14 years



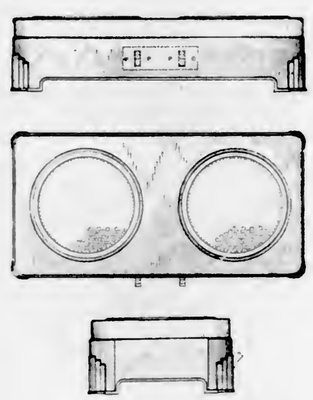
The ornamental design for an electric lantern, substantially as shown.

107,450
DESIGN FOR A BREAD TOASTER
Edward S. Preston, Hinsdale, Ill., assignor to Chicago Electric Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application September 17, 1937, Serial No. 71,666
Term of patent 7 years



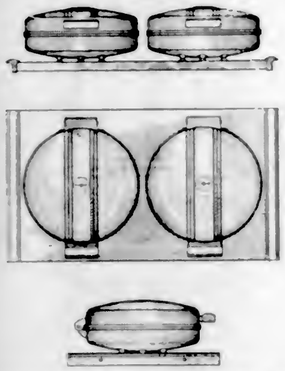
The ornamental design for a bread toaster as shown.

107,451
DESIGN FOR A SANDWICH TOASTER OR THE LIKE
Edward S. Preston, Hinsdale, Ill., assignor to Chicago Electric Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application September 17, 1937, Serial No. 71,668
Term of patent 7 years



The ornamental design for a sandwich toaster or the like, substantially as shown and described.

107,452
DESIGN FOR A TOASTER
Edward S. Preston, Hinsdale, Ill., assignor to Chicago Electric Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application October 8, 1937, Serial No. 72,079
Term of patent 7 years

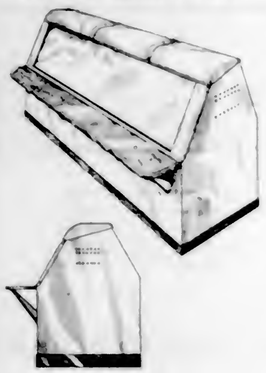


The ornamental design for a toaster, as shown and described.

107,453
DESIGN FOR A STOVE
Edward S. Preston, Hinsdale, Ill., assignor to Chicago Electric Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application October 8, 1937, Serial No. 72,080
Term of patent 7 years

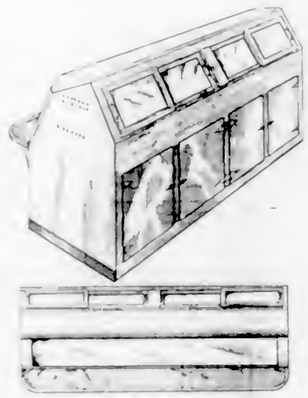
The ornamental design for a stove, substantially as shown and described.

107,454
DESIGN FOR A WAFFLE MOLD OR THE LIKE
Edward S. Preston, Hinsdale, Ill., assignor to Chicago Electric Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application October 8, 1937, Serial No. 72,081
Term of patent 7 years



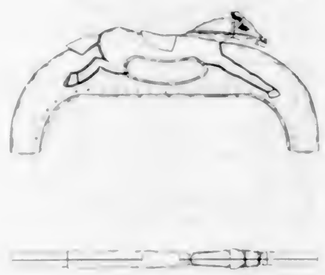
The ornamental design for a waffle mold or the like, substantially as shown and described.

107,455
DESIGN FOR A HANDLE OR THE LIKE FOR DOORS AND DRAWERS
Horace H. Raymond, Berlin, Conn., assignor to The Stanley Works, New Britain, Conn., a corporation of Connecticut
Application October 31, 1936, Serial No. 65,619
Term of patent 14 years

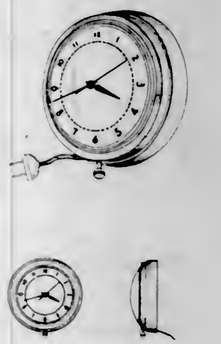


The ornamental design for a handle or the like for doors and drawers, as shown and described.

107,456
DESIGN FOR A SHOWCASE
Milton Rifkin, Denver, Colo.
Application July 12, 1937, Serial No. 70,367
Term of patent 7 years

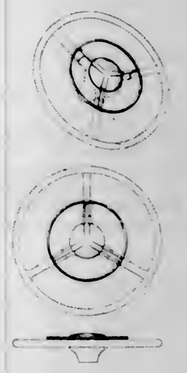


107,456—Continued



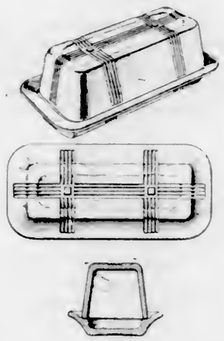
The ornamental design for a showcase, as shown.

107,457
DESIGN FOR A FRAME FOR A BAG OR SIMILAR ARTICLE
Herbert Rubin, New York, N. Y.
Application November 15, 1937, Serial No. 72,863
Term of patent 3½ years



The ornamental design for a frame for a bag or similar article, substantially as shown.

107,458
DESIGN FOR A CLOCK CASING
Max Schlenker, La Salle, Ill., assignor to General Time Instruments Corporation, New York, N. Y., a corporation of Delaware
Application June 11, 1937, Serial No. 69,790
Term of patent 7 years

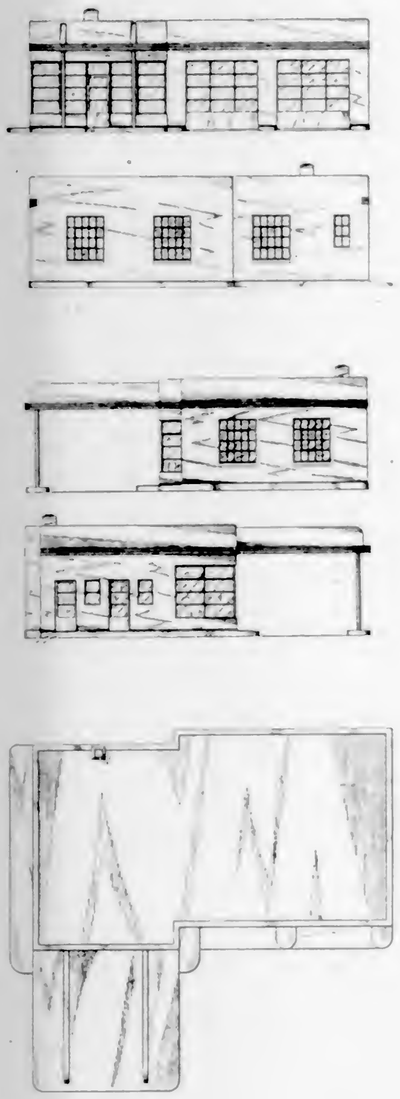


The ornamental design for a clock casing, as shown and described.

107,459
DESIGN FOR A COMBINED AUTOMOBILE STEERING WHEEL AND HORN CONTROL DEVICE
Robert D. Snoke, South Bend, Ind., assignor to Auburn Automobile Company, Connersville, Ind., a corporation of Indiana
Application February 19, 1937, Serial No. 67,743
Term of patent 7 years

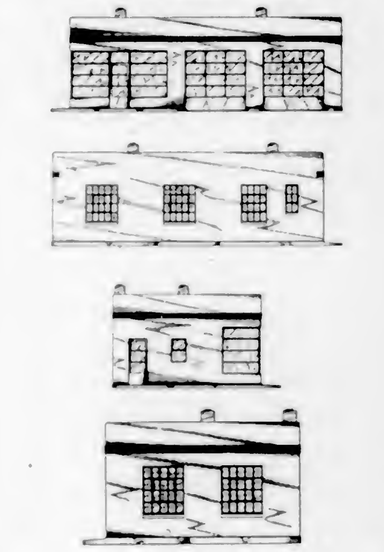
The ornamental design for a combined automobile steering wheel and horn control device substantially as shown and described.

107,460
DESIGN FOR A DISH
James E. Spence, Wheeling, W. Va., assignor to Hazel-Atlas Glass Company, Wheeling, W. Va., a corporation of West Virginia
Application November 5, 1937, Serial No. 72,638
Term of patent 7 years



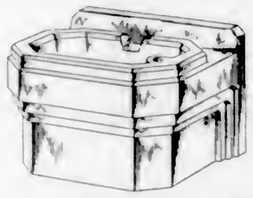
The ornamental design for a dish as shown.

107,461
DESIGN FOR A COMBINED COAL AND GAS RANGE
Walter D. Teague, Jr., Kew Gardens, N. Y.
Application December 10, 1936, Serial No. 66,464
Term of patent 14 years



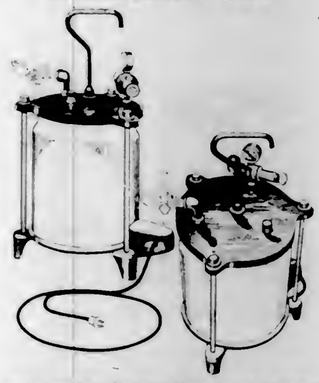
The ornamental design for a combined coal and gas range, substantially as shown, and described.

107,462
DESIGN FOR A SERVICE STATION
Walter D. Teague, Forest Hills, N. Y., assignor to The Texas Company, New York, N. Y., a corporation of Delaware
Application October 22, 1937, Serial No. 72,357
Term of patent 14 years



The ornamental design for a service station, as shown.

107,463
DESIGN FOR A SERVICE STATION
Walter D. Teague, Forest Hills, N. Y., assignor to The Texas Company, New York, N. Y., a corporation of Delaware
Application October 22, 1937, Serial No. 72,358
Term of patent 14 years

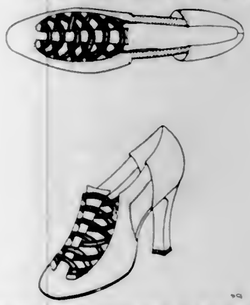


The ornamental design for a service station, as shown.

107,464
DESIGN FOR A DRINKING FOUNTAIN
Harry R. Trout, Pittsburgh, Pa., assignor to Standard Sanitary Manufacturing Company, Pittsburgh, Pa., a corporation of New Jersey
Application June 22, 1937, Serial No. 69,989
Term of patent 14 years

The ornamental design for a drinking fountain as shown.

107,465
DESIGN FOR A GEAR CASE FLUSHER
John William Tucker, Chicago, Ill., assignor to Linendoll Corporation, Chicago, Ill., a corporation of Illinois
Application October 14, 1937, Serial No. 72,173
Term of patent 7 years



The ornamental design for a gear case flusher, substantially as shown.

107,466
DESIGN FOR A SHOE
Abraham Turiansky, New York, N. Y.
Application November 10, 1937, Serial No. 72,749
Term of patent 3½ years

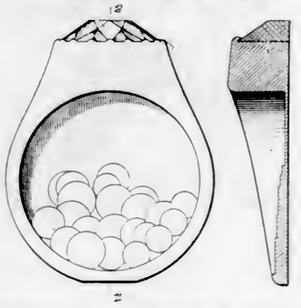
The ornamental design for a shoe substantially as shown.

107,467
DESIGN FOR A SHOE
Abraham Turiansky, New York, N. Y.
Application November 10, 1937, Serial No. 72,750
Term of patent 3½ years

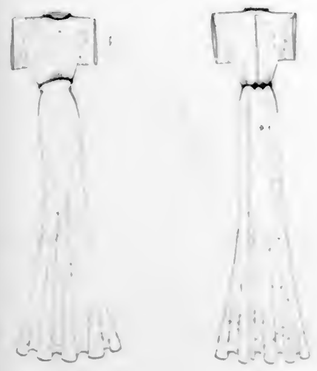
The ornamental design for a shoe substantially as shown.

107,468
DESIGN FOR A SHOE
Abraham Turiansky, New York, N. Y.
Application November 10, 1937, Serial No. 72,751
Term of patent 3½ years

The ornamental design for a shoe substantially as shown.



107,469
DESIGN FOR A SHOE
Abraham Turiansky, New York, N. Y.
Application November 10, 1937, Serial No. 72,752
Term of patent 3½ years

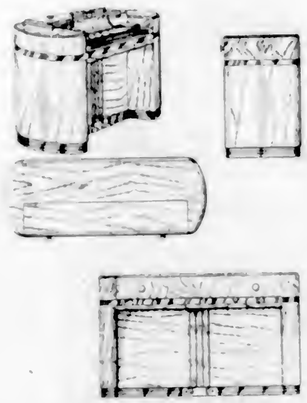


The ornamental design for a shoe substantially as shown.

107,470
DESIGN FOR A JEWELRY DISPLAY STAND
Rudolph J. Warner, Buffalo, N. Y.
Application January 14, 1937, Serial No. 67,065
Term of patent 14 years

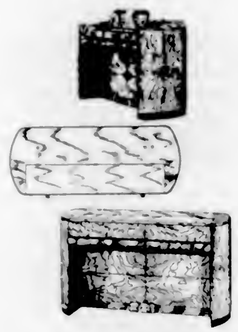
The ornamental design for a jewelry display stand, as shown and described.

107,471
DESIGN FOR A DRESS
Irene Welch, New York, N. Y.
Application October 19, 1937, Serial No. 72,303
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

107,472
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Schuyler A. Wood, Dolgeville, N. Y.
Application September 23, 1937, Serial No. 71,755
Term of patent 3½ years



The ornamental design for a shoe or similar article, substantially as shown.

107,473
DESIGN FOR A PIANO
William Zaiser, Rockville Centre, N. Y., assignor to The Rudolph Wurlitzer Company, De Kalb, Ill., a corporation of Ohio
Application June 19, 1937, Serial No. 69,921
Term of patent 3½ years

The ornamental design for a piano substantially as shown.

107,474
DESIGN FOR A PIANO
William Zaiser, Rockville Centre, N. Y., assignor to The Rudolph Wurlitzer Company, De Kalb, Ill., a corporation of Ohio
Application August 21, 1937, Serial No. 71,225
Term of patent 3½ years

The ornamental design for a piano substantially as shown, and described.

107,475
DESIGN FOR A DRESS
Jacob Abbate, New York, N. Y.
Application November 12, 1937, Serial No. 72,818
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

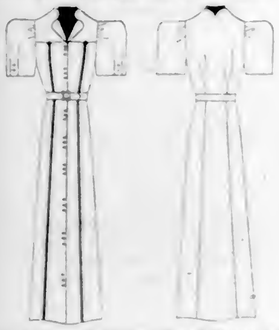
107,476
DESIGN FOR A TEXTILE FABRIC
John M. Balsam, Kenilworth, N. Y.
Application October 15, 1937, Serial No. 72,201
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown.

107,477
DESIGN FOR A DRESS
Marie R. Berger, New York, N. Y.
Application November 8, 1937, Serial No. 72,681
Term of patent 3½ years

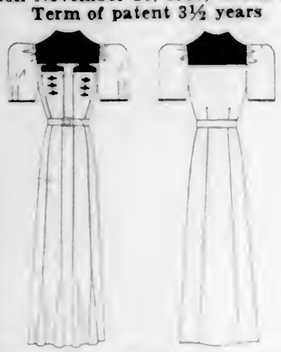
The ornamental design for a dress, substantially as shown, and described.

107,478
DESIGN FOR A DRESS
Viola Mayer Berrick, New York, N. Y.
Application October 6, 1937, Serial No. 71,985
Term of patent 3½ years



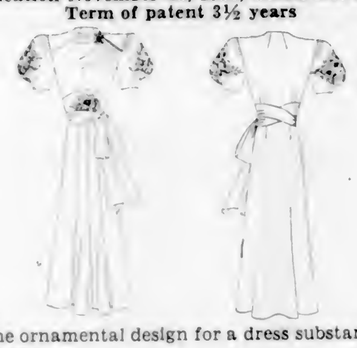
The ornamental design for a dress, substantially as shown and described.

107,479
DESIGN FOR A DRESS
Samuel Chapman, New York, N. Y.
Application July 14, 1937, Serial No. 70,447
Term of patent 3½ years



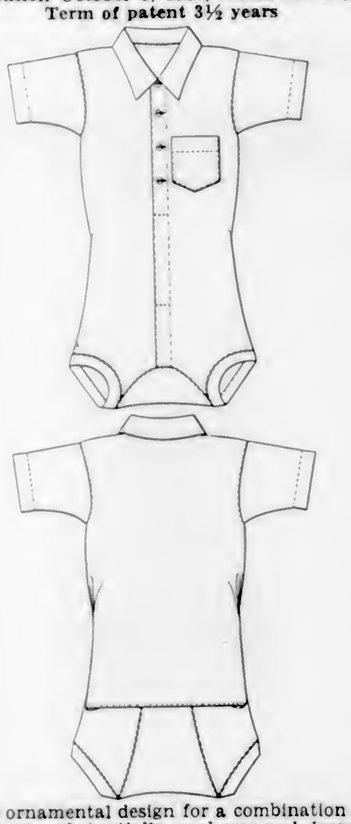
The ornamental design for a dress, substantially as shown.

107,480
DESIGN FOR A DRESS
Marie Efantes, New York, N. Y.
Application November 10, 1937, Serial No. 72,745
Term of patent 3½ years



The ornamental design for a dress substantially as shown.

107,481
DESIGN FOR A DRESS
Marie Efantes, New York, N. Y.
Application November 10, 1937, Serial No. 72,746
Term of patent 3½ years



The ornamental design for a dress substantially as shown.

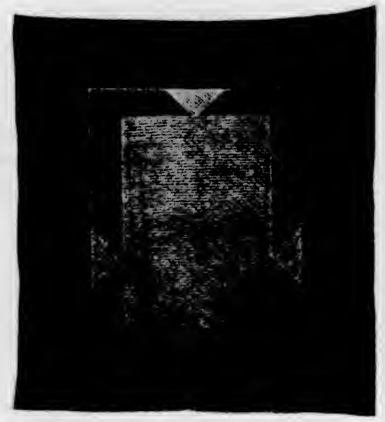
107,482
DESIGN FOR A DRESS
Louise Fenaroli, Astoria, Long Island, N. Y.
Application November 13, 1937, Serial No. 72,826
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

107,483
DESIGN FOR A COMBINATION SHIRT AND SHORTS
Everest D. Haight, New York, N. Y., assignor to E-Z Mills, Inc., New York, N. Y., a corporation
Application October 5, 1936, Serial No. 65,168
Term of patent 3½ years

The ornamental design for a combination shirt and shorts substantially as shown and described.

107,484
DESIGN FOR A LACE FOR A JACKET OR SIMILAR ARTICLE
Lawrence E. Hart and Herbert E. Lewy, New York, N. Y.
Application July 20, 1937, Serial No. 70,538
Term of patent 3½ years

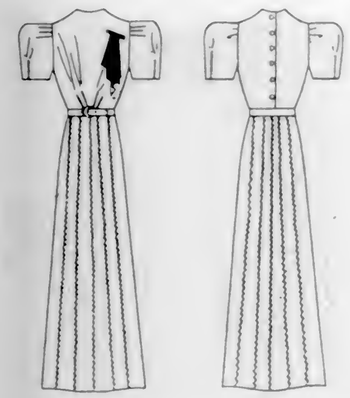


The ornamental design for a lace for a jacket or similar article, substantially as shown and described.

107,485
DESIGN FOR A WOVEN FABRIC
James Howard Hoffman, New York, N. Y.
Application October 20, 1937, Serial No. 72,337
Term of patent 7 years

The ornamental design for a woven fabric, as shown.

107,486
DESIGN FOR A BEDSPREAD
Clarence M. Jones, Calhoun, Ga.
Application October 21, 1937, Serial No. 72,347
Term of patent 3½ years



The ornamental design for a bedspread, substantially as shown.

107,487
DESIGN FOR A DRESS
Samuel Kronenfeld, Brooklyn, N. Y.
Application November 15, 1937, Serial No. 72,862
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

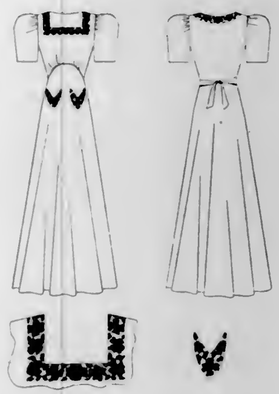
107,488
DESIGN FOR A DRESS
Herman Kushner, New York, N. Y.
Application November 1, 1937, Serial No. 72,555
Term of patent 3½ years

The ornamental design for a dress substantially as shown and described.

107,489
DESIGN FOR A TEXTILE FABRIC
Jacques E. Maisch, New York, N. Y., assignor to National Fabrics Corporation, New York, N. Y. a corporation of Delaware
Application September 11, 1937, Serial No. 71,569
Term of patent 3½ years

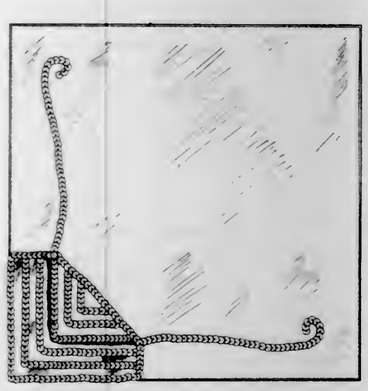
The ornamental design for a textile fabric substantially as shown and described.

107,490
DESIGN FOR A DRESS
David Rosenthal, New York, N. Y.
Application October 1, 1937, Serial No. 71,910
Term of patent 3½ years



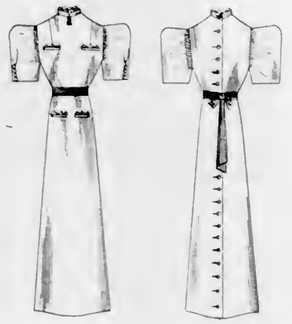
The ornamental design for a dress, substantially as shown and described.

107,491
DESIGN FOR A DRESS
Philip Schlessel, New York, N. Y.
Application October 8, 1937, Serial No. 72,054
Term of patent 3½ years



The ornamental design for a dress, substantially as shown and described.

107,492
DESIGN FOR A DRESS
Ralph Schultze, New York, N. Y.
Application November 24, 1937, Serial No. 73,167
Term of patent 3½ years



The ornamental design for a dress, substantially as shown and described.

107,493
DESIGN FOR A HANDKERCHIEF
David E. Schwab, New York, N. Y.
Application November 1, 1937, Serial No. 72,556
Term of patent 3½ years

The ornamental design for a handkerchief substantially as shown.

107,494
DESIGN FOR A DRESS
Augusta Waxberg, New York, N. Y.
Application November 10, 1937, Serial No. 72,753
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

107,495
DESIGN FOR A DRESS
Oscar Zaretzky, New York, N. Y.
Application October 23, 1937, Serial No. 72,379
Term of patent 3½ years

The ornamental design for a dress substantially as shown and described.

THE

OFFICIAL GAZETTE

OF THE

United States Patent Office

Vol. 485—No. 3 TUESDAY, DECEMBER 21, 1937 Price—$16 per year

The OFFICIAL GAZETTE is mailed under the direction of the Superintendent of Documents, Government Printing Office, to whom all subscriptions should be made payable and all communications respecting the Gazette should be addressed. Issued weekly. Subscriptions, $16.00 per annum, including annual index, $18.75; single numbers, 35 cents each.

PRINTED COPIES OF PATENTS are furnished by the Patent Office at 10 cents each. For the latter address the Commissioner of Patents, Washington, D. C.

CIRCULARS OF GENERAL INFORMATION concerning PATENTS or concerning TRADE-MARKS, PRINTS, and LABELS will be sent without cost on request to the Commissioner of Patents, Washington, D. C.

Interference Notice

U. S. PATENT OFFICE, *Washington, D. C., Dec. 3, 1937.*

Robert W. Edens and Omer E. Brubaker, their assigns or legal representatives, take notice:

Four interferences having been declared by this Office between a joint application for patent of Robert W. Edens and Omer E. Brubaker, of 349 Highland Avenue and 2892 Pershing Avenue, San Bernardino, California, respectively, and applications for patent filed by Edwin E. Daniels, 200 South Willard Street, San Jose, California, and Edison Harrington, 1128 Fugate Street, Houston, Texas, and ten other applications, and counsel for the parties Edens and Brubaker having been unable to secure satisfactory service upon said Edens and Brubaker, notice is hereby given that unless said Edens and Brubaker, their assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the interference will be proceeded with as in case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

Notice of Cancellation

U. S. PATENT OFFICE, *Washington, D. C., Dec. 1, 1937.*

Charles D. Fox, his assigns or legal representatives, take notice:

A cancellation proceeding has been instituted by this Office upon the application of Modern Merchandising Bureau, Inc., 36 West 44th Street, New York, N. Y., to effect the cancellation of trade-mark registration of M. Hirshfield, No. 241,179, dated April 17, 1928. The assignment records of this Office show a transfer of title to this registration to Charles D. Fox, New York, N. Y., who has been substituted for said M. Hirshfield to defend the registration concerned. The notice of such proceeding sent by registered mail to Charles D. Fox, at the said address, having been returned by the post office as undeliverable, notice is hereby given that unless Charles D. Fox, his assigns or legal representatives, shall enter an appearance therein within 30 days from the first publication of this order the cancellation will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

Attorneys—Disbarment

(ORDER No. 3,402)

U. S. PATENT OFFICE, *Washington, D. C., June 25, 1937.*

Acting under the provisions of section 487 Revised Statutes of the United States (U. S. C. title 35, sec. 11), Herman Tischer, of 428 East 92d Street, New York, N. Y., whose registration is number 12,927, is hereby disbarred from practice before the United States Patent Office.

CONWAY P. COE,
Commissioner.

SUITS UNDER SECTION 4915 R. S. (35 U. S. C. 63)

Rules of the District Court of the United States for the District of Columbia—Excerpts from

LAW RULE 75, par. 6:

Whenever a case, which has progressed as far as the ready calendars, has been settled or dismissed, the attorneys therein *shall at once notify the assignment commissioner* of that fact.

EQUITY RULE 32:

A bill in equity shall not be dismissed at the instance of plaintiff *except upon motion.*

DECISIONS IN PATENT AND TRADE-MARK CASES

Commissioner's Decision

CARTER *v.* WADE & URFER

Decided March 31, 1936

INTERFERENCE—PRELIMINARY STATEMENTS—OPENING OF STATEMENTS UNDER RULE 111.

Where an award of priority was made to senior party in interference following order to show cause on junior party who alleged no date in his preliminary statement earlier than the filing date of the senior party, and no testimony was taken, *Held* that the provisions of rule 111 do not preclude senior party from having access to the preliminary statement of the junior party and he is entitled to same since the statement is an essential part of the proceedings leading up to the award of priority.

ON PETITION.

Mr. Herbert H. Thompson for Carter.

Messrs. Cameron, Kerkam & Sutton for Wade and Urfer.

FRAZER, *Assistant Commissioner:*

The party Wade and Urfer petitions for access to the preliminary statement filed on behalf of Carter. The latter has presented no opposition to the petition.

The statement in question alleged no date earlier than the filing date of petitioner's interfering application and Carter was therefore placed under an order to show cause why judgment should not be rendered against him. The showing made by Carter in response to the order was held insufficient and priority was therefore awarded to petitioner.

The practice of the Office in the matter of opening preliminary statements to opposing parties in an interference is governed by rule 111. Before the recent amendment to the rule it was the practice to throw such statements open, under the conditions set forth in the rule, at the beginning of the motion period. As amended the rule provides that the statements shall not be opened to the opposing parties until after all motions have been finally disposed of or the time for filing such motions has expired "* * * and the case is in condition for taking of testimony."

Where, as here, the judgment on priority was rendered following an order to show cause, it is obvious that no testimony will be taken and, if the quoted clause of the rule is read in a limiting sense, the senior and winning party must be denied the privilege which he had under the earlier rule.

It is not deemed that such was the intention but that the amendment to the rule was intended merely to advance the time at which the parties are entitled to see their opponent's statements. This conclusion is supported by the inclusion in the rule of a second paragraph stating:

> A junior party who fails to file a preliminary statement or a party who alleges no date in his preliminary statement earlier than the filing date of the application or applications of another party shall not have access to the preliminary statement of said party.

If the first paragraph of the rule had been intended to mean that both parties should be excluded under the circumstances here presented there would have been no occasion for inserting the second paragraph separately excluding a junior party under order to show cause.

The preliminary statement of the junior party Carter is an essential part of the proceeding leading up to the judgment on priority and therefore should be opened to the inspection of petitioner.

The petition is granted.

LESLIE FRAZER,
Assistant Commissioner.

Commissioner's Decision

SUMMERS *v.* ESAU

Decided July 29, 1936

INTERFERENCE—APPLICATION AND PATENT—PATENTEE'S RIGHT TO MAKE CLAIMS.

An interference between an applicant and a patentee should not be terminated by dissolution on the ground that the claims in issue are not properly supported by patentee's original disclosure, but should proceed to an award of priority and where an applicant brings a motion to dissolve on this ground, consideration thereof should be postponed until final hearing. (*Hull v. Hallberg*, 110 O. G. 1428, 1904 C. D. 200, overruled.)

ON PETITION.

Mr. Frank E. Summers pro se.

Mr. Frank S. Appleman for Esau.

MACKLIN, *First Assistant Commissioner:*

The party Esau petitions that the Primary Examiner be directed to modify his decision of February 27, 1936, by eliminating the portion thereof which granted the motion of Summers to dissolve.

The interference is between a patent to petitioner and an application of Summers. Petitioner is the senior party. Petitioner moved to dissolve on the ground that the claims in issue are not supported by the disclosure in the application of Summers and on the ground that the claims are unpatentable to Summers in view of certain art alleged to constitute a statutory bar against Summers alone.

Summers too moved to dissolve on the ground inter alia that the original disclosure in the application of petitioner, upon which his patent was granted, does not support the claims in issue, such claims containing new matter introduced during the prosecution of the application. The motions on these grounds were set for hearing and were granted by the Primary Examiner who set a limit of appeal for both parties.

Petitioner contends that in view of the granting of petitioner's motion to dissolve no decision on the motion of Summers was necessary and none should have been made because the motion was one attacking the validity of the claims of petitioner's patent.

An interference between an application and a pat-

ent is declared solely for the purpose of determining whether this Office should grant to the applicant a patent containing the claims copied from his opponent's patent. A decision favorable to the applicant may be based either on proof that he was the prior inventor of the subject matter involved, or on a holding that of the two contestants only the applicant is entitled to a patent on such subject matter. In either case an award of priority to the applicant unavoidably casts a cloud on the validity of his opponent's patent in so far as the interfering claims are concerned. When an interference is thus terminated by an award of priority to the applicant the patentee has the right of appeal to the Board of Appeals, and if necessary, to the Court of Customs and Patent Appeals. If, on the other hand, the interference is terminated by dissolution on the ground that the claims involved should not have been allowed in the patent, the patentee may appeal to the Board of Appeals, but he has no right of appeal to the Court. If, in the instant case, the Board, on appeal by both parties, should affirm the decision granting petitioner's motion to dissolve, the applicant Summers would have the right to prosecute the claims *ex parte* and, if the claims are refused him in this Office, he would have the right to appeal to the Court of Customs and Patent Appeals, or to proceed in equity under Sec. 4915 R. S. If the Board of Appeals should also affirm the decision granting the motion of Summers, no proceedings would be available to petitioner to remove the cloud thus placed on the validity of his patent.

In somewhat similar circumstances it was held in *Pohle* v. *McKnight*, 119 O. G. 2519, 1905 C. D. 549, that an interference between a patentee and an applicant should not be terminated by dissolution on the ground that the claims are not properly supported by the patentee's original disclosure but should proceed to an award of priority from which the patentee may have a course of appeals.

A contrary holding was made in *Hull* v. *Hallberg*, 110 O. G. 1428, 1904 C. D. 200, but it is deemed that in order that the parties should be on a parity as to the right of appeal, the practice set forth in *Pohle* v. *McKnight*, supra, should be followed. The decision in *Hull* v. *Hallberg* is therefore overruled.

Where in an interference between a patentee and an applicant the applicant raises the question of the sufficiency of the original disclosure of the patentee to support the claims in issue, consideration of this question should be postponed until final hearing.

In conformity with this conclusion the decision of the Primary Examiner, in so far as it granted the motion of Summers to dissolve, is vacated without prejudice to the right of Summers to raise again at final hearing and on appeal from an award of priority, the alleged failure of the original disclosure of petitioner to support the counts.

The petition is granted to the extent indicated.

Commissioner's Decision

EX PARTE JOHN DAVID

Decided September 23, 1937

TRADE-MARKS—APPLICATION DRAWING—AMENDMENT REMOVING A PORTION OF MARK SHOWN, TO BE SIGNED BY APPLICANT—DISCLAIMER NOT REQUIRED.

Where application was made for registration of mark consisting of words "Dog-on-it", printed beneath the picture of a Scottie dog and in response to a rejection of the application in view of an existing registration, counsel for applicant requested that the picture of the dog be removed from the application drawing, *Held* that the requested change should be expressly authorized over applicant's signature, but applicant should not be required to file a disclaimer. (*Ex parte Wayne Poultry Tonic Co.*, 164 O. G. 251, 1911 C. D. 37, overruled in so far as it is in conflict.)

ON PETITION.

Mr. Harry Radzinsky for applicant.

FRAZER, *Assistant Commissioner.*

Applicant applied for registration of the words "Dog-on-it", printed beneath the picture of a Scottie dog, as a trade-mark for various items of men's wearing apparel. The application was rejected by the Examiner of Trade-Marks in view of an existing registration, for similar merchandise, of the silhouette of a Scottie dog. Counsel for applicant then requested that the picture of the dog be removed from the application drawing. On authority of *Ex parte Wayne Poultry Tonic Co.*, 100 Ms. D. 246, 164 O. G. 251, the Examiner denied the request, stating that

"an applicant will not be permitted to modify the mark originally shown on the drawing by the elimination of a fanciful, arbitrary and salient feature thereof unless there shall be filed a disclaimer of such feature duly verified by the applicant."

By this petition applicant seeks a review of the Examiner's ruling.

I am inclined to agree with counsel for applicant that so far as the Patent Office is concerned there can be no more effective disclaimer than the removal from the drawing of the matter required to be disclaimed. If the picture of a Scottie dog had been omitted from the drawing as originally filed the reference relied on by the Examiner would probably have been deemed inapplicable and would not have been cited. Registration to applicant with the objectionable feature eliminated from his mark as filed will afford him no broader rights than if such feature had been originally omitted. Moreover it is difficult to find any rational justification for requiring a disclaimer of matter that will not appear in the certificate of registration. To do so may conceivably prejudice an applicant's common law rights, and is in my opinion both unauthorized and unnecessary.

In the present case the request to erase the pictorial feature from the drawing was made by applicant's attorney. The attorney is empowered "to make alterations and amendments" in the application, but the applicant has stated under oath "that the description and drawing presented truly represent the trade-mark sought to be registered." As no attorney has the power to amend an applicant's affidavit, the requested change in the drawing should be expressly authorized over applicant's signature. When that is done the erasure will be permitted, the requirement for a disclaimer will be withdrawn, and such further action will be taken by the Examiner as he may deem appropriate.

The petition is granted to the extent indicated.

In so far as it conflicts with the views herein expressed the decision in *Ex parte Wayne Poultry Tonic Co.*, supra, is overruled.

U. S. Court of Customs and Patent Appeals

UNITED BATTERY MANUFACTURING CO., LTD.

v.

UNITED METAL BOX CO., INC.

No. 3,804. Decided June 7, 1937

[90 F.(2d) 260]

TRADE-MARKS—GOODS OF SAME DESCRIPTIVE PROPERTIES—"STORAGE BATTERIES" AND "ELECTRICAL SWITCHES AND SWITCH BOXES."

Storage batteries *Held* to constitute goods of the same descriptive properties as electrical switches and electrical switch boxes.

APPEAL from the Patent Office. Affirmed.

GARRETT, *J.*, dissenting.

Miss Marie K. Saunders and *Mr. Edmund A. Strauss* for United Battery Manufacturing Co., Ltd.

No appearance for United Metal Box Co., Inc.

BLAND, *J.*:

There is here brought to us for review the decision of the Commissioner of Patents, speaking through the Assistant Commissioner of Patents, reversing the decision of the Examiner of Trade-Mark Interferences, in a trade-mark opposition proceeding.

On May 29, 1933, appellant filed application for the registration of a composite trade-mark for storage batteries, alleging its use for such since 1930. The mark is fairly described in the brief on behalf of appellant as follows:

The trade-mark of the applicant, appellant here, includes a circular disk having a wavy outline; within the periphery of the disk are the words "United Battery Mfg. Co. Ltd." (the corporate name of the applicant) while the central portion of the disk is ornamented with a shield and the representation of a spread eagle surmounting the words "United Battery."

To the foregoing it may be added that certain other words of a descriptive nature appearing within the central portion of the disk, together with the word "Battery" on the shield are disclaimed "apart from the mark as shown."

The proposed mark having been passed to publication, appellee, United Metal Box Co., Inc., filed notice of opposition. The notice is in conventional form and need not be analyzed in detail. It alleged that long prior to the adoption by appellant of its mark appellee had used a mark embodying the word "United" as a trade-mark on a variety of articles such as electric switches, electric meter panel installations, fuse plug receptacles, electric outlet boxes, meter box wall mounting and wire conduits, apartment mail boxes, medicine cabinets, clothes hampers, clothes dryers, waste receptacles, disposal devices, and metal furniture. Opposer specifically pleaded its registration of "United" for "switch boxes, motor inclosures, and safety switches." This registration dated June 6, 1922, shows the word "United" embraced within an oblong geometric figure, having six sides. Specimens of the mark as actually used show the word "Products" imposed upon the word "United," and surrounding the whole are the words "United Metal Box Co., Inc. Brooklyn, New York."

The answer of appellant to the notice of opposition denied numerous averments of the notice, and specifically contended that the marks are different in design and appearance, and that the goods of the respective parties are not of the same descriptive properties within the meaning of the trade-mark statutes, although conceding both to be classified in the Patent Office in Class 21, Electrical apparatus, machines, and supplies.

The Examiner of Interferences dismissed the notice of opposition and adjudged appellant entitled to the registration sought. In so doing he considered and pointed out the differences in both the marks and the goods. The Commissioner, while saying that there are many differences in the marks viewed in their entireties, took the view that "United" is the feature of each "which would most likely be retained in the mind of the purchaser"; that "the goods of both parties would naturally be known by that word," and, citing different decisions of this court, such as *Cheek-Neal Coffee Company* v. *Hal Dick Manufacturing Company*, 17 C. C. P. A. (Patents) 1103, 40 F.(2d) 106, 395 O. G. 10, concluded that the goods belong to the same general class and hence fall within the meaning of "same descriptive properties" in the sense of the trade-mark registration act. Hence he reversed the decision of the Examiner of Interferences and sustained the opposition.

As we view the case, the fundamental question is that of the descriptive properties of the goods of the respective parties. Evidence was introduced on behalf of the opposer relating to the nature of the products upon which its mark is applied. It seems obvious that no consideration need be given to any of opposer's products except those having an electric feature. The evidence introduced as to these shows that opposer manufactures metal boxes in which the electrical apparatuses are enclosed, or to which such apparatuses are attached. Primarily opposer's business is that of manufacturing the boxes and the mark is applied only to the boxes. It is testified that in the case of the electric switches, opposer makes the boxes and sometimes the electrical devices which are attached within them, but at times it procures the electrical devices elsewhere, made to its "special design" and for its "individual use."

There was introduced as Exhibit 5 a sample of opposer's "safety switch." Of this the Examiner of Interferences said:

The safety switch shown in Exhibit No. 5 illustrates a form of knife switch such as is commonly used in electrical circuits and there possesses general utility. In other words, it is not essential thereto nor does it constitute a necessary part of a storage battery.

It was then pointed out by the Examiner of Interferences that:

The remaining goods sold by the opposer are in the nature of hardware of the type commonly purchased by contractors for use in apartment buildings.

From the answer of applicant-appellant and its brief, it appears to be its position that owing to the differences in the marks and the differences in the goods there was no likelihood of confusion or mistake in the mind of the public, that the goods were not of the same descriptive properties, and that notwithstanding the fact that storage batteries and the electrical goods upon which the opposer alleges its trade-mark use are classified under the same class in the United States Patent Office, they are not for that reason of the same descriptive properties. It stresses the contention that it cannot be concluded that all electrical goods belong to the same class. The Examiner of Interferences evidently being of the same opinion, called attention to the fact that an electrical knife switch is not necessarily a part of a storage battery, and relied upon *Williams Oil-O-Matic Heating Corp.* v. *Westinghouse Electric & Mfg. Co.*, 20 C. C. P. A. (Patents) 775, 62 F.(2d) 378, 430 O. G. 628.

We are in agreement with the conclusion reached by the Commissioner. Of course all electrical goods or devices do not belong to the same class, but an electrical switch, an electrical switch box, and possibly a number of other electrical articles manufactured and sold by the opposer under its mark are closely associated in the mind of the public with the source of electricity which is often a storage battery, for use on which the applicant seeks to register its mark. In most instances, electricity from storage batteries, which are in use, is controlled by electrical switches, and in its control and use switch boxes and many other well-known appurtenant articles are used. The nature of the articles and the close association of their use bring them into the same class. It is a matter of common knowledge that they are used together, and are handled by the same dealers. These facts suggest the probability of confusion to purchasers if identical or similar trade-marks are used.

While appellant has called attention to the differences in the marks, we, like the tribunals below, are not impressed with the contention that the differences are such as to eliminate the probability of confusion if the marks are used upon goods of the same descriptive properties.

Even if there were doubt as to whether there was a likelihood of confusion, such doubt should be resolved against the newcomer.

The decision of the Commissioner of Patents is affirmed.

Affirmed.

GARRETT, *J.*, dissenting:

I feel that the majority here failed to give proper weight to the striking differences between both the marks and the goods of the respective parties. The difference in the marks appears clearly from the descriptions of them set forth in the opinion. In appearance, there is no resemblance and the word "United" is their only common feature. So far as the goods are concerned, they differ entirely in nature, appearance, characteristics, and use. There can be no identification of similarity between them, save by applying to both the broad term, "electrical", and the term is applicable to only a part of the articles dealt in by opposer. Opposer manufactures metal boxes, many of which have no electrical feature whatsoever. Of those which do have an electrical feature, emphasis was placed throughout the trial of the case upon what is designated its safety switch, exemplified in Exhibit 5. This consists of a metal box having metal contact plates to which electric wires may be attached. Storage batteries are not metal boxes, and I find nothing in the record to indicate that storage batteries and safety switches are ever associated in use. Neither do I find anything of record which indicates that the products of the respective parties are sold in the same stores or to the same classes of purchasers. Rather I deduce from such testimony as may be construed to have any bearing upon this question that they are not sold in the same manner, or to the same classes of purchasers. Opposer sells its electrical equipment principally to contractors who install the boxes in buildings, or to jobbers who, in turn, sell to contractors.

The majority, as did the Commissioner of Patents, seem to have taken judicial notice as to many dealers in electrical supplies carrying storage batteries, We may, of course, apply the rule of judicial notice within proper limits, but I do not think we properly may go so far as to hold that it is applicable to the particular electrical equipment sold by opposer, especially in view of the testimonial record strongly indicating, if not positively establishing, the contrary, but even if the articles were shown to be sold as the majority opinion seems to infer I still would be of opinion, in view of the differences in the marks and the differences in the goods, that there is no reasonable likelihood of confusion within the meaning of that term as used in the trade-mark registration act. Numerous authorities might be cited, but I content myself with referring to *Williams Oil-O-Matic Heating Corp.* v. *Westinghouse Electric & Mfg. Co.*, 20 C. C. P. A. (Patents) 775, 62 F.(2d) 378, 430 O. G. 628.

U. S. Court of Customs and Patent Appeals

BECK, KOLLER & COMPANY, INC.
v.
BAKELITE CORPORATION

Nos. 3,816 to 3,824. Decided June 21, 1937

[90 F.(2d) 349]

Appeal No. 3,816

1. TRADE-MARKS—GOODS OF SAME DESCRIPTIVE PROPERTIES—SYNTHETIC RESINS.

Synthetic, oil-soluble resins used in the manufacture of air-drying varnish and lacquer *Held* goods of the same descriptive properties as synthetic resin soluble in oil only to a small extent and used in varnishes requiring artificial heat to set and harden the same. "Both resins were used for varnishes and the mere fact that the resins had different properties or that the ultimate product made from them was used in a slightly different way and sold, at that particular time, to different customers does not alter the situation."

2. SAME—CONFUSING SIMILARITY—"BECKACITE" AND "BAKELITE".

The trade-mark "Beckacite" *Held* confusingly similar to the mark "Bakelite" when used on goods of the same descriptive properties and registration of the former *Held* properly refused applicant in view of opposer's prior use of latter.

Appeal No. 3,817

3. SAME—SAME—SAME—GOODS HELD OF SAME DESCRIPTIVE PROPERTIES.

Registration of mark "Beckacite" for use in connection with dry, paste and ready-mixed paints, varnishes, lacquers, etc., *Held* properly cancelled as being confusingly similar to the notation "Bakelite" previously used by applicant for cancellation on phenol resin varnish which is held to be goods of the same descriptive properties.

Appeal No. 3,818

4. SAME—SAME—GOODS HELD OF SAME DESCRIPTIVE PROPERTIES.

Registration of mark comprising a slightly ornate trefoil border and enclosing the capital letters "B", "K", and "C", each within one of the lobes of the trefoil, applied to dry paints and ready mixed paints, varnishes and ready mixed lacquers *Held* properly cancelled as being confusingly similar to the registered mark of petitioner for cancellation, held to have prior right, comprising a trefoil border enclosing the capital letter "B" in the upper lobe and the conventional sign for infinity in the two lower lobes, applied to condensation products of phenols and formaldehyde and to paint enamels, lacquers, and varnishes, the goods of the parties being of the same descriptive properties.

Appeal No. 3,819

5. SAME—SAME—SAME.

Registration of a mark consisting of the trefoil mark described in Appeal No. 3,818 and a representation of the terrestrial globe with the notation around it "World Wide Distribution" applied to "soluble synthetic varnish and lacquer resins and ester gums", *Held* properly refused as being confusingly similar to opposer's mark described in previous appeal when used on goods held to be of same descriptive properties.

Appeal No. 3,820

6. SAME—SAME—SAME.

Opposition to registration of applicant's mark for use in connection with "oil soluble plastic resins and solutions thereof in oils and mineral spirits used as painters' materials" *Held* properly sustained in view of prior use by opposer of mark on "phenol resin varnish", the marks being the same as those described in Appeal No. 3,819, and the goods being of the same descriptive properties.

Appeal No. 3,821

7. SAME—SAME—"BECKOLLOID" AND "BAKELITE"—GOODS HELD OF SAME DESCRIPTIVE PROPERTIES.

Registration of mark "Beckolloid" for use in connection with paints, dry, paste, and ready mixed, as well as varnishes and lacquers *Held* properly cancelled as being confusingly similar to the notation "Bakelite" previously used by applicant for cancellation in connection with condensation products of phenol and formaldehyde, the goods of the parties being of the same descriptive properties.

Appeal No. 3,822

8. SAME—SAME—SAME—SAME.

Registration of mark "Beckolloid" for use in connection with "soluble synthetic varnish and lacquer resins and ester gums" *Held* properly refused as being confusingly similar to notation "Bakelite" previously used by opposer in connection with condensation products of phenol and formaldehyde, the goods of the parties being of the same descriptive properties.

Appeal No. 3,823

9. SAME—SAME—"BECK-O-LAC" AND "BAKELITE"—GOODS HELD OF SAME DESCRIPTIVE PROPERTIES.

Registration of mark "Beck-O-Lac" for use in connection with "solutions of soluble synthetic resins in oils and mineral spirits for use in the manufacture of paints, varnishes, and lacquers, but excluding paints, varnishes, lacquers, and like finished products", *Held* properly refused as being confusingly similar to the notation "Bakelite" previously registered and used by opposer on paint, enamels, lacquers, and varnishes, the goods of the parties being of the same descriptive properties.

Appeal No. 3,824

10. SAME—SAME—SAME—SAME.

Registration of the mark "Beck-O-Lac" for use in connection with "soluble synthetic varnish and lacquer resins" *Held* properly refused as being confusingly similar to the notation "Bakelite" previously registered to the opposer for use on condensation products of phenol and formaldehyde, the goods of the parties being of the same descriptive properties.

APPEAL from the Patent Office. Affirmed.

Mr. Munson H. Lane for Beck, Koller & Company, Inc.

Mr. Charles H. Potter, *Mr. Harold T. Stowell*, and *Mr. Jos. N. Nielsen* for Bakelite Corporation.

BLAND, *J.*:

Patent Appeal No. 3,816—Opposition No. 12,545

This is an appeal from the decision of the Commissioner of Patents sustaining the opposition of the Bakelite Corporation to the registration by Beck, Koller & Company, Inc., hereinafter usually referred to as applicant-appellant, in "Class 6, Chemicals, medicines, and pharmaceutical preparations", of the word "Beckacite" used as a trade-mark on a special type of synthetic resin suitable for use solely in the paint, varnish and lacquer industry. Applicant-appellant's application for the registration of the trade-mark "Beckacite" calls for its use upon "synthetic resins." A motion to amend was made so as to restrict the registration sought to "oil-soluble varnish and lacquer resins."

The opposition of the Bakelite Corporation is based upon opposer's trade-mark "Bakelite", No. 75,266, registered September 14, 1909, for "condensation products of phenol and formaldehyde, in Class 6, Chemicals, medicines, and pharmaceutical preparations."

This case is the first of a group of nine appeals numbered 3,816 to 3,824, inclusive, which involve the same parties and, for the most part, the same issues. The record in Appeal No. 3,816 includes the testimony and exhibits applicable to all cases and also the answers of the applicant-appellant in all cases. The main briefs of the parties are filed in Appeal No. 3,816 and briefs in the other appeals are filed by the parties so as to explain the differences in the cases and discuss the issues there involved which are not discussed in Appeal No. 3,816.

There is very little dispute about the facts proven, and the main issue is one of law and involves a determination of whether or not the goods upon which the respective marks were used at certain times were of the same descriptive properties.

Applicant-appellant makes no claim, which is of concern here, to the use of the mark prior to 1924.

Since that date, its mark "Beckacite" has been used in the sale of synthetic phenolic resins which are sold in this country to the manufacturers of varnishes and lacquers. Applicant-appellant's synthetic resin is dissolved in oil by the varnish and lacquer manufacturers to produce air-drying varnishes and lacquers, and is a substitute for the natural resins heretofore employed for that purpose.

The opposer-appellee prior to 1924 had manufactured a synthetic resin which was a new article of manufacture in which the opposer-appellee had a monopoly by virtue of certain patents. This resin possessed numerous valuable properties such as becoming solid at ordinary temperatures without lessening in volume. It had good insulating properties and long before 1924 went into general use in the electrical trades and was molded into various articles of manufacture. It was soluble in oil to only a small extent and was not of the type of resin which is used by the varnish manufacturers in manufacturing the air-drying type of varnish. Artificial heat was normally employed to set and harden the varnish made from opposer's resin. It was soluble in alcohol.

Later than 1924 and after the applicant-appellant had entered the field, opposer-appellee manufactured a synthetic resin which was soluble in air-drying oils. The exact date of opposer-appellee's entry into this field is in dispute but since it was subsequent to 1924 we do not regard this matter as of importance. It is conceded that prior to 1924 opposer-appellee supplied consumer customers with spirit varnishes which had a rather limited use owing to the baking requirement. The weight of the evidence is to the effect that it did not sell to varnish manufacturers a phenolic resin for use in making paints and varnishes until after applicant-appellant had entered the field. This fact is in dispute. The tribunals below on this question found against the opposer-appellee. On this question opposer-appellee in this court disputes the contention of applicant-appellant that it was the first to market oil-soluble resins in this country and points out the testimony of some witnesses (which the applicant-appellant claims were interested) to show that it did sell some such resin prior to 1924 and that samples of this resin were sent out to various customers for trial. Certain shipping papers were introduced to show that opposer-appellee's activities in dealing with this character of resin were increasing gradually in 1925 and grew steadily from that time. The Examiner of Interferences found, which finding was evidently approved by the Commissioner of Patents, that prior to 1924 when the applicant-appellant entered the field, opposer was not selling or dealing in, except in an experimental way, oil-soluble phenolic resins for use in making varnishes and lacquers.

In this opposition, therefore, is presented for decision, first, the question of law as to whether or not at the time applicant-appellant adopted and first used its mark in this country (1924) it used it on goods of the same descriptive properties as those upon which opposer-appellee was then using its mark. Upon this question it is the contention of applicant-appellant that varnishes generally, or varnishes made from non oil-drying resins or resins which were not soluble in oil, are not goods of the same descriptive properties as oil-soluble varnish and lacquer resins. Its argument is chiefly based upon the contention that its product was sold only to the manufacturers of air-drying varnishes and lacquers, and that the goods of the opposer prior to 1924 could not be sold to this class of customers and were for the most part manufactured into molded articles or sold in the form of spirit varnishes (dissolved in alcohol), and that since there was no likelihood of confusion, applicant-appellant should not be deprived of its right of registration and that it should not be held that the goods of the parties were of the same descriptive properties.

The question has been argued at great length as to whether or not after 1924 the opposer had the right to use its "Bakelite" trade-mark in entering the restricted field which the applicant-appellant had entered. This was one of the main questions ruled upon by the Examiner of Interferences and by the Commissioner. On that subject and on the subject as to the likelihood of confusion the Commissioner said:

> The answer to the applicant's question as to whether the opposer possessed the right to enter the specific field previously occupied by the applicant depends upon the determination of whether or not the goods of the opposer at the time the applicant entered the field, and prior thereto, possessed the same descriptive properties as the goods of the applicant. If the goods of the respective parties possessed the same descriptive properties at that time, and I am constrained to agree with the Examiner that such was the case, then it is well settled that the opposer possessed the right to later extend its business to include goods which, although specifically different in some characteristics, are nevertheless of the same class and may be said to possess the same descriptive properties. In support see: *Boston Rubber Shoe Company* v. *Abramowitz*, 47 App. D. C. 199; 247 O. G. 247; 1918 C. D. 137; *California Packing Corporation* v. *Halferty*, 295 Fed. 229; 54 App. D. C. 88; 320 O. G. 700; 1924 C. D. 225; *Berghoff Brewing Association* v. *Popel Giller Co., Inc.*, 273 Fed. 328; 50 App. D. C. 364; 287 O. G. 405; 1921 C. D. 192; *Parsons Trading Co.* v. *Hoffman*, 177 N. Y. Supp. 713; 9 T. M. Rep. 387.
>
> Notwithstanding the distinctive differences between the synthetic resins of the opposer and the applicant in 1924, as far as the air-drying varnish trade is concerned, because of their relation and association, they do possess the same descriptive properties; they are derivatives of phenol and susceptible of the common definition "synthetic resins"; in regard to their relation and association in trade, it may be noted that resin is an essential element of varnish, and that prior to 1924, the date Reichhold entered the United States with a synthetic resin for air-drying varnishes, synthetic resins for the manufacture of artificial heat-drying varnishes had been substituted for natural resins in the manufacture of varnishes, so that it seems beyond doubt but that the synthetic resins made and sold by the opposer in 1924, and prior thereto, possess the same descriptive properties as the synthetic resin introduced by the applicant.

In view of our conclusion we see no necessity for discussing at any great length the question as to whether or not under the circumstances the opposer-appellee had the right to enter the field which had been entered by the applicant-appellant because, as the Commissioner has stated, it all depends upon whether the goods upon which the "Bakelite" trade-mark was used prior to 1924 were of the same descriptive properties as the goods upon which the "Beckacite" trade-mark was used. If they were, of course applicant-appellant is not entitled to registration, and it would follow that the opposer-appellee was privileged to enter the alleged restricted field which the applicant-appellant claims for itself.

[1] We agree with the finding of the tribunals that the goods sold by both parties at the time when the applicant-appellant entered the field were of the same descriptive properties. Opposer-appellee also sold synthetic phenolic resin manufactured into spirit varnishes. Both resins were made from phenol. Both resins were used for varnishes and the mere fact that the resins had different properties or that the ultimate product made from them was used in a slightly different way and sold, at that particular time, to different customers does not alter the situation. Varnish manufacturers to whom applicant-appellant sold its resins may wish to make and sell several kinds of varnishes. Trade practices change and the owner of a mark for use on condensation products of phenol should not be so hampered in its trade practices as to prevent it from improving its product or giving its said product certain new qualities. The goods of both parties are so closely related that they must be regarded as belonging to the same class for trade-mark registration purposes.

While applicant-appellant argues here that the trade-marks are not similar, we do not think there is any merit to such contention. The tribunals below gave very little consideration to this subject. The record shows that the witnesses in speaking of the two terms were confused and it is too obvious to admit of logical contention to the contrary that "Bakelite" and "Beckacite" have so many things in common, notwithstanding the alleged fanciful manner of writing the term "Beckacite", that the concurrent use of the two terms upon goods of the same descriptive properties would lead to such confusion as the trade-mark registration law was intended to prevent.

As to the origin of its mark applicant-appellant states in its brief that the trade-mark "Beckacite" and some of the other trade-marks involved in these appeals such as "B K C", "Beckolloid" and "Beck-O-Lac" are derived from the firm name Beck, Koller & Company, which originally had the trade-mark "B K C" and used it since 1868 in Berlin and Vienna, and that when Helmuth Reichhold, president of Beck, Koller & Company, Inc., introduced the goods into this country it used its marks so as to suggest the origin of the goods with Beck, Koller & Company, Inc., and that the company always tried to emphasize the term "Beck" which was the surname of one of the original owners of the business, and also in some of the marks to suggest the word "Koller". In discussing the similarity of the trade-marks hereinafter in Patent Appeal No. 3,818, further reference will be made to this phase of the case.

Another question was discussed in the briefs of both parties, which by reason of the above conclusion requires no attention here other than to state it. It is the contention of the opposer that the judgment against the applicant in opposition No. 9,592 which involved the same parties and the same marks is res adjudicata of the issue in the present opposition. This matter was discussed by the Examiner of Interferences and he held that in any consideration of the resemblances and differences found in the marks the decision in said opposition proceeding was stare decisis with him. The Commissioner gave no consideration to this question and there is no assignment of error presenting the question here. Moreover, if the question had been presented, it would not be necessary for us to decide it in view of our conclusion hereinbefore reached.

[2] Since we conclude that the goods upon which the mark "Beckacite" is used are of the same descriptive properties as the goods upon which opposer used its mark "Bakelite" prior to 1924 and subsequent thereto, and that the marks are confusingly similar when used upon goods of the same descriptive properties, it follows that the Commissioner correctly affirmed the decision of the Examiner of Interferences in sustaining the opposition of the opposer and refusing registration of applicant's mark and the decision of the Commissioner is affirmed.

Patent Appeal No. 3,817—Cancellation No. 2,591

This is the second of a series of appeals relating to opposition and cancellation proceedings which proceedings involve several different trade-marks.

[3] In the instant cancellation proceeding the Commissioner of Patents affirmed the decision of the Examiner of Interferences in granting the petition of the Bakelite Corporation for cancellation of appellant's Registered Trade-Mark 231,360, of August 16, 1927, "Beckacite" used for "dry, paste, and ready-mixed paints; varnishes, lacquers, in Class 16, Paints and painters' materials." The parties are the same, the testimony and exhibits are the same, and the issues are substantially the same as were present in the above-entitled Appeal No. 3,816, Opposition No. 12,545, supra. Both sides concede that the general principles applicable to this case were discussed at length in the briefs in that companion appeal, and the Commissioner in deciding the cancellation proceeding stated:

> It satisfactorily appears that the applicant for cancellation has used the notation "Bakelite" in trade on a phenol resin varnish as of a date long prior to any claimed by the respondent for use of the notation "Beckacite" on the goods stated.
>
> For substantially the reasons set forth in my decision today in the related Opposition No. 12,545, it is held that confusion in trade would be likely to result from the simultaneous use of the marks upon the goods of the respective parties here involved.
>
> Being convinced that the relief prayed for should be granted, the decision of the Examiner of Interferences is believed to be without error and is accordingly affirmed.

In view of our conclusion in Patent Appeal No. 3,816, supra, we are in agreement with the conclusion reached by the Commissioner and his decision is affirmed.

Patent Appeal No. 3,818—Cancellation No. 2,590

This is the third of a series of appeals in related opposition and cancellation proceedings involving a number of different trade-marks, some of which were registered and others of which registration was applied for.

This is a cancellation proceeding and the respondent-appellant, Beck, Koller & Company, Inc., has appealed here from a decision of the Commissioner of Patents affirming the decision of the Examiner of Interferences granting the petition for cancellation of the registered mark. The mark relied upon by the petitioner-appellee, Bakelite Corporation, as was stated by the Commissioner

"comprises a trefoil border enclosing the capital letter 'B' in the single upper lobe and the conventional sign of infinity in the two lower lobes."

This mark is registered in registration No. 199,128 of June 2, 1925, for "condensation products of phenols and formaldehyde, in Class 1, Raw or partly prepared materials" and in registration No. 206,013, of November 24, 1925, for "paint enamels, lacquers, and varnishes, in Class 16, Paints and painters' materials." In both registrations the letter "B" and the sign of infinity are large enough to almost completely fill the trefoil or clover leaf border.

The mark of the respondent-appellant, registration No. 230,009, of July 12, 1927, for "dry, paste, and ready-mixed paints, varnishes, lacquers, in Class 16, Paints and painters' materials" is described by the Commissioner as comprising

"a slightly ornate trefoil border having a single lobe lowermost and enclosing the capital letters 'B', 'K', and 'C', symmetrically arranged, each within one of the lobes of the trefoil."

The letters "B", "K", and "C", like the characters in appellee's mark are so arranged as to almost completely fill the trefoil figure.

The Commissioner said:

• • • For substantially the reasons set forth in my decision today in the related Opposition No. 12,545, it is held that the goods of the parties do possess the same descriptive properties and that priority of right has been established in the applicant, so that the question of likelihood of confusion in trade turns upon a consideration of the marks used by the parties.

• • • The similarity of the marks, if not obvious from this description, [quoted supra] is immediately apparent upon an inspection of the marks themselves. The letter "B" is prominently displayed in each mark, and the trefoil border, common to both marks, is similarly represented in each. I am persuaded that confusion in trade would be likely to result from the simultaneous use of the marks here involved upon the goods of the opposing parties. Any doubt on this issue must be resolved in favor of the prior user which is here the applicant for cancellation.

We are in agreement with the above finding of the Commissioner, and in accordance with our statement in the opinion in Appeal No. 3,816, supra, we wish to say that it seems to us that if the respondent in introducing its goods into this country wished to distinguish its goods from the goods of the petitioner-appellee, it would not have adopted a mark so similar to that of the latter. This mark is used in connection with the "Beckacite" mark and the adoption of the two marks under the circumstances shown by this record would not suggest that the newcomer sought to distinguish its goods from those of the appellee.

We are in agreement with the conclusion reached by the Commissioner of Patents and his decision is affirmed.

Patent Appeal No. 3,819—Opposition No. 12,580

This is the fourth of a series of appeals in opposition and cancellation proceedings which are closely related and involve certain trade-marks which are either registered or sought to be registered by Beck, Koller & Company, Inc.

In this instance, Beck, Koller & Company, Inc., is the applicant-appellant and seeks to register, in Class 6, Chemicals, medicines, and pharmaceutical preparations, over the opposition of the Bakelite Corporation, the opposer-appellee, a mark quite similar to, but differing in some respects from, the trefoil mark described in the last-above-decided appeal. The difference is that to the trefoil "B K C" mark is added at the lower right side thereof a representation of the terrestrial globe with the notation around it "World Wide Distribution." The mark of the Bakelite Corporation, opposer-appellee, is the trefoil mark described in the last above-decided appeal. The goods of applicant-appellant, upon which the mark is used, according to the application, are "synthetic resins, plastic synthetic resins and ester gums" and by amendment it is proposed to change the description to "soluble synthetic varnish and lacquer resins and ester gums."

In affirming the decision of the Examiner of Interferences, the Commissioner said:

The opposer relies upon its trade-mark registration No. 199,128, and, for substantially the reasons set forth in my decision today in the related Opposition No. 12,545, the goods of the parties are held to possess the same descriptive properties, whether the goods of the applicant be those described in the application as published or in the amendment filed February 8, 1933, in which it was proposed to change the description of the goods to "soluble synthetic varnish and lacquer resins and ester gums."

The marks here involved are only slightly more different than the marks which were considered in a companion proceeding in a decision of even date herewith, namely, Cancellation No. 2,590. The difference is caused by the addition to the mark involved in the companion case of a representation of a terrestrial globe with the notation "World Wide Distribution." Such an addition would tend to indicate "world wide distribution" rather than a difference of origin or ownership; and when the marks are considered in their entireties, as they must be, I am convinced that confusion in trade would be likely to result from the simultaneous use of the marks here involved upon the goods of the opposing parties.

The main issue of this case relating to the descriptive properties of the goods of the parties is decided in Appeal No. 3,816, supra. We are in agreement with the decision of the Commissioner to the effect that the marks being confusingly similar and the goods of the respective parties having the same descriptive properties, the opposition was properly sustained and registration properly denied, and his decision is affirmed.

Patent Appeal No. 3,820—Opposition No. 12,688

This is the fifth of a series of opposition and cancellation proceedings which involve trade-marks either registered or for which registration was sought by Beck, Koller & Company, Inc., applicant-appellant.

The Commissioner of Patents affirmed the decision of the Examiner of Interferences who sustained the opposition.

The marks involved herein are the same as those involved in the companion opposition proceeding, Appeal No. 3,819, last above-decided.

In the application as it is proposed to be amended, applicant-appellant seeks to register the trade-mark for "oil soluble plastic resins and solutions thereof in oils and mineral spirits used as painters' materials" in Class 16, Paints and painters' materials.

The Commissioner of Patents was of the opinion that, under the circumstances, the concurrent use of the marks in trade on the goods of the respective parties would be likely to result in confusion to the trade and said:

The applicant for cancellation [opposition] relies upon its trade-mark registration No. 206,013, and it satisfactorily appears that the applicant has used the mark disclosed therein in trade on a phenol resin varnish since a date long prior to any claimed by the respondent for use of its mark upon the goods stated. For substantially the reasons set forth in my decision today in the related Opposition No. 12,545, it is held that the goods of the parties do possess the same descriptive properties and that priority of right has been established in the applicant, so that the question of likelihood of confusion in trade turns upon a consideration of the marks used by the parties.

The decision of this case is controlled by our decision in Patent Appeal No. 3,816, supra, and in the last above-decided case. We are in agreement with the conclusion reached by the Commissioner of Patents and his decision is affirmed.

Patent Appeal No. 3,821—Cancellation No. 2,592

In this cancellation proceeding Beck, Koller & Company, Inc., has appealed from the decision of the Commissioner of Patents reversing the decision of the Examiner of Interferences who denied the petition for cancellation filed by the Bakelite Corporation. This is the sixth of a series of appeals involving trade-mark proceedings which were submitted upon a single testimonial record and involves several marks registered or sought to be registered by Beck, Koller & Company, Inc.

The mark sought to be cancelled is "Beckolloid" used for "paints, dry, paste, and ready mixed, as well as varnishes and lacquers, in Class 16, Paints and painters' materials", registration No. 258,623, of July 9, 1929. The Bakelite Corporation based its petition for cancellation upon its well-known trade-mark "Bakelite", registration No. 75,266 of September 14, 1909, for "condensation products of phenol and formaldehyde, in Class 6, Chemicals, medicines, and pharmaceutical preparations", and registration No. 210,522, of March 16, 1926, for "paint enamels, lacquers, and varnishes, in Class 16, Paints and painters' materials."

The Examiner of Interferences concluded that there was not sufficient similarity between the marks to bring about confusion in trade in event of their concurrent use and accordingly dismissed the petition for cancellation.

In reversing the decision of the Examiner of Interferences, the Commissioner said:

It satisfactorily appears that the applicant for cancellation has used the notation "Bakelite" in trade on a phenol resin varnish as of a date long prior to any claimed by the respondent for use of the notation "Beckolloid" on the goods stated, and for substantially the reasons set forth in my decision today in the related Opposition No. 12,545, it is held that the goods of the parties possess the same descriptive properties. This being so, the sole question here to be decided is whether the two notations are confusingly similar.

In my opinion the two words "Bakelite" and "Beckolloid" are confusingly similar. In meaning they have little, if any, significance and therefore similarity in meaning is of little or no importance. On the other hand, in sound the two words strike me as being very much the same. They have the same number of syllables and when pronounced in the perfectly normal way the only difference between the marks is found to reside in the suffixes. For all other practical purposes, so far as sound is concerned, the remaining portions of the marks might as well be identical. Even the suffixes comprise a single syllable beginning with the same letter, namely, "L". For this reason and in view of the similarity in appearance of the marks I am of the opinion that they are confusingly similar.

In view of our holding in Patent Appeal No. 3,816, supra, it is unnecessary for us to discuss the issue presented further than is indicated by our approval of the above-quoted part of the Commissioner's decision. We think that the Commissioner arrived at the right result for the right reasons and his decision is affirmed.

Patent Appeal No. 3,822—Opposition No. 12,582

This is the seventh of a series of appeals from the decision of the Commissioner of Patents relating to opposition or cancellation proceedings which involve different marks of the parties to this litigation.

In the instant case the Commissioner of Patents reversed the decision of the Examiner of Interferences which dismissed opposer-appellee's notice of opposition and adjudged that the applicant-appellant was entitled to the registration of the mark involved.

The mark of applicant-appellant, Beck, Koller & Company, Inc., which the Commissioner held not entitled to registration was the notation "Beckolloid" used, according to the application, for "synthetic resins, plastic synthetic resins and ester gums in Class 6, Chemicals, medicines, and pharmaceutical preparations." It was proposed to change the description to read: "soluble synthetic varnish and lacquer resins and ester gums."

The opposer-appellee relies upon its registered mark "Bakelite" No. 75,266, of September 14, 1909, for "condensation products of phenol and formaldehyde, in Class 6, Chemicals, medicines, and pharmaceutical preparations."

The case in the Patent Office turned on the question as to whether or not the terms "Beckolloid" and "Bakelite" were sufficiently similar as to lead to confusion when used upon goods of the same descriptive properties. The question of the same descriptive properties was not passed upon by the Examiner of Interferences and the Commissioner relied upon his reasons set out in Opposition No. 12,545, Patent Appeal No. 3,816. Since his reasons have been fully set out above, it is not necessary to discuss them here.

We agree with the Commissioner that the goods of the respective parties have the same descriptive properties and that the marks are confusingly similar and his decision is affirmed.

Patent Appeal No. 3,823—Opposition No. 12,584

This is the eighth of a series of appeals by Beck, Koller & Company from decisions of the Commissioner of Patents involving trade-mark oppositions or cancellation proceedings in connection with various marks used by the respective parties.

This is an opposition proceeding instituted by the Bakelite Corporation, the opposer-appellee, challenging the right to registration by the applicant-appellant of the trade-mark "Beck-O-Lac". According to the application, it is used on "dry, paste and

ready mixed paints, varnishes and lacquers, in Class 16, Paints and painters' materials." It is proposed to amend the description to read:

"solutions of soluble synthetic resins in oils and mineral spirits for use in the manufacture of paints, varnishes, and lacquers, but excluding paints, varnishes, lacquers, and like finished products."

The trade-mark relied upon by the Bakelite Corporation in this opposition proceeding is the mark "Bakelite", registration No. 210,522, of March 16, 1926, for "Paint enamels, lacquers, and varnishes, in Class 16, Paints and painters' materials."

As in the prior opposition case, Patent Appeal No. 3,822, the Examiner of Interferences concluded that the differences in the marks predominated over the similarities to such an extent that there was no likelihood of confusion whether the use of applicant-appellant's mark was as stated in the application or as proposed to be amended.

The Commissioner of Patents in reversing the decision of the Examiner of Interferences and in holding that the applicant-appellant was not entitled to registration said:

It satisfactorily appears that the opposer has used the notation "Bakelite" in trade on a phenol resin varnish as of a date long prior to any claimed by the applicant for use of the notation "Beck-O-Lac" on the goods stated. For substantially the reasons set forth in my decision today in the related Oppositions Nos. 12,545 and 12,581 the goods of the parties are held to possess the same descriptive properties. It is further held that the opposer has the right to oppose, whether the goods of the applicant be those described in the application as published or in the proposed amendment filed February 8, 1933, wherein it was proposed to change the description of the goods to read—"solutions of soluble synthetic resins in oils and mineral spirits for use in the manufacture of paints, varnishes, and lacquers, but excluding paints, varnishes, lacquers and like finished products—".

Furthermore, for substantially the same reasons set forth in my decision of even date in Cancellation No. 2,592, in which the marks involved are "Bakelite" and "Beckolloid", it is believed that the notations in the case at bar, namely: "Bakelite" and "Beck-O-Lac", are confusingly similar. They have the same number of syllables and when pronounced in the normal way the only substantial difference between the marks is found to reside in the suffixes. Even these comprise a single syllable beginning with the same letter, namely: "L", and when pronounced sound somewhat alike.

We think the issues in this case as to the goods being of the same descriptive properties is controlled by our decision in Patent Appeal No. 3,816, supra, and we agree with the Commissioner that "Bakelite" and "Beck-O-Lac" resemble each other so closely that there would be probability of confusion if they were concurrently used upon goods of the same descriptive properties, and that the mark "Beck-O-Lac" therefore should not be registered, and his decision is affirmed.

Patent Appeal No. 3,824—Opposition No. 12,581

This is the ninth and last of a series of appeals by Beck, Koller & Company, Inc., in which the Bakelite Corporation is the appellee, from the decision of the Commissioner of Patents, in either opposition or cancellation proceedings. In the instant opposition proceeding, the applicant-appellant sought to register the trade-mark "Beck-O-Lac" and in the application stated that it was to be used on "synthetic resins, in Class 6, Chemicals, medicines, and pharmaceutical preparations." Amendment was later offered to make the application read for "soluble synthetic varnish and lacquer resins."

The trade-mark "Bakelite", No. 75,266, of September 14, 1909, which formed the basis of the opposition by the opposer-appellee, was registered for use on "condensation products of phenol and formaldehyde, in Class 6, Chemicals, medicines, and pharmaceutical preparations."

The Examiner of Interferences concluded that the goods were of the same descriptive properties but that the marks "Beck-O-Lac" and "Bakelite" were so dissimilar that their concurrent use would not result in confusion, and he dismissed the notice of opposition and adjudged that the applicant was entitled to registration.

Upon appeal to the Commissioner, he too found that the goods of the parties possessed the same descriptive properties and stated that the sole question was whether the notations "Beck-O-Lac" and "Bakelite" were confusingly similar. He then referred to his decision in Opposition No. 12,584, Patent Appeal No. 3,823, in which decision he had held that the marks were confusingly similar and upon these findings reversed the decision of the Examiner of Interferences.

In view of our holding in Patent Appeals Nos. 3,816 and 3,823, it is not necessary for us to discuss the issue of this case. We agree with the decision of the Commissioner of Patents and the same is affirmed.

Agreeable to the above holdings, the decisions of the Commissioner of Patents in Patent Appeals 3,816 to 3,824, inclusive, are affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE FERRIS

No. 3,825. Decided June 21, 1937

[90 F.(2d) 363]

REISSUE—PATENTABILITY—CLAIMS BROADER THAN DISCLOSURE OF PATENT.

Certain claims in a reissue application for process of refining mineral oils reciting use of "a solvent" *Held* unpatentable for lack of supporting disclosure in applicant's patent where the only solvents disclosed therein were nitrobenzene and its equivalents belonging to the group of nitro compounds or mixtures.

APPEAL from the Patent Office. Affirmed.

Mr. T. Wallace Quinn, Mr. Theodore S. Kenyon, Mr. Edgar F. Baumgartner, and *Mr. William F. Stotz* for Ferris.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

BLAND, *J.:*

The Primary Examiner of the United States Patent Office rejected all the appealed claims in the appellant's application for the reissue of a Patent No. 1,788,569 of January 13, 1931, relating to refining viscous mineral oils. The first 18 claims of the patent stand allowed in the application. Upon appeal to the Board of Appeals, the decision of the Examiner was affirmed upon substantially the same grounds as those assigned by the Examiner. From the decision of the Board, appellant has here appealed.

The invention which is covered by the patent involves the use of aromatic nitro compounds as a selective solvent in the treatment of lubricating oils to produce fractions which differ therefrom in character in that one fraction is more paraffinic and the other more naphthenic than the original oil. Each of the patent claims calls for the use of nitrobenzene as a solvent but the specification of the patent states that this term is employed in a generic sense to include that material and equivalent aromatic nitro compounds or mixtures of them.

The purpose of the invention disclosed in the patent and of the invention which appellant claims in the appealed rejected claims is to obtain from an Appalachian crude oil and crude oils of the mixed base type from the Mid-Continent area an oil which may normally be obtained from the naphthenic oils from the Gulf Coast area. The claims also call for the production of an oil such as is normally obtained by distillation of Pennsylvania crudes. The original patent can hardly be said to teach that a paraffinic oil such as can be obtained from Pennsylvania oil may be obtained by the process recited.

Claims 19 to 37 were rejected by the tribunals as being broader than the disclosure in the patent since the rejected claims call for the use of a solvent broadly and are not limited to the use of aromatic nitro compounds. Claims 19, 20, 31, 32, 33, 34, 35, and 36 were additionally rejected as being directly anticipated by certain patents. Some of these patents disclose the use of aniline as a selective solvent for petroleum distillates. Others show that isopropyl alcohol or liquid sulfur dioxide are used for this purpose. It is stated by the Examiner that each of these solvents is known to possess selective solvent properties for the non-paraffinic type of hydrocarbons. Claims 21 to 31, and claim 37, were further rejected for failing to distinguish patentably from references which showed the use of selective solvents for separating the saturated from the unsaturated and aromatic constituents of mineral oils. Claims 19 to 37 were further rejected as failing to distinguish patentably from certain publications.

In view of our conclusion that we approve of the decision of the Board affirming that of the Examiner in rejecting the claims upon the ground that they are broader than the invention disclosed in appellant's patent and are based upon new matter, it will not be necessary for us to discuss the other grounds of rejection or to set out or discuss the references further than is above noted.

The appeal as to claim 31 was withdrawn in this court and therefore it is not before us for consideration.

Claim 19 was regarded as illustrative of the appealed claims by the Board and it follows:

19. In the art of refining viscous mineral oils, the process which comprises bringing a solvent into intimate contact with a viscous hydrocarbon oil of a quality other than that of a Pennsylvania type viscous oil, and containing paraffinic and naphthenic components, thereby to dissolve from the oil substantial amounts of its naphthenic components, thereafter removing the solvent plus the portion of the oil which dissolves therein from the portion of the oil which remains undissolved, thereby to produce an oil such as is normally obtained from Pennsylvania type crudes by distillation.

The Examiner has gone into a discussion of the original disclosure at great length which is summarized as follows by the Board:

• • • The Examiner calls attention to certain portions of the specification which in his opinion involve new matter.

The invention disclosed in the patent relates to the use of an aromatic nitro compound as a selective solvent in the treatment of lubricating oils to produce fractions which differ therefrom in character in that one fraction is more paraffinic and the other more naphthenic than the original oil. Each of the claims of the patent specifies nitrobenzene as the solvent but the specification of the patent states that this term is employed in a generic sense to include that material and equivalent aromatic nitro compounds or mixtures of them. The patent further discloses that it is possible to produce an oil of the quality normally obtained from Appalachian crudes, from crudes of the mixed base type from the Mid-Continent area and conversely to obtain oils from mixed base crudes such as are normally obtained from the naphthenic oils from the Gulf Coast area. It does not, however, fairly teach that paraffinic oils equivalent to Pennsylvania oils may be obtained from any source whatsoever.

The specific data incorporated in the specification relating to viscosity-gravity constant may serve conveniently applicant's purpose of drafting shorter claims by reference to the constant values included in some of the claims, but we are constrained to agree with the Examiner that this disclosure goes beyond what may properly be introduced by the way of mere explanation in the reissue application without involving new matter. There is no suggestion in the patent that solvents other than those in the class mentioned therein would be suitable for applicant's purpose and accordingly the appealed claims not only involve new matter in a reissue in the sense that they are not for the same invention claimed or indicated in the patent as intended to be claimed, but they are broader than the disclosure in the patent to Ferris warrants.

It will be noticed that the claims call broadly for the step of bringing a solvent into intimate contact with the oil without mentioning the particular solvent employed. It seems to us that appellant's invention as taught in the patent was the use of nitrobenzene or its equivalent belonging to the group of nitro compounds or mixtures, and that appellant now seeks to acquire a patent with claims which involve the use of any kind of solvent which would do the work regardless of whether or not it is of the type disclosed. The appealed claims themselves are so broad in calling for a solvent as to amount to asking a monopoly on treating oils for the purposes stated with any material which has a solvent characteristic. The claims are really so broad that they state only the desired result and say that it can be done with a solvent.

We agree with the tribunals that this broad alleged invention was not disclosed in the patent and that the insertion in the specification of the matter pointed out by the Examiner, but too lengthy to quote here, which was inserted into the specification in the reissue application, was more than an explanation or amplification of his original invention and was more than a mere variance in the description of the material found therein. It must be remembered that the disclosure contemplated the use as a solvent of only aromatic nitro compounds or mixtures of them, and the claims specifically call for only one of such type—nitrobenzene. There was no suggestion in the patent that any other kind of solvent might be used. We are in agreement with the tribunals that the appellant is not entitled to broaden the field of the solvents beyond those disclosed or their equivalents. It is not contended by appellant, as we understand

his position, that he is claiming here merely the equivalents of those disclosed, but it is his contention in substance that he disclosed the use of a solvent for the particular purposes stated and that he is entitled to broadly claim all solvents that will do the work.

In equity the law is well settled

"that an inventor is entitled to a range of equivalents commensurate with the scope of his invention."

Walker on Patents (Sixth Edition) §416. As to whether or not a patent may reissue for the purpose of claiming known equivalents we are not called upon to decide nor do we think it necessary to enter into a lengthy discussion of the law as to what constitutes known equivalents in a case like the one at bar. It is interesting, however, to note that in Walker, supra, §399, is found the following:

• • • Precisely what constitutes equivalency, as between acts, has never been decided or stated by the Supreme Court. Reason seems to indicate that one act is the equivalent of another when it works in substantially the same way to accomplish the same result. Accordingly, it has been held that damping oil wells with benzine is equivalent to damping them with water in respect of the series of acts which constitute the process covered by the Roberts torpedo patent. [Citing *Roberts* v. *Roter*, 5 Fisher 296 (1872).]

Concerning what claims may be allowed in a reissue patent the following statement from Robinson on Patents, Vol. II, §673, is quite pertinent:

• • • A patent for a specific invention cannot reissue to embrace the generic, for these are not only distinct inventions, but as the genus covers all possible species, the re-issue would indefinitely extend the scope of the original patent beyond the invention which it first attempted to protect. • • •

In support of the above-quoted language *Ex parte Waters* (1875), 8 O. G. 399, is cited.

Appellant's argument here with reference to his right to claim broadly a solvent to be used as the claim calls for may be summed up in the following language quoted from his brief:

Under the law, the applicant was entitled to make claims as broad as his invention. Actually there are two aspects of the invention and in the original patent Ferris claimed only one.

The aspect which he originally claimed, and to which the Patent Office still limits him, is the treatment of oil containing naphthenic and paraffinic hydrocarbons with nitrobenzene. He has claimed that broadly and without limitation to the sources of crude or to the kind of change—change in type—in the fractions produced.

• • •

But all of these allowed claims are limited to the use of "nitrobenzene" as expressive of the particular group of solvents specified in the patent.

Unless by law Ferris is limited to that definition of solvents, and we propose to show now that he is not, he is also entitled to claim his solvent more broadly provided his new claims clearly define the essential properties of the solvent and the resulting change in type or kind of the fraction produced.

The difficulty with th's position is that the appealed claims describe the characteristics of the solvent only in terms which amount to the result of its use or the solution of the problem, while in his original disclosure he definitely stated what particular type of solvent did the work.

Again, appellant in his brief states:

If the original claims were not so plainly limited, they might well be broadly construed to include equivalent solvents which are now being used by some refiners to achieve precisely the same new result by the same new mode of operation. But correction of the mistake by reissue is a fairer and more certain remedy both to the patentee and the public than that of awaiting judicial construction. And in circumstances such as here presented, it is a remedy, we submit, which should be liberally applied.

The Solicitor for the Patent Office in answer to this statement, states that of course appellant having named more than one solvent in his original application should not be limited in his patent protection to but one solvent and then argues:

• • • However, assuming that appellant might have been entitled in his original patent to claims which were broad enough to include all the solvents which he disclosed and their equivalents and assuming further, merely for the purpose of argument, that appellant might reissue his patent to secure claims broad enough to include all the originally mentioned solvents and their equivalents, it does not follow that appellant is entitled to the appealed claims.

The Solicitor then points out that appellant has broadened his claims to the extent that the Examiner has held in the instant case that they include solvents which were not originally taught by appellant and when so broadened do not avoid the prior art references.

The appeal as to claim 31 is dismissed. After carefully considering appellant's two briefs and his argument before us, we are not convinced that the Board was in error in affirming the Examiner in rejecting the claims before us upon the ground which we have hereinbefore approved, and its decision is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

ARTHUR I. FALLS

v.

THE SCHOLL MFG. CO., INC.

No. 3,803. Decided June 21, 1937

[90 F.(2d) 499]

1. TRADE-MARKS—OPPOSITION—CONFUSING SIMILARITY—"NO-VEX" AND "SOLVEX".

Registration of trade-mark "No-Vex" applied to ointment for treatment of skin disorders, *Held* properly refused as being confusingly similar to opposer's previously registered mark in which term "Solvex" is the predominant feature when used on goods having same descriptive properties.

2. SAME—SAME—REGISTRATIONS BY OTHERS THAN THE PARTIES NOT CONSIDERED.

"This court has repeatedly held that, in opposition proceedings, registrations of trade-marks by others, not parties to the proceedings, will not be considered."

3. SAME—SAME—PATENT OFFICE NOT CONFINED TO ISSUES RAISED BY PARTIES.

"It is well settled that, in opposition proceedings, the tribunals of the Patent Office are not confined to the issues raised by the parties, but may dispose of any question relating to the proposed registration that might properly be considered in an ex parte case."

APPEAL from the Patent Office. Affirmed.

Mr. Clarence A. O'Brien, Mr. Charles E. A. Smith, Mr. Thomas E. Turpin, Mr. George C. Baldt, and *Mr. Joseph A. O'Connell* for Falls Chemical Company.

Mr. Stephen J. Cox for The Scholl Mfg. Co., Inc.

HATFIELD, *J.*:

This is an appeal in a trade-mark opposition proceeding from the decision of the Commissioner of Patents affirming the decision of the Examiner of Trade-Mark Interferences holding that appellant was not entitled to the registration of the trade-mark "No-Vex" for use on an ointment for treating "athlete's foot, ringworm, dandruff, and scalp and skin disorders."

In his application for registration, filed April 17, 1934, appellant alleged that he had used his trade-mark "No-Vex" since October 15, 1930.

In its notice of opposition appellee alleged that it was the owner of the trade-mark "Solvex" for use on a preparation—an ointment—for the treatment of "gym or athlete's foot, golfer's itch, epidermophytosis (ringworm), eczema of the feet and itching toes and feet, and for other skin disorders of the feet"; that it had used its trade-mark on its goods "during the interval between 1924 and October 15, 1930, and particularly since March 1, 1930"; that it had advertised and sold its goods under its trade-mark "Solvex" throughout the United States; and that its trade-mark and its goods have become well and favorably known to the consuming public. Appellee further alleged that it was the owner of trade-mark registration No. 192,076, registered November 25, 1924, on an application filed June 27, 1924, for the trade-mark "Solvex" for use on ointments and other pharmaceutical preparations for the treatment of corns; that appellant's trade-mark "No-Vex" is so similar to appellee's trade-mark "Solvex" that confusion in trade would be likely to result by the concurrent use by the parties of their respective trade-marks; and that appellee would, therefore, be damaged by the registration of appellant's mark.

In his answer to the notice of opposition, appellant denied that appellee would be damaged by the registration of appellant's mark, and, with reference to appellee's alleged ownership of trade-mark registration No. 192,076 of the trade-mark "Solvex", stated:

Answering paragraph 3 of the amended grounds for opposition, respondent denies the right of opposer raised by presumption through the registration of the trade-mark pleaded in said paragraph, or others, and requires strict proof of the adoption, continuity of use and ownership of the trade-mark covered by said registration in opposer.

The Examiner of Trade-Mark Interferences reviewed the record in the case, and concluded that appellant had failed to establish that he had used his trade-mark on his goods prior to September, 1931, and that appellee had established use of its mark on its goods as early as March or April, 1930.

Relative to the issue of confusing similarity of the marks here involved, the Examiner said:

As to whether opposer's mark is in fact "Solvex" or "Dr. Scholls Solvex" opposer's record is deemed to show that in connection with the products actually sold by the opposer to [the] name "Dr. Scholls" is always associated with the notation "Solvex". However, a mere inspection of opposer's cartons, as for example Exhibit 16, seems to show that "Solvex" is the dominating feature of the mark. This conclusion is based upon the fact that "Solvex" is displayed in somewhat larger type than the name "Dr. Scholls" and also upon the fact that "Solvex" is featured against a contrasting background partially enclosed by a heavy line. Added to these facts discernible from a mere inspection of opposer's cartons is the testimony of opposer's witnesses. This shows that opposer's product is known and not uncommonly ordered as "Solvex" without reference to the name "Dr. Scholls".

• • • • • • •

The differences and also the resemblances between "No-Vex" and "Solvex" as used by the parties in connection with their respective ointments are obvious from mere inspection. It is believed that either "No-Vex" or "Solvex" to the average purchaser would be merely a coined word. Coined marks are often difficult to remember. In view of the resemblances found to exist between the marks the Examiner is persuaded that there is at least reasonable doubt upon the question of likelihood of confusion in trade. The practice requires that such doubt be resolved in favor of the prior user.

and, accordingly, held that appellant was not entitled to the registration of his trade-mark.

In his decision, the Commissioner of Patents held that appellee failed to establish that it was the owner of trade-mark registration No. 192,076 for the word "Solvex", as alleged in its notice of opposition; that its trade-mark appeared to be the word "Solvex" in immediate association with the name "Dr. Scholl's"; that he was inclined to believe that appellee's trade-mark consisted of the words "Dr. Scholl's Solvex"; and that appellee had established use of its trade-mark on its goods as early as May, 1930. The Commissioner further held that appellant's mark "No-Vex" and the word "Solvex" in appellant's mark were "printed in letters of about the same size, and of somewhat similar style"; that the word "Solvex", in appellee's mark, was printed in somewhat larger type than the name "Dr. Scholl's"; that, when spoken, the name "Dr. Scholl's" would clearly distinguish appellee's product from that of appellant; that it was not only likely, but that it appeared from the evidence of record, that some purchasers would ask for "Solvex" without using the name "Dr. Scholl's"; that the terms "Solvex" and "No-Vex" were so nearly alike both in sound and in appearance that the addition of the name "Dr. Scholl's" to appellee's mark was not sufficient to overcome the probability of confusion, which would clearly be present if the trade-marks of the parties were "Solvex" on the one hand, and "No-Vex" on the other; that appellant had not established use of his trade-mark on his goods prior to the fall of 1931, and, accordingly, affirmed the decision of the Examiner of Trade-Mark Interferences holding that appellant was not entitled to register his mark.

The Commissioner further stated in an ex parte disposition of the case that, although appellee had not established that it was the owner of registration No. 192,076, such registration was a complete bar to the registration of appellant's mark.

In explanation of his ex parte decision, the Commissioner stated that the registered trade-mark "Solvex" and appellant's trade-mark "No-Vex" were printed in identical type; that they were used on goods of the same descriptive properties; and that the trade-mark "No-Vex" was confusingly similar with the trade-mark "Solvex".

Thereupon, after affirming the decision of the Examiner of Trade-Mark Interferences on the issues presented by the notice of opposition, the Commissioner held that

"regardless of the rights of the opposer, it is further adjudged that applicant [appellant] is not entitled to the registration applied for."

We think it clearly appears from the evidence of record that appellee's trade-mark consists of the name "Dr. Scholl's" and the coined word "Solvex", with the name "Dr. Scholl's" appearing immediately above the word "Solvex".

The Examiner of Trade-Mark Interferences stated

that the word "Solvex" is "featured against a contrasting background partially enclosed by a heavy line."

That the word "Solvex" is so featured, cannot be questioned. It appears on a blue background of oval-shape design, which is partially surrounded by a black line. The name "Dr. Scholl's" is immediately above the word "Solvex" in somewhat smaller type, and it, together with the other printed matter on the labels, appears on a yellow background.

It appears from the testimony of some of appellant's witnesses, who are druggists, that a request for "Solvex" would indicate to them and to their employees that the purchaser wanted the product of appellee, and that appellee's product is called "Solvex" by purchasers. One of appellant's witnesses, a wholesale druggist, stated that the term "Solvex" indicated origin of the goods in The Scholl Mfg. Co., Inc., appellee.

It appears from Exhibits 26 and 27 that appellee's product was ordered by at least two concerns by the term "Solvex", although one of them spelled it "Salvex", and was invoiced and sold to them under that term. Whether it is always sold by appellee under that term, or how frequently it is so sold, does not appear of record.

The goods of the parties possess the same descriptive properties, and, so far as the evidence of record is concerned, are identical in character. They are sold in the same stores, and to the same class of people.

In view of the evidence or record and the prominence given the term "Solvex" on appellee's labels, we are of opinion that the term "Solvex" is the predominant feature of appellee's trade-mark.

[1] We are in agreement with the tribunals of the Patent Office that the terms "Solvex" and "No-Vex", when used on the goods of the respective parties, are confusingly similar, and that, as the term "Solvex" is the predominant feature of appellee's mark, there would be likelihood of confusion in the trade if the marks of the parties were used concurrently on their goods.

It clearly appears from the record that appellee used its mark on its goods in interstate commerce as early as March or April, 1930. The record fails to establish, however, as held by the Patent Office tribunals, that appellant used his trade-mark on his goods prior to September, 1931. We conclude, therefore, that the tribunals of the Patent Office were not in error in sustaining appellee's opposition to the registration of appellant's trade-mark.

As the terms "Solvex" and "No-Vex", when used on goods of the same descriptive properties, would be likely to cause confusion in the mind of the purchasing public, we are in entire agreement with the Commissioner's holding ex parte that, in view of the registration hereinbefore referred to of the trade-mark "Solvex", appellant is not entitled to the registration of his trade-mark.

[2] This court has repeatedly held that, in opposition proceedings, registrations of trade-marks by others, not parties to the proceedings, will not be considered. See *Sharp & Dohme* v. *Parke, Davis & Co.*, 17 C. C. P. A. (Patents) 842, 37 F.(2d) 960, 394 O. G. 545; *American Fruit Growers, Inc.*, v. *Michigan Fruit Growers, Inc.*, 17 C. C. P. A. (Patents) 906, 38 F.(2d) 696, 393 O. G. 789; *California Packing Corporation* v. *Tillman & Bendel, Inc.*, 17 C. C. P. A. (Patents) 1048, 40 F.(2d) 108, 394 O. G. 789; *Standard Oil Co. (New Jersey)* v. *Clarence W. Epley*, 17 C. C. P. A. (Patents) 1224, 40 F.(2d) 997, 398 O. G. 547.

[3] It is well settled that, in opposition proceedings, the tribunals of the Patent Office are not confined to the issues raised by the parties, but may dispose of any question relating to the proposed registration that might properly be considered in an ex parte case. See *Quaker State Oil Refining Co.* v. *Wolverine-Empire Refining Co.*, 23 C. C. P. A. (Patents) 827, 81 F.(2d) 245, 465 O. G. 244, and cases therein cited.

For the reasons stated, the decision of the Commissioner of Patents is affirmed.

Affirmed.

GARRETT, *J.*, concurs in the conclusion solely upon the ex parte ground.

LENROOT, *J.*, did not participate in the decision of this case.

U. S. Court of Customs and Patent Appeals

I. & B. COHEN, BOMZON & CO., INC.

v.

BILTMORE INDUSTRIES, INCORPORATED

No. 3,811. Decided June 21, 1937

[90 F.(2d) 369]

1. TRADE-MARKS—CANCELLATION PROCEEDINGS—RES ADJUDICATA.

   Issue raised in trade-mark cancellation proceeding *Held* to be same as issue in a previous opposition proceeding in which opposition was sustained, and the issue therefore *Held* res adjudicata.

2. SAME—SAME—SAME.

   Where registration of a trade-mark was denied under the statutory provision as to names of individuals, firms, or corporations, the effect of the decision as res judicata in subsequent cancellation proceeding based on the same provision was not destroyed by the subsequent denial of registration of the same mark by the adverse party on the ground that it had not established a trade-mark use and that the mark was geographical.

3. SAME—SAME—EQUITY SUIT PENDING—EFFECT OF.

   Petitioner for cancellation of the registration of a trade-mark *Held* to have the right to bring the petition notwithstanding that petitioner's right to the registration of the mark is pending in another court.

APPEAL from the Patent Office. Affirmed.

Mr. Asher Blum and *Mr. Charles R. Allen* for I. & B. Cohen, Bomzon & Co., Inc.

Mr. Arthur F. Durand and *Mr. Charles S. Grindle* for Biltmore Industries, Incorporated.

HATFIELD, *J.*:

This is an appeal in a trade-mark cancellation proceeding from the decision of the Commissioner of Patents affirming the decision of the Examiner of Trade-Mark Interferences sustaining the petition of appellee for the cancellation of appellant's registered trade-mark "Biltmore" for use on men's worsted suits and overcoats.

The mark in question consists of the word "Biltmore" printed in script and enclosed in an ellipse. It was registered by appellant's predecessor—registration No. 120,552, issued February 19, 1918, on an application filed September 20, 1917.

The question involved is concisely stated in the Commissioner's decision as follows:

> Biltmore Industries, Incorporated, petitioned for the cancellation of trade-mark registration No. 120,552, issued February 19, 1918, to the assignor of I. & B. Cohen & Company. From an adverse decision of the Examiner of Trade-Mark Interferences the registrant appeals.
>
> The trade-mark involved is the word "Biltmore" applied to men's clothing. It has been the subject of two opposition proceedings between these same parties. In the first of them an application of the appellant here was successfully opposed by the appellee, and in the second appellant's opposition to an application filed by appellee was sustained. The decision to be reviewed in the instant case holds that the judgment in the first opposition proceeding is res judicata of the single issue here raised, and the correctness of that holding is the only question to be determined on appeal.

The sole contention raised by appellee's petition for cancellation is that, because of the decision of the Commissioner in opposition No. 11,528, wherein appellant here was the applicant and appellee the opposer, the right of appellee to cancellation of appellant's mark has become res adjudicata.

The record in the opposition proceeding was made a part of the record herein.

It appears from the record before us that there was a second opposition proceeding, No. 12,190, between the parties here involved, wherein appellant opposed appellee's application for the registration of the mark "Biltmore" for use on wool fabrics. In that proceeding, the Examiner of Trade-Mark Interferences and the Commissioner of Patents held that the opposition should be sustained and the application for registration rejected.

It is stated in the briefs of both parties that the applicant in opposition No. 12,190—appellee in the case at bar—has filed a bill in equity under §4915, Revised Statutes, for the registration of its mark, which suit has not yet been determined.

The Commissioner in his decision herein, referring to opposition No. 11,528, stated:

> One of the grounds of that opposition was that the applicant had appropriated the predominant word of opposer's name and that of its predecessors, and that was the sole ground on which the Examiner of Trade-Mark Interferences sustained the opposition. An appeal was taken to the then Commissioner of Patents, who, in affirming the Examiner, used the following language:
>
> "The opposer has pleaded and the Examiner has rested his decision largely upon that portion of the statute, Sec. 5 of the 1905 act, which forbids registration of a mark 'which consists merely in the name of an individual, firm, corporation, or association' save under certain conditions not present here. The opposer incorporated long after the adoption and use by the applicant of the mark here under consideration. It should be noted the statute does not limit the prohibition to corporations but includes a firm or an association. It would seem that prior to applicant's entry into the field there existed an association engaged in commerce that was using 'Biltmore' as part of its name. Considering the statute in connection with its interpretation by the United States Supreme Court in the case of *American Steel Foundries* v. *Robertson, Commissioner of Patents, and Simplex Electric Heating Company*, 342 O. G. 711, 269 U. S. 372, it is at once apparent the applicant is not seeking registration of the entire name of the opposer, either corporation or association. It must be considered therefore whether the facts of this particular case support the view that registration by applicant would be calculated to deceive or confuse the public to the injury of opposer. The applicant has shown, and such circumstances were taken note of by the Supreme Court in the above referred to case, that there were other firms or corporations in existence prior to that of the opposer having the word 'Biltmore' as part of the name and has argued that, in consequence, this word does not indicate to the public the opposer company, association or corporation. It is believed however that when used in connection with goods so similar to those upon which the applicant uses the word there would be some probability of confusion in the mind of the public and that for this reason registration should be denied the applicant."
>
> Appellant now argues that the foregoing was mere dictum, and that the real basis of the decision was the expressed opinion of the Commissioner that appellee's use of the word "Biltmore" in its advertising was sufficient to warrant a judgment in its favor. In this connection he said:
>
> "It is deemed • • • proper to hold that the opposer's fabric was generally known to the public and was advertised and sold by the opposer's predecessors in connection with the name 'Biltmore Homespun' for some years prior to the date the applicant began the use of its mark. While the Examiner of Interferences was unable to find evidence that the word 'Biltmore' was used at this time as a trade-mark yet this would seem to be immaterial. The word was used in a descriptive sense as indicating the geographical location of the place where the goods were produced. It is clear enough this use is sufficient to support the claim of damage to the opposer by the registration of this word as a trade-mark by applicant."
>
> While it thus appears that the Commissioner disagreed with the Examiner's ruling on this branch of the case, the fact remains that the point was not before him for decision. As previously noted the Examiner had sustained the opposition squarely and solely upon the so-called name clause of the statute, expressly ruling against the opposer on all other grounds set up in the notice. It was from that decision that the appeal was taken and that was the decision affirmed by the Commissioner. If there was any dictum in the decision on appeal I think it pertained to the effect of the applicant's use in advertising of the word "Biltmore," rather than to the question involved in the present proceeding.
>
> No appeal was taken from the Commissioner's decision, and the suggestion now made that it was erroneous is of course not to be considered. Even though I may disagree with both the reasoning and the conclusions therein set forth, that would in no manner alter the legal effect of the adjudication. According to my understanding the doctrine of res judicata permits of no inquiry into the correctness of a final judgment properly pleaded as an estoppel.
>
> I think the case before me is conclusively controlled by the decision of the Court of Customs and Patent Appeals in *Panhard Oil Corporation* v. *Societe Anonyme Des Anciens Etablissements Panhard & Levassor*, 39 Fed.(2d) 496, where the essential facts considered were substantially the same as those here involved.
>
> Appellant's counsel have devoted considerable discussion to the judgment in the second opposition proceeding above referred to, which they contend conflicts with and hence neutralizes that rendered in the first. Their position in this regard is in my opinion clearly untenable. That case involved only the right of Biltmore Industries, Incorporated, to register the mark in issue. For various reasons such registration was refused. One of those reasons was that it had failed to show a trade-mark use of the word "Biltmore." Another was that the word is geographical. The decision was in no way predicated upon use or lack of use of the word as a name; nor can I perceive how the question could have been material in that proceeding.

We have quoted thus extensively from the Commissioner's decision for the reason that it is appellant's contention that the issue in this cancellation proceeding is not the same as in opposition No. 11,528.

[1] Counsel for appellant here contends that the decision of the Commissioner of Patents in opposition No. 11,528 was not based upon that portion of section 5 of the Trade-Mark Act of February 20, 1905, which forbids the registration of a trade-mark

> "which consists merely in the name of an individual, firm, corporation, or association not written, printed, impressed, or woven in some particular or distinctive manner,"

and that there was no prior adjudication of the issue involved in this cancellation. We think it is sufficient to say that we have examined the record with care and agree with the Commissioner that the issue decided in opposition No. 11,528 was based upon the quoted provisions of the statute, and that

the issue in the case at bar is the same as in that case.

[2] Counsel for appellant further contends that

"If an estoppel was created by the first opposition No. 11,528, said estoppel was cancelled by the judgment in the second opposition No. 12,190."

In support of that proposition, counsel has cited the cases of *Branson* v. *Wirth*, 84 U. S. 32, 42; *Shaw* v. *Broadbent*, 129 N. Y. 114, 125.

We have examined the decision of the Commissioner of Patents in opposition No. 12,190—*I. & B. Cohen, Bomzon & Co., Inc.*, v. *Biltmore Industries, Incorporated*, 22 U. S. Pat. Q. 257 It was there held that Biltmore Industries, Incorporated, had failed to establish a trade-mark use of the mark "Biltmore"; that the mark was merely geographical, and, therefore, Biltmore Industries, Incorporated—appellee in the case at bar—was not entitled to register it. The so-called name clause of section 5, hereinbefore quoted, was not in issue in that case. Accordingly, the decision therein has no bearing on the issue in the case at bar.

It clearly appears from the evidence of record in the case at bar, which includes the record in opposition No. 11,528, that appellee's predecessors manufactured and sold wool fabrics—"Biltmore Homespuns"—long prior to the filing date, September 20, 1917, of appellant's predecessor's application for the registration of the trade-mark "Biltmore", issued February 19, 1918, registration No. 120,552; that such products were manufactured and sold originally under the name "Biltmore Estate Industries"; that, in 1917, one Seely, who at that time was president of Grove Park Inn, Inc., purchased the Biltmore Estate Industries, and, at the time of the purchase, agreed to carry on the business in the name of Biltmore Industries; that he carried out the terms of that contract, and manufactured and sold the goods under the name of Biltmore Industries. Thereafter, in 1928, Grove Park Inn, Inc., had its name changed to Biltmore Industries, Incorporated, and has manufactured and sold the products here involved under its corporate name. It appears, therefore, as stated by the Commissioner of Patents in his decision in opposition No. 11,528, that long prior to the filing of the application, September 20, 1917, for the registration here involved, appellee's product had been continuously manufactured and sold by Biltmore Estate Industries, and Biltmore Industries.

It is argued by counsel for appellant that, at the time the predecessor of appellant began to use the trade-mark "Biltmore", September 20, 1917, the predecessor of appellee was manufacturing and selling appellee's goods under the name Grove Park Inn, Inc.

It may be that Biltmore Industries was owned by Grove Park Inn, Inc. Nevertheless, appellee's goods were manufactured and sold by Biltmore Industries, and were never sold nor advertised for sale under the name Grove Park Inn, Inc.

[3] The right of appellee to the registration of the term "Biltmore" is now pending in another court. That issue not being before us, we, of course, make no comment with regard thereto. Regardless of how the issues in that case may be decided, we are of opinion that appellee had a right to bring the involved petition for cancellation, by virtue of the quoted provisions of section 5 of the Trade-Mark Act of February 20, 1905, and section 13 of that act. See *United Shoe Mach. Corp.* v. *Compo Shoe Mach. Corp.*, 19 C. C. P. A. (Patents) 1009, 1014, 56 F.(2d) 292, 421 O. G. 4.

We are of opinion, therefore, that the issue decided against appellant in opposition No. 11,528 and the issue before us in this proceeding are the same, and that the decision in the former case is res adjudicata of the issue here involved. See *Williams Oil-O-Matic Heating Corporation* v. *The Butler Co.*, 17 C. C. P. A. (Patents) 934, 39 F.(2d) 693, 396 O. G. 519; *Panhard Oil Corp.* v. *S. A. Anciens Estab. Panhard & Levassor*, 17 C. C. P. A. (Patents) 971, 39 F.(2d) 496, 396 O. G. 881; *American Fruit Growers (Inc.)* v. *John Breadland, Ltd.*, 18 C. C. P. A. (Patents) 790, 45 F.(2d) 443, 403 O. G. 249.

We are of opinion that the Commissioner of Patents reached the right conclusion, and his decision is affirmed.

Affirmed.

LENROOT, *J.*, did not participate in the decision of this case.

U. S. Court of Customs and Patent Appeals

DIRKES, KIMBALL & LONG

v.

POTTS

No. 3,722. Decided June 7, 1937

[90 F.(2d) 120]

INTERFERENCE—PRIORITY—RIGHT TO MAKE CLAIMS.

Record reviewed and *Held* that P. has a right to make the claims in issue and priority properly awarded to him.

APPEAL from the Patent Office. Affirmed.

Mr. Eugene C. Brown for Dirkes, Kimball & Long.

Mr. J. W. Schmied for Potts.

GARRETT, *J.*:

This is stated in the brief for appellants to be one of a series of interferences declared in the United States Patent Office in which a reissue application of the party Potts is involved. Another of the series is the case of *Duerr et al.* v. *Potts* (Suit No. 3710), decided by this court May 29, 1937, 24 C. C. P. A. (Patents) —, 90 F.(2d) 117. As will be seen from an examination of our decision in that case, the issue here is entirely different from the issue there decided, but, by stipulation of counsel, certain parts of the record in this case were not printed, because they appeared in the record filed in that case, and, with respect to those parts, it has been necessary to resort to that record. None other of the series has reached the stage for hearing before us.

On April 16, 1929, Patent No. 1,708,054 was issued to Potts upon an application filed September 17, 1925. On April 21, 1931, Patent No. 1,802,240 was issued to Dirkes et al. upon an application filed August 18, 1928. On April 10, 1931, Potts filed application, Serial No. 529,268, for the reissue of his above named patent, and, at some time subsequent to the issuance of the patent to Dirkes et al., copied therefrom the three claims which correspond to the counts at issue. The interference was declared April 13, 1933. In due course Dirkes et al. moved to dissolve, alleging that Potts had no right to make the claims. The motion to dissolve was denied by the Examiner of Interferences, and, later, judgment upon the record was entered awarding priority to Potts. Upon appeal to the Board of Appeals that tribunal affirmed the decision of the Examiner of Interferences, and Dirkes et al. bring the case to us for review.

The three counts at issue read:

Count 1. In a telegraph system, a multiplex transmission circuit in which the signals transmitted comprise equal-impulse code combinations, a distributor for separating the successive combinations into separate channels, means in each channel for storing the received combinations, a simplex printer for each channel, means controlled by the distributor for producing start impulses for the printers after each combination stored, means associated with the distributor for supplying the stored combinations to the printers, and means controlled by the distributor for transmitting a rest impulse to each printer after the transmission of each combination.

Count 2. In a telegraph system, a multiplex transmission circuit in which signals for the different channels are transmitted in rotation, a receiving distributor for separating the signals into separate channels, means in each channel for storing the received signal, a simplex printer for each channel, means including said distributor for transmitting a start impulse to each printer after a signal is stored, and means including said storing means for preventing the transmission of the starting impulse when no signal is received.

Count 3. In a telegraph system, a multiplex transmission circuit in which the signals transmitted comprise equal-impulse code combinations, a receiving distributor for separating the successive combinations into separate channels, a simplex printer for each channel, and local means including said distributor for generating start and rest impulses for each printer.

To the lay mind the devices of both parties seem exceedingly complicated. Fortunately, however, there appears to be no necessity for an elaborate or particularly detailed description of them in their entirety, since the issue before us is limited to a specific feature, or features. The following general statement is taken from the decision of the Board:

The subject matter relates to a telegraph system in which there is a multiplex transmission circuit for transmitting signals in code combinations. The structure comprises a distributor for separating the successive combinations into different channels, means in each channel for storing the received combinations, a simplex printer for each channel, means controlled by the distributor for producing start impulses for the printer and for transmitting rest impulses to the printers, and means associated with the distributor for supplying the stored combinations to the printers.

The limitations in the respective counts emphasized before us by counsel for appellants are (the italics being as used in the brief): First, that limitation in count 1, requiring "means controlled by the distributor for *transmitting* a rest *impulse* to each printer"; second, that limitation in count 2, requiring

"means including said storing means for preventing the transmission of the starting impulse when no signal is received,"

and, third, that limitation in count 3, requiring means "for generating start and rest impulses" which the brief paraphrases, "*generating* start *impulses* and rest *impulses*."

The gist of the argument by appellants' counsel is that the limitations so emphasized had definite meanings, which meanings were expressed in appellants' application, and that the limitations must be construed in the light of their application.

It is the well settled rule that in an interference between a patent and an application, if the counts taken from the patent be found to be ambiguous, they are given the meaning which they have in the patent. In the instant case the Examiner of Interferences applied this rule and as a result denied the right of Potts (who did not appeal) to make certain counts. As to the three counts here at issue, however, he designated specific features in the Potts disclosure which, in his opinion, support them, holding that impulses stored upon a mechanism, shown in Figure 18 of Potts' drawings, are supplied to the printer and that this device sends a rest impulse to the printer; that this mechanism is clearly "associated with the distributor" and controlled by it through a magnet; that this magnet is involved in the means for transmitting a start impulse to each printer; that when no signals are received and stored in the Potts system no starting impulse is sent; that the storing means, including certain grooved members, is clearly involved in the storing means in this operation, and that certain means, including the magnet above alluded to, under the control of the distributor, supports the limitation quoted, supra, from count 3. The Board gives an even more elaborate description of the Potts system and the manner in which it functions.

Upon matters involving highly technical mechanisms like those here involved, this court must give great weight to the findings of the experts of the Patent Office. In the instant case those findings constitute the only explanations which the record affords of the technical features of the respective systems. No affidavit, or other evidence, respecting the structure and operation of the systems was presented. Appellants insist upon a very limited interpretation of the counts, more limited we think than is proper under the well established rules of law and practice. We are not convinced that there was error in the findings below to the effect that Potts shows a start-stop device controlled by the distributor, and that, in the operation of his system, there is action which, under any reasonable interpretation of the count, transmits "rest impulse" to the printer.

Counsel for appellants argues, as to the "rest impulse," that the requirement of count 3 is that a positive rest impulse be transmitted and not an impulse resulting from stopping the electric current. The Board says:

The term "impulse", as a verb means to give an impulse or tendency to. In the sense of, to give a tendency to, the no current condition gives the tendency to rest and would appear to render the counts readable upon the disclosure of the Potts device. It is understood that the term, as used in this art, is in the broad sense, as to give a tendency to, and it is our view that "rest impulse",

as employed in these counts, is sufficiently broad to be readable upon the current and no current system of the Potts disclosure.

We do not regard the interpretation of the count thus made as being erroneous, but, upon the contrary, think it reasonable and proper.

The decision of the Board of Appeals accordingly is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE DREYFUS

No. 3,785. Decided June 7, 1937

[90 F.(2d) 277]

1. APPEAL—ASSIGNMENT OF ERROR.

Where none of the reasons of appeal are sufficiently specific to present for consideration the question of alleged new matter in the patent of S. et al., one of the references of record, that question will not be considered by the court.

2. PATENTABILITY—EVIDENCE OF PRIOR INVENTION.

Record reviewed and *Held* that the invention of the appealed claims was not disclosed in appellant's earlier application and as no other evidence was offered to antedate the filing date on the application for the patent granted to S. et al., the latter is available as a reference and *Held* further that the claims are unpatentable over the prior art including the S. patent.

APPEAL from the Patent Office. Affirmed.

GRAHAM and BLAND, *Judges*, concurring.

Mr. I. Seltzer and *Mr. C. W. Levinson* for Dreyfus.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

LENROOT, *J.:*

The fifteen claims, 12, 19, 22, 25, 27 to 31, inclusive, 36, 38, 43, 46, 49, and 50, involved in this appeal and other claims of appellant's application for a patent relating to a process for the manufacture of aliphatic anhydrides were rejected by the Primary Examiner of the United States Patent Office. The grounds of the rejection will be more particularly stated hereinafter.

Upon appeal to the Board of Appeals, the rejection of the Examiner of the here-involved claims was affirmed for substantially the same reasons as those assigned by the Examiner.

From the decision of the Board, appellant has appealed here.

The claims on appeal relate to a process of manufacturing aliphatic anhydrides such as acetic anhydride, which process involves subjecting an aliphatic acid in vapor form in a retort to a sufficient temperature for thermal decomposition into anhydride and water vapor. This mixture is conducted into another chamber and into a stream of vapor of some liquid that has the property of affinity for water vapor. Sufficient temperature is maintained to allow vapors of the anhydride to condense into liquid form but yet to maintain the vapor of the entraining liquid and water in a vaporous form whereby the mixed vapor may be conducted from the top of a chamber and the condensed anhydride collected at the bottom. Appellant's specification names toluene, or toluol, or xylene, or xylol as suitable entraining materials in vaporous form. All the claims except claim 29 broadly call for an entraining liquid. Claim 29 is limited to xylene.

The references relied upon by the Examiner are: Meingast et al., 1,570,514, January 19, 1926; Dreyfus (British), 256,663, July 26, 1926; Ricard, 1,668,380, May 1, 1928; Schleicher et al., 1,815,802, July 21, 1931.

Claims 12 and 29 are regarded as illustrative and follow:

12. Process for the manufacture of an aliphatic anhydride which comprises subjecting the vapor of an aliphatic acid to thermal decomposition and separating the anhydride so formed by condensation from the reaction vapors whilst carrying away the water vapor by the vapor of at least one entraining liquid of boiling point above that of water.

29. Process according to claim 12 wherein the entraining liquid is a xylene.

The Examiner held, and the Board concurred in the Examiner's view, that "Every claim except 29 is fully met" by Schleicher et al., and that claim 29 was not patentable over Schleicher et al. and was fully met by Schleicher et al. in view of Ricard.

The Schleicher et al. disclosure is described and applied by the Examiner in the following language:

Schleicher describes a process separating acetic anhydride and water vapor in a column of "customary construction" by injecting vapors of benzene or toluene, etc., into the column at the base, while the mixed vapors to be separated pass into the column elsewhere. The water vapor is carried along by the hydrocarbon vapor and condensed in a receiver at a lower temperature while the anhydride is condensed in the column and passes downward counter-current to the hydrocarbon vapors.

* * * * * * *

The process of separation claimed is fully met by Schleicher who describes essentially the same procedure as applicant has. He injects benzol vapor into the base of a column containing mixed acetic anhydride and water vapor passing in contact, it extracts the water vapor. The temperature is below the boiling point of acetic anhydride and hence, being in major portion, it must condence. The azeotropic mixture of toluene and water boils at about 80° which is lower than any other component so it will be readily carried over. Just where the water and anhydride mixture is added, probably has some small difference on the efficiency, but it is not involved in the claims under rejection other than found in Schleicher.

The Examiner also rejected claims 12, 19, 22, 25, 27, 28, and 29, as being drawn to an old, exhausted, unpatentable combination. Claims 36, 38, 43, 49, and 50 were also rejected by the Examiner as being too broad.

In view of our conclusion it is not necessary for us to consider the second and third grounds of rejection stated. We are in agreement with the concurring decisions of the tribunals that none of the claims involved are patentable over the Schleicher et al. patent, and that claim 29 is fully met by Schleicher et al. when combined with Ricard.

Appellant has stressed at great length both in brief and in oral argument the contention that the tribunals improperly rejected the claims upon Schleicher et al. for the reason that appellant is entitled to the filing date (being prior to the application date of the Schleicher et al. patent) of his prior Patent No. 1,735,959, in which prior patent he contends that there is disclosed, but not claimed, the invention here involved, and argues, therefore, that Schleicher et al. cannot be used singly to anticipate the claims or in combination with Ricard to anticipate claim 29. Appellant seems to concede that if his prior patent does not disclose the issue of the claims and if Schleicher et al., therefore, is a proper reference, the rejection of the Board upon that ground was proper except as to claims 19, 22, 25, 27, and 28. Appellant contends that any showing that may be made in Schleicher et al. upon the subject matter of these claims was not in the Schleicher application when filed, but was introduced by amendment after the filing date of the Schleicher et al. application. This is, in effect, as we understand it, a contention that the amended subject matter in Schleicher et al. is new matter and, therefore, improperly in the patent.

As to the last contention the Solicitor for the Patent Office in his brief states:

Not only does it appear from the record in the instant case that the evidence, as to the amendment in the application of the Schleicher et al. application, was not brought before either the Board of Appeals or the Examiner, but furthermore in the notice of appeal there does not appear to be raised the point that the Schleicher et al. patent is not entitled to its filing date for everything appearing in the printed patent. Had appellant raised any such point before the Examiner or the Board of Appeals those tribunals might have pointed out wherein the amendment was in harmony with the original disclosure and permissible under rule 70 of the Rules of Practice in the United States Patent Office, and not contrary thereto because of the introduction of new matter as now alleged by appellant, apparently for the first time in this case.

We find, however, that in this court there is filed a stipulation, the material portion of which is divided into three paragraphs as follows:

1. The applicant did on Aug. 12, 1933 urge before the Examiner the point that the Schleicher et al. Patent 1,815,802 was not available as a reference against claims 19, 22, 25, 27, and 28 on the ground that the statement found in lines 21 to 27 of page 1 of the printed patent did not occur in the Schleicher et al. application as filed but was inserted by amendment filed July 8, 1930.

2. In the letter of Dec. 1, 1933, the Examiner ruled "No inventive difference is seen in introducing the entraining liquid in vapor form as specified in claims 18 to 23, 25, 27, and 28 in place of the method disclosed in the original Schleicher et al. specification", and thereafter the applicant made three responses to the Examiner's rejections but applicant made no specific references in these to the amendment to the Schleicher et al. application.

3. The applicant did call attention of the amendment to the Schleicher et al. application in his brief before the Board of Appeals on appeal from the Examiner's decision.

It would seem, therefore, that we must regard the question presented by said last contention as having been called to the attention of the tribunals below, although neither of them commented upon the subject matter in their written opinions nor does the record show that the question was considered by the Board.

[1] The record does not disclose any reason of appeal which presents this question here more specifically than do appellant's three following reasons:

3. In holding that all the said claims, except claim 29, are unpatentable over the U. S. patent to Schleicher et al. No. 1,815,802.

4. In holding that claim 29 is unpatentable over said patent to Schleicher et al. in view of the U. S. patent to Ricard No. 1,668,380.

5. In holding that the applicant was not entitled to the benefit of the filing date of his U. S. Patent No. 1,735,959 as to the subject matter on appeal.

On appeal from the Primary Examiner to the Board of Appeals, the record contains nothing aside from the above-quoted stipulation bearing on the question, and the only reasons of appeal assigned there were the following:

1. In finally rejecting all of the claims on the art and for the reasons of record.

2. In not allowing any of the claims.

Notwithstanding the facts set out in the stipulation, it is probable that the Board of Appeals, upon the record as presented to it, did not feel required to discuss or decide the issue alleged to have been presented relating to the new matter inserted in the Schleicher et al. reference.

Appellant's reason of appeal No. 3 relates to the rejection of all the claims, except claim 29, on the Schleicher et al. patent, and reason of appeal No. 4 challenges the correctness of the rejection of said claim 29 on Schleicher et al. in view of Ricard. But, under the circumstances of this case, we are of the opinion that said reasons of appeal are not sufficiently specific to present for our consideration the question of the alleged new matter in the Schleicher et al. patent. If appellant wished consideration for this subject matter it would seem to us that he should have pointed out with more specificity the particular matter complained of, the same not appearing upon the face of the patent. We say this without intimating whether or not, if he had done so, we would be privileged to consider the same and pass upon the soundness of appellant's contentions.

For the reasons above stated we are, therefore, of the opinion that the question with reference to the alleged new matter in the Schleicher et al. patent is not before us for consideration.

The main question pressed by appellant is that the tribunals below are in error in holding that appellant's prior patent did not disclose the use of the entraining liquid so as to support the claims at bar. On this phase of the case the Examiner went into considerable detail and among other things said:

The fact that the claims call for the entraining liquid being volatile in steam is not a patentable feature since it is disclosed in the references, and is obviously essential or the processes would not be operative.

Applicant has tacitly admitted the propriety of the rejection since he relies, in order to avoid it, on the prior filing date of his Patent 1,735,959. That process is also one of recovering and separating acetic anhydride and water from a vapor mixture of the two. The mixed vapors are passed into a water immiscible solvent for acetic anhydride above 100° C. The water vapor obviously passes on. This solvent is not used as an entraining liquid. An entraining liquid or vapor must be in motion. It gathers up the substance entrained and carries it along with it. This is the sense in which the term is used in the distillation art. A mere solvent of a vapor is not an entraining liquid. The "Century Dictionary" gives the following definition applicable here: "To carry along mechanically one fluid by another at high velocity."

"New English Dictionary" (1933) Murray, defines "entrain", "Of a fluid: To carry (particles) along by its flow; spec. of steam which carries along particles of water through a pipe or particles of sugar from an evaporating pair—. Hence Entrainer—a device for saturating a current of gas or steam with liquid—in such a way that it will be picked up by a passing current of gas or steam. Entrainment—the action of a fluid in carrying particles along."

No such result occurs according to the process of Patent 1,735,959. Applicant places much reliance on his statement, page 2, lines 44 to 50 of the patent and emphasizes "preferably" which he states means that he would do otherwise. He says in lines 48 to 50 that he may employ solvents volatile in steam. In the following paragraph he gives a list of solvents which may be used, and in second column, lines 66 to 80 he describes use of the same solvents to absorb the acetic anhydride while the water vapor passes on. Nowhere does he state any solvents which will be volatilized with steam at the temperature use. If he used any such, they would not be solvents for the anhydride in the sense meant in the patent for there the invention is to dissolve and then redistil. If one could stretch the disclosure of the patent and include solvents like benzene toluene and xylene,

then there would be no disclosure of the process claimed herein because the vapor of those solvents is not passed into the mixture of vapors, but the vapor mixture would be passed in liquid solvent.

It is evident therefore that applicant's prior patent does not disclose the invention here claimed and can not be relied upon to avoid the rejection.

The Board of Appeals adopted the same view as that of the Examiner on this phase of the case but only briefly discussed the question. Concerning this important feature of the claims, the Board said:

It is our opinion that the showing in the prior Dreyfus patent has no bearing on the present situation for the reasons fully discussed by the Examiner, namely, that the term "entraining" has a definite meaning in this application which is quite distinct from a mere absorbent bath of the prior Dreyfus patent. The two processes also differ materially in other respects. In the Dreyfus patent apparently only water vapor escapes through the vent 2^a and some solvent would be involved which is less volatile than acetic anhydride rather than more volatile as in the present case.

[2] We find no error in the concurring decisions of the tribunals below that the appellant's prior patent did not disclose the "entraining" feature of the involved claims and that he may not here rely upon the disclosure of his prior patent and that the rejection by the Patent Office tribunals of all the claims on Schleicher et al., and of the additional rejection of claim 29 on Schleicher et al., in view of Ricard, was proper. Appellant's earlier patent did not disclose the important feature of the appealed claims involving the question of entraining liquids for the reason that the subject matter is not mentioned nor do we regard it as being inherent in appellant's method as performed on the apparatus disclosed.

In view of this conclusion it is obvious that the additional grounds of rejection need not be discussed here, and the decision of the Board of Appeals is affirmed.

Affirmed.

GRAHAM and BLAND, *Judges*, concur in the conclusion.

U. S. Court of Customs and Patent Appeals

IN RE YOUNG

No. 3,831. Decided June 7, 1937

[90 F.(2d) 275]

PATENTABILITY—STREAMER ADAPTED FOR TOWING BY AIRCRAFT.

Certain claims for a streamer adapted for towing by aircraft which include the provision that the tow line is slidably connected to the loop bridle *Held* patentable over the prior art and further *Held* that certain other claims not so limited are unpatentable over the prior art.

APPEAL from the Patent Office. Modified.

Mr. Leonard L. Kalish for Young.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

LENROOT, *J.*:

This is an appeal from a decision of the Board of Appeals of the United States Patent Office affirming a decision of the Examiner rejecting, for lack of invention in view of the cited prior art, claims 1, 2, and 6 to 10, inclusive, of appellant's application. Certain claims were allowed:

Claim 1 is illustrative of claims 1, 2, and 6, and reads as follows:

1. A streamer adapted for towing by aircraft comprising a substantially rectangular skeleton framework including vertical and longitudinal members, the vertical members being rigid and the frame work having a center of gravity nearer its lower edge, a loop bridle joining the upper and lower ends of the foremost vertical member, a tow line slidably connected to said loop bridle, and a drag element connected to the rear end of said framework.

Claim 7 is illustrative of the remaining claims and reads as follows:

7. A streamer adapted for towing by power-driven aircraft, comprising a skeleton frame-work having a relatively very small horizontal dimension transverse to the intended line of movement in comparison to its height and including generally flexible longitudinal members and relatively rigid vertical members with the leading vertical member having its center of gravity nearer the lower edge of the streamer, and having greater resistance against bending than the following vertical members a tow line connected with the leading vertical member and a drag element flexibly connected with the trailing end of the streamer.

The references cited are: Worrell et al., 145,709, December 16, 1873; Rothenberg, 1,611,080, December 14, 1926; Picco, 1,893,149, January 3, 1933; Du Pont, 1,901,855, March 14, 1933.

Appellant's alleged invention is concisely described by the Examiner as follows:

The invention relates to a sign towed by an aeroplane. It is in the form of a streamer and consists of horizontal stringers connected by rigid vertical members. The latter carry weights at their lower ends. The foremost vertical member is provided with a V-shaped bridle which is slidably connected with the tow-line. The rearmost vertical member is provided with a similar bridle which is slidably connected with a resistance member.

The patent to Du Pont discloses a sign in the form of a banner towed by an aeroplane, and in a vertical plane. A bridle connects the sign with the tow line, and air resistance means are secured to the rear end of the sign to keep the sign taut. The bridle is not slidably connected to the tow line.

The patent to Picco also discloses a sign in the form of a banner towed by an aeroplane, weights on the under side of the sign, and a bridle; air resistance means are connected at the rear of the banner. The tow line is not slidably connected to the bridle.

The patent to Worrell et al. discloses a device for suspending stationary signs. A cord is shown for that purpose, which provides a sliding movement.

The patent to Rothenberg is for an apparatus for ejecting atomized liquids. The apparatus is suspended in the air, and there is shown a loop or an eye and a slidable sling of steel wire, operating upon the same principle as the slidable connection disclosed by appellant.

It was conceded by the Patent Office tribunals that neither Du Pont nor Picco disclosed or suggested a tow line slidably connected with the loop bridle. Du Pont, by involved mathematical calculation, determined the point at which the tow line should be attached to the bridle.

The Board of Appeals in its decision stated:

* * * One of the changes relied upon for patentability is the employment of a loop bridle having a tow line slidably connected thereto. None of the streamers discloses the sliding connection and the Examiner has referred to the patents to Worrell et al. and Rothenberg for such a connection. Appellant urges that these patents are on such non-related structures that they would not suggest this form of connection with a streamer.

We are of the opinion that, wherever it is desirable to connect a tow line to different points, it is merely a matter of choice as to whether that line shall pass through a sliding loop in order to equalize the pull on the two points or whether it is better to provide a connection which does not permit the equalization. There are advantages and disadvantages with both types. We do not believe it required the exercise of invention to experiment with the sliding connection and adopt it if it was found more suitable with streamers.

It is our opinion that neither the patent to Worrell et al. nor the patent to Rothenberg is available as a reference. Each belongs to a clearly nonanalogous art, and neither would suggest the use in an aeroplane streamer of "a tow line slidably connected to said loop bridle."

The Board, however, did not seem to greatly rely upon these references, but held that it did not require the exercise of the inventive faculty to employ the slidable connection disclosed by appellant. We do not agree with this conclusion. It seems to us that Du Pont, presumably skilled in the art, would not have employed involved mathematical calculations to determine the point at which the tow line should be attached to the bridle if a slidable connection was obvious to one skilled in the art. In our opinion the application of a slidable connection to a streamer towed by an aeroplane did require more than mechanical skill, and claims 1, 2, and 6 should be allowed.

The remaining claims, Nos. 7, 8, 9, and 10, do not contain the element of a tow line slidably connected to the bridle, but appellant relies, for patentability, upon the use of a front vertical member having greater resistance against bending than the other vertical members. Under this arrangement the bridle may be connected at the upper and lower portions of the streamer, and the middle portion may be anchored to the stiff front vertical member and be drawn thereby, making it unnecessary to provide stiff vertical members throughout the length of the streamer.

Both the Board and the Examiner were of the opinion that it would involve merely mechanical skill to make the leading spacer bar heavier than the others, thus relieving the strain upon the other vertical members, enabling them to be made of lighter construction. We are in accord with this conclusion. See *In re Pomeroy*, 20 C. C. P. A. (Patents) 1026, 64 F.(2d) 681, 433 O. G. 512.

For the reasons stated herein, the decision of the Board of Appeals is reversed with respect to claims 1, 2, and 6, and affirmed as to claims 7, 8, 9, and 10.

Modified.

Patent Suits

[Notices under sec. 4921, R. S., as amended Feb. 18, 1922]

Des. 106,402, P. Schlessel, Dress, filed Oct. 8, 1937, D. C., S. D. N. Y., Doc. E 85/357, *New York, Dress & Costume Co., Inc.*, v. *Abrams & Norman, Inc.*

Adjudicated Patents

(D. C. Del.) Bell patent, No. 1,574,546, for an oil heating furnace, claims 1, 2, 3, 9, and 13 *Held* valid and infringed. *Sinclair Refining Co.* v. *Globe Oil & Refining Co.*, 20 F. Supp. 681.

(D. C. Del.) Bell patent, No. 1,574,547, for operation of oil stills, claims 1, 2, 5, 7, and 8 *Held* valid and infringed. *Id.*

(D. C. Del.) Bell patent, No. 1,623,773, for oil still, claims 1–4, 7, 12–16 *Held* valid and infringed. *Id.*

(D. C. N. J.) Chipman patent, No. 1,694,205, for weed killer and method of killing weeds, *Held* void for failure to file a disclaimer as to claims 3, 4, 6, 8, 9, and 10, which had been declared invalid. *Chipman Chemical Engineering Co.* v. *Reade Mfg. Co.*, 20 F. Supp. 674.

(D. C. N. J.) Baum patent, No. 1,821,902, for manometer, *Held* invalid. *W. A. Baum & Co.* v. *Becton, Dickinson & Co.*, 20 F. Supp. 707.

(D. C. Ind.) Jauch et al. patent, No. 1,888,533, for liquid dispensing apparatus, claims 1, 2, 16, 17, 18, 19, and 22 *Held* valid and infringed. *Wayne Co.* v. *Anchor Oil Co.*, 20 F. Supp. 745.

(D. C. N. J.) Balmer design patent, No. 78,498, for combination bathroom fixture, *Held* invalid. *J. H. Balmer Co.* v. *Bay Ridge Specialty Co.*, 20 F. Supp. 714.

TRADE-MARKS

OFFICIAL GAZETTE, DECEMBER 21, 1937

[VOL. 485. No. 3]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 1 of said act, a fee of ten dollars must accompany each notice of opposition.

CLASS 1

Raw or Partly-Prepared Materials

Ser. No. 398,901. WILLARD HELBURN, INC., Salem, Mass. Filed Oct. 25, 1937.

SMOOTHIE

For Leather.
Claims use since Oct. 1, 1937.

CLASS 2

Receptacles

Ser. No. 398,343. L. B. BARBER, doing business as Vivian Manufacturing Company, St. Louis, Mo. Filed Oct. 11, 1937.

VIVIAN
SERV-ICE
Products

The words "Serv-ice Products" are disclaimed apart from the mark.
For Ice Delivery Bags and Crushed Ice Baskets, Ice Cube Cartons, and Pails.
Claims use since June, 1925.

Ser. No. 398,845. NELL L. FULTON, New York, N. Y. Filed Oct. 23, 1937.

"COIN-NITIALS"

The word "Coin" is disclaimed apart from the mark.
For Metal Coin Holders.
Claims use since Oct. 5, 1937.

Ser. No. 398,846. NELL L. FULTON, New York, N. Y. Filed Oct. 23, 1937.

"COIN-O-GRAMS"

The word "Coin" is disclaimed apart from the mark.
For Metal Coin Holders.
Claims use since Oct. 5, 1937.

Ser. No. 398,847. NELL L. FULTON, New York, N. Y. Filed Oct. 23, 1937.

"COIN-VENIENCE"

The word "Coin" is disclaimed apart from the mark.
For Metal Coin Holders.
Claims use since Oct. 5, 1937.

CLASS 3

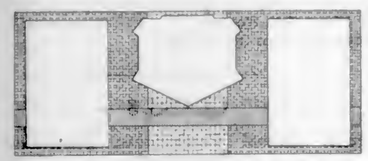
Baggage, Animal Equipments, Portfolios, and Pocketbooks

Ser. No. 393,233. THE SCHAFER COMPANY, Decatur, Ind. Filed May 25, 1937.

SCHAFER
BLACK BEAUTY

For Harness for Teams, Buggy, Express, Pony, Goat, Dog, and Baby; Bridles, Lines, Hame Straps, Traces; Express and Riding Saddles; Halters for Horses, Colts, Pony, Cow, and Bull; Collars, Team Pads, Sweat Pads, and Collar Neck Pads; Whips, Leather Fly Nets, Curry Combs, Horse Brushes, Hames, Dog Collars, Traveling Bags, Suitcases, Bill Folds, Purses, and Key Cases.
Claims use since 1901.

Ser. No. 394,769. H. MARGOLIN & CO. INC., New York, N. Y. Filed June 30, 1937.



Marcraft

For Pocketbooks, Purses, Change-Purses, Wallets, Trunks, Handbags, Suitcases, Satchels, Portfolios.
Claims use since Jan. 16, 1933.

CLASS 6

Chemicals, Medicines, and Pharmaceutical Preparations

Ser. No. 390,959. THE HYGIENIC PRODUCTS COMPANY, Canton, Ohio. Filed Apr. 5, 1937.

The drawing is lined for red and yellow.
For Chemical Preparation Used as a Laundry Cleaner, Bleacher, and Whitener, a Stain Remover, a Mildew Remover, a Scorch Remover, a Fruit, Grass, Ink, Blood, Wine, Tea, Coffee, Chocolate, and Iodine Stain Remover.
Claims use since Mar. 20, 1937.

Ser. No. 392,025. THE GLIDDEN COMPANY, doing business as The Chemical & Pigment Company, Cleveland, Ohio. Filed Apr. 29, 1937.

OPACITONE

For Chemicals Used as a Pigment and Filler for Paints, Paper, Rubber, Ink, Linoleum, Shoe Polish, and Plastics (Including Composition Wall Board, Composite Flooring, Plaster, and Stucco).
Claims use since Apr. 11, 1930.

Ser. No. 392,615. SOPHIA COMPANY, INC., New York, N. Y. Filed May 11, 1937.

RÉJUVENÉ

For Hair Tonic.
Claims use since January, 1934.

Ser. No. 393,195. JOHN H. WOOD COMPANY, Philadelphia, Pa. Filed May 24, 1937.

Zhongiva

For Tooth and Gum Washes.
Claims use since Apr. 15, 1920.

Ser. No. 396,502. MOLINARD, INC., New York, N. Y. Filed Aug. 17, 1937.

For Astringents, Astringent Cerates, Beauty Creams, Bleach Creams, Cold Creams, Cleansing Creams, Obesity Creams, Refreshing Creams, Vanishing Creams, Obesity Astringents, Dry Rouges, Liquid Rouges, Face Bleaches, Face Packs, Skin Whitener in Liquid and Solid Forms, Eyebrow and Eyelash Grower, Eye Drops, Eye Lotions, Eyebrow Pencils, Chemical Preparations Suitable for the Darkening of Eyelashes and Eyebrows, Hand Lotions, Skin Lotions, After Shaving Lotions, Styptic Pencils, Pomades, Face Powders, Body Powders, Sachets, Hair Salves, Hair Elixirs, Dandruff Preparations, Hair Tonics, Hair Oils, Shampoos, Hair Dyes, Bath Salts, Bath Oils, Bath Powders, Bath Crystals, Smelling Salts, Lip Sticks, Incense, Tooth Powders, Mouth Washes, Dentifrices, Tooth Pastes, Depilatories, Nail Creams, Nail Powders, Nail Bleaches, Nail Polishes, Nail Polish Removers, Witch Hazel, Peroxide, Petroleum Jellies, Witch Hazel Salves, Camphor Creams, Foot Powders, Corn Salves, Deodorants, Disinfectants, Bay Rum, Perfumes, and Toilet Waters.
Claims use since October, 1936.

Ser. No. 397,496. CAAL LABORATORIES, INC., Detroit, Mich. Filed Sept. 17, 1937.

For Solution for Treating Epidermophytosis and Other Types of Local Dermatitis.
Claims use since Feb. 1, 1937.

Ser. No. 397,800. EFF LABORATORIES, INC., Cleveland, Ohio. Filed Sept. 25, 1937.

VANAY

For Concentrates and Preparations Rich in Vitamin Activity for Use in Foods and Particularly Vitamin A in a Form, Including Flavoring, for Incorporation in Bakery Goods and Confectionery.
Claims use since Aug. 17, 1937.

Ser. No. 398,126. PARKE, DAVIS & COMPANY, Detroit, Mich. Filed Oct. 4, 1937.

SIBLIN

For Preparation of Plantago with Vitamin B for Use in the Treatment of Constipation.
Claims use since Sept. 8, 1937.

Ser. No. 398,136. WARWICK CHEMICAL COMPANY, West Warwick, R. I. Filed Oct. 4, 1937.

TORRIDEX

For Softening Agent for Textiles.
Claims use since Sept. 17, 1937.

Ser. No. 398,210. MAYO BROTHERS CHEMICAL CORPORATION, Jackson, Miss. Filed Oct. 6, 1937.

MAYOLENE

For Mouth-Wash Preparation.
Claims use since Sept. 10, 1937.

Ser. No. 398,262. ROYCE CHEMICAL COMPANY, Carlton Hill, N. J. Filed Oct. 7, 1937.

PAROLITE

For Chemicals Adapted for Discharging Dyeings Upon Textile Fibers and Fabrics and for Use in Discharge Printing of Textile Fibers and Fabrics.
Claims use since Sept. 14, 1937.

Ser. No. 398,390. CHAPPEL BROS., INC., Rockford, Ill. Filed Oct. 12, 1937.

PENARTHIN

For Pharmaceutical Preparation for the Treatment of Arthritis and Neuritis.
Claims use since Sept. 24, 1937.

Ser. No. 398,397. RAYMOND E. HARRIS, Los Angeles, Calif. Filed Oct. 12, 1937.

Chaleur

For Perfumes.
Claims use since Sept. 26, 1937.

Ser. No. 398,434. RICHARD A. GREEN, doing business as Green Medicine Co., Shreveport, La. Filed Oct. 13, 1937.

DISTEMPO

For Dog Medicine for Distemper.
Claims use since Jan. 1, 1931.

Ser. No. 398,515. FÉLIX JEAN CAUCHOIS, Hussigny-Godbrange, Meurthe-et-Moselle, France. Filed Oct. 15, 1937.

AXYOL

For Powder for the External Treatment of Skin Diseases.
Claims use since June 28, 1934.

Ser. No. 398,517. FÉLIX JEAN CAUCHOIS, Hussigny-Godbrange, Meurthe-et-Moselle, France. Filed Oct. 15, 1937.

BIOXYOL

For Medicinal Ointments for Skin Diseases.
Claims use since June 28, 1934.

Ser. No. 398,519. FÉLIX JEAN CAUCHOIS, Hussigny-Godbrange, Meurthe-et-Moselle, France. Filed Oct. 15, 1937.

EXSUGYL

For Medicinal Composition in Powder Form for External Use in the Treatment of Skin Diseases.
Claims use since June 28, 1934.

Ser. No. 398,521. FÉLIX JEAN CAUCHOIS, Hussigny-Godbrange, Meurthe-et-Moselle, France. Filed Oct. 15, 1937.

OXYTHYOL

For Medicinal Ointments for Skin Diseases.
Claims use since June 28, 1934.

Ser. No. 398,522. FÉLIX JEAN CAUCHOIS, Hussigny-Godbrange, Meurthe-et-Moselle, France. Filed Oct. 15, 1937.

THIOXYOL

For Medicinal Ointments for Skin Diseases.
Claims use since June 28, 1934.

Ser. No. 398,569. DYE-COL PRODUCTS, INC., New York, N. Y. Filed Oct. 16, 1937.

RE-KO

For Fungicides.
Claims use since Oct. 4, 1937.

Ser. No. 398,731. R. H. MACY & CO., INC., New York, N. Y. Filed Oct. 20, 1937.

MARCHIONESS

For Aspirin, Bath Salts, Cold Cream, Dusting Powder, Eau de Cologne, Face Powder, Hair Tonic, Hand Lotion, Nail Polish, Rouge, and Shampoo.
Claims use since Aug. 3, 1937.

Ser. No. 398,762. A. B. DICK COMPANY, Chicago, Ill. Filed Oct. 21, 1937.

MIMEOGRAPH

For Chemical Photographic Developer and Chemical Photographic Fixing Materials for Use in the Preparation of Stencils.
Claims use since Mar. 27, 1934.

Ser. No. 398,773. J. L. HOPKINS & Co., New York, N. Y. Filed Oct. 21, 1937.

COCILCO

For Preparation Used in the Production of Syrup Cocillana Compound.
Claims use since February, 1936.

Ser. No. 398,815. LABORATORY PRODUCTS, Memphis, Tenn. Filed Oct. 22, 1937.

RESURRECTION

For Tonic Shampoo for Dandruff, Scalp Disorders, and Premature Baldness.
Claims use since Aug. 1, 1937.

Ser. No. 398,816. LABORATORY PRODUCTS, Memphis, Tenn. Filed Oct. 22, 1937.

PEDIGREED

For Tonic Shampoo for Mange and Skin Disorders of Dogs and Other Animals, and for Killing Fleas.
Claims use since Aug. 1, 1937.

Ser. No. 398,825. A. H. ROBINS COMPANY, INC., Richmond, Va. Filed Oct. 22, 1937.

THEOTONE

For Medicinal Preparation Used as a Vasodilator and Sedative.
Claims use since Sept. 5, 1937.

Ser. No. 398,827. THE RYCO COMPANY, Waycross, Ga. Filed Oct. 22, 1937.

RY CO

Ry-Co

For Painless Eye Water.
Claims use since Mar. 20, 1933.

Ser. No. 398,862. E. R. SQUIBB & SONS, New York, N. Y. Filed Oct. 23, 1937.

VIGRAN

For Vitaminic Preparations.
Claims use since Oct. 14, 1937.

CLASS 10

Fertilizers

Ser. No. 397,890. THE WRIGHT COMPANY, Philadelphia, Pa. Filed Sept. 27, 1937.

THE HAPPY GARDENER

For Fertilizers and Artificial Soil, the Latter Being Compounded from Predetermined Amounts of Sand, Clay, and Plant Food Such as Earth and/or Fertilizer.
Claims use since June 1, 1937.

CLASS 13

Hardware and Plumbing and Steam-Fitting Supplies

Ser. No. 357,809. THE JOHN DOUGLAS COMPANY, Cincinnati, Ohio. Filed Nov. 2, 1934.

THE SYMBOL
Siphon-Proof
OF SAFETY

The words "Siphon-Proof" are disclaimed apart from the mark.
For Lavatory Flush Bowls and Slop Sinks.
Claims use since Sept. 1, 1934.

Ser. No. 394,854. FLORENCE B. MYERS, doing business as Cooper Hose Jacket Company, Los Angeles, Calif., and Minneapolis, Minn. Filed July 3, 1937.

COOPER LEAK STOP & COUPLER
SINCE 1894
MINNEAPOLIS MINN.

The words "Leak Stop & Coupler" and "Minneapolis, Minn." are disclaimed apart from the mark.
For Metal Emergency Hose Leak Stop and Coupling Sleeves.
Claims use since 1931.

Ser. No. 395,183. ANDERSON DIE CASTING AND ENGINEERING CORPORATION, Los Angeles, Calif. Filed July 14, 1937.

A

For Metal Venetian Blind Tilts, Cord Stops, and Supporting Bearings, and Combinations and Parts Thereof.
Claims use since May 1, 1935.

Ser. No. 398,460. COLONIAL STOVE COMPANY, Philadelphia, Pa. Filed Oct. 14, 1937.

COLONIAL SINK N KLOSURE

The notation "Sink N Klosure" is disclaimed apart from the mark.
For Sink Enclosures.
Claims use since Oct. 11, 1937.

Ser. No. 398,667. COLONIAL STOVE COMPANY, Philadelphia, Pa. Filed Oct. 19, 1937.

Colalloy Kwik Konnector

The words "Kwik Konnector" are disclaimed except as shown.
For Pipe Coupling.
Claims use since Oct. 12, 1937.

CLASS 14

Metals and Metal Castings and Forgings

Ser. No. 390,562. SHARON STEEL CORPORATION, Sharon, Pa. Filed Mar. 26, 1937.

SHARONSTEEL

The word "Sharonsteel" is disclaimed apart from the mark.
For Hot Rolled Strip Steel, Cold Rolled Strip Steel, Hot Rolled Stainless Strip Steel, Cold Rolled Stainless Strip Steel, Hoop and Band Steel, Sheet Steel, Galvanized Steel, and Terne Coated Steel.
Claims use since May, 1936.

CLASS 15

Oils and Greases

Ser. No. 398,941. SOUTHPORT PETROLEUM COMPANY, Kilgore, Tex. Filed Oct. 25, 1937.

HI-O-FILM

The word "Film" is disclaimed except as shown.
For Lubricating Oil.
Claims use since Aug. 15, 1937.

CLASS 19

Vehicles, Not Including Engines

Ser. No. 397,780. TOM'S AUTO SERVICE, INC., Washington, D. C. Filed Sept. 24, 1937.

SILVER-SEAL Tom's USED-CARS

The words "Used Cars" are disclaimed apart from other features of the mark.
For Used or Second Hand Automobiles.
Claims use since Sept. 8, 1937.

CLASS 21

Electrical Apparatus, Machines, and Supplies

Ser. No. 395,479. KEM MANUFACTURING CO., INC., New York, N. Y. Filed July 21, 1937.

KEM

For Starting, Lighting, and Ignition Parts for Automobiles.
Claims use since July, 1920.

Ser. No. 396,362. GENERAL MOTORS CORPORATION, Detroit, Mich. Filed Aug. 13, 1937.

DELCO

For Electric Motors of All Types Including: Dynamo Electric Motors and Fractional Horse-Power Electric Motors and Parts Thereof, Including: Stators, Rotors, Armatures, Short Circuiting Mechanisms and Devices and Weights, Springs and Necklaces Thereof, Brush Brakes, Brushes, Bearings, Governor Assemblies, Governor Springs, Governor Spring Cups, Spring Retaining Cups, Bases, Base Mounting Rubber, Base Mounting Rings, Belt-Tighteners and Belt Tightening Bases, Mounting Plates, End Play Take-Up Devices, Oil-Filled, Wax-Filled and Electrolytic Condensers, Transformers, Transformer-Condensers, Reactors, Rheostats, Speed Controls, Reversing Switches, Automatic Switches, Centrifugal Switches, Relays, Switch Contacts, Contact Plates, Contact Arms, Protective Devices, Thermatrons, Terminal Blocks, Terminal Plates, Conduit Boxes, Field Coils and Commutators, Control Apparatus for Electric Motors and Parts Thereof Including: Magnetic Starting Switches, Across-the-Line Starters, Solenoid Coils, Heater Elements, Contacts, Reset Mechanisms, Reset Buttons, Arc Boxes, Overload Relays, Disconnecting Switches, Push Button Stations, Limit Switches, Pressure Switches and Thermostatic Relays; Motor Vehicle Generators and Parts Thereof Including: Armatures, Brushes, Cut-Out Relays, Voltage Regulators, Field Coils, Bearings, and Bushings; Motor Vehicle Starting Motors and Parts Thereof Including: Armatures, Brushes, Starter Drives, Manual Solenoid Starter Switches, Relays, and Vacuum Controls; Motor Vehicle Ignition Distributors and Parts Thereof Including: Caps, Rotors, Condensers, Contact Arms, Contact Points, Gears, Couplings, and Vacuum Control Units; Motor Vehicle Switches, Including: Starter, Lighting, Dimmer, Stop-Light and Solenoid Switches; Ignition Coils; Horn Relays for Motor Vehicles; Current Regulators for Motor Vehicles; Conductors; Insulators; Connectors; Coils; Switch Boards; Overload Circuit Breakers; Magnetos; Electric Power Stands; Batteries; Storage Batteries and Parts Thereof; Storage Battery Cables; Current Generating and Distributing Systems for Lighting and Power Purposes Including Power Operated Dynamo Electric Machines and Controls, Parts and Accessories Thereof; Electric Fans of All Types Including: Attic, Circulating, Desk, and Ventilating Fans and Controls, Parts and Accessories Thereof; Radio Receiving Sets, Controls, Parts and Accessories Thereof; Vibrators for Radio Sets; Electrically Operated Blower Units for Motor Vehicle Heaters and Refrigerators of All Types; Vacuum Cleaners, Controls, and Parts Thereof; Starting, Lighting, and Ignition Apparatus and Controls, Parts and Accessories Thereof for Use in Connection with Internal Combustion Engines for Motor Vehicles, Boats, Aircraft, and All Other Types of Self-Propelled and Stationary Machines; Electric Irons and Parts Thereof; Electrically Operated Signal Devices of All Types, for Motor Vehicles Including Horns and Turn Signals and Parts Thereof; Bulbs for Electric Lights of All Types Including Those Used on Motor Vehicles, Trailers, and Semi-Trailers.
Claims use since 1911.

Ser. No. 396,430. CORONET RADIO CORPORATION, Chicago, Ill. Filed Aug. 14, 1937.

Coronet

For Radio Receiving Sets.
Claims use since June 26, 1937.

Ser. No. 396,933. THE PYLE-NATIONAL COMPANY, Chicago, Ill. Filed Aug. 30, 1937.

PYLETS

For Electrical Conduit Fittings.
Claims use since June, 1937.

Ser. No. 397,856. FRANK MCCALL, Los Angeles, Calif. Filed Sept. 27, 1937.

DESERT-AIR

For Electric Lamps.
Claims use since Aug. 1, 1931.

Ser. No. 398,780. MARSHALL-WELLS COMPANY, Duluth, Minn. Filed Oct. 21, 1937.

ZENITH

For Electric Ranges.
Claims use since Sept. 30, 1937.

Ser. No. 398,945. UNITED STATES ELECTRIC MFG. CORPORATION, New York, N. Y. Filed Oct. 25, 1937.

Rubberlite

For Flash-Lights.
Claims use since Sept. 23, 1937.

CLASS 22

Games, Toys, and Sporting Goods

Ser. No. 396,847. MARY VIAULT, doing business as The Ray-Fair Company, New York, N. Y. Filed Aug. 27, 1937.

DICEBALL

The representation of a baseball is disclaimed apart from the mark.
For Baseball Game Employing Dice, Said Dice Having Numerical and Word-Bearing Indicia Thereon, to be Played With or Without a Board.
Claims use since June, 1928.

Ser. No. 398,596. THE STEEL STAMPING COMPANY, Lorain, Ohio. Filed Oct. 16, 1937.

DIAL-O-VISION

For Toy Telephones.
Claims use since Apr. 20, 1937.

Ser. No. 399,115. THE UNITED STATES PLAYING CARD COMPANY, East Norwood, Cincinnati, Ohio. Filed Oct. 29, 1937.

POKERETTE

For Parlor Game to be Played with Boards and Cards.
Claims use since February, 1930.

Ser. No. 399,217. ACUSHNET PROCESS COMPANY, Acushnet, New Bedford, Mass. Filed Oct. 30, 1937.

Magnum

For Golf Balls.
Claims use since Sept. 15, 1937.

CLASS 23

Cutlery, Machinery, and Tools, and Parts Thereof

Ser. No. 384,507. CAROBRONZE RÖHRENWERK GESELLSCHAFT M. B. H., Vienna, Austria. Filed Oct. 19, 1936.

CAROBRONZE

For Machinery Bearings, Cog or Gear Wheels, Bearing Bushings, Spherical Shaped Guides for Machinery Drive Shafts, Valve Guides, Bearing Raceways.
Claims use since June, 1934.

Ser. No. 391,064. GENERAL REFRIGERATION CORPORATION, Beloit, Wis. Filed Apr. 8, 1937.

HYDRO-CYCLONIC

For Condensers of the Evaporative Type Employing Both Air and Water as Means for Removing Heat from the Condenser Coils Thereof.
Claims use since Aug. 14, 1936.

Ser. No. 392,403. MILTON D. MYER, Pittsburgh, Pa. Filed May 7, 1937.

MYCO BLADE

Applicant disclaims the word "Blade" as part of the mark.
For Safety Razor Blades.
Claims use since Jan. 1, 1934.

Ser. No. 394,929. S. G. BOLINDERS MOTOR AKTIEBOLAG, STOCKHOLM, Stockholm, Sweden. Filed July 7, 1937.

The word "Bolinderdiesel" is disclaimed apart from the mark.

For Internal Combustion Engines and Parts of and Accessories for the Same.

Claims use since Dec. 31, 1935.

Ser. No. 396,044. THE RIDGE TOOL COMPANY, North Ridgeville, Ohio. Filed Aug. 5, 1937.

The mark consists of an angular bar extending across the head of the wrench housing.

For Pipe Wrenches.

Claims use since July 10, 1937.

Ser. No. 396,448. COLTON RAZOR BLADE COMPANY, Boston, Mass. Filed Aug. 16, 1937.

KISMET

For Safety Razor Blades.

Claims use since Aug. 11, 1937.

Ser. No. 396,907. JOHN H. BEST & SONS, INC., Galva, Ill. Filed Aug. 30, 1937.

The drawing is lined for blue.

For Water Well Pumps, Pump Jacks, Cylinders, Foot Valves, Strainers, and Combination Foot Valves and Strainers, for Pumps.

Claims use since 1900.

Ser. No. 398,010. THE LUBRICATION CORPORATION, Chicago, Ill. Filed Oct. 1, 1937.

STANDIX TURI-VAC

For Air-Operated Vacuum Cleaners.

Claims use since Nov. 21, 1935.

Ser. No. 398,755. CLUB RAZOR & BLADE MANUFACTURING CORPORATION, Newark, N. J. Filed Oct. 21, 1937.

fan

For Razor Blades.

Claims use since Mar. 18, 1936.

Ser. No. 398,796. UNDERWOOD ELLIOTT FISHER COMPANY, New York, N. Y. Filed Oct. 21, 1937.

TYPEMASTER

For Typewriters.

Claims use since Aug. 26, 1937.

Ser. No. 398,843. FLEMING MANUFACTURING COMPANY, East Providence, R. I. Filed Oct. 23, 1937.

The showing in the drawing is of Rodney Maybee.

For Oil Filters, Particularly for Use as Attachments for Internal Combustion Engines and Parts for Said Filters Including Cartridges Therefor.

Claims use since September, 1934.

Ser. No. 399,001. METROPOLITAN SEWING MACHINE CORPORATION, Nyack, N. Y. Filed Oct. 27, 1937.

METROPOLITAN

For Sewing Machines and Sewing Machine Parts and Attachments.

Claims use since May, 1901.

CLASS 26

Measuring and Scientific Appliances

Ser. No. 379,475. THE GENERAL TIRE & RUBBER COMPANY, Akron, Ohio. Filed June 9, 1936.

Vulcameter

For Hand Operated Dial Indicators Used as Reminders in Connection with Timed Operations.

Claims used since Oct. 1, 1935.

Ser. No. 395,772. SPAULDING-MOSS COMPANY, Boston, Mass. Filed July 29, 1937.

For Sensitized Blue Print Paper and Cloth, Sensitized Van Dyke Paper and Cloth, Sensitized Direct Positive Paper and Cloth; Mechanical Drawing Materials—Namely, Drawing Instruments, Drawing Boards, Slide Rules, Measuring Rules, Measuring Tapes, Lettering Instruments, Triangles, T Squares, Machines for Blue Printing, Machines for Direct Positive Printing.

Claims use since July 20, 1937.

Ser. No. 397,706. JACOB WILLIAM FRANKEL, doing business as The Minimax Co., Chicago, Ill. Filed Sept. 23, 1937.

TOOZ
The 2-in-1 X-Ray Film

The expression "2-in-1 X-Ray Film" apart from the mark is disclaimed.

For X-Ray Films.

Claims use since Sept. 13, 1937.

Ser. No. 397,721. PENN ELECTRIC SWITCH CO., Goshen, Ind. Filed Sept. 23, 1937.

Tem-Clock

The word "Clock" is disclaimed except as shown.

For Control Clocks for Controlling Oil Burners, Gas Burners, Air Conditioning Apparatus and Other Heating and/or Cooling Apparatus.

Claims use since Mar. 15, 1937.

Ser. No. 397,722. PITTSBURGH EQUITABLE METER COMPANY, Pittsburgh, Pa. Filed Sept. 23, 1937.

For Meters for the Measurement of Water, Oils, and Greases.

Claims use since Sept. 30, 1936.

Ser. No. 397,744. AMERICAN SPECTACLE CO., INC., New York, N. Y. Filed Sept. 24, 1937.

SOL-A-BAR

For Goggles and Spectacles.

Claims use since August, 1937.

Ser. No. 398,715. A. B. DICK COMPANY, Chicago, Ill. Filed Oct. 20, 1937.

MIMEOGRAPH

For Sensitized Photographic Film and Sensitized Photographic Paper for Use in the Preparation of Stencils.

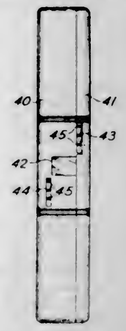
REISSUES

DECEMBER 21, 1937



20,595

FILM MAGAZINE

Nils Bouveng, Elgo, Sweden, assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey

Original No. 1,984,111, dated December 11, 1934, Serial No. 526,027, March 28, 1931. Application for reissue January 26, 1937, Serial No. 122,415

9 Claims. (Cl. 88—17)

8. A reversible magazine for motion picture apparatus comprising side walls and an edge wall, cores mounted between said side walls, one core having a driving means at one end and the other core having a driving means at the other end, a film strip provided with perforated edges, wound on said cores and extending therebetween, and means for guiding the intermediate portion of said film strip along said edge wall, said edge wall being provided with a pair of slots, one slot being in line with the perforations along one edge of said film strip and the other slot being in line with the perforations along the other edge of said film strip, and said edge wall with respect to said slots being symmetrically apertured for alternative co-operation with an exposure opening in said motion picture apparatus respectively during reversed positions of said magazine therein whereby oppositely extending longitudinal series of images on the film strip may be alternately exposed.

20,596

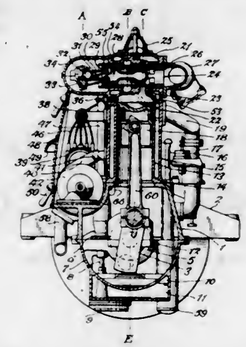
PROCESS FOR MANUFACTURING MOTOR FUEL

Jack Francis Mahon Taylor and Bernard Sutro Greensfelder, San Francisco, and Russell Norman Shiras, Long Beach, Calif., assignors, by direct and mesne assignments, of one-half to Shell Development Company, San Francisco, Calif., a corporation of Delaware, and one-half to Phillips Petroleum Company, Bartlesville, Okla., a corporation of Delaware

No Drawing. Original No. 2,055,455, dated September 22, 1936, Serial No. 607,010, April 22, 1932. Application for reissue October 4, 1937, Serial No. 167,250

11 Claims. (Cl. 44—9)

11. A gasoline whose active fuel component consists of a mixture of a hydrocarbon fraction comprising saturated hydrocarbons boiling within the gasoline range, and which is substantially free of the normal hydrocarbons containing less than six carbon atoms in a molecule, said fractions having a vapor pressure lower than that of the normal gasoline and a quantity of an isopentane fraction which is in excess of that normally present in the gasoline and is sufficient to raise the vapor pressure of the fuel to that of the normal gasoline and to enhance its antiknock rating.



20,597

INTERNAL COMBUSTION ENGINE

Lucian C. Jackson, Buffalo, N. Y.

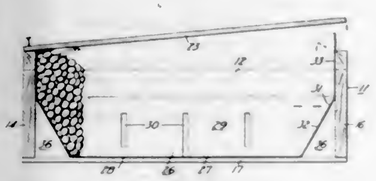
Original No. 1,898,963, dated February 21, 1933, Serial No. 314,279, July 30, 1919, which is a division of application November 9, 1914, Serial No. 871,042, now Patent No. 1,314,487, dated August 26, 1919. This application for reissue February 21, 1935, Serial No. 7,580

19 Claims. (Cl. 123—195)

1. In an internal combustion engine, having a cylinder with a combustion chamber, in combination with a source of fuel supply, a crank shaft and means for rotating said crankshaft, electrical generating apparatus for furnishing ignition for the fuel in said combustion chamber, means to operate said electrical generating apparatus from said crank shaft a crank case, means to lubricate said operating means from said crankcase and means formed from said cylinder to entirely enclose said electrical generating apparatus on said engine.

20,598

PACKING CONTAINER



Moses P. Mosesian, Fresno, Calif.

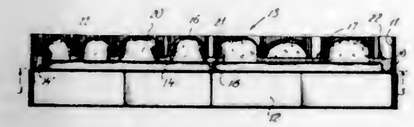
Original No. 1,933,869, dated November 7, 1933, Serial No. 592,918, February 15, 1932. Application for reissue July 5, 1935, Serial No. 29,894

4 Claims. (Cl. 217—40)

1. A packing container for use in shipping fresh fruits comprising a receptacle including a lid, a bottom having a plurality of apertures therein, a pair of side walls and a pair of end walls join-

ing and projecting above said side walls; said lid together with said side walls forming apertures for the passage of air currents, and an insert engaging said bottom, said side walls and said end walls; said insert including a pair of inclined slotted ends and a pair of inclined slotted sides to provide, in conjunction with said receptacle, a continuous passageway within said container communicating with the exterior thereof

through the apertures in said bottom and with the interior of the insert through said slotted ends and said slotted sides whereby said fruit is subjected to circulating air, said insert also including extensions on said inclined ends each of which is foldable upon itself so as to overlie a portion of the receptacle adjacent an end wall to protect the contents of the container from being crushed against an end wall upon fitting a lid to the receptacle.



20,599

DISPLAY DEVICE

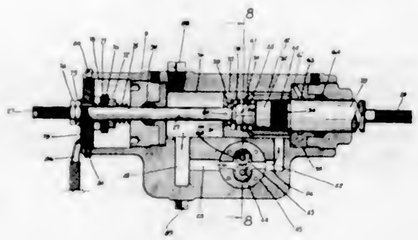
Louis E. Shaw, East Orange, N. J., assignor to Adartcraft, Incorporated, New York, N. Y., a corporation of Delaware

Original No. 1,968,915, dated August 7, 1934, Serial No. 604,930, April 13, 1932. Application for reissue December 20, 1935, Serial No. 55,431

39 Claims. (Cl. 40—126)

1. A display device, comprising a base, and a plurality of elevated members secured thereon with substantially large areas of the base exposed between certain of the members, for the reception of individual members, said members representing the articles to be displayed.

20,600



FLUID POWER CONTROLLING MECHANISM

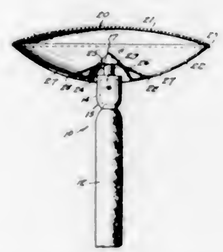
Edwin G. Staude, Minneapolis, Minn.

Original No. 1,921,590, dated August 8, 1933, Serial No. 375,846, July 3, 1929. Application for reissue December 26, 1933, Serial No. 703,985

47 Claims. (Cl. 188—152)

1. A brake control comprising a fluid circulating system including intercommunicating passages, a pedal, brake-applying means, a valve member and valve seat member cooperable therewith for controlling flow through the fluid system, one of the members being connected to the pedal and the other to the brake-applying

means, small pump gears for controlling pressure in the system, means for operating said gears at high velocity, and means operable by pedal movement to braking position to initiate operation of said gear operating means.



20,601

SNAP FASTENER

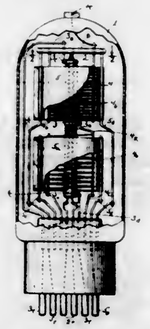
Frank Thiele, Brooklyn, N. Y., assignor, by mesne assignments, to Dependable Tuft Corporation, Philadelphia, Pa., a corporation of Delaware

Original No. 2,013,528, dated September 3, 1935, Serial No. 742,686, September 4, 1934. Application for reissue December 21, 1936, Serial No. 118,011

2 Claims. (Cl. 24—90)

1. A tufting device for mattresses, cushions and the like, comprising a flexible fabric member, a male member having one end hollow for receiving one end of the flexible fabric member, said hollow end being crimped about said fabric member to securely fasten same together, the opposite end of said male member having a reduced neck terminating in an enlarged cone head, a tufting button adapted to be permanently attached to said male member, said button having an annular dished bottom portion provided with an apertured collar centrally thereof, a plurality of spaced prongs radially of the collar and intermediate the circumference of the button and the collar struck integrally out of said bottom, said prongs being folded back with their free ends overlapping the edge of said collar, whereby the cone head of the male member may extend through the apertured collar beyond the free ends of the prongs and be entrapped by said free ends springing into position below the base of the cone head.

20,602



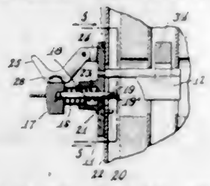
VACUUM TUBE

Samuel Ruben, New Rochelle, N. Y., assignor, by mesne assignments, to Revelation Patents Holding Company, New York, N. Y., a corporation of Delaware

Original No. 1,815,931, dated July 28, 1931, Serial No. 426,828, February 8, 1930. Reissue No. 18,367, dated March 1, 1932, Serial No. 582,168, December 19, 1931. This application for reissue June 11, 1936, Serial No. 84,779

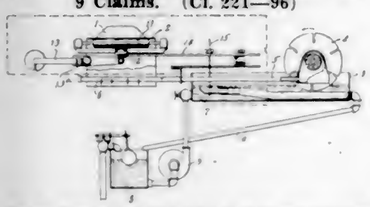
8 Claims. (Cl. 250—27.5)

1. An electron discharge device comprising an envelope containing a plurality of triode units, each unit consisting of an electron emission element, a grid element and a plate element, said plates being electrically separate within said device, the grid element of one unit being con-



nected directly to the electron emission element of another unit.

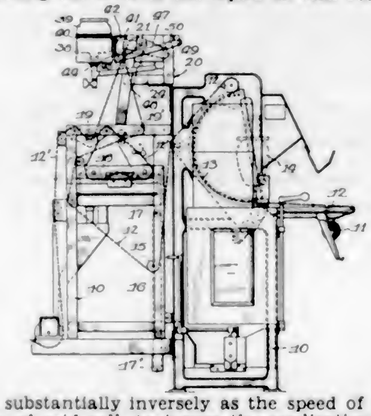
PATENTS



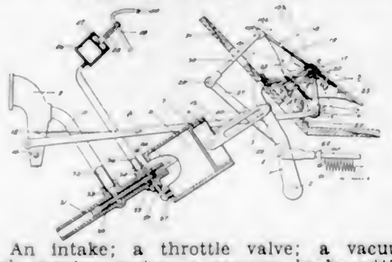
GRANTED DECEMBER 21, 1937

2,102,583
SAFETY DEVICE FOR LOCKS
Henry Alberg, Millstadt, Ill.
Application December 21, 1936, Serial No. 116,861
In Canada January 2, 1936
2 Claims. (Cl. 70—424)

1. A device of the character described comprising, in combination, a plate, an extension on said plate adapted for insertion into the keyhole of a lock, yieldably mounted means including a hand grip mounted on said plate adapted to retain the device in place, and a lock lever pivotally mounted on said plate movable into position for locking engagement by said hand grip to lock said retaining means.



2,102,584
AUTOMATIC PROPORTIONING DEVICE
Davis Brown, Los Angeles, Calif.
Application July 1, 1936, Serial No. 88,390
9 Claims. (Cl. 221—96)

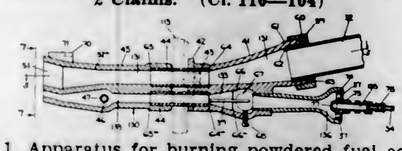


1. In a device of the character described, the combination of: a belt conveyor for continuously feeding comminuted material at a substantially uniform volumetric rate, a feeding hopper provided with an outlet of predetermined cross-sectional area adapted to supply comminuted material to said conveyor, liquid feeding means, pump means for supplying liquid to said liquid feeding means, drive means for simultaneously driving said conveyor and pump at uniform speeds, and means responsive to variations in weight of comminuted material carried by said conveyor for by-passing said liquid feeding means and varying the output of said liquid feeding means.

2,102,585
MEANS AND A METHOD FOR APPLYING DEVELOPER TO A MOVING PRINT
Harold J. Brunk, Chicago, Ill., assignor to The C. F. Pease Company, a corporation of Delaware
Application December 16, 1936, Serial No. 116,181
13 Claims. (Cl. 95—94)

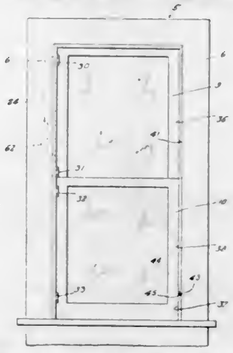
1. Apparatus for applying liquid to a traveling sheet of material, comprising a receptacle for liquid, a roll mounted to dip in said liquid and to contact with said traveling sheet, whereby rotation of said roll results in conveying a layer of liquid to said traveling sheet at the line of contact with said roll, and means for raising and lowering the level of the liquid in said receptacle substantially inversely as the speed of rotation of said roll, to insure the application of a substantially uniform layer of liquid to said sheet, regardless of variations in the rate of travel thereof.

2,102,586
MOTOR CAR CONTROL MECHANISM
Ray G. Coates, Pasadena, Calif.
Application December 23, 1932, Serial No. 648,550
5 Claims. (Cl. 192—.01)



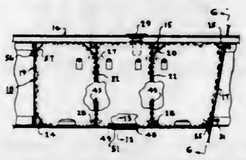
1. An intake; a throttle valve; a vacuum clutch-opening motor; a vacuum brake-setting motor; an operator controlled member yieldably maintained in a released position intermediate the ends of its path of movement, said released position involving the throttle valve closed to idling and the clutch-opening motor and the brake-setting motor inactive; a motor control device connected to said motors, to said member, and to said intake; means, connecting said member to said throttle valve, adapted to open said throttle valve when said member moves in one direction from said released position; means, connecting said member to said motor control device, adapted to start said clutch-opening motor when said member moves in the other direction from said released position and to start the brake-setting motor when said member passes beyond the clutch-opening position.

2,102,587
SOLAR NAVIGATOR
Leon T. Eliel, Pasadena, Calif.
Application November 10, 1936, Serial No. 110,083
21 Claims. (Cl. 33—61)



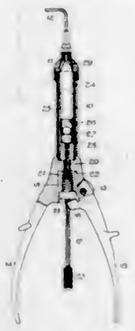
1. In a navigator of the character described, for use in an aerial vehicle, the combination of: a ground reference member having means for adjusting it relative to the aerial vehicle and so as to follow a selected object on the ground as the aerial vehicle moves relative to the ground; a sun reference member connected to said ground reference member so as to be moved thereby, said sun reference member having means which correspond to a prescribed azimuth when said aerial vehicle is moving on its course; and photoelectric means operative by the sun's rays in response to the movement of said sun reference member from its prescribed azimuth position to give a sensible indication that said sun reference member has been so moved by said ground reference member.

2,102,588
FUEL BURNING APPARATUS
Earle V. Francis, Columbus, Ohio, assignor to The Jeffrey Manufacturing Company, a corporation of Ohio
Application March 17, 1934, Serial No. 716,119
2 Claims. (Cl. 110—104)



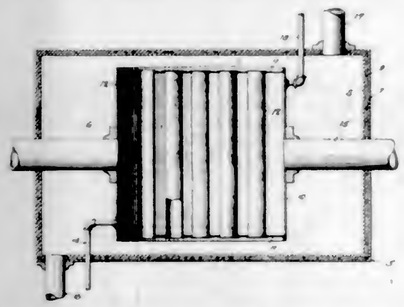
1. Apparatus for burning powdered fuel comprising a burner adapted to communicate with the interior of a furnace and including a nozzle, substantially horizontal means within the nozzle comprising an integral wall extending longitudinally therethrough for dividing the nozzle into a pair of axially spaced separate passages having separate but adjacent discharge outlets, means for introducing powdered fuel and air into one of the passages, means for introducing a combustible mixture of gas and air into the other passage, the said passages being substantially enlarged at their intake end and tapering therefrom into a relatively restricted area for facilitating introduction of fuel and gas into the respective passages, and means for igniting said mixture while within said other passage to preheat the powdered fuel while in its passage and ignite it as it issues therefrom.

2,102,589
WINDOW STRUCTURE
Vernon M. Frey, East Moline, Ill.
Application March 15, 1935, Serial No. 11,345
2 Claims. (Cl. 20—50)



1. In combination, an ordinary window frame, three spaced stationary sash stops fastened to one side of said frame and defining two sash receiving channels therebetween, three opposite sash stops secured on the opposite side of said frame and defining two sash receiving channels therebetween, said opposite sash stops including an outer stationary sash stop and two inner sectional sash stops, each sectional sash stop including upper and lower stationary sections and an intermediate removable section, and two sashes slidably mounted channels defined by the said opposite sash stops, the upper and lower ends of said removable sections being upwardly and inwardly inclined and dovetailed with the lower and upper ends respectively of the said upper and lower stationary sections, whereby said removable sections can be removed from the stationary sections only by moving said removable sections inwardly and upwardly toward the opposite side of the window frame, said removable sections including detents extending laterally therefrom and through openings in the respective laterally inward side of the window frame engaged by the removable sections when in place, and spring catches located in said openings with which said detents are removably engageable to hold the removable sections in place.

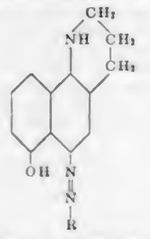
2,102,590
AIRCRAFT CONSTRUCTION
Reid B. Gray, Dundalk, and Edwin L. Zivi, Baltimore, Md., assignors to The Glenn L. Martin Company, Baltimore, Md.
Application December 2, 1936, Serial No. 113,773
9 Claims. (Cl. 244—135)



1. A petroleum containing means including a rigid supporting enclosure and a collapsible enclosure positioned within said supporting enclosure, the outer dimensions of the said collapsible enclosure being greater than the inner dimensions of the said supporting enclosure.

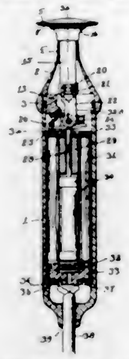
2,102,591
DENTAL SYRINGE
Heinrich Hagemeier, Hamburg, Germany
Application July 28, 1936, Serial No. 93,050
In Germany June 5, 1935
3 Claims. (Cl. 128—236)

2. A dental syringe of the character described comprising a supporting body, a barrel on said body, a plunger in the form of a screw spindle guided longitudinally in said body for operation within the barrel, a headed nut on said spindle accommodated in a recess in the body and adapted to co-operate with the latter for limiting the displacement and regulating the position of the plunger within the barrel, a pair of hand grips on the body branching out from the latter at opposite sides of and substantially symmetrically with the spindle, one of said hand grips forming a lever operable by pressure on the hand grips at right angles to the spindle to engage said nut for the displacement of the spindle within the barrel, and a spring arranged between the body and the head of the nut for opposing the displacement of the plunger by said lever.



2,102,592
AIR HEATER
William P. Hayne, Natchitoches, La.
Application February 1, 1937, Serial No. 123,468
1 Claim. (Cl. 257—219)

An apparatus for supplying heated air in the conditioning of seed cotton, comprising a rectangular chamber, a radiator within the chamber, said radiator embodying a circular casing having closed ends, said circular casing being supported in spaced relation with the walls of the chamber, a plurality of vertical tubes supported within the casing and arranged in spaced relation with each other, said tubes having open ends whereby air entering the chamber may pass through the tubes, a pipe for directing air to the chamber, a pipe through which hot air passes from the chamber, a pipe extending through the chamber and having connection with the radiator and through which exhaust gases are directed to the casing heating the vertical tubes, a pipe extending into the circular casing through which steam is directed to the interior of the circular casing controlling the temperature of the tubes, and a pipe through which condensation within the casing may be exhausted from the casing.

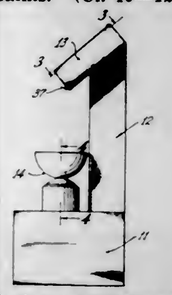


2,102,593
AZO DYESTUFFS
Johann Heinrich Helberger, Cologne-Mulheim, and Otto Bayer, Leverkusen-I. G. Werk, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application November 18, 1935, Serial No. 50,470. In Germany November 23, 1934
3 Claims. (Cl. 260—38.5)

1. Azodyestuffs of the general formula:

wherein R stands for a member selected from the group consisting of an aromatic radical of the benzene and naphthalene series.

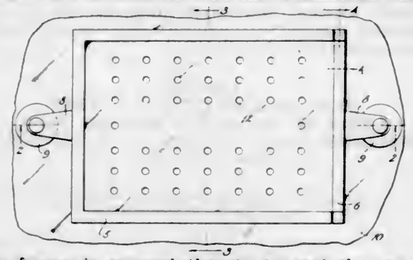
2,102,594
CLIPPER
Hermann Hill and William H. Foxall, Brighton, N. Y., assignors to Hillfox Manufacturing Corporation, Rochester, N. Y.
Application January 2, 1935, Serial No. 129
7 Claims. (Cl. 30—210)



1. Clippers comprising a handle, a fixed supporting rod projecting from one end of said handle, a cutter disc having cutting teeth arranged in a convex curve on the perimeter thereof attached to said supporting rod so as to have its teeth project substantially at right angles to the handle, an axially movable cutter disc having correspondingly arranged cutting teeth on the perimeter thereof surrounding said supporting rod and held yieldingly against said stationary cutter disc, a driving sleeve mounted to oscillate on said fixed supporting rod and means connecting said driving sleeve with said axially movable cutter disc and means for oscillating said driving sleeve.

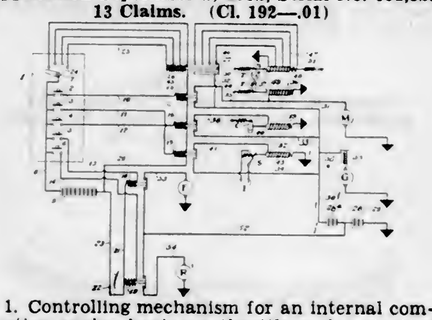
2,102,595
COATING COMPOSITION AND METHOD OF MAKING THE SAME
Maurice V. Hitt, Wilmington, Del., and David G. Kennedy and Harry L. Priddy, Parlin, N. J., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application May 8, 1935, Serial No. 20,394
6 Claims. (Cl. 134—79)

1. Process of preparing coating compositions which comprises mixing about two parts of undissolved nitrocellulose and one part of organic liquid consisting of a diluent in major proportion and a volatile solvent in minor proportion for about 30 minutes, mixing therewith about .1 part of carbon black wet with amyl alcohol, kneading until homogeneous and mixing therewith solvent, diluent, and resin.



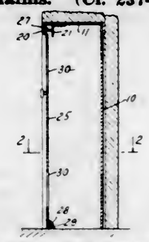
2,102,596
DISPLAY DEVICE
John A. Kern, Chicago, Ill., assignor to The W. J. McCahan Sugar Refining & Molasses Co., Philadelphia, Pa., a corporation of Delaware
Application September 13, 1937, Serial No. 163,623
6 Claims. (Cl. 40—126)

1. A display device, comprising a delivery unit in the form of a commercial package, a receiving unit including means mounted therein for retaining only a predetermined quantity of material delivered thereto by said delivery unit, and means for conveying the material delivered to said receiving unit in excess of said predetermined quantity from said receiving unit to said delivery unit.



2,102,597
WINDSHIELD ATTACHMENT
William Mable, Fort Collins, Colo., assignor of forty-one percent to Winthrop B. Morris, New York, N. Y.
Application September 12, 1935, Serial No. 40,337
1 Claim. (Cl. 20—40.5)

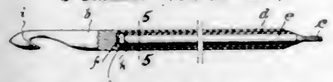
A device of the character described comprising in combination, a frame; a sheet of transparent perforated material removably held in the frame; means attached to the frame to secure it in parallelism to an automobile windshield or the like; and resilient means mounted on one side of the frame and in contact with the windshield when



the frame is secured thereto to seal the space between the frame and the windshield.

2,102,598
CONTROLLING APPARATUS
Rex D. McDill, East Cleveland, Ohio, assignor to Adjustable Scaffold & Form Company, Cleveland, Ohio, a corporation
Application September 2, 1932, Serial No. 631,529
13 Claims. (Cl. 192—.01)

1. Controlling mechanism for an internal combustion engine having a throttle and a starting motor, which comprises electro-magnetic means operatively connected to the throttle and arranged upon energization to move the throttle to the starting position, a circuit including said electro-magnetic means and said starting motor, a source of current supply in said circuit, and manually operable controlling means controlling the supply of said current to said circuit.



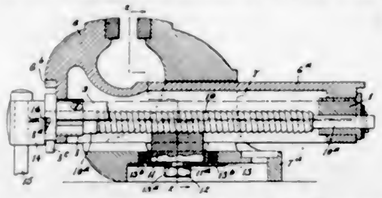
2,102,599
RADIATOR INCLOSURE
Albert D. Mellor, Flushing, N. Y.
Application December 13, 1935, Serial No. 54,200
4 Claims. (Cl. 237—79)

1. An inclosure having a top wall, a back wall, end walls and a downwardly opening channel member disposed at the front edge of the top wall, and a cover plate adapted to close the front of the inclosure and having a flange at the upper edge

thereof adapted to enter said channel member, the upper edge portion of the cover having an off-set portion extending forwardly of the remaining portion of the plate when the cover plate is in position on the closure.

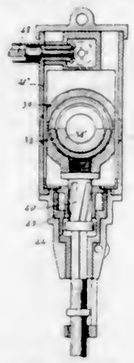
2,102,600
FLEXIBLE KNITTING NEEDLE
Lillian M. Miller, Fort Harrison, Mont.
Application January 27, 1937, Serial No. 122,633
2 Claims. (Cl. 66—117)

1. In a flexible knitting needle the combination of a knitting pin, a flexible shaft affixed to the shank of said pin, a second knitting pin, said pin having a hollow chamber, a tube inserted in and affixed to said chamber and having its inner end spaced from the inner end of the chamber, a core affixed to the flexible shaft and rotatably mounted in the aforesaid tube, said core having a head of greater diameter than the core and engaging against the end of the aforesaid tube within the knitting needle whereby to provide a flexible joint.



2,102,601
GOLF OVERSHOE
George E. Murber, San Francisco, Calif.
Application April 13, 1936, Serial No. 74,103
1 Claim. (Cl. 36—7.6)

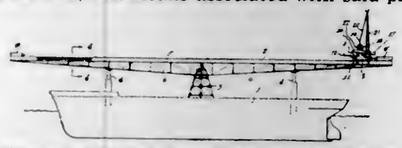
A rubber overshoe comprising a thin rubber upper provided with heavy solid rubber sole and heel portions formed integrally with the upper and of a thickness substantially greater than that of the material forming the upper, a separate outer sole of leather upon the bottom face of the rubber sole portion, a separate outer heel of leather upon the bottom face of the rubber heel portion, spikes positioned upon the bottoms of leather sole and heel and provided with securing means anchored to the leather without penetrating the rubber sole or heel portions, a leather insole and heel, and securing means extending through the leather sole and heel members and the adjacent rubber sole and heel portions and the insole and heel, said securing means being anchored to the insole and heel for binding the outer and inner soles and heels against the adjacent rubber sole and heel portions and for preventing material shifting of the securing means within the rubber sole and heel.



2,102,602
VISE
Samuel Thomas Nash, Woden Works, Wednesbury, England, assignor to The Steel Nut & Joseph Hampton Limited, Wednesbury, England
Application September 12, 1936, Serial No. 100,398
In Great Britain September 28, 1935
3 Claims. (Cl. 81—33)

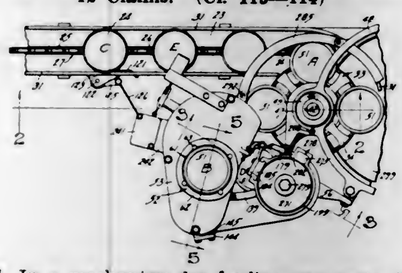
1. A quick action vise comprising a fixed part, a movable part, a screw carried by the movable part, a half nut complementary to the screw, carried by the fixed part, eccentric bearing means for the screw turnably mounted in the movable part, a projecting means turnable with the screw, and a complementary recessing of the eccentric

bearing for engagement by the said projecting means said engagement resulting in the positive turning of the eccentric bearing means so as to lift the screw out of engagement with the nut when the screw is rotated in a counter direction to that employed for moving the jaws together.



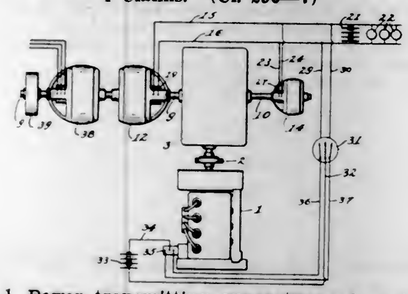
2,102,603
PERCUSSION APPARATUS
Giosuè Pinazza, Milan, Italy
Application February 8, 1936, Serial No. 63,035
In Italy February 16, 1935
6 Claims. (Cl. 255—42)

1. A percussive apparatus of the character described, comprising a striking element, means for supporting said striking element for alternating oscillatory motion and preventing rotation thereof, eccentric bodies rotatably disposed on said striking element and having their centres of gravity moving in the same plane comprising the axis of percussion in opposite directions symmetrically with respect to said axis of percussion, and means for imparting to said bodies a periodic variable rotation during each revolution, progressively accelerated during the active stroke and progressively retarded during the return stroke of said striking element.



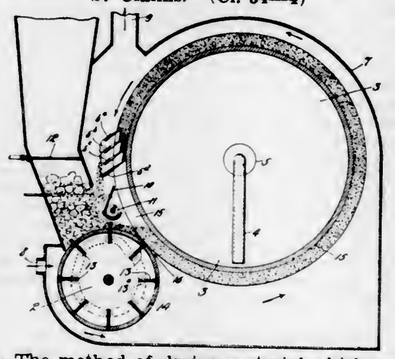
2,102,604
PACKAGE AND PACKAGE HANDLING MEANS FOR AIRPLANES
Kurt Arndt, Detroit, Mich.
Application January 5, 1935, Serial No. 493
12 Claims. (Cl. 244—137)

1. A container having the shape of an airfoil adapted for use with an airplane pick-up system, a stabilizing fin integral therewith, a rigid projection extending from rigid attachment to the bottom thereof through and outwardly of the top thereof, and means associated with said pro-



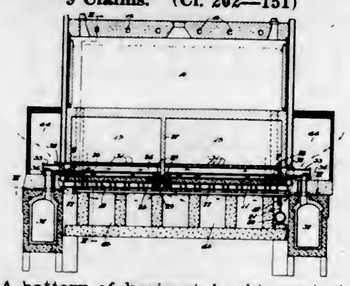
jection by which said container may be picked up by an airplane in flight.

2,102,605
CAN AND COVER FEEDING MECHANISM
Nelis P. Bach, Geneva, N. Y., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application May 17, 1934, Serial No. 726,165
12 Claims. (Cl. 113—114)



1. In a mechanism for feeding can parts, the combination of detecting instrumentalities located at a testing station for a can part, other detecting instrumentalities located at a second testing station for another can part, feeding devices for moving said can parts into their respective testing stations, and means associated with one of said instrumentalities and effective on the failure of feeding of a can part into its testing station for operating the other of said detecting instrumentalities at the other station.

2,102,606
POWER TRANSMITTING APPARATUS AND CONTROL MEANS THEREFOR
George B. Bailey, Sharon, Mass.
Application April 29, 1935, Serial No. 18,721
4 Claims. (Cl. 290—7)



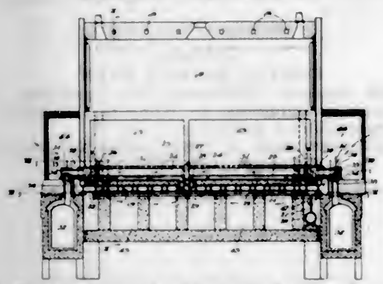
1. Power transmitting apparatus and control means therefor comprising, in combination, a prime mover; a dynamo driven thereby; power transmitting means connecting them including a differential unit; a second dynamo connected to said unit and adapted to impart power thereto; and control means actuated by variations in the electrical output of the first said dynamo, occasioned by changes of the load thereon, for controlling the power applied to said unit by both the prime mover and the second dynamo to maintain the speed of the first said dynamo substantially constant.

2,102,607
METHOD AND APPARATUS FOR TREATING MATERIALS
David S. Baker, Greenwich, Conn.
Application April 17, 1934, Serial No. 720,944
27 Claims. (Cl. 34—4)

1. The method of drying material which comprises repeatedly applying, and re-applying it to the same attempering surface in such a manner that while it is disposed on said surface it is divided into a number of spaced units, and disintegrating said units and redistributing the material comprising the units between applications to said surface.

2,102,608
COKING RETORT OVEN
Joseph Becker, Pittsburgh, Pa., assignor, by mesne assignments, to Koppers Company, a corporation of Delaware
Application July 9, 1935, Serial No. 30,533
9 Claims. (Cl. 202—151)

1. A battery of horizontal coking retort ovens comprising, in combination, a series of alternate coking chambers and intermediate heating walls therefor arranged side-by-side, a series of cross-regenerators therefor beneath and paralleling the same with sole channels at the bottom of and communicating through ports with the regenerators, a structural pad supporting said regenerators and itself supported above a sub-structure providing accessible passageways throughout the basement of the battery, a system of under-jet firing for said heating walls comprising fuel gas connections leading from the basement directly



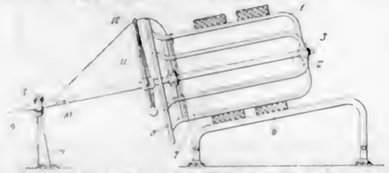
to the heating flues and accessible from the basement and valved air-conduit connections leading from the basement to the sole flues of the regenerators for conveying the air for combustion from the basement to the sole flues of the regenerators for preheating for combustion, and a waste gas flue alongside the basement on at least one longitudinal side of the battery and having valved connections with the sole flues of the regenerators for off-flow of waste gas from the regenerators, openings being provided all along both the pusher-side and coke-side of the basement directly below the structural pad for indraft of the combustion air requirements of the battery into the basement from the outside atmosphere, the air inlets for substantially all of the air-conduit connections which lead from the basement to the sole flues of the regenerators being arranged and concentrated at substantially the region of the lengthwise middle of the top part of the basement so as to maintain throughout the basement, from the side openings at the cooler longitudinal coke- and pusher-sides of the battery all the way into the warmer lengthwise middle region of the basement, ventilating cross-drafts of the total volume of combustion air for the basement regenerator air inlets, with all air supplied to the regenerators from the basement by the regenerator sole flue air inlets therein confined to air substantially solely from sole flue air inlets at the warmer lengthwise middle region of the basement.

2,102,609

COKING RETORT OVEN

Joseph Becker, Pittsburgh, Pa., assignor, by mesne assignments, to Koppers Company, a corporation of Delaware

Application August 17, 1935, Serial No. 36,682
8 Claims. (Cl. 202—151)



1. In a battery of coking retort ovens, in combination a series of alternate coking retort chambers and flued heating walls therefor arranged side-by-side in a row, cross regenerators beneath said chambers and paralleling the same and having sole-channels communicating with the regenerators, a structural pad supporting said regenerators and their sole channels and itself supported above a sub-structure providing accessible passage-ways throughout the basement of the battery, a system of under-jet underfiring for said heating walls and accessible in said passage-ways, a series of subsole-channels intermediate the pad and the sole-channels of the regenerator chambers and paralleling the latter, said subsole-channels having air inlets arranged for intake of air along the middle line of the basement roof at the longitudinal median line of said row and said subsole-channels communicating through ports at their outer ends with the sole-channels, a series of air-flow boxes for introducing underfiring air into the regenerators, said air-flow boxes having communicable connections directly with the atmosphere in the battery alleyways and with said sole-channels at their outer part, valve-means for the basement air inlets to the sub-sole channels and for the communicable connections of the air flow boxes to the atmosphere whereby air may be taken into the sole channels either from the basement or from the alley-ways, and said battery having openings along the pusher-side and coke-side of the basement for in-draft of air from the outside atmosphere and maintaining through the basement cross drafts from said side openings to said sub-sole-channel intakes along the middle line of the basement roof at the longitudinal median line of said row.

2,102,610

METHOD AND APPARATUS FOR UNWINDING WIRE, THREAD, OR THE LIKE

Arthur Ernest Blashill, Withington, Manchester, England

Original application June 18, 1931, Serial No. 545,321, now Patent No. 1,996,061, dated April 2, 1935. Divided and this application January 14, 1935, Serial No. 1,794. In Great Britain June 24, 1930
16 Claims. (Cl. 242—54)

1. Apparatus for supplying wire from coils thereof comprising a stationary reel having one end unobstructed so that the coils may be placed upon the reel from that end, the reel passing through each coil, a rotatable shaft extending beyond the opposite end of the reel adapted to restrain the reel from axial movement, said shaft being coaxial with the reel and being journalled at one end in the said reel and at its outer end in a stationary part of the apparatus, the arrangement being such as will prevent axial movement of the reel towards the said stationary part.

2,102,611

DIHALOGEN BUTENES AND PROCESS FOR THEIR PREPARATION

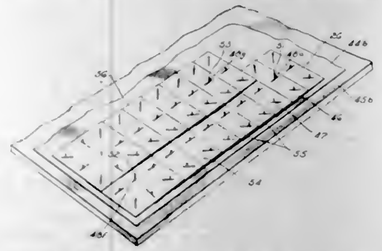
Wallace H. Carothers, Arden, and Arnold M. Collins, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application September 2, 1933, Serial No. 688,030
25 Claims. (Cl. 260—162)

1. A product having the formula:

$$CH_3CX{=}CH{-}CH_2X$$

in which X is a halogen atom.



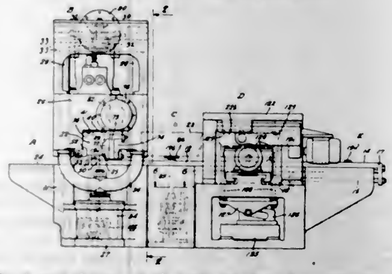
2,102,612

METHOD AND APPARATUS FOR MAKING MAPS

Charles W. Collier, Alexandria, Va., assignor to Fairchild, Polley & Eliel, Inc., Los Angeles, Calif., a corporation of California

Application December 10, 1935, Serial No. 53,791
14 Claims. (Cl. 33—1)

11. A method of the character described for locating points for map purposes, including the steps of: taking a series of photographs of consecutive overlapping areas including basic reference points for which map data are known; forming templets representative of said photographs, each templet having a hole representing the center point of the corresponding photograph and having slots radial to the hole representing angular relationships among outlying reference points of the photograph, said outlying points including said basic reference points; plotting said basic reference points on a control surface at locations spaced in accordance with a desired scale; assembling said templets on said control surface in the sequence of the corresponding photographs; in-



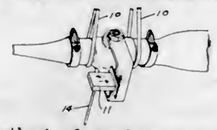
terconnecting said templets by a plurality of means representing said reference points and extending through the center holes and at least some intersecting slots of overlapping templets, thereby interlocking the templets for coordinated extension or contraction; and adjusting said series of templets to cause the interconnecting means at slot intersections that correspond with said ploted basic reference points on the control surface to register with said plotted points, thereby placing on the control surface the remaining interconnecting means and slot intersections at positions with respect to said basic reference points corresponding to said desired scale.

2,102,613

MACHINE TOOL

Lyndon C. Cole, Hamilton, Ohio, assignor to General Machinery Corporation, Hamilton, Ohio, a corporation of Delaware

Application December 30, 1935, Serial No. 56,630
18 Claims. (Cl. 29—33)



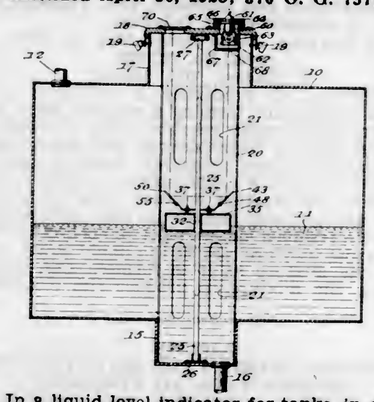
1. A machine of the character described comprising conveying means adapted to move a work piece to a predetermined position, a work engaging head movable from a retracted position affording clearance for movement of a work piece on the conveyor to an operating position adjacent the predetermined position of a work piece on the conveyor, means for moving the head to operating position, means to move the work piece from the conveyor when in the predetermined position thereon into engagement with said head, a cutting tool movably carried by the head to traverse the work piece, and means to move the cutting tool.

2,102,614

METHOD OF PRODUCING AND DISTINGUISHING FREQUENCY VIBRATIONS

Howard H. Couch, Fairfield, Ohio

Application September 20, 1935, Serial No. 41,431
17 Claims. (Cl. 73—51)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

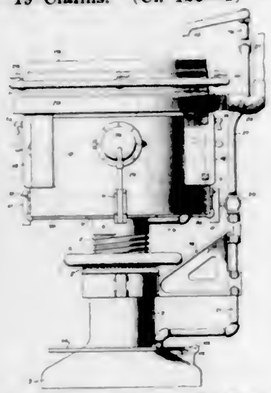


1. The method of predetermining wave phenomena in a propeller blade to obtain its resonant characteristics at different frequencies, which consists in the steps of supporting the propeller in balanced relation about its axis of rotation, subjecting the mid point of the propeller to an exciting force in a predetermined direction with respect to said axis of rotation to cause it to vibrate at a resonant vibration frequency with a predetermined vibration characteristic at the mid point of the propeller, and detecting and distinguishing the nodal characteristics of the vibration of the blades of said propeller and thereafter reproportioning the propeller profile to cause such resonant characteristics that produce excessive stresses in the propeller blade to occur outside the normal operating speed range of said propeller under similar operating conditions.

2,102,615

LIQUID MEASURING DEVICE

Joseph J. Cubete, Pittsburg, Kans.

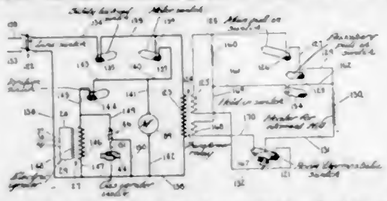


Application February 15, 1937, Serial No. 125,790
7 Claims. (Cl. 73—319)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In a liquid level indicator for tanks, in combination, a measuring element fixed within the tank and extending into the liquid therein, said element having light transmissible portions forming characters each of which is representative of the quantity of liquid in the tank when the liquid level is at a predetermined lower point on said element, a float carried by said liquid, a window in said tank, a source of light, means positioned on said float for projecting a beam of

light from said source through the one of said characters corresponding to the liquid level in the tank, and means for causing said beam to form an image of said character which may be viewed through said window.

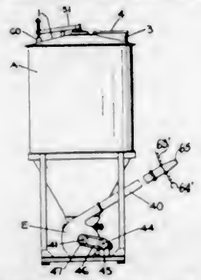
2,102,616
STOVE
Clement Ehret, White Plains, N. Y.
Application May 21, 1935, Serial No. 22,511
19 Claims. (Cl. 126—1)



1. A stove comprising a stove body mounted for rotation and having a plurality of fuel burners, a water supply duct having a water outlet positioned to deliver water into receptacles associated with the burners, a valve for controlling the flow of water through said duct, and means rotatable with the stove body for controlling said valve.

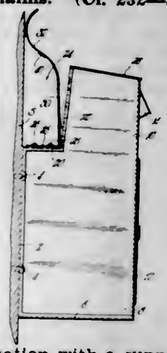
2,102,617
SYNTHETIC RESINS
John D. Farber, Philadelphia, Pa., assignor to Management and Research, Inc., Philadelphia, Pa., a corporation of Delaware
No Drawing. Application May 25, 1934, Serial No. 727,523
2 Claims. (Cl. 260—4)

1. Process of producing a synthetic resin which consists in: forming a resinous mass as a condensation product resulting from the reaction between phenol, formaldehyde and oxalic acid; simultaneously and separately forming another resinous mass as a condensation product resulting from the reaction between citric acid, glycerine and phthalic anhydride; then mixing said separate resinous masses prior to cooling thereof and while they are still in the liquid state; stirring the mixture as it is formed; and finally cooling the mixture to produce the completed resin.



2,102,618
AUTOMATIC SYSTEM FOR SUPPLYING PULVERIZED FUEL TO FURNACES
Earle V. Francis, Columbus, Ohio, assignor to The Jeffrey Manufacturing Company, a corporation of Ohio
Application January 23, 1933, Serial No. 652,975
2 Claims. (Cl. 158—28)

1. In combination with a motor operated fuel feeding and ignition means, a control system therefor comprising an ignition circuit having a switch therein, a motor circuit, a motor switch, a thermal time limit cut-out switch which opens when heated to a predetermined degree and must thereafter be manually closed, said thermal switch controlling both of said circuits, a first control circuit having means which when energized closes said motor switch, a resistance heater for said cut-out switch, first and second switches and contacts of a main switch which close in response to a determined lowering of the temperature of the space to be heated, a second control circuit including a resistance and a third switch in parallel with said first and second switches and in series with said heater, a third control circuit including said third switch, the

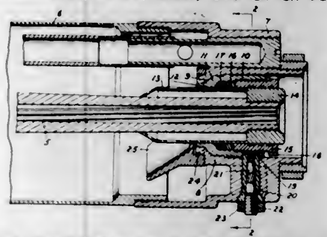


resistance heater and the contacts of the main control switch which close in response to a determined rise in temperature of the space to be heated, and combustion responsive switching mechanism operable upon the establishment of combustion to (1) close said third switch, (2) to open said second switch and (3) to open said first and said ignition switches and upon cessation of combustion to (1) open said third switch, (2) to close said second switch and (3) to close said first and ignition switches whereby, if said third switch fails to close the cut-out switch will operate in a time period to shut down the system.

2,102,619
FUEL FEEDER
Earle V. Francis, Columbus, Ohio, assignor to The Jeffrey Manufacturing Company, a corporation of Ohio
Application July 28, 1933, Serial No. 682,680
14 Claims. (Cl. 221—134)

1. In a heating apparatus, the combination with a feeding device for pulverized fuel including a hopper for receiving the fuel, of mechanism for feeding the fuel from the hopper into an ejecting position, the said mechanism comprising a rotatable supporting member, agitating means mounted on the supporting member for maintaining a zone of agitated fuel as the supporting member rotates, a feeder plate also mounted on the supporting member and rotative therewith, the said plate having a port therethrough, a second plate below the feeder plate for receiving fuel from the said feeder plate, and also having a port for passing fuel into ejecting position, a scraper associated with the said second plate and rotative with the supporting member for directing fuel through the port of the said second plate, and driving mechanism for the said supporting member and parts carried thereby.

2,102,620
MAIL BOX
Henry S. Gilman, Springfield, Mass.
Application February 25, 1937, Serial No. 127,654
2 Claims. (Cl. 232—33)

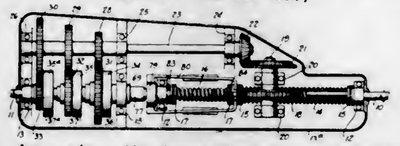


1. The combination with a support of a receptacle secured thereto, said receptacle being formed to have a horizontal ledge part intermediate the upper and lower marginal edges of its rear side and a yielding spring member having one end secured to said receptacle adjacent said ledge part and its other end extending freely away therefrom.

2,102,621
ACCELERATOR OF VULCANIZATION
Robert C. Goodwin, Lubbock, Tex., and Arthur W. Sloan, Akron, Ohio; said Sloan assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York
No Drawing. Application April 11, 1936, Serial No. 73,969
16 Claims. (Cl. 18—53)

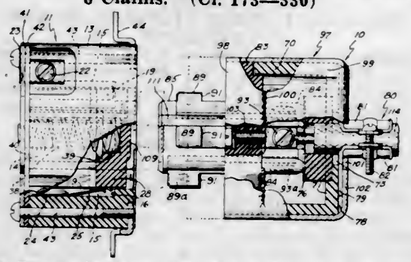
1. The process which comprises vulcanizing rubber in the presence of a salt consisting of a bivalent metal combined solely with diaryl dithiocarbamic acids.

2,102,622
GUN BARREL MOUNTING
Samuel G. Green, Gray, Ga.
Application November 20, 1936, Serial No. 111,867
5 Claims. (Cl. 89—14)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



1. In a machine gun, a jacket for a cooling fluid and having a front end cap, a gun barrel mounted for reciprocation within the jacket, a fixed sleeve on the cap and having an internal shoulder, a bearing member for the barrel threaded in the fixed sleeve and having an offset engaging the internal shoulder of the sleeve, said bearing member having an aperture, a gland threaded in the bearing member and adapted to support the gun barrel, a packing confined between the gland and the offset of the bearing member, a hollow set screw in the end cap and inserted in the aperture of the bearing member, a pin in the hollow set screw, and a set screw in the hollow set screw and holding the pin against the gland.

2,102,623
WATER-RESISTANT PROLAMINE BASE COMPOSITION
Donald W. Hansen, Decatur, Ill., assignor, by mesne assignments, to Prolamine Products Incorporated, Dover, Del., a corporation of Delaware
No Drawing. Application December 11, 1933, Serial No. 701,864
14 Claims. (Cl. 106—38)



1. A composition of matter useful in the form of films, filaments and coatings comprising a prolamine base, and a salt of an amino acid ester having the property of preventing the composition in dry solid form from spotting or blushing by action of moisture thereon.

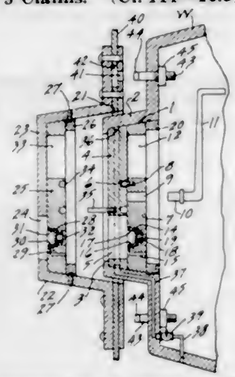
2,102,624
AUTOMATIC TRANSMISSION
Clifford P. Hopson, Bakersfield, Calif.
Application March 2, 1936, Serial No. 66,644
8 Claims. (Cl. 74—337)

1. An automatic transmission comprising a driving element; a driven element; and power transferring mechanism operatively connecting said elements to vary the speed ratio between the elements in accordance with the variations in load on the driven element relative to power applied to the driving element; said mechanism including a plurality of differently ratioed driving connections; a plurality of constantly meshing gears one of which is mounted on the driving element for rotation thereby to drive the other of said gears and for axial feeding from one extreme position to another on the driving element while or without driving said other of the gears; means for yieldingly resisting the axial feeding of said one of the gears; and means responsive to axial feeding of said one of the gears to render active a predetermined one of said driving connections.

2,102,625
INTERLOCKING RECEPTACLE, CONNECTER, AND CAP
Harvey Hubbell, Jr., Bridgeport, Conn.
Application March 20, 1935, Serial No. 11,942
6 Claims. (Cl. 173—330)

1. In an electrical device, a socket, a plug, said

socket comprising a body of insulating material having a bore therein and recesses at the sides of said bore and opening through the front end of the body, contacts in said recesses and extending lengthwise of the body, tensioning springs in said recesses in the rear of the contacts and bearing against the walls of the recesses and the forward end portions of the contacts, laterally extending lugs on said springs, said body having locating recesses receiving said lugs to position said springs, and contacts carried by said plug and engageable with the first contacts on insertion into said bore.



2,102,626

RESCUE APPARATUS

James W. Justus, Birmingham, Ala., assignor of four eighths to J. B. Owens, Birmingham, and seventy-six eighths to Deep Sea Rescue & Salvage Corporation, Birmingham, Ala.

Application August 10, 1936, Serial No. 95,159

5 Claims. (Cl. 114—16.8)

1. In combination, a vessel hull having an opening therethrough defined by a surrounding flange providing an entrance member, a closure member for the said entrance member provided with a passage opening, a closure member mounted within the entrance member and having an opening to register with the opening in the first closure member, a submergible vessel having an opening in a wall thereof defined by a surrounding flange to provide a member to telescope with the entrance member of the hull, a plurality of closure members within the member of the submergible vessel, said closure members having openings adapted to register with each other, said openings being also adapted to be brought into register with the openings in the closure members of the hull.

2,102,627

ZIRCONIUM OXIDE VITREOUS ENAMEL OPACIFIER

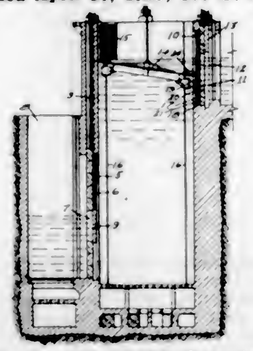
Charles J. Kinzie, Niagara Falls, N. Y., assignor to The Titanium Alloy Manufacturing Company, New York, N. Y., a corporation of Maine

No Drawing. Application August 7, 1935, Serial No. 35,040

11 Claims. (Cl. 106—36.2)

1. The method of making a vitreous enamel white opacifying composition from a zirconium oxide compound which comprises mixing said zirconium compound with an alkali-metal reagent in a ratio not to exceed 4 parts of said reagent to 10 parts ZrO_2 in said compound, and roasting said mixture, but without fusion, at temperatures from 800° to 950° C. to convert said compound into the zirconium oxide opacifying composition.

2,102,628



TELESCOPIC BARRIER IN CONNECTION WITH EXIT PORTAL IN FISH LIFTS

Lewis E. Knerr, Portland, Oreg., assignor to the Government of the United States of America, represented by the Secretary of War

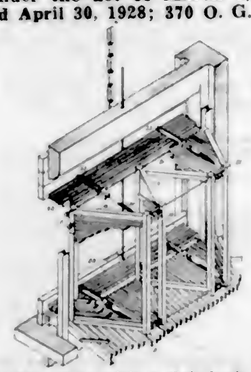
Application May 25, 1937, Serial No. 144,616

5 Claims. (Cl. 61—21)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A dam structure of the character described comprising a fish lock having an exit portal, the latter including a sill, a fish lift operable in the lock to a fish discharging position with respect to the exit portal and means in connection with the exit portal and coacting with the fish lift to close the space between the bottom of the fish lift and the sill of the exit portal when the lift is in its fish discharging position.

2,102,629



FISH TRAP FOR FISH LIFTS

Lewis E. Knerr, Portland, Oreg., assignor to the Government of the United States of America, represented by the Secretary of War

Application May 25, 1937, Serial No. 144,617

5 Claims. (Cl. 61—21)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. The combination with a fish lock construction, and a fish lift operating in the lock, of a fish trap supported by the lift and adapted to cooperate with an entrance opening formed in the lock construction, said trap comprising a pair of barriers arranged to form a passage converging from the entrance portal to the interior of the lock, said passage terminating in a restricted fish outlet, a ceiling and flooring in connection with the barriers and means associated with the top and bottom of the fish trap and adjacent the entrance to the converging passage to prevent passage of fish above and below the fish trap.

2,102,630

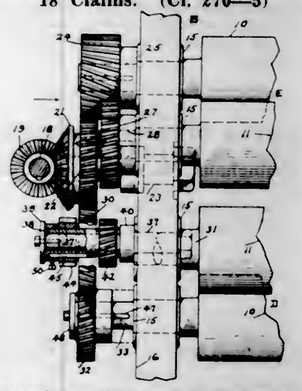
CLOUDED VITREOUS ENAMEL

Ignaz Kreidl, Vienna, Austria

No Drawing. Application February 9, 1933, Serial No. 656,047

13 Claims. (Cl. 106—36.2)

1. An article of manufacture comprising a metal article having thereon a coating of clouded vitreous enamel produced from a slip containing clay and having an opacity substantially greater than that which would be produced with the frit used and clay alone, a substantial part of the increase in opacity over that caused by the frit and clay alone being contributed by gas bubbles which are retained in the fired enamel.



2,102,631

DRIVE FOR PRINTING MACHINES

Frederick Lamatsch, Grantwood, N. J., assignor, by mesne assignments, to R. Hoe & Co., Inc., New York, N. Y., a corporation of New York

Application February 26, 1934, Serial No. 713,058

18 Claims. (Cl. 270—5)

1. In a web printing unit including a plurality of printing couples, each couple comprising a form cylinder and an impression cylinder, intermeshing synchronizing gears for operably synchronizing the cylinders of each printing couple, a rotatable member including a drive gear and a synchronizing gear, the synchronizing gear of the rotatable member meshing directly with a synchronizing gear of each printing couple to operably synchronize all the cylinders of the printing unit, and a drive gear meshing directly with the drive gear of the rotatable member, the drive and synchronizing gears being located at one side of the printing unit.

2,102,632

VIEWING SCREEN FOR USE IN OPTICAL SYSTEMS EMPLOYING POLARIZED LIGHT

Edwin H. Land, Wellesley Farms, Mass., assignor to Sheet Polarizer Company, Inc., Union City, N. J., a corporation of New Jersey

Application June 2, 1936, Serial No. 83,038

11 Claims. (Cl. 88—1)

1. In an automotive vehicle or the like, a viewing screen comprising a sheet-like light-polarizing element adapted, when the elements of said screen are in a predetermined position, to block polarized light vibrating in a plane substantially parallel to the surface upon which said vehicle rests, and wave retardation means mounted for movement into and out of position between said light-polarizing means and a source of polarized light impinging thereon, and being adapted,

when interposed between said light source and said light-polarizing means, for causing said screen to block polarized light of a different predetermined character or direction of vibration from that blocked by said light polarizing element, the optical axes of said wave retardation means being positioned at predetermined angles to the polarizing axis of said polarizing element.

2,102,633

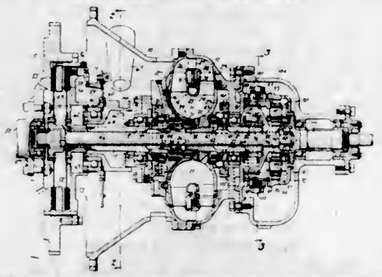
PRODUCTION OF METALLIC DRIERS

Kenneth E. Long, South Euclid, Ohio, assignor to The Harshaw Chemical Company, Elyria, Ohio, a corporation of Ohio

No Drawing. Application November 10, 1933, Serial No. 697,472

12 Claims. (Cl. 134—57)

1. A process of making driers, which comprises preparing a basic lead drier salt, and controllably lessening the basicity of the basic salt by reacting on the basic salt with an agent providing an organic carboxyl acid radical reactive therewith the resulting drier being basic but of lesser basicity than the basic lead drier salt initially treated.



2,102,634

VARIABLE SPEED POWER TRANSMISSION

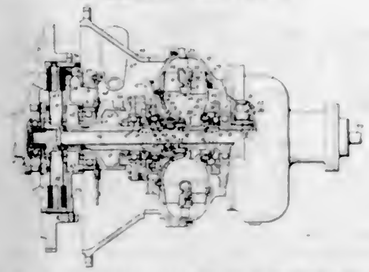
Alf Lysholm, Fred Horney, and Gösta Wahlsten, Stockholm, Sweden, assignors to Aktiebolaget Ljungstroms Ångturbin, Stockholm, Sweden, a corporation of Sweden

Application March 3, 1933, Serial No. 659,500. Renewed July 30, 1936. In Germany January 14, 1931

12 Claims. (Cl. 74—293)

1. A variable-speed power transmission comprising a driving shaft, a driven shaft, a first means comprising a releasable clutch for transmitting power mechanically from the driving shaft to the driven shaft, a second means for transmitting power from the driving shaft to the driven shaft, said second means comprising hydraulic variable speed power transmitting mechanism having a driven member, a second releasable clutch for transmitting power from the

driving shaft to said hydraulic variable speed mechanism, mechanism for transmitting power from the driven member of the hydraulic mechanism to said driven shaft comprising planetary gearing and mechanism including frictionally engaging parts for controlling said planetary gearing to cause power to be transmitted directly through the gearing in one position of the control means and to cause power to be transmitted to the driven shaft in reverse direction through the gearing in another position of the controlling means.



2,102,635

VARIABLE SPEED POWER TRANSMISSION

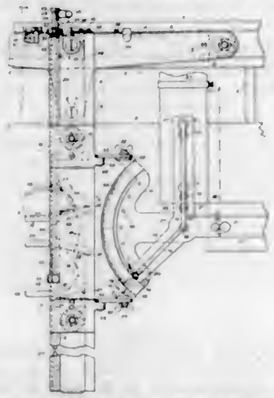
Alf Lysholm, Fred Horney, and Gösta Wahlsten, Stockholm, Sweden, assignors to Aktiebolaget Ljungstroms Ångturbin, Stockholm, Sweden, a corporation of Sweden

Original application March 3, 1933, Serial No. 659,500. Divided and this application November 21, 1934, Serial No. 754,080. In Germany January 14, 1931

6 Claims. (Cl. 60—54)

1. In a variable-speed power transmission, a casing providing a chamber for operating fluid, hydraulic variable-speed power transmitting mechanism comprising a driving member and a driven member, the driving member comprising a shaft portion, a hub portion and a disc portion located in said chamber and carrying a ring of impeller blades, the driven member comprising a shaft portion, a hub portion and a disc portion located in said chamber and carrying a ring of impelled blades, said impeller blades and said impelled blades being arranged to transmit power from the driving member to the driven member and said shaft parts being in axial alignment, the exterior of said hub portions being shaped to define the radially inner part of a closed path of flow for the operating fluid, one of said hub portions being recessed axially and the other of said hub portions having a cooperating axial extension to provide therebetween a pilot bearing, and bearings for rotatably mounting each of said members in said casing.

2,102,636



DRAFTING MACHINE

Leonard McDonald, El Campo, Tex.

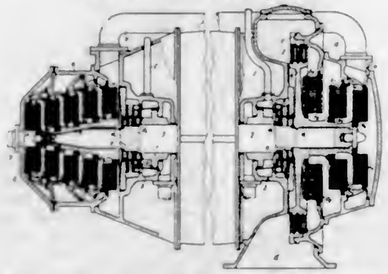
Application August 13, 1932, Serial No. 628,622

25 Claims. (Cl. 33—79)

1. A straight guide adapted to be attached to supporting means having a drawing surface, a straight guide and means adapting it to be guided by said stationary guide, longitudinally thereof, and for maintaining it at right angles thereto, a carriage having means engaging said movable guide for guidance of the carriage longitudinally thereon, a protractor carried by said carriage, having a rule and means supporting the rule for angular adjustment with respect to said movable guide, a clutch carried by said movable guide adapted to engage said stationary guide for holding the movable guide fast thereon, means connected with said clutch extending lengthwise of

said movable guide and for disengaging the clutch from the stationary guide, and means on said carriage, the manual operation of which, actuates said lengthwise extending means, permitting the carriage to be moved in any direction over the drawing surface.

2,102,637



ARRANGEMENT OF RADIALLY TRAVERSED BLADES IN ROTARY MACHINES

Ulrich Meininghaus, Mulheim-Ruhr, Germany

Application May 17, 1933, Serial No. 671,442

In Germany June 1, 1932

15 Claims. (Cl. 253—79)

1. In a rotary machine, such as a steam or gas turbine, the combination of a shaft, bearings adapted to support said shaft, a driven rotating machine part arranged on said shaft between said bearings, rotary discs arranged on a stub end of said shaft in overhung fashion, a number of radially traversed rows of reaction blades on each of said discs, carrier rings supporting said blades at both ends thereof, and stationary bladed discs cooperating with said rotary discs, the latter being arranged to be impinged in series and on corresponding sides of the discs and there being a pressure drop through said blades and along said discs, the mean pressures acting upon the opposite sides of at least certain of said discs being different and thus causing axial thrusts upon said discs in the same direction, the number of rotary blades being such that they can be distributed on a smaller number of discs of larger

diameter without causing overstressing by centrifugal force acting on the outermost rotating blades or on the disc or discs supporting them when the discs are driven at approximately the rated speed of the machine, whereby the thrust on said discs is reduced, for a given total pressure drop, as compared with the thrust on discs carrying the maximum permissible number of rows of blades.

2,102,638

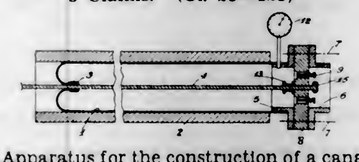
HYDRAULIC FLUID

Douglas V. Moses, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application February 24, 1933, Serial No. 658,440. Renewed December 8, 1936

10 Claims. (Cl. 252—5)

1. A hydraulic fluid comprising a solution of an aliphatic monohydric alcohol, a blown oil, and a soap.



2,102,639

APPARATUS FOR CONSTRUCTING MONOLITHIC CANALIZED STRUCTURES

Jean Pierre Louis Mourraille, Paris, France, assignor to Sté dite Satujo Sté Anme de Construction de Tuyaux sans Joints Systeme Cravetto Breveté S. G. D. G., Paris, France

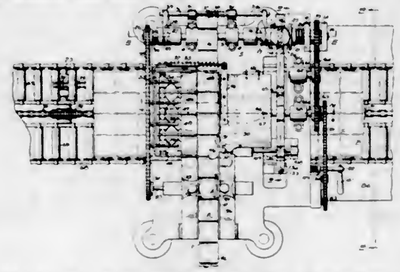
Original application July 1, 1933, Serial No. 678,711. Divided and this application April 17, 1934, Serial No. 720,986. In France October 28, 1932

3 Claims. (Cl. 25—128)

1. Apparatus for the construction of a canalized structure out of a self-setting plastic material, comprising an inflatable, collapsible, flexible core consisting of a hollow body closed at one end and having a pull cord attached thereto, means for admitting a fluid under pressure within said core so as to inflate the same, and means for maintaining pressure within said core, when a pull is exerted upon said cord so as to turn said core inside out, and to gradually detach it from the surface of the surrounding conduit, said cord extending through and beyond said pressure maintaining means.

2,102,640

PACKING MACHINE



Anton Novotny, Detroit, Mich., assignor, by mesne assignments, to Tivoli Brewing Company, Detroit, Mich., a corporation of Michigan

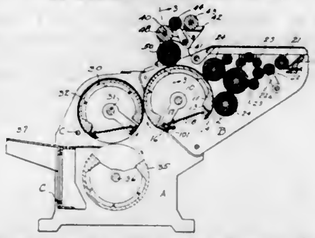
Application February 23, 1935, Serial No. 7,739

24 Claims. (Cl. 226—14)

1. In a mechanism of the character described, the combination of a chute open at all times for packages to drop therethrough, a slide to deliver the packages thereinto, feeding means for transporting the packages within the range of the slide, a portion of the feeding means extending between the normal position of the slide and the chute, and means for checking the movement of the packages as they are delivered to the chute by the slide.

22. In a mechanism of the character described, the combination of a chute, a cage vertically movable therein, a slide adapted to feed packages into the chute, a conveyor carrying shipping cases to loading position beneath the chute, and means actuated by the final movement of the slide for moving the cage vertically to engage the sides of the shipping cases and hold them substantially vertical during the delivery of the packages down the chute into the cases.

24. In an arrangement of the character described the combination of a conveyor including a tail sprocket, a slide mounted for reciprocation across the conveyor, a chute adjacent a portion of the conveyor into which packages are delivered from the latter by the slide, a second conveyor including a driven sprocket wheel beneath the chute, a shaft on which the latter is mounted, a spindle driven by rotation of the tail sprocket, a trip on said spindle, and means on said shaft actuated by said trip whereby the second conveyor is advanced.



2,102,641

METHOD OF AND APPARATUS FOR PLANOGRAPHIC PRINTING

Henry C. Osborn, Cleveland, Ohio, assignor, by mesne assignments, to Addressograph-Multigraph Corporation, Cleveland, Ohio, a corporation of Delaware

Application November 22, 1934, Serial No. 754,247

10 Claims. (Cl. 101—148)

1. In a planographic press wherein the image-carrying member comprises a metallic plate, one dampening roller in contact with such printing plate, said roller having a surface of a material which is resilient and at the same time non-absorptive, and means for adjusting the pressure of said roll against the plate to cause a squeegee action.

2,102,642

TREATMENT OF MILK PRODUCTS

Herbert E. Otting, Westerville, and Edwin H. Browne and Maurice E. Hull, Columbus, Ohio, assignors to M. & R. Dietetic Laboratories, Inc., a corporation of Ohio

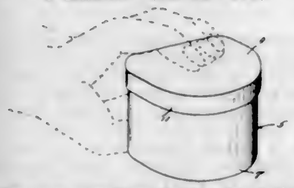
No Drawing. Application November 25, 1935, Serial No. 51,468

29 Claims. (Cl. 99—60)

1. The method of effecting the partial removal of calcium and phosphate ions from acidified liquid milk products by contact with a reactivated spent exchange material which comprises separately treating the spent exchange material

carrying calcium and phosphate ions with solutions of a water soluble silicate and of a water soluble aluminate, and with an intervening alkali metal salt solution, and subsequently contacting the activated material with the acidified milk product.

11. In the method of effecting the partial removal of calcium and phosphate ions from acidified milk products by contact with a reactivated spent exchange material, the step comprising treating exchange material carrying calcium and phosphate ions with an aqueous solution of a water-soluble silicate.



2,102,643

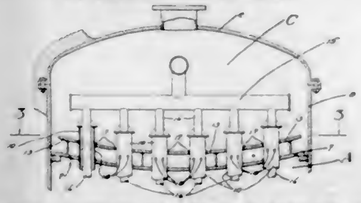
DENTURE CLEANING DEVICE

Domenick Pellegrini, New York, N. Y.

Application March 13, 1936, Serial No. 68,739

2 Claims. (Cl. 15—104)

1. A denture cleaning device comprising a receptacle in which pieces of denture can be placed, a closure for the receptacle and a multiplicity of small pellets in the receptacle for abrasive contact with pieces of denture in the receptacle when said receptacle is agitated, and a spacing member freely positioned in the receptacle for spacing pieces of denture in the receptacle, said spacing member having an opening to permit passage of the pellets to opposite sides thereof.



2,102,644

TEMPERATURE CONTROL OF REACTION VESSELS

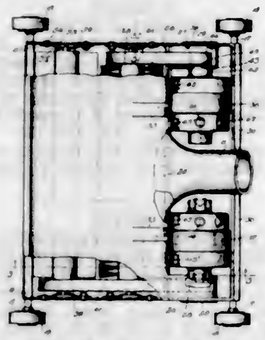
Thomas B. Prickett, Woodbury, N. J., assignor to Houdry Process Corporation, Dover, Del., a corporation of Delaware

Application April 1, 1935, Serial No. 14,068

14 Claims. (Cl. 23—288)

1. In a converter for effecting chemical reactions, a partition extending across said converter and defining one end of a reaction chamber and one end of a fluid reservoir, a contact mass in said chamber, heat baffling means in spaced relation with said partition and interposed between the latter and said mass, and heat baffling means in said reservoir in spaced relation with said partition.

2,102,645



DOUBLE BRUSH TYPE FLOOR TOOL FOR AIR-METHOD CLEANERS

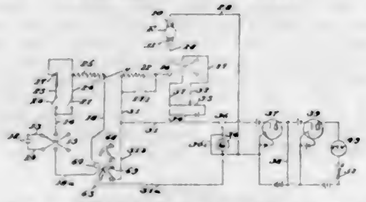
Daniel Benson Replogle, Berkeley, Calif., assignor to The Ohio Citizens Trust Company, Toledo, Ohio, a corporation of Ohio, as trustee

Application May 1, 1935, Serial No. 19,310

10 Claims. (Cl. 15—6)

4. In an apparatus of the character described, a suction nozzle having a pair of agitators mounted therein, said nozzle having parallel chambered arms communicating with the interior of the nozzle and extending rearwardly therefrom, corresponding openings in each of said arms facing each other, and motors for actuating said agitators having hubs closing said openings air-tight, and power transmission means extending through said chambered arms from said motors to said agitators.

7. A floor tool comprising a suction nozzle having a pair of rotatable agitators therein, and means for selectively actuating said agitators to rotate singly, or simultaneously, in the same or in opposite directions, at the will of the operator.



2,102,646

METHOD AND APPARATUS FOR TESTING EGGS

Frederick Langdon Rivenburgh, Springfield, Ohio

Substitute for application Serial No. 487,603, October 9, 1930. This application April 25, 1935, Serial No. 18,251. Renewed June 4, 1936

38 Claims. (Cl. 175—265)

1. The method of testing eggs for life activity, which comprises arousing the egg, exciting the egg by imposing an electromotive potential thereon, and determining the response upon excitation.

2,102,647

ARTIFICIAL EFFECT MATERIAL

Robert Pierce Roberts, Spondon, near Derby, England, assignor to Celanese Corporation of America, a corporation of Delaware

No Drawing. Application September 16, 1930, Serial No. 482,280. In Great Britain November 18, 1929

4 Claims. (Cl. 8—20)

1. Process for the production of improved textile materials, which comprises producing filaments of an organic ester of cellulose by a dry spinning operation, in the course of which the solvent content of the evaporative atmosphere is

varied to produce local differences in the resistance to saponification of the filaments, and subsequently treating said filaments with a saponifying agent of such strength, at such temperature and for such time that local differences in the degree of saponification are produced.

2,102,648

FABRICS AND OTHER MATERIAL AND THEIR MANUFACTURE

Robert Pierce Roberts, Spondon, near Derby, England, assignor to Celanese Corporation of America, a corporation of Delaware

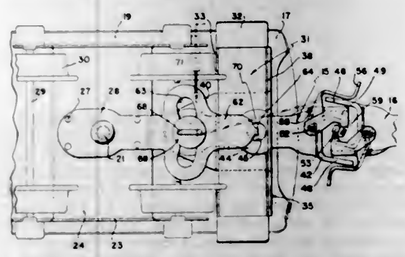
Application April 12, 1933, Serial No. 665,630

In Great Britain April 27, 1932

13 Claims. (Cl. 8—20)

1. Process for the production of materials particularly adapted for the production of color and other effects, which comprises subjecting materials containing organic esters of cellulose, different portions of which materials have been stretched to different extents, to saponification under such conditions that the portions which have been stretched to different extents are saponified to different extents.

7. Process for the production of materials particularly adapted for the production of color and other effects, which comprises stretching along selected portions of their length threads containing cellulose acetate, and then saponifying the threads under such conditions that the unstretched portions are saponified while the stretched portions are unsaponified.



2,102,649

TOY TRAIN COUPLER

Norval Rydin, Chicago, Ill.

Application August 6, 1936, Serial No. 94,603

2 Claims. (Cl. 213—100)

1. In a toy coupler, a drawbar, a coupler head on said drawbar having a forwardly extending inclined side wall, a substantially bell crank-shaped knuckle, means pivotally connecting the knuckle, at its angle, to the head, said knuckle having an outer jaw portion normally urged in the direction of the side wall, said outer jaw portion being normally arranged at an acute angle to the transverse axis of the head, and a manipulating finger-piece on the knuckle disposed at one side of the head, said finger-piece extending in close proximity to the coupler head.

2,102,650

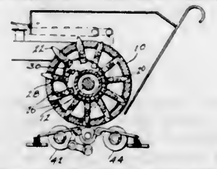
METHOD OF VAPORIZING AND SPRAYING THICK LIQUIDS

Hermann H. Schmidt, Hanover, Kans., assignor to Missouri Holding and Investment Company, St. Joseph, Mo.

No Drawing. Application January 21, 1935, Serial No. 2,705

19 Claims. (Cl. 99—1)

3. The method of spraying heavy viscous fluids or heavy powders without pre-heating the same comprising whirling a quantity thereof at a velocity such as to increase the fluidity thereof due to the centrifugal force set up by said whirling, and discharging said fluid or powder through an orifice while under the influence of said centrifugal force.



2,102,651

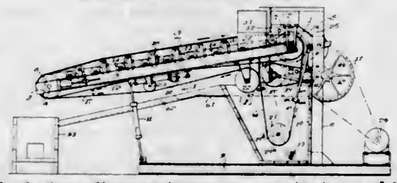
PINWHEEL FEED

John Q. Sherman and Henry G. Dybvig, Dayton, Ohio; said Dybvig assignor to said Sherman

Application March 21, 1935, Serial No. 12,206

52 Claims. (Cl. 197—133)

26. Apparatus for feeding and aligning superposed sheets of record or like material comprising a moving material carrier, and a pin feeding device associated with the carrier including pins having lateral movement at different speeds relative to movement of the record material carrier.

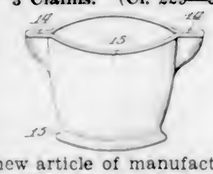


2,102,652

TRAVELING MAT CONCENTRATOR

John T. Shimmin, Buchans, Newfoundland; Daisy M. Shimmin administratrix of said John T. Shimmin, deceased

Application March 23, 1936, Serial No. 70,452



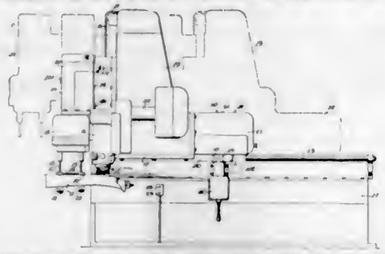
8 Claims. (Cl. 209—430)

1. A traveling-mat ore concentrator, which comprises: an inclined table structure provided with head and tail drums at the upper and lower ends thereof, respectively; an endless carrier belt mounted on said table, extending over said head and tail drums, and having an ascending run above said table and a descending run below said table; driving means for said carrier belt to cause movement thereof in an upward direction along said ascending run; an endless value-collecting belt of greater length than said carrier belt and having a collecting portion resting upon and carried by said ascending run of said carrier belt and a value-discharging portion extending below and removed from said descending run of said carrier belt; feed means for supplying a value-containing ore and water to said collecting portion adjacent the upper end of said table; a concentrate

bin disposed below said table; means for maintaining a body of water in said concentrate bin; idler means engaging said value-discharging portion of said collecting belt to cause said portion to enter said bin and extend below the level of water therein; agitator means positioned between said head drum and said idler means and operable to engage each of the opposite faces of said value-collecting belt at said value-discharging portion thereof; and means operatively associated with said agitator means to effect a positive forth and back movement thereof transverse to the faces of said value-collecting belt whereby said value-discharging portion of said belt is given a positive forth and back movement transverse to the faces thereof.

2,102,653
MOLDED HANDLED RECEPTACLE
Gertrude L. Smith, Los Angeles, Calif.
Application April 30, 1935, Serial No. 19,038
3 Claims. (Cl. 229—52)

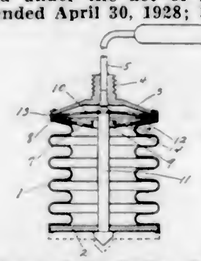
1. As a new article of manufacture, a handled receptacle molded in a single piece from waterproofed fibrous or granular pulp, a portion of the wall of said receptacle adjacent its upper edge being extended outwardly and pressed together to form a short integral vertically disposed handle of double thickness.



2,102,654
METHODS FOR PRODUCING DECOMPOSITION PRODUCTS FROM OLEFINE-SO_2 COMPLEXES
Robert Dewey Snow, Bartlesville, Okla., assignor to Phillips Petroleum Company, Bartlesville, Okla., a corporation of Delaware
No Drawing. Application January 26, 1934, Serial No. 708,523
21 Claims. (Cl. 260—43)

1. The process of producing useful products which comprises decomposing high molecular weight heteropolymeric compounds of sulfur dioxide and unsaturated organic compounds by means of alkaline chemical agents, whereby the said heteropolymeric compounds are broken down into organic compounds of relatively low molecular weight containing sulfur and oxygen.

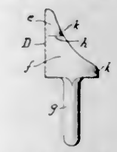
20. The process of producing organic compounds containing sulfur and oxygen, which comprises decomposing heteropolymeric compounds of sulfur dioxide and compounds containing the ethylenic double bond with an alkaline chemical agent, and then partially oxidizing the decomposition product.



2,102,655
MACHINE TOOL
Marion L. Strawn, Rockford, Ill., assignor to The Ingersoll Milling Machine Company, Rockford, Ill., a corporation of Illinois
Application June 12, 1936, Serial No. 84,869
16 Claims. (Cl. 29—26)

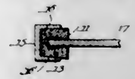
1. A machine tool comprising, in combination, a work supporting member, a tool supporting member, driving means including an electric driving motor operatively connected to a differential gear mechanism for effecting relative movement between said members, means including a reversible second electric driving motor operatively connected to said differential gear mechanism for selectively changing the direction and speed of the relative movement effected between said members by said driving means, control means responsive to the movement of one of said members past a predetermined point for deenergizing both of said motors and for posi-

tively stopping one of said motors, the momentum of the other of said motors in coasting to a stop being sufficient to return said one member to a predetermined position with respect to the other of said members, and means for automatically interposing a positive stop in the path of movement of said one member to effect accurate positioning of said members with respect to each other when said one member has returned to a predetermined position.



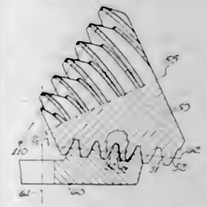
2,102,656
THERMOSTATIC DEVICE
Sidney P. Vaughn, United States Navy, Ackerman, Miss.
Application February 8, 1936, Serial No. 63,007
4 Claims. (Cl. 297—8)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A thermostatic device of the character described comprising a flexible metallic bellows arranged to expand or contract in length in response to pressure changes, a snap acting spring element within said bellows, means for supporting the edges of said spring element in the walls of one end of said bellows, and means connecting the central portion of said spring element to the other end of said bellows, whereby when the bellows expands or contracts the spring element will be snapped from one position to the other and cause the bellows to expand or contract with a snap action.



2,102,657
CLIP
Raymond T. von Palmenberg, New York, N. Y.
Application April 17, 1935, Serial No. 16,808
3 Claims. (Cl. 312—140)

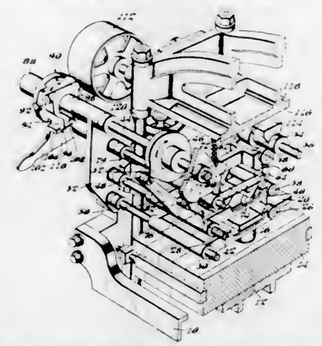
1. A clip for supporting a partition element comprising a pin member, a back member extending upwardly from the pin member, and opposed pairs of flanges extending from the back member, the length of one pair of flanges being at least twice the length of the other pair, the lower



corners at the ends of the flanges being bent toward each other whereby the corner portions only of the flanges are adapted to engage a partition element.

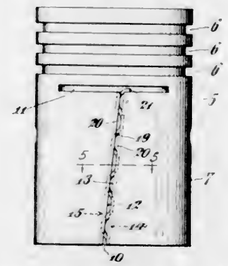
2,102,658
WINDOW CHANNEL
Andrew Weisenburg, Baltimore, Md., assignor to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York
Application March 24, 1933, Serial No. 662,632
8 Claims. (Cl. 296—44.5)

1. A flexible and resilient channel comprising an expanded body of comminuted cork and rubber and having its base of greater density than the channel walls.



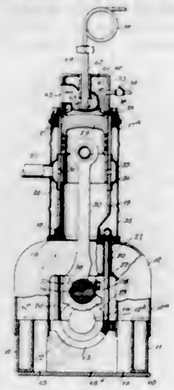
2,102,659
METHOD OF PRODUCING GEARS
Ernest Wildhaber, Rochester, N. Y., assignor to Gleason Works, Rochester, N. Y., a corporation of New York
Application June 23, 1933, Serial No. 677,243
Renewed March 1, 1937
26 Claims. (Cl. 90—4)

1. The method of producing a tapered gear which comprises rotating a tool, whose operating portions are arranged in a thread, in engagement with the work while producing a bodily relative displacement of the tool relative to the work in the direction of the pitch surface of the tool at the zone of its engagement with the work.



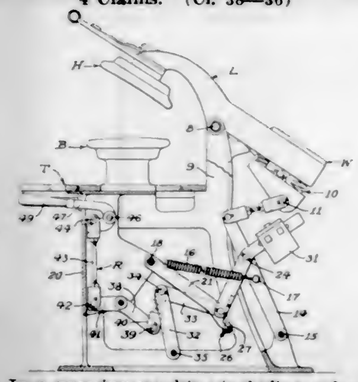
3. The method of producing a tapered gear which comprises rotating a tapered hob, whose cutting teeth are arranged in an involute helicoidal thread which is of such thickness as to have contact simultaneously with opposite sides of finished tooth spaces of the gear to be cut, in timed relation with a continuously rotating tapered gear blank and feeding said hob relative to the blank in the direction of depth of the gear teeth while maintaining a fixed angular relation between the hob and blank axes so that in final cutting position, the hob sweeps out the finished tooth surfaces of the gear.

2,102,660
MACHINE FOR OPERATING ON SHEET MATERIAL
Erastus E. Winkley, Lynn, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application June 15, 1934, Serial No. 730,707
21 Claims. (Cl. 164—23)



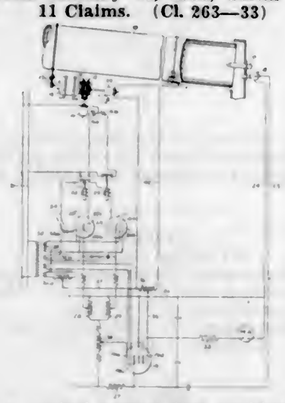
1. A machine for operating upon sheet material comprising a bed, a die mounted for movement toward and away from the bed, a rotatable cam, and a wedge movable inwardly between the cam and the die independently of the rotation of the cam for forcing the die step-by-step toward the bed.

2,102,661
PISTON CONSTRUCTION
William Wuerfel, Philadelphia, Pa., assignor to Wilkening Manufacturing Company, Philadelphia, Pa., a corporation of Delaware
Application June 30, 1933, Serial No. 678,493
15 Claims. (Cl. 309—12)



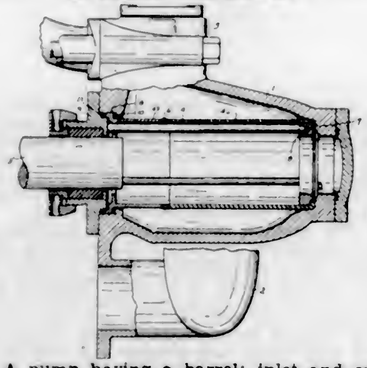
1. The combination of a trunk type piston having the skirt portion thereof slotted generally longitudinally and having also a generally transverse slot in communication with said generally longitudinal slot near the inner end of the latter (that is, nearest the head-end of the piston) so as to permit expansion and contraction of said skirt, recesses formed in the juxtaposed sides of said longitudinal slot, and a generally corrugated spring member operatively interposed between the two juxtaposed sides of said generally longitudinal slot, said spring including means extending into and coacting with said recesses for retaining said spring member against generally radial displacement in relation to the piston skirt, and including means cooperating with the walls of said transverse slot to retain said spring member against generally longitudinal displacement in relation to the piston skirt.

2,102,662
INTERNAL COMBUSTION ENGINE
Allan R. Wurtele, New Roads, La.
Application October 21, 1932, Serial No. 638,852
7 Claims. (Cl. 123—195)



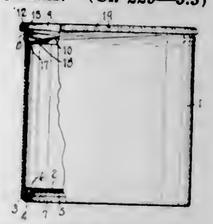
1. In an internal combustion engine, a frame including a plurality of arched members, a plurality of cylinders each having flange means thereon, said flange means being adapted to rest on said arched members, and means including a plurality of tie bolts operatively engaging said flange means and extending beneath an arched member for maintaining said cylinder in place.

2,102,663
GARMENT PRESSING MACHINE
Thomas Yosyk, Ridgewood, N. Y.
Application August 2, 1935, Serial No. 34,439
4 Claims. (Cl. 38—36)



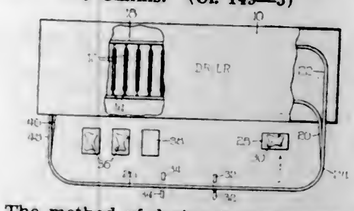
1. In a pressing machine including a frame, a pair of pressing elements, a head lever on said frame carrying one of said elements, a plurality of operatively connected toggles one of which is operatively connected to the head lever to move it and said one element relative to the other, a bell-crank pivotally mounted on the frame and having one arm operatively connected to another of said toggles, a hand lever pivotally mounted on the frame adjacent the upper front portion thereof, said hand lever having a relatively long arm extending outwardly thru the front of the frame convenient to the hand of the operator, and a link connecting the other arms of the hand lever and bell-crank.

2,102,664
CONTROL SYSTEM
James R. Alexander, Jr., Lansdowne, Pa., assignor to General Electric Company, a corporation of New York
Application January 16, 1935, Serial No. 2,016
11 Claims. (Cl. 263—33)



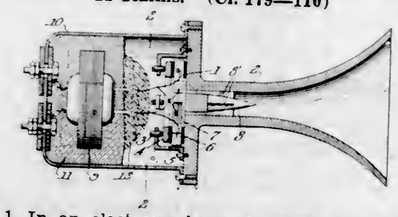
1. In a control system the combination with a device to be controlled, motor means for controlling an operating characteristic of said device, means for maintaining said characteristic substantially constant at a predetermined value comprising means for producing a control voltage varying with said characteristic and electric valve apparatus controlled by said voltage for controlling said motor means, means for controlling said valve apparatus to respond at a predetermined value of said control voltage and a pilot generator driven by said motor means for producing a voltage opposing said control voltage thereby to cause said valve apparatus to respond to a different value of said control voltage.

2,102,665
PUMP
Herbert Allen, Houston, Tex., assignor, by mesne assignments, to Abercrombie Pump Company, Houston, Tex., a corporation of Texas
Application May 14, 1934, Serial No. 725,567
14 Claims. (Cl. 103—44)



1. A pump having a barrel; inlet and outlet means for said barrel; a hollow pumping member in said barrel; said member being substantially cylindrical, and made in separable sections; each of said sections being connected to one of the end walls of said barrel; one of said sections being made of rubber and the other of said sections being made of metal; pumping fluid in said member; and means to actuate said pumping fluid to effect the expansion and contraction of said rubber section to draw pumped fluid into said barrel through said inlet means and to expel it from said barrel through said outlet means; said metal section serving to effect the transfer of heat from said pumping fluid to said pumped fluid.

2,102,666
CONTAINER
James E. Annen, Kalamazoo, Mich., assignor to Sutherland Paper Company, Kalamazoo, Mich.
Application July 22, 1935, Serial No. 32,489
7 Claims. (Cl. 229—5.5)

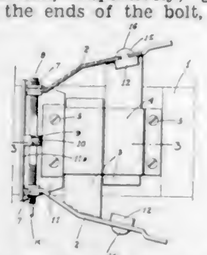


1. A container comprising a cylindrical fibrous body member having a plurality of relatively high pitched overlapping screw threads pressed therein with one end of each thread merging into the upper edge of the body, and a convex cover comprising an upwardly extending cylindrical flange joined with the convexed body portion of the cover with an annular curved surface, the flange terminating in an outwardly extending downwardly facing channeled rim receiving the edge of the body member when the cover is completely seated, the flange also having a plurality of relatively high pitched overlapping threads merging at their lower ends into said curved surface whereby the threads of the cover and body may be engaged with a telescoping movement and the cover rotated to completely seat the same and clamp the rim over the upper edge of the body, said upper edge being expanded by said curved surface to seal the container.

2,102,667
LEATHER PROCESSING
George M. Argabrite, Chicago, Ill.; Margaret Milstead Argabrite, executrix of said George M. Argabrite, deceased, assignor to Wesley H. Argabrite, Des Plaines, Ill.
Application November 19, 1936, Serial No. 111,698
6 Claims. (Cl. 149—5)

1. The method of drying tanned skins, or the like, which comprises: moving a series of plates in a closed circuit; over a predetermined first portion of said circuit positioning said plates in closely spaced parallel relationship and exposing said plates and such skins as may be thereon to forced drying action with the plates in a vertical position; in a subsequent second portion of said circuit positioning said plates in end to end relationship and removing the dried skins from said plates with the plates in a vertical position; in a subsequent third portion of said circuit retaining said plates in end to end relationship and rubbing and swabbing said plates to remove therefrom traces of dried paste remaining thereon, with the plates in a vertical position; in a subsequent fourth portion of said circuit retaining said plates in end to end relationship and applying fresh undried skins and adhesive to said pasted plates and with the plates in vertical position swabbing and smoothing said skins against the plates to cause the skins to adhere to the plates over the entire area of the skins; and returning the plates and wet skins to said first, or drying, portion of the circuit in closely spaced parallel relationship.

2,102,668
PIEZOELECTRIC LOUDSPEAKER
Stuart Ballantine, Mountain Lakes, N. J., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware
Application June 14, 1933, Serial No. 675,834
11 Claims. (Cl. 179—110)



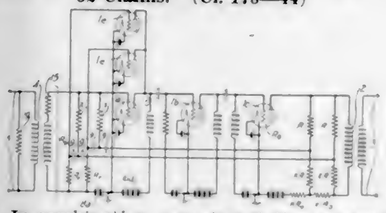
1. In an electromechanical transducer, a flat assembly of four piezoelectrically active plate-shaped elements arranged in edge alinement and with corners of the said elements substantially meeting at a common central point of said assembly, each of said elements comprising a pair of superposed crystal plates having an electrode between their adjacent faces and electrodes at their outer faces, and circuit connections between the several electrodes of said elements to produce like deflections of all elements at said common point when voltages are impressed across said electrodes or, alternatively, to produce like electrical responses between connected electrodes of all elements when pressure is applied to said common point of the assembly, and means introduced between the contiguous edges of said elements to prevent leakage of air past said contiguous edges, said means consisting of a resilient cement joining the adjacent edges of said elements to each other.

2,102,669
SKI BINDING
Jerome E. Barieau, Auburn, Calif.
Application October 28, 1935, Serial No. 47,011
2 Claims. (Cl. 280—11.35)

1. In a ski binding including toe irons, means mounting the toe irons on the ski for relative lateral movement, and means to move the toe irons in opposite directions relative to each other; said last named means comprising a laterally immovable but rotatable transverse bolt mounted adjacent the forward ends of the toe irons, the

ends of the bolt being threaded with right and left-hand threads, respectively; grooved nuts threaded on the ends of the bolt, the forward

end of each toe iron being notched and engaging over the grooved portion of the corresponding nut.



2,102,670

WAVE TRANSLATION SYSTEM

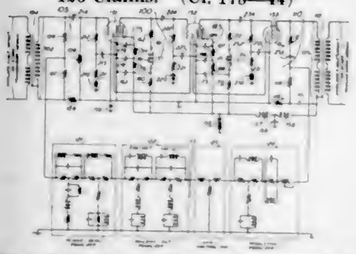
Harold S. Black, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Original application August 8, 1928, Serial No. 298,155. Divided and this application December 3, 1929, Serial No. 411,223. Renewed October 21, 1932. In Canada May 21, 1929

52 Claims. (Cl. 178—44)

1. In combination, wave translating apparatus, means for applying to said apparatus waves producing modulation in said apparatus, wave balancing and isolating means for deriving, from the modulation components, waves including odd order modulation components to the substantial exclusion of waves produced without frequency change by the applied waves, and means for impressing the derived waves on the input side of said apparatus.

2,102,671



WAVE TRANSLATION SYSTEM

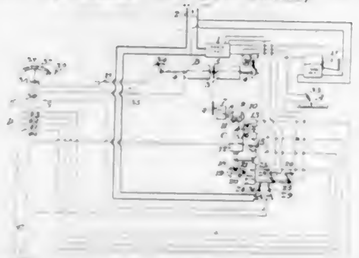
Harold S. Black, Westfield, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application April 22, 1932, Serial No. 606,871

In Canada May 21, 1929

126 Claims. (Cl. 178—44)

3. In a wave translating system operating to amplify applied fundamental waves, and to produce distortion components as a function of nonlinearity in the system, means to increase the ratio of the amplified fundamental wave component to distortion components comprising means to utilize a portion of the waves translated by said system to reduce the gain of the system below the gain with zero feedback in the system of the waves translated by the system.



2,102,672

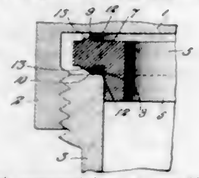
REMOTE CONTROLLED SOUND PRODUCING APPARATUS

Austin Day Brixey, Greenwich, Conn., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware

Application April 22, 1932, Serial No. 606,799

9 Claims. (Cl. 179—100.11)

1. The combination with a radio tuning element, of a unidirectional electric motive means for operating said element to effect the tuning operation, driving means between said electric motive means and said element comprising a pivoted driving shaft movable laterally in one direction or in an opposite direction to drive said tuning element in one direction or the other, electro-magnetic means for controlling the direction of lateral movement of said pivoted driving shaft, and means for supplying current to said electric motive means and said electro-magnetic means selectively at will, comprising a source of electricity and switching mechanism.



2,102,673

GASKET

Mortimer J. Brown, Niagara Falls, N. Y.

Application September 23, 1936, Serial No. 102,063

3 Claims. (Cl. 288—1)

1. A gasket comprising a readily deformable elastic body having an annular fin of wedge-shaped cross-section on each side thereof with the apexes of said wedges protruding axially from the gasket so as to constitute the sole engagement with the surfaces to be sealed, said wedge-shaped fins being in alignment with each other and having their inner faces substantially parallel to the axis of the gasket and their outer faces inclined at an angle to said axis such that said outer faces remain out of engagement with the surfaces to be sealed except at said apexes when said fins are caused to bend toward the axis of the gasket by application of normal sealing pressure to said apexes.

2,102,674

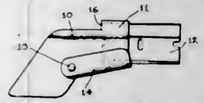
WHEEL TRUCK

William Y. Brown, Charlotte, N. C., assignor of one-third to William C. Honeycutt, Black Mountain, N. C., and one-third to Robert H. Garland, Charlotte, N. C.

Application April 13, 1937, Serial No. 136,643

1 Claim. (Cl. 280—61)

A wheel truck for removing and installing heavy wheels on automotive trucks and the like, comprising a sheet of metal having its central portion curved throughout its breadth to fit the periphery of a truck wheel, a horizontally disposed portion at each end of said curved portion, a downwardly bent portion at each end of the sheet, two wheel mountings secured to the lower side of each of the horizontal portions of said sheet, a wheel rotatably disposed in each mounting on an axis disposed at right angles to the axis of the truck wheel so that the wheel truck can be rolled under a raised truck wheel from the side of the wheel, and whereby the truck wheel can be removed from its axle laterally and in alignment with a projection of the axle, and due to the fixed axis of the wheels on the wheel truck, the bearings of the truck wheel will at all times be held in alignment with its axle thus insuring easy replacement of the truck wheel on its axle.



2,102,675

HOLDER FOR RAZOR BLADES

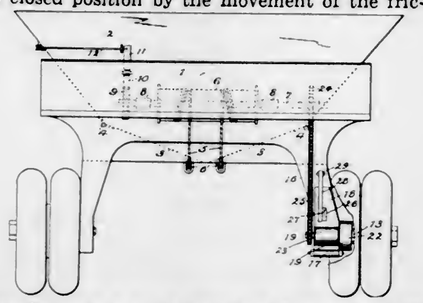
Paine Lee Bush, Dallas, Tex.

Application August 21, 1935, Serial No. 37,240

2 Claims. (Cl. 30—162)

2. A blade holder comprising a blade gripping element of resilient material, the said blade gripping element being formed in the shape of a looped band and adapted to grip one end of a blade, a clamp pivotally mounted upon the blade gripping element, and the clamp having a cut out portion adapted to receive the blade and blade gripping element.

2,102,676



DUMP WAGON

William C. Byington, Nacogdoches, Tex., assignor to All Steel Trailer Company, Nacogdoches, Tex.

Application March 17, 1937, Serial No. 131,447

3 Claims. (Cl. 298—35)

1. A dump vehicle, comprising a body having wheel supporting legs, ground wheels mounted on the legs, a friction element carried by one of the ground wheels, load discharging doors hinged to the bottom of the body, cables for moving the doors to closed position, a plate pivotally supported to one of the legs, a friction element mounted on the plate, means for moving the plate to cause the friction element mounted thereon to engage the friction element carried by the ground wheel, means intermediate the friction element mounted on the plate and the doors to operate the cables and move the doors to closed position by the movement of the fric-

tion elements, a guide extending from one of the legs and through the plate, and a spring between the plate and leg to normally separate the friction elements.

2,102,677

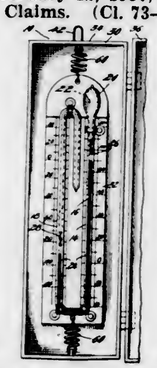
GUN SIGHT

Homer E. Campbell, Fort Wayne, Ind.

Application December 16, 1936, Serial No. 116,180

8 Claims. (Cl. 33—53)

8. An adjustable sight for a gun, said sight having two face-plates arranged adjacent each other and mounted to have rotary movement upon a common axis, each of said face-plates being the counterpart of the other and provided with a curved wing, and manually-operated mechanism associated with said face-plates adapted to adjustably turn said face plates equally in opposite directions.



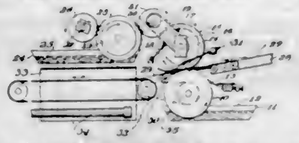
2,102,678

SEALED TAMPERPROOF MAXIMUM AND MINIMUM THERMOMETER FOR USE PARTICULARLY IN BROODING OF CHICKS

Max A. Campbell, East Providence, R. I.

Application February 12, 1937, Serial No. 125,472

7 Claims. (Cl. 73—374)



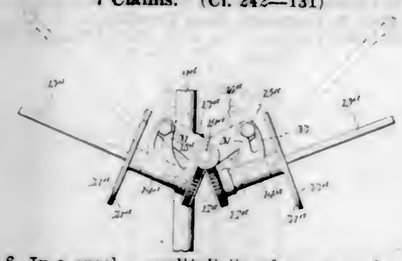
1. As a new article of manufacture, a maximum and minimum thermometer having vacuum tube means having maximum and minimum limbs and containing thermometric indicating liquid means and magnetizable indicator means carried by the thermometric indicating liquid means

in each limb to the respective maximum and minimum positions therein movable back to positions floating on said thermometric indicating liquid means by an externally applied magnet, a casing for removably enclosing said thermometer constructed of magnetic material to provide a magnetic casing-screen to positively prevent movement of said indicator means by a magnet applied externally of said casing, means to seal the casing when completely enclosing the thermometer and means to movably mount said thermometer within the casing.

2,102,679

COATING AND STRIPPING DEVICE

Frank P. Carlson, New York, N. Y.
Application October 1, 1935, Serial No. 42,996
10 Claims. (Cl. 91—18)

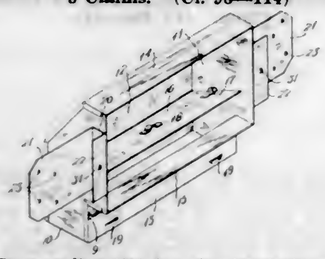


1. In a gripperless coating device for handling work in the form of individual sheets of relatively soft, pliable material, possessing little or no inherent body firmness, and which sheets are to be coated in a continuous, close succession, so as to simulate the coating of a continuous web, movable work supporting and propelling means, provided with a work engaging, tacky surface film designed, while said means are in motion, to temporarily attract and release, successively, all points of one face of the work, lying between its two ends, without coating or marring that one work surface, and means in cooperation with said propelling means for simultaneously coating the opposite face of the thus attracted and propelled work, at the points of attraction.

2,102,680

CREEL

George B. Cocker, Gastonia, N. C.
Application September 28, 1934, Serial No. 745,843
7 Claims. (Cl. 242—131)



6. In a creel, a multiplicity of yarn spools; individually associated guides through which the yarns are withdrawn tangentially from the spools; and individual supporting means for the spools including axial mounting stems inclined to the horizontal, a friction disk on each stem adapted to be contacted by one end of the corresponding spool, and means whereby the stems can be angularly adjusted individually relative to the horizontal so that, under the influence of gravity upon the individual spools, the pressure of the latter upon the disks is increased or decreased to correspondingly vary the tension of the individual yarns as they are withdrawn from the spools.

2,102,681

OUTLET FOR AIR CIRCULATING SYSTEMS

Herbert F. Curtis, Berea, Ohio, assignor to The Henry Furnace & Foundry Company, Cleveland, Ohio, a corporation of Ohio
Application November 29, 1935, Serial No. 52,062
5 Claims. (Cl. 98—114)

1. In a wall outlet for air circulating systems, a body member having a vertical outlet opening, and a pair of sheet metal brackets permanently fastened to the side walls of the body member to constitute a part of the body member, said brackets comprising arms adapted to engage the surfaces of the studding on either side of the outlet and to be nailed thereto, and said brackets also comprising flanges spaced forwardly from said arms adapted to receive and hold a grill.

2,102,682

SNELLED HOOK CASE

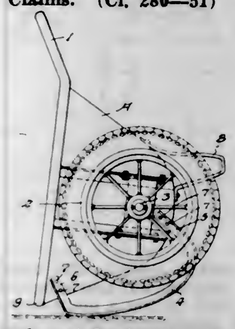
William J. De Witt and Paul A. Ross, Auburn, N. Y., assignors to Shoe Form Co., Inc., Auburn, N. Y., a corporation of New York
Application February 19, 1937, Serial No. 126,610
7 Claims. (Cl. 43—32)

1. A snelled hook case comprising a base plate having a rack at one end provided with hook receiving notches, longitudinally extending depressions adapted to receive the snells and snell engaging means for holding them in the depressions, and a cover plate therefor, said cover plate having longitudinally extending depressions which, when the case is closed, register with the depressions in the base plate and form therewith closed snell containing chambers.

2,102,683

METHOD OF HEAT TREATING NICKEL-IRON ALLOYS

Alfred L. Dixon, Hollywood, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
No Drawing. Application September 13, 1933, Serial No. 689,206
2 Claims. (Cl. 148—13.1)



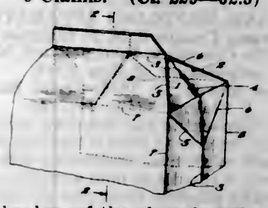
1. An article of manufacture comprising an industrial magnetic product composed of an iron-nickel alloy which has been super-annealed, slowly cooled in a hydrogen atmosphere, reheated in air to a high temperature and then rapidly cooled on a copper plate to impart a high permeability to the product.

2. The process of making an industrial magnetic product composed of an iron-nickel alloy which comprises super-annealing the product, slowly cooling the product in a hydrogen atmosphere, reheating the product in air to a high temperature and then rapidly cooling the product on a copper plate to impart a high permeability to the product.

2,102,684

ROCKER DUMP HAND CART

Raymond B. Dorward, Indianapolis, Ind., assignor to Insley Manufacturing Corporation, Indianapolis, Ind., a corporation
Application March 30, 1936, Serial No. 71,759
2 Claims. (Cl. 280—51)

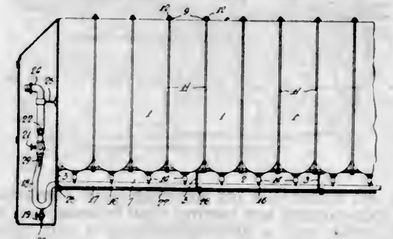


1. A hand push cart for transporting concrete and similar materials, comprising a cart body of generally arc-shaped form viewed from the side, handle means at the rear end of the body, the front end of the body forming a dumping nose or lip, axle means on the body near the lower or bottom portion thereof and at opposite sides, supporting wheels carried by the axle means, and rockers attached to the front and lower portions of the body, comprising angle bars having attachment arms secured to the upper front end portion of the body adjacent to the dumping nose and projecting forwardly therefrom and bent downwardly in advance of the plane of the front end portion of the body and to points below the bottom portion of the body, and thence bent upwardly to provide attaching arms at opposite sides of the bottom portion of the body, and means for securing the attaching arms to the body at the front end and adjacent to the bottom portions of the body.

2,102,685

VALVE-CLOSED BAG

Alfred Du Bois, Paris, France, assignor to Bartlett Arkell, New York, N. Y.
Application February 9, 1934, Serial No. 710,403
In Belgium May 5, 1933
9 Claims. (Cl. 229—62.5)

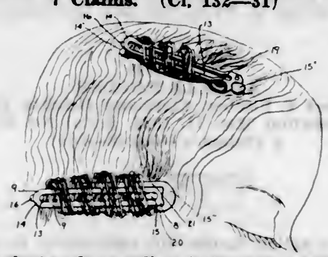


1. A valve bag of the class described, comprising a flattened tube having its ends closed, and one corner thereof folded in to form a valve, with the under flap of the valve creased on lines extending diagonally from the outer corners of the flap to a point on the longitudinal center line of the flap spaced from the inner edge thereof so as to provide hinged portions which when the bag is filled tend to cause the valve flap to be positioned in close fitting engagement with the overlying wall of the valve.

2,102,686

APPARATUS FOR THE TRANSPORTATION OF COMPRESSED OR LIQUEFIED GASES

James W. Dunham, Evanston, Ill., assignor to National Cylinder Gas Company, Chicago, Ill., a corporation of Delaware
Application January 6, 1936, Serial No. 57,803
2 Claims. (Cl. 221—73.5)



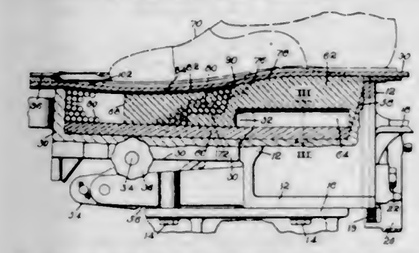
1. A vehicular compressed gas cylinder battery having a plurality of vertically disposed cylinders each having a convex lower end, a supporting plate having apertures presenting marginal surfaces on which said convex cylinder ends seat and whereby they are gravitationally centered in their respective openings, a conduit disposed beneath said plate and connected to each of said cylinders at the lower ends of the latter whereby moisture in said cylinders may drain into said conduit, a trap in said conduit for collecting said moisture, and a blow-off valve at the lower end of said trap.

2,102,687

DEVICE FOR HOLDING AND CURLING HAIR

Anna E. Farrell, Seattle, Wash.
Application July 16, 1935, Serial No. 31,557
7 Claims. (Cl. 132—31)

1. A device for curling hair, comprising two pairs of integral flexible flattened clamp legs, resiliently connected at their rear end with a curved head plate, and extending therefrom for a hair holder substantially parallel with each other, but separated by a slot laterally for ventilation, and normally pressed in alinement with each other perpendicularly for a clamp to hold the ends of a lock of hair, the front ends of each pair of legs connected respectively and bent in opposite directions from the other pair for entry of hair therebetween, said plate provided with a pivot aperture, and a resilient bar slidably and rotatably mounted therein the length of said bar



for a spindle on which to rotate the legs, and also to bind the hair when curled around the latter, said bar adapted to be passed through said slot and beneath said hair when bound.

2,102,688

APPARATUS FOR USE IN PRESSING SOLES

Sidney J. Finn, Beverly, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey

Application August 20, 1936, Serial No. 97,017
9 Claims. (Cl. 12—38)

1. An apparatus for pressing soles comprising an open-topped box having rigid bottom, end and side walls, and a filler comprising a soft rubber member, and a mass of rigid spherical balls in contact with the soft rubber member.

2,102,689

METHOD OF PRODUCING RUBBER BANDS

Albert T. Fischer, Cleveland Heights, Ohio

Application August 17, 1935, Serial No. 36,751
12 Claims. (Cl. 101—426)

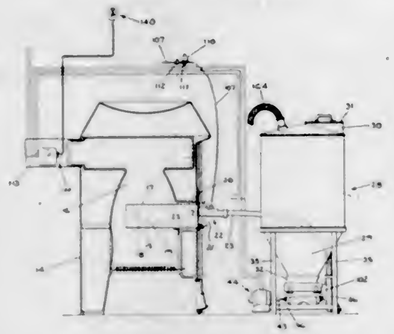
6. The method of making printed rubber bands which comprises maintaining a rubber tube stretched transversely of its axis into substantially flat collapsed condition, printing matter at spaced points on the outside of the tube while in such condition, and severing the tube between the printing to divide the tube into bands.

2,102,690

ARTICLE HOLDER

Albert T. Fischer, Cleveland Heights, Ohio

Application May 21, 1936, Serial No. 80,978
4 Claims. (Cl. 248—205)



2. An article holder for application to a generally flat wall surface or like support, comprising a flat endless elastic band, a spreader in the band, said spreader being of substantially the same width as the band and of a length to hold the front and back portions of the band in substantially parallel relation, said front portion of the band being free to be stretched relative to the spreader for gripping an article and said back portion being substantially uniformly connected with the spreader, said back portion of the band presenting a flat surface having thereon a substantially coextensive layer of adhesive adapted to be pressed against said wall surface for connecting the holder therewith.

2,102,691

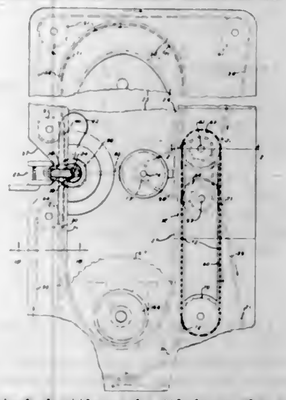
AUTOMATIC SYSTEM FOR SUPPLYING PULVERIZED FUEL TO FURNACES

Earle V. Francis, Columbus, Ohio, assignor to The Jeffrey Manufacturing Company, a corporation of Ohio

Application January 18, 1933, Serial No. 652,347
1 Claim. (Cl. 110—28)

In a furnace system, the combination with a furnace constructed and adapted for domestic operation and having a main combustion chamber, of an ignition chamber within said furnace and within said main combustion chamber, feeding means for supplying pulverized fuel mixed with air to said ignition chamber for initial combustion, said feeding means including a rotating plate, an adjustable non-rotating plow positioned to remove material from said plate, a fan, means directing material removed from said plate to said fan, and means fed by said fan and directing pulverized coal mixed with air to said ignition chamber as aforesaid; electro-magnetic means for adjusting said plow to increase the feeding rate of said feeding means during a flame starting period whereby the ignition chamber becomes sufficiently heated during the flame starting to act continuously during a following running period to maintain combustion of the mixture of pulverized fuel and air, ignition means for igniting said mixture, and automatic thermostatically controlled means constructed and arranged to effect operation of said ignition means, said feeding means and said plow to initiate combustion with the mixture of pulverized coal and air fed at an increased rate during the starting period as aforesaid after which said ignition means and electro-magnetic plow adjusting means are devitalized, and for stopping the operation of said feeding means after a longer period of operation.

2,102,692



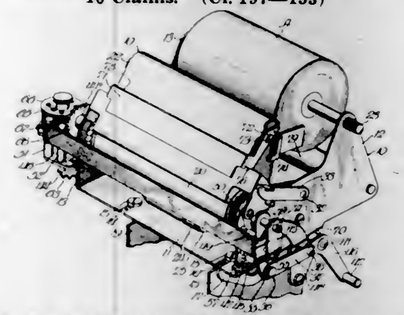
STRAND HANDLING APPARATUS

Erwin E. Franz, Cranford, N. J., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

Application March 11, 1936, Serial No. 68,233
5 Claims. (Cl. 242—4)

1. In an apparatus for winding strand on a toroidal core, means to hold a toroidal core to be wound, a pair of sheaves positioned with the core therebetween, a shuttle to hold a supply of strand, flexible means passing over one of the sheaves and positioned to engage the shuttle and having means thereon to insert the shuttle into the core and then release the shuttle after it has moved into the core, and flexible means passing over

the other sheave and positioned to engage the shuttle and having means thereon to couple to



the inserted shuttle and withdraw the same from the core.

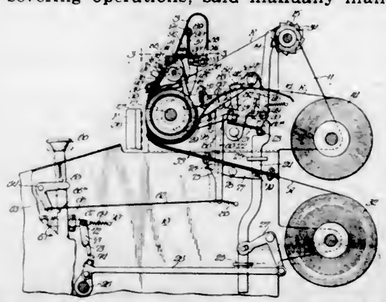
2,102,693

ADDING MACHINE

Max Garbell, Chicago, Ill., assignor to Victor Adding Machine Company, Chicago, Ill., a corporation of Delaware

Application June 3, 1937, Serial No. 146,171
16 Claims. (Cl. 197—153)

1. In an adding machine or the like, a carriage having a platen adapted to receive impressions from the printing elements of the machine, said carriage being arranged to move toward and away from the printing elements, of manually controlled means operatively connected to the carriage for effecting its movement, a ribbon carried by the carriage and arranged to be fed in overlapped relation in close proximity with the platen, and means guiding said ribbon including operative connections associated with said carriage whereby upon the movement of said carriage away from the printing elements said guiding means will be rocked to swing and spread the ribbon.



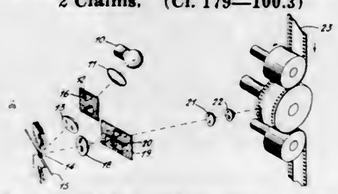
2,102,694

PAPER CUT-OFF AND FEEDING MECHANISM

Max Garbell, Chicago, Ill., assignor to Victor Adding Machine Company, Chicago, Ill., a corporation of Delaware

Application June 17, 1937, Serial No. 148,647
8 Claims. (Cl. 197—132)

1. In a paper cut-off and feeding mechanism for an adding machine or the like comprising feeding means arranged to feed a paper strip upon one operation of the machine and severing means for the paper strip adapted to be conditioned upon said operation, manually manipulative means conditioning said severing means for severing operations, said manually manipu-



lative means serving also to condition said feed means for a greater distance of feed while conditioning the severing means, said severing means when conditioned being releasable at near the restoring operation of the machine for effecting a severing movement of said severing means.

2,102,695

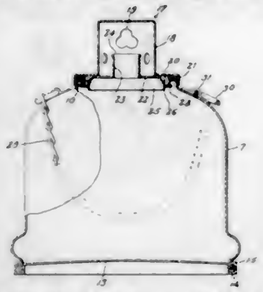
RECORDING AND REPRODUCING OF ELECTRICAL IMPULSES

Marion W. Gieskieng, Little Rock, Ark., assignor to Radio Corporation of America, a corporation of Delaware

Application December 29, 1933, Serial No. 704,445
2 Claims. (Cl. 179—100.3)

1. The method which includes producing a light beam having differently colored components, modulating one of said components in accordance with only the positive half waves of the impulses to be recorded, modulating another of said components in accordance with only the negative half waves of said impulses and photographically recording said components in alinement in their respective colors.

2,102,696



HIGHWAY TORCH

Michael J. Gilmore, Youngstown, Ohio

Application December 18, 1936, Serial No. 116,623
1 Claim. (Cl. 67—55)

A highway torch of the class described comprising a body provided at its top with a neck having an inturned annular ledge, said ledge being provided on its inner periphery with depending arcuate flanges, said flanges being spaced apart to provide clearance openings, and being beveled on their lower edges, a cap having openings therein, an annular member surrounding the lower end of the cap and adapted to rest on the ledge, a depending rim on the annular member for engaging the neck, a wick tube extending into the lower part of the cap, an annular member connected with and extending outwardly from the lower end of the tube and to which the

annular member connected with the cap is fastened, the annular member of the tube having a depending rim extending into the neck and having notches therein, outwardly and downwardly

sloping tongues located in said notches and formed with the annular member of the tube and having lateral extremities for engaging the beveled edges of the flanges of the ledge for removably holding the cap and tube on the neck.

2,102,697

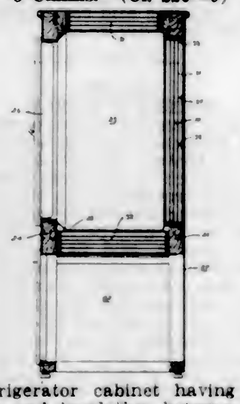
METHOD FOR THE DEHYDRATION OF NITROCELLULOSE AND TO THE PRODUCT THEREOF

Walter E. Gloor, Kennett Square, Pa., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application July 8, 1936, Serial No. 89,651

19 Claims. (Cl. 260—148)

1. The method of treating nitrocellulose, which comprises treating nitrocellulose damp with water with a monohydric aliphatic alcohol containing not less than six carbon atoms and not more than twelve carbon atoms in liquid phase and in amount greater than the amount of water present in the nitrocellulose and removing a mixture of the alcohol and water from the nitrocellulose.



2,102,698

REFRIGERATING APPARATUS

Richard E. Gould, Dayton, Ohio, assignor, by mesne assignments, to General Motors Corporation, a corporation of Delaware

Application May 27, 1932, Serial No. 613,941

8 Claims. (Cl. 220—9)

1. A refrigerator cabinet having inner and outer walls and insulation between said inner and outer walls, said insulation including a plurality of sheets of zinc separated by dead air spaces.

2,102,699

PROCESS OF TANNING

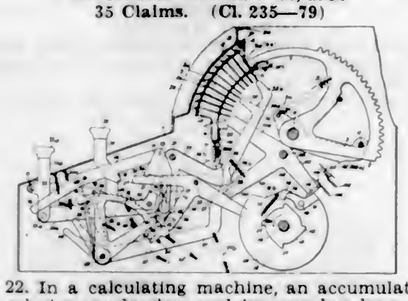
Arthur J. Green, Marblehead, Mass., assignor to A. C. Lawrence Leather Company, Peabody, Mass., a corporation of Maine

No Drawing. Application October 1, 1935, Serial No. 43,083

11 Claims. (Cl. 149—4)

6. That step in the tanning of hides and skins which comprises the quick freezing of the untanned hide or skin at a temperature of approximately —30° F.

2,102,700



CALCULATING MACHINE OF THE TEN KEY TYPE

Ernst Valfrid Gustafsson, St. Essingen, and Gustaf Hilarius Hellgren, Malmo, Sweden, assignors to Aktiebolaget Facit, Atvidaberg, Sweden, a joint-stock company of Sweden

Application November 14, 1933, Serial No. 698,004

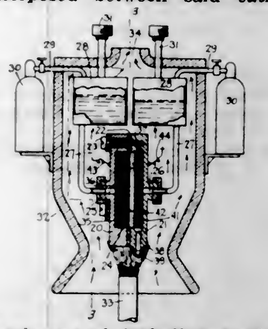
In Sweden November 22, 1932

35 Claims. (Cl. 235—79)

22. In a calculating machine, an accumulator, a selector mechanism and ten number keys for setting a desired numerical value on said selector mechanism, transfer means for transferring to said accumulator a numeral value set on said selector mechanism, said transfer means comprising transfer mechanism having a main shaft adapted to be connected by a clutch to an operating shaft, and control means for actuating said clutch in accordance with the desired number of transfers of the set numerical value; said control means including a pivotally mounted toothed sector, a member actuated thereby, and a three armed lever actuated by said member, one arm of said lever controlling said clutch to engage the same upon a displacement of said toothed sector to actuate said member and thereby said lever.

2,102,701

ELECTRIC CURRENT PRODUCING UNIT OR CELL



Janos Gyuris, New York, N. Y.

Application November 18, 1933, Serial No. 698,607

In Hungary July 17, 1933

6 Claims. (Cl. 136—83)

1. In a continuously operating current-producing electric element, the combination comprising a cathode and an anode chamber opening into each other, means including a reservoir for feeding a fused alkali metal into said cathode chamber, means including a second reservoir for feeding fused oxygen-releasing substance into said anode chamber, heating means for maintaining both said cathode and anode substances above the temperature of fusion, and diffusing means interposed between said cathode and

anode chambers and including a plurality of metal screens for controlling the reaction between said substances.

2,102,702

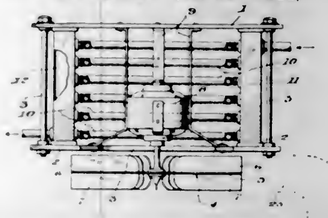
PACKAGE

Andrew M. Hall, Cambria, Va.

Application January 28, 1937, Serial No. 122,830

1 Claim. (Cl. 229—63)

A package assembly comprising a bag made of dust-proof material and having its walls adjacent its mouth gathered into a bundle, a protecting cap-like member of dust-proof deformable material completely enclosing the end portion of the bundle, the said member having a central portion overlying the end of the bundle and a skirt-like portion extending along the sides of the bundle to a point adjacent the inner end of the bundle, and a strand tied tightly about the outside of the protecting member and bundle at a point between the end of the bundle and the end of the skirt-like portion of the protecting member.



2,102,703

AIR TREATING UNIT

De Lancey M. Hall, Montclair, N. J.

Application October 19, 1935, Serial No. 45,818

18 Claims. (Cl. 257—244)

1. In an air treating unit, an attaching support structure forming an air guiding passage, an air treating member carried by said attaching support, and an air circulating member carried by said support, said air circulating member constructed to circulate a quantity of untreated air and mix it with the treated air circulated.

2,102,704

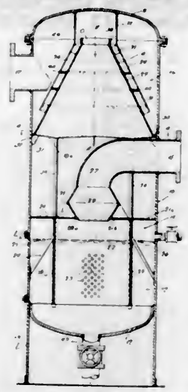
SYRINGE CARTRIDGE

George N. Hein, San Francisco, Calif.

Application June 10, 1935, Serial No. 25,791

3 Claims. (Cl. 128—218)

1. A syringe cartridge including an elongated tubular vial body having an opening at a filling end for receiving a plunger and having a discharge end opening, a closure member for closing said filling end and being snugly slidable longitudinally of the vial body, a discharge closure member of resilient material mounted at the discharge end opening of the vial body, said last mentioned closure member being tubular and having a puncturable wall of said resilient material normally closing said tube, said last mentioned closure member having at its outer end portion means for releasable mounting thereto of an injection needle hub in abutting contact with the closure member and in fixed relation against longitudinal pressure within the vial body when the puncturable wall has been punctured by an injection needle, said cartridge including means for maintaining said discharge closure member against sliding longitudinally inwardly of the vial body, and the said discharge closure member being extended beyond the confines of the vial body and providing a resilient frictional grip bumper and sealing washer against which the hub of a needle may abut when mounted to the cartridge.



2,102,705

SEPARATOR

Elting Henderson, Huntington Park, and John B. Reddick, Sierra Madre, Calif., assignors to The Fluor Corporation, Ltd., Los Angeles, Calif., a corporation of California

Application May 8, 1935, Serial No. 20,352

11 Claims. (Cl. 183—24)

7. In a separator of the character described, a shell containing a body of liquid, an apertured wall at the outside of said liquid body and spaced from said shell, means for discharging a stream of dust laden gas downwardly at high velocity against the surface of said liquid body, the liquid level being depressed by the gas to uncover apertures in said wall and the gas flowing outwardly through the apertures into a chamber in the upper interior of said shell, and liquid and gas separating means within said chamber, said separating means comprising inner and outer annularly

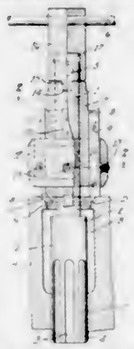
spaced and substantially concentric conical walls forming an annular separating passage of downwardly increasing cross sectional area, the gas flowing to the upper end of said passage through the interior of said inner conical wall, means for draining separated liquid from said passage into said liquid body, and a gas outlet communicating with said passage by way of a space between said outer conical wall and said shell.

2,102,706

DRILL FEEDING MECHANISM

Charles A. Hirschberg, Mountain Lakes, N. J., assignor to Worthington Pump and Machinery Corporation, Harrison, N. J., a corporation of Virginia

Application February 19, 1936, Serial No. 64,790
Renewed May 18, 1937
32 Claims. (Cl. 255—51)



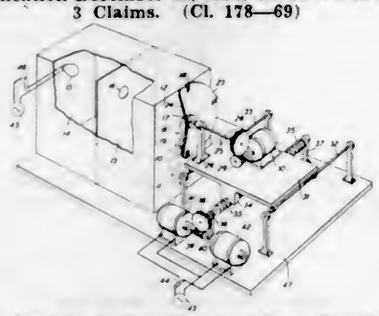
1. In a drill feeding mechanism, a support, a two-way pneumatic feed cylinder slidable on said support, a piston in said cylinder, releasable means for holding said piston against movement relative to the support, a valve for controlling delivery of pressure fluid to the cylinder for moving the cylinder on the support, and means for locking said cylinder in adjusted positions on said support.

2,102,707

VALVE-SEAT SURFACING TOOL

Michael Holhut, Jennings, Mo., assignor to H & H Machine & Motor Parts Co., St. Louis, Mo., a corporation of Missouri

Application September 16, 1936, Serial No. 101,002
4 Claims. (Cl. 90—12.5)



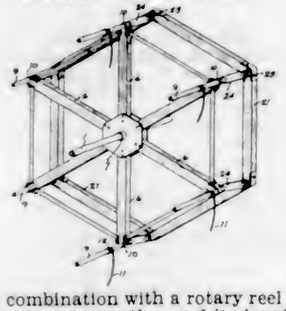
1. A valve-seat surfacing cutter comprising a sleeve adapted for rotative movement in a path accurately concentric about the axial line of a valve-seat, and a plurality of valve-seat cutting-bits operatively mounted in the sleeve, some of said bits having a cutting angle of 15°, others of said bits having a cutting angle of 45°, and still others of said bits having a cutting angle of 75°, said 15° bits being positioned to cut an initial face, said 45° bits being positioned to cut a face contiguous to the radially inwardly disposed edge of the initial face, and said 75° bits being positioned to cut a face contiguous to the radially inwardly disposed edge of the face cut by the 45° bits.

2,102,708

SIGNAL TESTING APPARATUS

Louis W. Howle, Atlanta, Ga., assignor to American Telephone and Telegraph Company, a corporation of New York

Application December 28, 1936, Serial No. 117,935
3 Claims. (Cl. 178—69)



1. Apparatus for testing telegraph signals which comprises a signal producing means, a signal receiving means, a light beam, a photosensitive member in the path of the light beam, a shutter operated by the signal receiving means and adapted to interrupt said light beam in accordance with the received signals, means synchronized with the signal producing means for rotating said light sensitive member, and means for simultaneously imparting a transverse motion to said light sensitive member whereby a discontinuous spiral trace is formed upon said light sensitive member, the position of the discontinuities being an indication of the condition of the received signal.

2,102,709

HARVESTER REEL

Horace D. Hume and James E. Love, Garfield, Wash., assignors to Hume-Love Company, Garfield, Wash., a corporation

Application November 18, 1935, Serial No. 50,388
4 Claims. (Cl. 56—220)

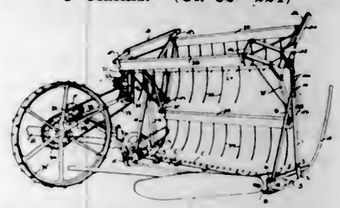
1. The combination with a rotary reel of polygonal shape in cross section and its longitudinally extending tine bars having a supplemental rotary movement, of an exterior, eccentric operating frame for said bars conforming to the shape of the reel and mounted at one end of the reel, power transmission means connecting said frame and bars, and an exterior, complementary stabilizing frame mounted on said bars at the other end of the reel.

2,102,710

HARVESTER

Horace D. Hume and James E. Love, Garfield, Wash., assignors to Hume-Love Company, Garfield, Wash., a corporation

Application November 18, 1935, Serial No. 50,389
6 Claims. (Cl. 56—158)



1. In a harvesting implement of the reciprocating cutter type, the combination with a relatively stationary supporting frame and a separate vertically movable cutter bar in advance of the frame, of a supporting arm flexibly attached at its front end to the cutter bar, a ground-shoe forming part of the supporting arm, and a pivotal connection between the rear end of the arm and said frame.

2,102,711

HARVESTING MACHINE

Horace D. Hume and James E. Love, Garfield, Wash., assignors to Hume-Love Company, Garfield, Wash., a corporation

Application May 23, 1936, Serial No. 81,418
5 Claims. (Cl. 56—224)

1. In a reel mount for a harvesting machine of the side cutting type, the combination with cutting mechanism and a pointed shoe forming a supporting means therefor, of a standard having a loop at its lower end frictionally engaging said pointed shoe, a rearwardly extending diagonal brace and adjustable means for securing the upper end of the brace to said standard, and means for rigidly attaching the spaced, lower end of said brace to the shoe.

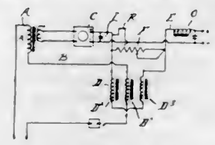
2,102,712

PROTECTIVE COSMETICS

Samuel Isermann, Summit, Ernst Ohlsson, Jersey City, and John W. Orelup, Summit, N. J.

No Drawing. Application January 4, 1935, Serial No. 426
5 Claims. (Cl. 167—90)

1. A cosmetic effective in thin films to retard ultra violet absorption containing as an active ingredient an amino or substituted amino-orthobenzoic acid in concentrations of less than 5%.



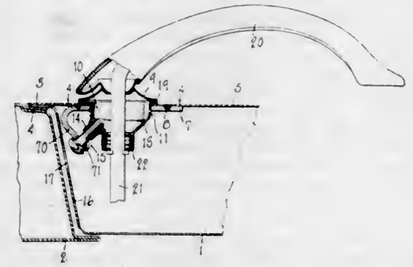
2,102,713

RECTIFIER

John G. Jackson, Detroit, and Stanley M. Hanley, Grosse Pointe Farms, Mich., assignors, by mesne assignments, to Raytheon Manufacturing Company, Newton, Mass., a corporation of Delaware

Application October 30, 1933, Serial No. 695,904
9 Claims. (Cl. 175—363)

1. A voltage regulating system comprising a rectifier adapted to be fed from a source of alternating current through an alternating current circuit, a regulating reactor in said alternating current circuit, said regulating reactor comprising a magnetic core, a magnetizing winding on said core, said magnetizing winding being energized in accordance with the load current output of said rectifier, and a single phase alternating current winding on said core and connected in



said alternating current circuit, said alternating current winding and said magnetizing winding being related to each other to neutralize alternating voltages induced in said magnetizing winding by said alternating current winding, and stabilizing means for said system comprising a resistance connected across said magnetizing winding and forming a local closed circuit therewith.

2,102,714

DOOR HANDLE MOUNTING

Gerald V. Jakeway, Grand Rapids, Mich., assignor to Keeler Brass Company, Grand Rapids, Mich.

Application September 5, 1936, Serial No. 99,565
16 Claims. (Cl. 292—350)

1. In a handle mounting for an automobile door panel apertured to receive the same, a reinforcing plate secured to said panel and apertured in line with the panel aperture, said plate having a locking offset, an escutcheon member fitted in said apertures and having an annular flange abutting said panel, the door having an opening in the edge thereof adjacent the frame, said locking offset having a hole therein and said escutcheon member having a threaded element in alinement with said hole and opening, and a screw abutting said offset and extending through said hole in threaded engagement with said element and operative to secure said escutcheon member on said door.

2,102,715

DECORATIVE COATED FABRIC

Harry J. Jenemann, Newburgh, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

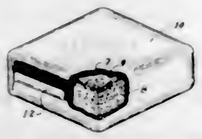
No Drawing. Application July 3, 1935, Serial No. 29,686
1 Claim. (Cl. 91—67.9)

The process of preparing a leather substitute which comprises coating fabric with a plasticized

nitrocellulose coating composition, removing volatile solvent, imprinting on the coated surface a photographically reproduced leather design with an ink consisting of

	Parts by weight
Cellulose nitrate	9.06
Pigment	20.51
Castor oil	10.25
Ethyl acetate	10.22
Ethyl alcohol	15.34
Butyl acetate	34.62

embossing the printed coating in a leather grain and finally coating the printed and embossed surface with a clear nitrocellulose lacquer and drying the same.



2,102,716

METHOD AND MEANS OF PACKING FOOD PRODUCTS AND THE LIKE

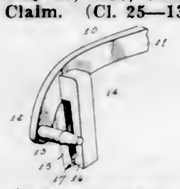
Samuel H. Berch, Beverly Hills, Calif.

Application October 26, 1937, Serial No. 170,993

6 Claims. (Cl. 99—152)

1. A method of packing roasted coffee which consists in placing roasted coffee within a container capable of collapsing and incapable of distending, said container being formed with a laminated sheet wall including an inner sheet of flexible, pliable and stretchable material impervious to air, moisture and action of coffee oils and an outer flexible non-stretching sheet of material, said sheets being united between their surfaces so as to exclude entrance of air between the two sheets, the container being completely filled with coffee, then exhausting the air from the container causing the walls of the container to collapse around the product and compressing the same into a hard solid mass and hermetically sealing and vulcanizing the inner wall of the container so that the sealed vulcanized ends of the container will also be impervious to moisture and air and the deteriorating action of coffee oils and whereby atmospheric pressure acting against walls of the container will maintain the container in its collapsed position and the coffee in a compacted condition therein.

4. A vacuum package completely filled with ground coffee comprising a collapsible container of laminated material including an outer flexible sheet of non-stretching material and an inner sheet of flexible pliable stretchable material impervious to air and moisture, said sheets being united between their surfaces so as to exclude entrance of air between the two sheets, said package being vacuumized and hermetically sealed and said container being collapsed around the ground coffee and compressing the same into a hard solid mass, and the inner sheet being stretched over the individual coffee particles in contact with it and conforming to and partially surrounding the same, whereby the native coffee gases are confined within the cells of the coffee particles and the package maintained in its preformed shape and in vacuum condition until the package is unsealed.



2,102,717

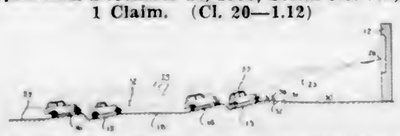
METAL FORM CLAMPING DEVICE

William Allen Jennings, Des Moines, Iowa, assignor to Economy Forms Corporation, Des Moines, Iowa, a corporation of Iowa

Application July 27, 1936, Serial No. 92,754

1 Claim. (Cl. 25—131)

A clamping device comprising a lever, a fulcrum pin extended laterally from one end portion of the lever, and a pair of jaws formed integral with the lever and of resilient material, the space between the ends of the jaws furthest from the lever being less than the space between the remainder of the jaws and whereby when the jaws are forced upon two articles to be clamped together and which are relatively thick at their outer edges and of less thickness at a point spaced from said outer edges, the jaws will be forced apart during the time when the jaws are moving over said relatively thick portions and then spring toward each other and form a frictional locking engagement with said articles when the end portions of the jaws reach said less thick portions of the articles.



2,102,718

THEATER

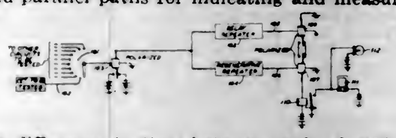
Louis P. Josserand, Houston, Tex.

Application December 14, 1933, Serial No. 702,294

1 Claim. (Cl. 20—1.12)

An outdoor theater for vehicles comprising a stage, a generally concaved surface located in front of the stage, spaced driveways on said surface, a parking area located on each side of each driveway, the area in front of each driveway being inclined upwardly therefrom and the area in the rear of each driveway being inclined downwardly therefrom in such a manner that the occupants of the vehicle parked on said parking areas will have an unobstructed view of the stage.

2,102,719



SIGNAL DISTORTION INDICATING AND MEASURING DEVICE

Fullerton S. Kinkead, Ridgefield Park, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application August 4, 1934, Serial No. 738,416

12 Claims. (Cl. 178—69)

9. In a signaling system, a device for measuring distortion present in incoming signals comprising a source of signaling current impulses, relaying means for regenerating said impulses, a circuit for transmitting said regenerated impulses, parallel paths including said circuit, distributing means connected in one of said paths for reproducing the current impulses as originally transmitted from said source, distortion introducing means in another of said paths for delaying the transmission of said regenerated impulses for a predetermined interval, and indicating means common to said parallel paths for indicating and measuring

the difference in time between each of said regenerated impulses and its corresponding reproduced impulse.

2,102,720

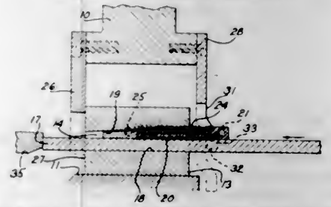
OPAQUE VITREOUS ENAMEL

Charles J. Kinzie, Niagara Falls, N. Y., assignor to The Titanium Alloy Manufacturing Company, New York, N. Y., a corporation of Maine

No Drawing. Application June 12, 1934, Serial No. 730,264

4 Claims. (Cl. 106—36.2)

1. The method of making opaque vitreous enameled and glazed ware, which comprises smelting part of a raw batch mixture of fusible enamel ingredients to form a relatively fluid melt and clear frit, then milling said clear frit mixed with lead zirconium silicate, the remaining ingredients of the batch and water to prepare the enamel slip, coating said ware with said slip and burning same to form said opaque enameled and glazed ware.



2,102,721

MATERIAL WORKING APPARATUS

Ray C. Kivley, Oak Park, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

Application February 9, 1935, Serial No. 5,718

2 Claims. (Cl. 164—51)

1. In a material working apparatus, a support for the material having a tapered channel therein for the passage of elongated material, means movable to and from the material for working thereon, means reciprocative in said channel effective in one position thereof in cooperation with a tapered side of said channel and the material for holding the material relative to the support and in another position releasing the material, and means including an operative connection between the working means and the holding means responsive to the movement of the working means towards the material for actuating the holding means to hold the material and actuating the holding means to release the material during the movement of the working means from the material.

2,102,722

TRACTOR HITCH DEVICE

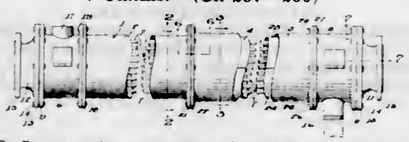
Justin H. Kortering, Holland, Mich.

Application February 26, 1936, Serial No. 65,770

22 Claims. (Cl. 180—14.5)

1. In a hitch device, the combination of a draft rod provided with a draw bar coupling at its front end and with a draft lug, a hitch member slidable on said draft rod and comprising spaced front, rear and intermediate crossheads, the front and intermediate crossheads being in slidable engagement with the draft rod, the rear crosshead being provided with a coupling member, tie rods joining said front and rear crossheads and arranged extending through the intermediate crosshead, a dashpot cylinder arranged between the intermediate and rear crossheads, said draft rod being provided with a plunger coacting with said dashpot cylinder and provided with a check valve, a cylindrical housing arranged between said front and intermediate crossheads, a coiled draft spring arranged within said housing, an adjust-

able support member for said spring provided with supporting and adjusting screws on said front crosshead, a yoke disposed within the spring and provided with a thrust collar engaging the inner end of said spring, coupling pawls pivoted to said yoke and shouldered to engage said draft lug on said draft rod, springs acting to urge said coupling pawls to lug engaging position, a collar slidable on said draft rod at the rear of said draft lug, links connecting said collar to the swinging ends of said coupling pawls, a spring urging said collar forwardly, a stop rod on said intermediate crosshead limiting the forward movement of said collar, and a stop within said housing disposed at the rear of and normally out of engagement with said yoke thrust collar.



2,102,723

COOLER

Meinhard H. Kotzebue, Tulsa, Okla.

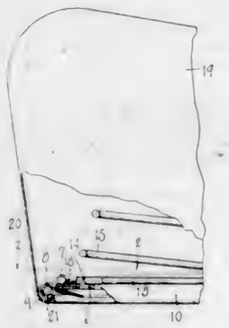
Application February 5, 1937, Serial No. 124,248

7 Claims. (Cl. 257—236)

2. In a cooler, a casing, liquid inlet and outlet heads at the ends of said casing, tubes extending through said casing, said casing between said heads being formed of a large section and a small section arranged end to end whereby the smaller section may be telescoped into the larger section to permit access to the tubes at one end of the cooler, and the larger section telescoped over the smaller section to permit access to the tubes at the other end of the cooler, and an inner casing section within said larger section and extending from the inner end of the smaller section to the outer end of the larger section.

2,102,724

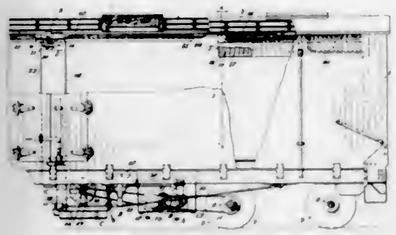
SPRING CUSHION STRUCTURE



Walter Lesinski, Detroit, Mich., assignor to L. A. Young Spring and Wire Corporation, Detroit, Mich.

Application September 24, 1936, Serial No. 102,295

12 Claims. (Cl. 155—180)

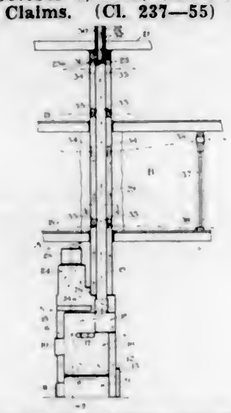


1. In a spring cushion structure, a border frame comprising fixedly connected side and end members formed of metal strips, the strips being folded longitudinally to provide a relatively wide

double thickness horizontal web, the upper arm of the web being reversely folded to provide an inwardly facing spring supporting channel, the lower arm of the web being extended beyond the upper and curved downwardly and inwardly to provide an inwardly facing curved upholstery securing channel disposed outwardly relative to the spring securing channel whereby said upper arm may be deformed to close said spring securing channel without deforming said upholstery skirt

channel, cross bars extending between said side members and fixedly secured to the webs thereof, a spring supporting wire grid disposed upon said cross members with their ends lapped upon said webs and fixedly secured thereto, coiled body springs arranged on said grid, the bottom coils of certain of said body springs being clamped within the inwardly facing spring supporting channel, and an upholstery covering provided with a depending skirt passed around said upholstery securing channel and disposed therein.

2,102,725
REFRIGERATOR CAR
John Lithgow, Blue Island, Ill., assignor to North American Car Corporation, Chicago, Ill., a corporation of Illinois
Application January 11, 1933, Serial No. 651,156
7 Claims. (Cl. 62—117)

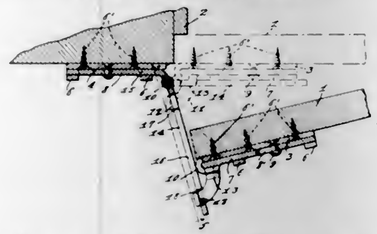


1. In a refrigerating system, a cold-storage tank, a refrigerating coil positioned inside the tank, a refrigerating coil positioned outside the tank, the two coils being connected in parallel, and means responsive to temperature changes within the space the temperature of which is controlled by the system for circulating a refrigerant through the outside coil only when the temperature in the space is above a predetermined temperature, and through the inside coil only when the temperature in the space is below this predetermined temperature.

2,102,726
PRODUCTION OF ALCOHOLS
Martin Luther, Mannheim, and Wilhelm Dietrich, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application June 23, 1936, Serial No. 86,816. In Germany October 15, 1929
6 Claims. (Cl. 260—156)

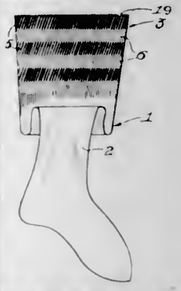
1. The process for the production of products consisting mainly of mixtures of the higher members of the aliphatic alcohol series which comprises heating the products, comprising non-aromatic long-chain acids, esters and carbonyl compounds from a destructive oxidation of difficultly volatile hydrocarbons in the liquid phase by means of a gaseous oxidizing agent containing free oxygen, in the presence of hydrogen and of a copper catalyst at a pressure about 10 atmospheres.

2,102,727
HEATING SYSTEM
James H. Maher, Montreal, Quebec, Canada
Application October 8, 1936, Serial No. 104,669
7 Claims. (Cl. 237—55)



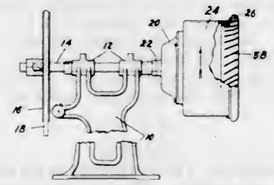
1. A hot air heating system comprising a hot air furnace including an air heating chamber provided with a cold air inlet, a smoke flue extending upwardly from said furnace, an air heating flue extending upwardly from said air heating chamber and surrounding said smoke flue, said air flue having its upper end closed off and being provided, at intervals corresponding to different floor levels, with air inlets and outlets arranged to provide at least one inlet and one outlet for each floor level, said air inlets being arranged to extend upwardly within the flue so that relatively cool air is caused to enter the latter through the inlet or inlets at each floor level by the injector action of the heated air rising in said flue.

2,102,728
METHOD OF REFINING COPPER
Albert T. March and Walter E. Remmers, Western Springs, Ill., assignors to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
No Drawing. Application August 7, 1936, Serial No. 94,797
6 Claims. (Cl. 75—76)



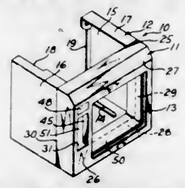
2. The process of removing lead from copper which comprises heating molten copper to a temperature in the vicinity of 2050° F., introducing an oxidizing medium into the bath, raising the temperature to the vicinity of 2160° F. to volatilize lead oxide, and keeping the surface of the bath substantially free from slag during said oxidation and volatilization.

2,102,729
COMBINATION DOOR PROTECTOR AND LOCK
Gordon Grant McDonald, Nova Scotia, Nova Scotia, Canada, assignor to Edna P. Cox, Halifax, Nova Scotia, Canada
Application August 10, 1936, Serial No. 95,263
3 Claims. (Cl. 292—269)



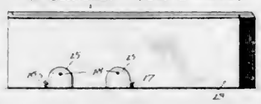
1. A door fastener comprising an attaching plate secured to a door, a second attaching plate secured to a door frame, an attaching member pivotally and slidably connected to the first-named attaching plate and capable of extending parallel therewith or at right angles to the length thereof, a second attaching member pivoted to the second-named attaching plate and capable of extending parallel therewith or at right angles to the length thereof, jaws formed on the attaching members and the jaws of each attaching member extending in opposite directions to each other and adapted to overlie the attaching members when in parallelism with the attaching plates, and separable means connected with the attaching plates for securing the door in a closed position or in a partly open position.

2,102,730
STOCKING
Milton M. Meyers, Elkins Park, Pa., assignor to Clarence L. Meyers & Co., Philadelphia, Pa.
Application July 31, 1936, Serial No. 93,553
8 Claims. (Cl. 66—173)



1. In a knitted stocking, a knitted welt comprising an alternating arrangement of fabric bands of predetermined width, each band consisting of a multiplicity of successive courses, the courses of every other band being knitted from a yarn twisted at a degree different from the degree of twist of the yarn forming the courses of the interposed bands, whereby the bands will have different degrees of surface brightness.

2,102,731
LIP LAYING DEVICE
George A. Miner, Goffstown, N. H., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application July 20, 1936, Serial No. 91,465
3 Claims. (Cl. 12—29)



1. A lip-laying device comprising a hollow rotary member having an open end which is surrounded by a smooth annular rim, and a plurality of strips of a soft smooth material embedded in said rim for frictionally engaging a lip formed on a sole to assist the rim in wiping down the lip.

2,102,732
METHOD OF FORMING SHEET METAL ARTICLES
Ivar A. Morberg, Chicago, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application January 11, 1936, Serial No. 58,635
3 Claims. (Cl. 113—116)

1. The method of forming the front of a coin box for telephone pay stations which comprises forming a blank having a front wall and top, bottom and side flanges, perforating two openings in the front wall of the blank, enlarging one of said openings by shearing and folding the metal adjacent thereto at an angle to the front wall, and drawing the metal adjacent the edges of the second opening out of the plane of the front wall, and swaging the edges of said second opening to form a door seat and to thicken the material adjacent the edges along a predetermined line.

2,102,733
BATHTUB
Robert Mueller, Decatur, Ill.
Original application December 23, 1935, Serial No. 55,910, now Patent No. 2,074,234, dated March 16, 1937. Divided and this application September 16, 1936, Serial No. 101,141
7 Claims. (Cl. 4—173)

1. A bath tub having an apron, the lower portion of which is cut out to provide a foot receiving opening, and a cover plate for said opening movable into and out of operative position.

2,102,734

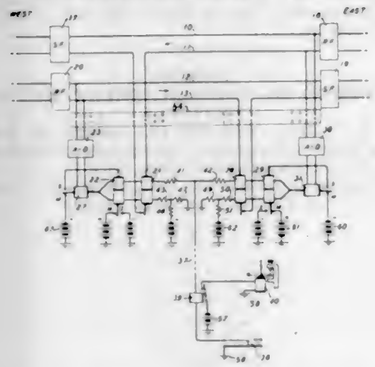
PREPARATION FOR TREATING PLANTS

Edward P. Naus, Minneapolis, Minn.

No Drawing. Original application July 29, 1933, Serial No. 682,887. Divided and this application May 25, 1936, Serial No. 81,714

1 Claim. (Cl. 167—29)

A dry preparation for protecting plants, trees, and shrubs against the ravages of bugs, insects, and plant diseases, composed substantially entirely of finely pulverized asphalt pitch, whereby it may readily be applied to the plants in a dry, dust-like powder which readily adheres thereto.



2,102,735

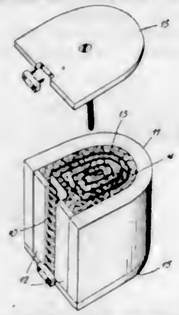
CARRIER TELEGRAPH SYSTEM

James T. Neiswinter, Cleveland, Ohio, assignor to American Telephone and Telegraph Company, a corporation of New York

Application December 23, 1936, Serial No. 117,381

3 Claims. (Cl. 178—66)

3. In a telegraph system, an eastward line transmitting carrier currents in a plurality of frequency ranges, a westward line transmitting carrier currents in a plurality of frequency ranges, a pair of filters in series in each line at a given location, the two filters of each pair selectively passing the same range of frequencies, a subscriber's loop comprising a symmetrical differential circuit layout, each half of said loop circuit including a send relay, a receive relay, a break relay, a potentiometer and a voltage source, said send relays and said break relays having two operating windings, a conductor joining the armature of one of said receive relays, the first winding of each of said send relays and each of said break relays and the armature of the other of said receive relays in series, a second conductor joining the armature of one of said receive relays, the second winding of one of said send relays and one of said break relays, one of said potentiometers and one of said voltage sources in series, a third conductor joining the armature of the other of said receive relays, the second winding of the other of said send relays and the other of said break relays, the other of said potentiometers and the other of said voltage sources in series, a sounder in the subscriber's loop, a relay for controlling the operation of said sounder, a fourth conductor joining the midpoint of said first conductor and the operating winding of said last-mentioned relay, each of said send relays controlling a contact in a respective one of said lines at a point between the pair of filters in the respective line and each of said receive relays being effectively connected in bridge of a different respective line at a point between the pair of filters connected in the respective line.



2,102,736

ACOUSTICAL DEVICE

Harry F. Olson, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application November 21, 1933, Serial No. 699,090

6 Claims. (Cl. 179—138)

2. The combination of magnetic field producing means arranged to form a chamber, an electrically conducting diaphragm mounted in said field to form a section in a wall of said chamber, means arranged within said chamber to form a winding passageway with one of its openings covering the rear of said diaphragm, means within said passageway for rendering the impedance presented to the diaphragm independent of frequency.

2,102,737

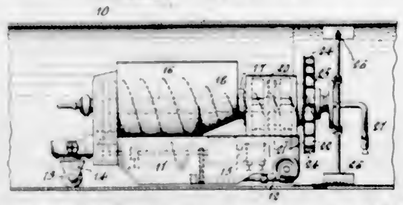
PREPARATION OF ANTIMONY CHLORIDES

Ferdinand W. Peck, Penns Grove, N. J., and William R. Waldron, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application February 28, 1934 Serial No. 713,400

10 Claims. (Cl. 23—98)

10. The process of producing antimony trichloride which comprises reacting metallic antimony in a state of subdivision with chlorine in a high-boiling aromatic solvent for antimony chloride of the class consisting of nitrobenzene, ortho-nitrochlorobenzene and para-nitrochlorobenzene at a temperature not higher than about 85° C., while maintaining an excess of metallic antimony in the chlorination reaction mixture during the reaction.



2,102,738

PIPE COATING APPARATUS

Albert G. Perkins, Warsaw, N. Y.

Application May 22, 1936, Serial No. 81,275

7 Claims. (Cl. 91—44)

1. An apparatus for lining pipe walls and the like, comprising a feed conduit adapted for communication with a source of coating material and having an annular row of discharge ports therein, said ports being disposed obliquely to the conduit axis, and a revolving dispensing member including intercepting blades disposed in operative communicating relation to and covering a plurality of said discharge ports simultaneously for receiving and discharging the material centrifugally therefrom onto the pipe wall.

2,102,739

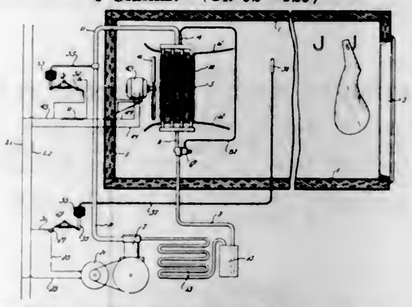
FISH BAIT

Frank J. Peters, Portland, Oreg.

Application July 7, 1936, Serial No. 89,335

1 Claim. (Cl. 43—42)

A new article of manufacture comprised of a jacket made of stretchable material and delineated upon its exterior to resemble live bait and a fish hook and a leader associated with the jacket and means for opening and closing the jacket to facilitate the filling and the emptying of the jacket with bait material of the desired color.



2,102,740

REFRIGERATING APPARATUS

Lawrence A. Philipp, Detroit, Mich., assignor, by mesne assignments, to Nash-Kelvinator Corporation, Detroit, Mich., a corporation of Maryland

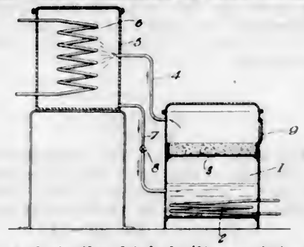
Application November 26, 1934, Serial No. 754,704

6 Claims. (Cl. 62—129)

5. In a conditioning system the combination of a refrigerant evaporator, a refrigerant circulating device, means for causing air to flow over said refrigerant evaporator, and means directly responsive to the temperature of the evaporator for controlling the flow of air over the evaporator so that the evaporator operates at proper temperatures for removing both sensible and latent heat from excessively humid air and substantially only the sensible heat from air of proper humidity.

2,102,741

PROCESS FOR TREATING VULCANIZED RUBBER



Francis Norman Pickett, London, England, assignor to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware

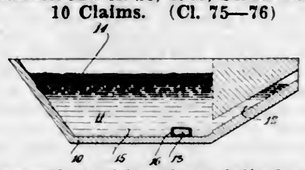
Application April 21, 1934, Serial No. 721,760

In Great Britain July 31, 1933

10 Claims. (Cl. 18—52)

6. A process of manufacture of rubber which comprises plasticizing comminuted vulcanized rubber from vulcanized rubber waste by heating the rubber under pressure not exceeding 60 lbs./sq. in. with a distillate of rubber comprising

Heveene and similar high boiling point oils from which distillate the isoprene fraction has been substantially removed, the process being carried out at a temperature and for a period of time sufficient to ensure devulcanization.



2,102,742

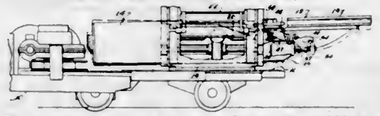
HIGH CONDUCTIVITY, PHOSPHORUS-DEOXIDIZED COPPER AND PROCESS FOR MAKING THE SAME

Frank F. Poland, New Brunswick, N. J., assignor to American Smelting and Refining Company, New York, N. Y., a corporation of New Jersey

Application March 26, 1935, Serial No. 13,049

10 Claims. (Cl. 75—76)

1. The method of treating relatively pure copper which comprises introducing same in the molten state into contact with a predetermined amount of phosphor-copper of known composition under a bed of carbonaceous reducing agent thereby deoxidizing the copper and imparting thereto a predetermined phosphorus content and casting the resultant deoxidized copper into a mold of desired shape, the interior surfaces of which are coated with a mold dressing comprising an alcoholic solution of resin in which bone black is suspended.



2,102,743

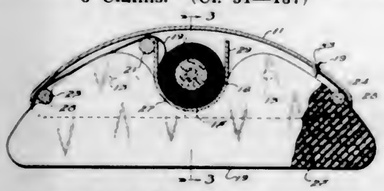
KERF-CUTTING MACHINE

Thomas E. Pray, Chicago, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois

Application November 22, 1935, Serial No. 51,003

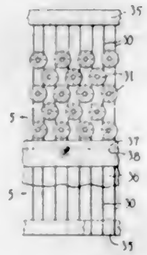
14 Claims. (Cl. 262—28)

1. In a mining machine, a base, a cutting element including a frame having a cutter bar projecting therefrom, means for supporting said cutting element for vertical adjustable movement with respect to said base including a pair of parallel-spaced vertically extending guides mounted on said base, a cradle slidably guided therein, means for adjustably moving said cradle along



said guides, a supporting connection between said cradle and cutting element permitting pivotal movement of said cutting element with respect to said base about a horizontal transverse axis extending between the ends of said guides, and means disposed forwardly of said guides for pivotally moving said cutting element about said transverse axis.

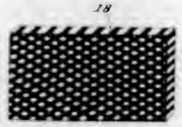
2,102,744
TOOL
Harry Ratcliffe, Chicago, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application September 25, 1936, Serial No. 102,448
2 Claims. (Cl. 30—212)



1. A tool for simultaneously cutting a plurality of parallel predeterminedly spaced fixed wires with the points of cutting being progressively offset along the length of the wires comprising a member having a plurality of wire receiving notches having cutting edges, an actuating member pivotally connected thereto, a second member having a plurality of wire receiving notches having cutting edges cooperating with the notches and cutting edges of said first member, said second member being pivotally connected to said actuating member, said notches extending diagonally and transversely of the members at a predetermined angle, the notches in each member having a spacing similar to that of the wires to be cut, one of said notched members having a dovetail extension engaging in a complementary recess in the other notched member to cause said latter member to move in a predetermined path by said actuating member, and means including a resilient element for maintaining said second notched member in a normal position with its notches aligned with the notches of said first member for receiving wires to be cut.

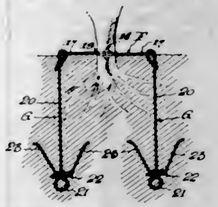
2,102,745
ABRASIVE PAD
Merwin F. Read, Detroit, Mich.
Application August 24, 1936, Serial No. 97,540
3 Claims. (Cl. 51—187)

1. An abrasive pad including, in combination, a housing, a rolled strip of abrasive tape, means within said housing for supporting said roll of abrasive tape, a resilient pad having a portion adapted to fit within said housing and a portion adapted to project therefrom, rolls at each end of said housing over which said tape is adapted to pass, means for urging said rolls against said housing to preclude movement of said tape thereover, said rolls serving to retain said tape in tensioned condition over the surface of said pad thereby retaining the same seated in said housing.



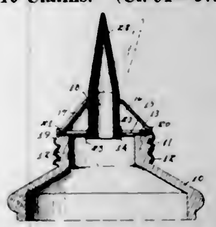
2,102,746
ORNAMENTATION
Alfred F. Reilly, North Attleboro, Mass., assignor to Evans Case Company, North Attleboro, Mass., a corporation of Massachusetts
Application March 1, 1937, Serial No. 128,498
17 Claims. (Cl. 41—34)

1. The method of mounting a mesh made of substantially parallel cords having beads including plastic holding the cords in position throughout a portion of their lengths and leaving their ends free, comprising placing an adhesive member on the free ends so as to hold them in position, and attaching between the beads and the adhesive member a member to which the mesh is to be permanently attached.



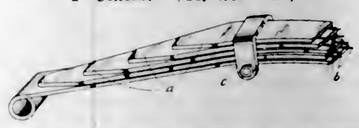
4. A bag comprising a frame, a mesh, portions of which are cut away made of substantially parallel cords crossed throughout a portion of their lengths, beads including plastic holding the cords in position at their crossing points, but leaving the cord ends free, means for fastening the free ends of the cords to the frame so as to bring into contact the cut edges, and means to fasten together the cut edges.

2,102,747
METHOD OF MAKING ORNAMENTED PLASTIC MATERIAL
William F. Roberts, Indian Orchard, Mass., assignor to The Fiberloid Corporation, Indian Orchard, Mass., a corporation of Massachusetts
Application April 27, 1935, Serial No. 18,639
3 Claims. (Cl. 18—61)



1. The method of producing ornamented sheets which comprises forming a block by combining a plurality of superimposed plastic sheets, the adjacent sheets being of different color, one of each pair of adjacent sheets being transparent, sheeting said block in a direction transverse to the original sheets to form striped sheets, forming a second block by superimposing and combining said striped sheets in such relative positions that the stripes of adjacent sheets cross, sheeting said second block to produce sheets in which areas of one color appear to be surrounded by areas of another color, and combining one of said last mentioned sheets with another sheet having ornamentation visible through the transparent areas of said superimposed striped sheets.

2,102,748
THEFT-PREVENTING DEVICE FOR PLANTS
Camille J. Rocquin, New Orleans, La.
Application June 15, 1936, Serial No. 85,357
8 Claims. (Cl. 47—25)

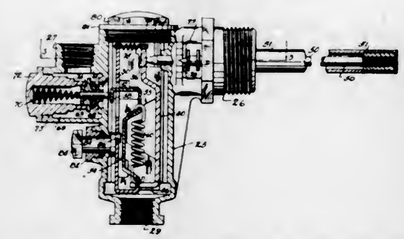


1. A theft-preventing device for plants comprising an attachable collar adapted to closely embrace the plant stem directly above the roots so as to prevent withdrawal of the rooted portion of the stem therethrough, and at least one ground-engaging anchor attached to said collar.

2,102,749
DISPENSING CAP
Richard E. Salvesen, Forest City, Iowa
Application March 8, 1937, Serial No. 129,632
10 Claims. (Cl. 91—67.5)

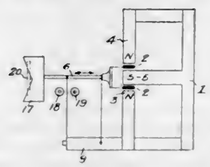
1. In a device of the class described, a closure cap including an end portion having an opening, a flexible and collapsible tube mounted in said opening for closing the same, one end of said tube being closed and projecting outwardly and beyond said cap, the other end projecting inwardly thereof, and means fixing the inner end of said tube against movement whereby that portion of the tube supported within said opening will be collapsed when bending strain is applied to the outer end of said tube to form an opening through which fluid within said container may be fed to the outer surface of the outer end of said tube when the container is in an inverted position.

2,102,750
LAMINATED SPRINGS
Thomas Henry Sanders, Leeds, England
Application September 8, 1936, Serial No. 99,835
In Great Britain October 22, 1935
1 Claim. (Cl. 267—49)



In laminated springs the provision between and along the longitudinal marginal edges of the plates thereof of wire adapted to separate adjacent plates from each other and to be retained in position by engaging holes in said plates.

2,102,751
PRODUCTION OF ACETALDEHYDE
Arno Scheuermann, Ludwigshafen-on-the-Rhine, Rudolf Brill, Heidelberg, and Gustav Wietzel, Mannheim, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application February 27, 1936, Serial No. 66,052. In Germany March 5, 1935
4 Claims. (Cl. 260—139)

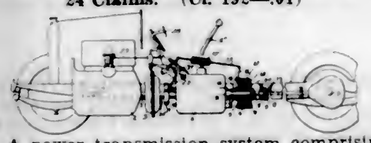


1. In the production of acetaldehyde from acetylene by catalytic hydration in the gas phase by means of a cadmium phosphate catalyst the improvement which comprises employing a cadmium phosphate catalyst in which the cadmium is partially replaced by at least one alkaline earth metal.

2,102,752
VALVE MECHANISM
Frank H. Schoenfeld, Cleveland Heights, Ohio
Application October 24, 1935, Serial No. 46,543
6 Claims. (Cl. 236—48)

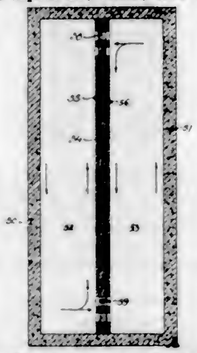
1. In a thermostatic control device, a casing having an inlet opening and an outlet opening, a lever carrying frame fitted therein, a main lever adapted to be actuated by a thermostatic device, a secondary lever having a pivot seat on the main lever, a spring connected to said frame and to said secondary lever for effecting snap action, the frame having a plurality of pivot seats for selectively positioning said main lever, and a valve cooperating with one of said openings and adapted to be operated by said secondary lever.

2,102,753
RECORDING OF ELECTRICAL IMPULSES
Karl Schwarz, Berlin, Germany, assignor to Klangfilm G. m. b. H., Berlin, Germany, a corporation of Germany
Application July 23, 1936, Serial No. 92,085
In Germany October 30, 1935
5 Claims. (Cl. 179—100.3)



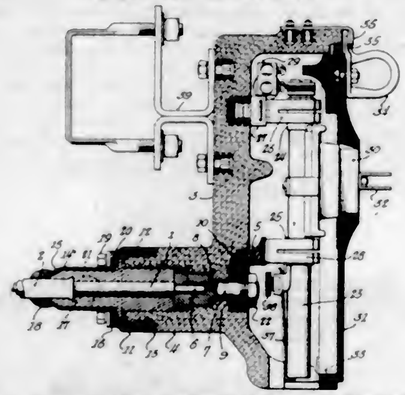
1. The combination of a light slit adapted to have its illumination modulated in accordance with the impulses to be recorded, means for producing a magnetic field, a shutter provided with a V-shaped edge traversing said slit, and a coil movably mounted in said field and connected to said shutter for causing said edge to follow the envelope of said illumination.

2,102,754
JAR
Baker L. Shannon, Houston, Tex.
Application July 13, 1936, Serial No. 90,333
4 Claims. (Cl. 255—27)



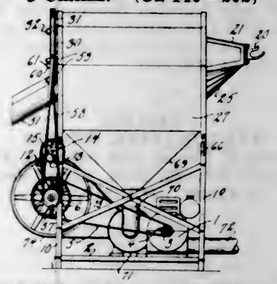
1. A jar comprising a housing, a grapple attached to the housing, a cylinder in the housing having an impact abutment, a piston in the cylinder having an impact face opposite said abutment, means on the housing and piston adapted to interlock, said cylinder and piston being simultaneously movable into one position to cause the interengagement of said interlocking means to hold the piston stationary in the housing, said cylinder being movable independent of the piston to another position to cause a vacuum to be created in said cylinder and means arranged to be controlled by pressure fluid and adapted to release said interlocking means whereby to release the piston to permit said impact face to strike against said abutment.

2,102,755
POWER TRANSMISSION MECHANISM
Harold Sinclair, Surbiton Hill, England
Application September 19, 1931, Serial No. 563,788
In Great Britain September 25, 1930
24 Claims. (Cl. 192—.01)



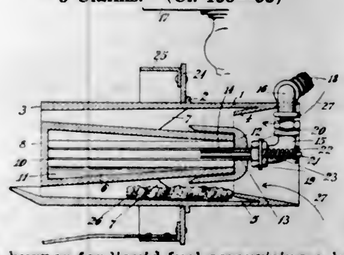
1. A power transmission system comprising a source of power, a multi-ratio gear box, a hydraulic coupling connecting between said source of power and said gear box, a driven shaft, a friction clutch connecting between the change-speed gearing of said gear box and said driven shaft, means for arresting the shaft connecting said hydraulic coupling to said gear box and rocking said connecting shaft backwards, means for regulating the output of said source of power independently of normal power-regulating means, and common controlling means initial operation of which simultaneously unclutches said friction clutch and actuates said means for independently regulating the power output so as to reduce the output of said source of power, further operation of which further reduces the output of said source of power, still further operation of which actuates said means for arresting said connecting shaft, and the final operation of which actuates said means for rocking said connecting shaft backwards.

2,102,756
BUILDING BLOCK
George A. Smith, Chevy Chase, Md., and Milton S. Van Dusen, Washington, D. C.
Application July 3, 1936, Serial No. 88,772
2 Claims. (Cl. 72—16)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



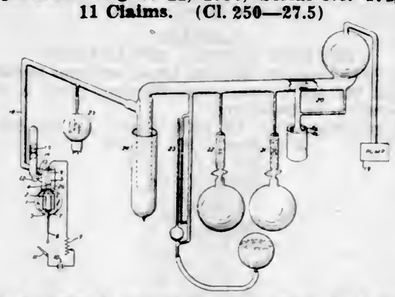
1. A wall structure comprising an outer and inner shell and an insulating partition therebetween adapted to divide the air space enclosed by said shell, said partition having apertures formed therein and adapted to permit the passage of a portion of the air in one subdivision into another, thereby causing the warm moisture laden air to pass from the warmer to the cooler chamber and inhibiting condensation on said insulating partition.

2,102,757
COMBINED HOUSED ELECTRICAL DEVICE AND CABLE SEALING MEANS
James P. Smith, West Orange, N. J., assignor to Line Material Company, South Milwaukee, Wis., a corporation of Delaware
Application October 31, 1935, Serial No. 47,550
4 Claims. (Cl. 247—6)



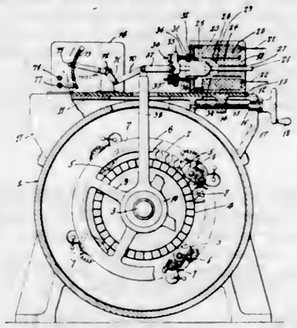
1. In an electrical device, a housing formed of insulating material and having an internally located terminal member, said housing having an external bushing provided with a cavity opening through the outer face of said bushing and extending inwardly towards said housing and terminated by an inner wall, said housing having an opening through the said inner wall at the inner end of the cavity in said bushing, a headed member located within the cavity of said bushing, conducting means extending from said headed member through said opening and including detachable screw means accessible interiorly of said housing for holding both said terminal member and headed member in place, a metal sheathed cable having a conductor secured to said headed member, and a wiping bell secured to the sheath of said cable and detachably secured to said bushing.

2,102,758
CLEANER FOR VEGETABLES
Walker H. Spayd, Van Wert, Ohio
Application November 18, 1936, Serial No. 111,340
3 Claims. (Cl. 146—202)



1. A material cleaner comprising a base, a housing mounted on the base in spaced relation above the same, parallel shafts mounted in the housing longitudinally thereof and adjacent the top thereof, sets of aligned sprockets on and adjacent both ends of the shafts and within the housing, means for driving one of said shafts, an endless belt surrounding and driven by said sprockets, the lower run of the endless belt having a substantial sag between the sprockets and forming a longitudinal runway for material being cleaned, brushing members fixed to the inner surface of the belt for brushing the material as it passes through the runway, another shaft journaled in the housing between the runs of the endless belt and carrying flexible wiping members, the last mentioned shaft extending parallel to the first mentioned shafts and situated nearer the bottom run of the endless belt, the wiping members extending into contact with the material being cleaned and means to drive said shaft.

2,102,759
BURNER FOR LIQUID FUEL
Josef Spirig, Hard, near Bregenz, Vorarlberg, Austria, assignor to Anton Hofstetter, Widnau, Switzerland
Application January 20, 1936, Serial No. 59,942
In Austria January 22, 1935
3 Claims. (Cl. 158—53)

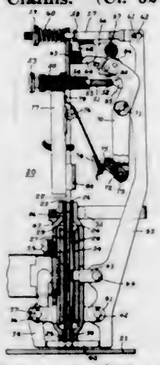


1. A burner for liquid fuel comprising a burner tube, a vaporizer disposed within said burner tube and spaced therefrom, said vaporizer having its rear end closed and having a resiliently urged cap bearing against its front end and means for leading liquid fuel to said vaporizer.

2,102,760
PHOTOELECTRIC TUBE
George R. Stilwell, Plainfield, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application August 11, 1930, Serial No. 474,330
11 Claims. (Cl. 250—27.5)

1. A method of preparing a cathode for a light sensitive device which comprises providing a metallic cathode member in an evacuated container, introducing into the container an element having characteristics different from the member, chemically combining a surface layer of said member with said element by ionic bombardment of the surface of the member, further ionically bombarding said member to decompose the resulting combination, and providing a light sensitive electron emissive surface on the member.

2,102,761
WELDING GENERATOR
Karl Strobel, Whittier, Calif., assignor to Karl Strobel Corporation, Los Angeles, Calif., a corporation of California
Application October 12, 1931, Serial No. 568,314
2 Claims. (Cl. 219—8)



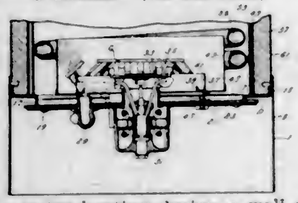
1. In an arc welding system, a pair of welding electrodes between which an arc may be struck, said electrodes being subject to rapid relative movement toward and away from each other whereby the length of the arc therebetween is subject to rapid and frequent variations, a generator having an output circuit connected to supply current to said electrodes, said generator having a commutator and brushes contacting said commutator, means mounting said brushes for movement relative to the commutating plane of

said generator, an electromagnetic structure comprising a core, a coil on said core, means connecting said coil for constant potential excitation, an armature movably mounted relative to said core, a coil on said armature, means connecting said coil in shunt across the output circuit of said generator, and means connecting said armature to said brush mounting means whereby variations in the resistance of said output circuit will cause a shifting of said brush mounting structure to maintain the current across said arc at a constant value.

2,102,762
REFRIGERATING APPARATUS

Otto M. Summers, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware

Application July 10, 1934, Serial No. 734,524
4 Claims. (Cl. 62—4)



1. Refrigerating apparatus comprising a closed refrigerating system having means for circulating condensing and evaporating refrigerant, means for automatically controlling the circulation of refrigerant including means for controlling the starting and stopping of the circulation of refrigerant according to predetermined temperature limits and separate means for separately adjusting the starting of the circulation, and separate means for adjusting the stopping of the circulation, said starting and stopping adjusting means being entirely independent of each other and being independently adjustable, each of said separate means acting effectively solely during a period when the other separate means is not acting effectively.

2,102,763
LIQUID FUEL BURNING APPARATUS

Noel H. Sutterfield, Detroit, Mich., assignor to The Timken-Detroit Axle Company, Detroit, Mich., a corporation of Ohio

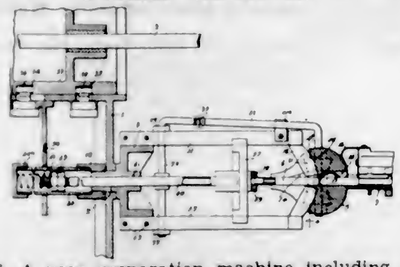
Application October 26, 1935, Serial No. 46,947
5 Claims. (Cl. 122—250)

1. In a water heating device, a wall structure defining a substantially upright combustion chamber, a water-heating coil disposed in said chamber and located adjacent the walls thereof, a substantially centrally disposed liquid fuel burning apparatus mounted in the lower end of said chamber and comprising a central means for projecting a blast of air and a horizontal sheet of unatomized oil outwardly, an upright metallic impact member spaced inwardly from the walls of said chamber against which said oil is adapted to impinge and over which said air is adapted to flow, said oil atomizing against said impact member and combusting with said air above and outwardly of said impact member, to thereby maintain the latter at a temperature sufficiently high to volatilize oil impinging thereagainst, and a generally annular upright baffle disposed in said chamber between the lower end of said coil and said impact member for precluding direct contact of the combustion gases with the lower end of said coil.

2,102,764
ILLUMINATING DEVICE

Vernon F. Taylor, San Antonio, Tex.

Application July 29, 1936, Serial No. 93,281
1 Claim. (Cl. 240—7.1)

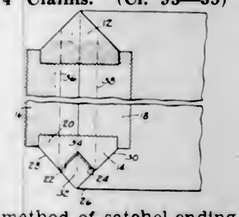


In vehicle road illuminating devices of the character described, in combination with a vehicle, a pair of headlights, each provided with a transparent closure having a colored portion along the right-hand periphery thereof, as seen by an observer, amounting to from about 1 per cent to 10 per cent of the area of closure, said portions being of different color for each one of said pair of head-lights whereby main beams of light are sent forth by said head-lights having colored signal streaks along the sides of said beams toward an observer in an approaching vehicle, thus giving visual indication as to the position of the body of the first-mentioned vehicle without blinding the observer with the main light from the head-lights thereof.

2,102,765
FRUIT DIVIDING MECHANISM FOR FRUIT PREPARATION MACHINES

Albert R. Thompson, Los Gatos, Calif., and William de Back, Niagara Falls, N. Y.

Application September 26, 1936, Serial No. 102,760
5 Claims. (Cl. 146—33)

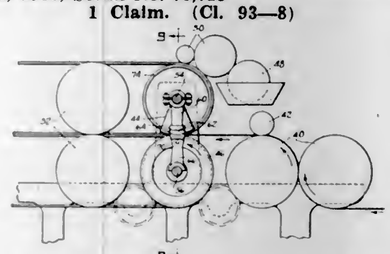


1. A pear preparation machine including an impaling member in the form of a stem for impaling and supporting the pear along the axis of the pear, said impaling member having a projection adapted to cut into the flesh of the pear to maintain the same from rotation relative to the impaling member, halving blades, and means for effecting relative movement of the halving blades and the impaling member, with the projection in such relation that the halving blades sever the pear into halves in a plane substantially aligning with the cut formed by the said projection.

2,102,766
METHOD OF FORMING VALVE BAGS

John N. Tooker, Canajoharie, N. Y., assignor to Bartlett Arkell, New York, N. Y.

Application August 29, 1934, Serial No. 741,892
4 Claims. (Cl. 93—35)

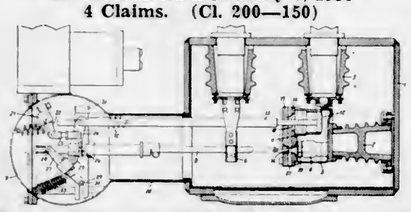


1. In the method of satchel ending a bag tube which includes opening and flattening the end of the tube so as to provide inwardly directed corner flaps and longitudinally extending side flaps, and folding over the side flaps in overlapping relation and pasting them together so as to provide a satchel end with one of said corner flaps constituting the under flap of a valve, the improvement which consists in the additional step of creasing the under flap of the valve when the end of the bag tube is in said opened and flattened condition so as to provide a hinged portion adjacent the end of the upper wall of the valve when the satchel end has been completed, the hinged portion tending to cause the under flap of the valve to lie tightly against the underside of the upper wall of the valve when the bag is filled and the valve is permitted to close.

2,102,767
MACHINE FOR FORMING VALVE BAGS

John N. Tooker, Canajoharie, N. Y., assignor to Bartlett Arkell, New York, N. Y.

Original application August 29, 1934, Serial No. 741,892. Divided and this application April 22, 1936, Serial No. 75,713
1 Claim. (Cl. 93—8)

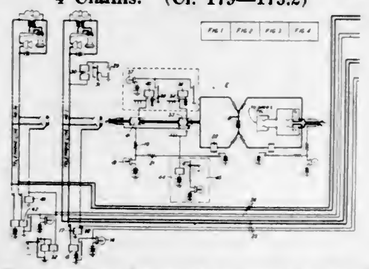


In a bag machine, the combination of a rotatable pasting segment and a drum adapted to cooperate therewith to engage opposite surfaces of the spread and flattened end of a bag tube, means operated in timed relation with the rotation of said segment for forming a V-shaped crease in one infolded flap of the bag tube during the period of engagement of the tube by said segment and drum, and a shaft to which said pasting segment is secured for rotation thereby, said crease-forming means comprising a pair of members, one rigidly secured to said shaft in substantial radial alinement with a portion of said segment and the other of said members secured to said drum for rotation thereby, one of said members having a V-shaped groove therein and the other of said members having a correspondingly shaped projection thereon whereby the V-shaped crease is formed in the flap of the bag tube when said projection and groove are alined and in engagement with opposite surfaces thereof.

2,102,768
LIQUID BREAK CIRCUIT BREAKER

Henry Trencham, Ruislip, and Harold Ernest Cox, Dollis Hill, London, England, assignors to General Electric Company, a corporation of New York

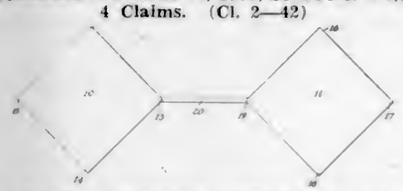
Application January 7, 1936, Serial No. 57,968
In Great Britain January 7, 1935
4 Claims. (Cl. 200—150)



1. An electric circuit breaker of the impulse type comprising means forming a chamber containing an arc-extinguishing liquid, relatively movable contacts separable within said liquid, one of said contacts movable through a wall of said chamber, means forming a passage transverse to the path of said movable contact, a piston, one side of which is in communication with said chamber and the opposite side with said passage and actuating means for biasing said piston in a direction to cause a blast of arc-extinguishing liquid through said transverse passage and across the arc formed therein, the arc pressure generated in said chamber also acting on said one side of said piston so as to aid said transverse blast.

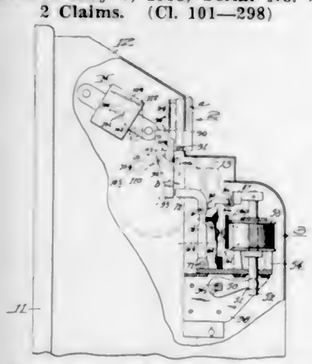
2,102,769
SERVICE OBSERVING SYSTEM

Horace W. Ulrich, Newark, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York



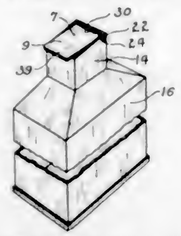
Application July 29, 1936, Serial No. 93,188
4 Claims. (Cl. 179—175.2)

1. In a service observing system, a subscriber's line having a message register, adapted to reduce its effective resistance when operated, associated with the line, an operator's cord circuit adapted to be connected thereto having means therein for operating the message register, a service observing circuit connected to said line, a signal lamp associated with said observing circuit, means comprising a voltmeter relay in a Wheatstone bridge arrangement established when the cord is connected to the line, said voltmeter relay



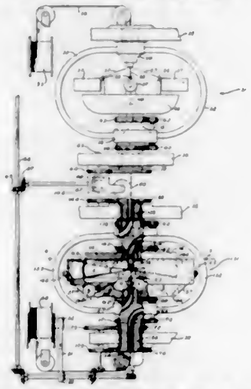
being adapted to operate to light said lamp when the subscriber's receiver is off the hook, one arm of said Wheatstone bridge arrangement including said message register, and means effective when said message register is operated to compensate said bridge for the change in resistance of its message register arm to maintain said voltmeter relay operated.

2,102,770
HALTER
Lucie von Ledermann, Beverly Hills, Calif., assignor of one-half to Claramae Blum Burns, New York, N. Y.
Application December 17, 1936, Serial No. 116,313
4 Claims. (Cl. 2—42)



1. A halter for women comprising a pair of triangular pieces of material and a strap joining said pieces and having one of its ends attached to one corner of one of said pieces and its other end attached to one corner of the said other piece, said strap being adapted to be positioned around the neck or back of the wearer, the second corners of each of said pieces being adapted to be passed beneath the arms and secured together by tying in a knot at the back of the wearer, and the third corners of each of said pieces being adapted to be secured together by tying in a knot at the front of the wearer.

2,102,771
WORKMAN'S TIME RECORDER
Edward G. Watkins, Gardner, Mass., assignor to Simplex Time Recorder Company, Gardner, Mass., a corporation of Massachusetts
Application May 7, 1935, Serial No. 20,140
2 Claims. (Cl. 101—298)

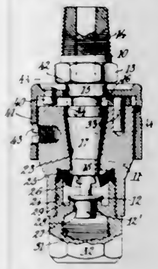


1. In a time recorder wherein is provided a card chute, an impression hammer, a solenoid coil, a solenoid plunger connected to actuate said hammer, a circuit for said coil, and means to close said circuit manually, that improvement which comprises providing a removable casing for said time recorder, positioning said circuit-closing means above and to the rear of said card chute but adjacent thereto and supporting said circuit-closing means on said removable casing in such manner that said closing means is removable with said casing from operative position in said time recorder.

2,102,772
DISPENSING AND MEASURING CLOSURE
James G. Watts, Vancouver, British Columbia, Canada
Application July 16, 1936, Serial No. 90,970
2 Claims. (Cl. 221—98)

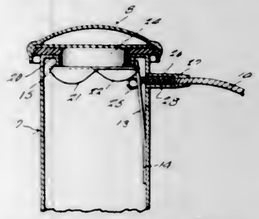
1. In a dispensing closure, the combination with a container having a neck provided with a pair of alined openings forming bearings, of a receptacle comprising a pair of angularly disposed inner and outer plates and side walls therefor, and said walls each having an outwardly extending lug adapted for co-action with said alined openings.

2,102,773
METHOD OF AND APPARATUS FOR HANDLING STRANDS
Leo L. Weaver, Cranford, N. J., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application December 27, 1933, Serial No. 704,099
8 Claims. (Cl. 96—3)



1. The method of braiding on a core which comprises the steps of serving a cover strand on a longitudinally advancing core at one point, stripping the cover strand from the core at another point, and reapplying the stripped cover strand to the core at a third point together with a second cover strand.

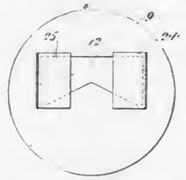
2,102,774
COUPLING
Selden T. Williams, Bellerose, N. Y., assignor to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut
Application January 3, 1936, Serial No. 57,350
2 Claims. (Cl. 285—173)



2. A hose coupling comprising a socket member and a plug member for engaging in said socket member, the plug member having an annular

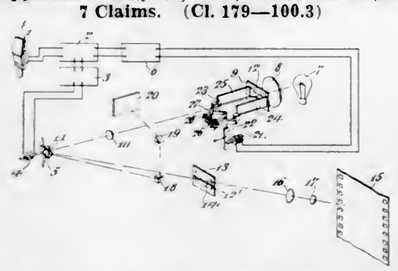
groove therein, the socket member having a pivotally mounted pawl at one end thereof for engaging in said groove, spring means for urging the pawl radially inwardly, a sleeve carried by and capable of limited rotative movement relatively to the socket member enclosing the pawl

and the spring, and an axially-projecting pin carried by the sleeve normally acting directly upon the pawl to limit the radial inward movement thereof and adapted for moving said pawl outwardly against the tension of the spring means upon limited rotation of the sleeve relatively to the socket member.



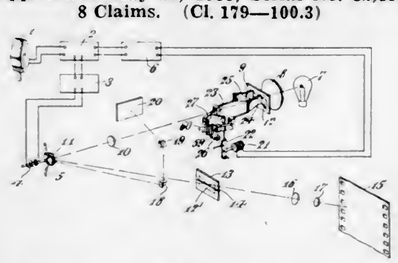
2,102,775
AUTOMOBILE GAS TANK CAP LOCK
Hannah C. Woodhead, Darby, Pa.
Application January 19, 1937, Serial No. 121,341
2 Claims. (Cl. 220—55)

1. An arrangement of the character described comprising a filling neck having a flange including opposed notches, a cap imposable on the upper end of said filling neck and provided with opposed wings adapted to pass downwardly through the notches and engage under the flange, and spring-pressed detent means located in one of said notches and mounted on the filling neck for blocking said notch to prevent withdrawal of one of the wings through said notch, cam means on the wings for moving the detent means partly out of the notch when the cap is being put on the neck and means for withdrawing said detent from normal operative locking position.



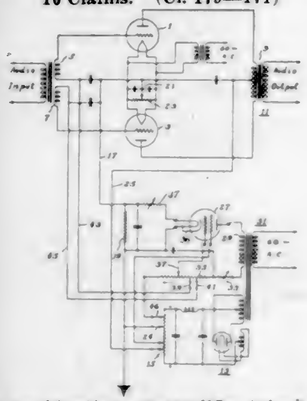
2,102,776
SOUND RECORDING APPARATUS
Judd O. Baker, Westmont, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application May 28, 1936, Serial No. 82,375
6 Claims. (Cl. 179—100.3)

1. Apparatus of the class described comprising means for forming a spot of light increasing in width from the middle to both ends, means for selecting a narrow line of light from said spot, means for vibrating said spot across said selecting means in accordance with sound waves to be recorded, and means for masking the ends of



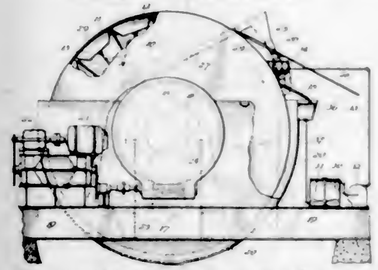
said spot in accordance with the volume of the sound to be recorded.

2,102,777
PHOTOPHONOGRAPHIC APPARATUS
Judd O. Baker, Westmont, and Cecil N. Batsel, Haddonfield, N. J., assignors to Radio Corporation of America, a corporation of Delaware
Application May 29, 1936, Serial No. 82,596
7 Claims. (Cl. 179—100.3)



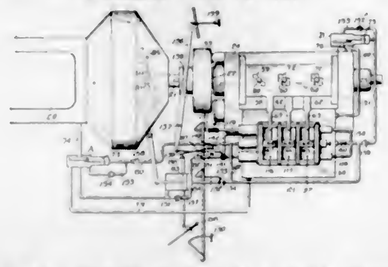
1. Apparatus of the class described comprising means for forming a spot of light tapering from the middle to both ends, means for selecting a narrow line of light from said spot, means for vibrating said spot across said selecting means in accordance with sound waves to be recorded, and a pair of pivoted shutters for masking the ends of said spot in accordance with the volume of the sound to be recorded.

2,102,778
PHOTOPHONOGRAPHIC APPARATUS
Harold J. Hasbrouck, Merchantville, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application May 29, 1936, Serial No. 82,418
8 Claims. (Cl. 179—100.3)



8. Sound recording apparatus including an aperture plate having a recording aperture and a monitoring aperture and masking means for covering the recording aperture inversely in accordance with the volume of the sound to be recorded and simultaneously and similarly covering the monitoring aperture.

2,102,779
THERMIONIC AMPLIFIER
George L. Beers, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application February 28, 1934, Serial No. 713,261
10 Claims. (Cl. 179—171)



1. In combination, an amplifier tube having an input circuit and an output circuit, a self-bias resistor common to both of said circuits, a thermionic rectifier having a cathode, means for utilizing the normal potential drop across the self bias resistor for energizing the cathode of the rectifier, a resistor in the output circuit of the rectifier and means for including at least a portion of said resistor in the input circuit of the amplifier tube.

2,102,780
FILTRATION
Paul W. Bielfeldt, Grand Rapids, Mich., assignor to Swenson Evaporator Company, Harvey, Ill., a corporation of Illinois
Application September 24, 1934, Serial No. 745,197
2 Claims. (Cl. 210—201)

1. The method of continuously filtering liquids which consists in maintaining a permanent layer of precoat upon the periphery of a filtering drum, rotating said drum so that its filtering surface moves through the liquid to be filtered, applying on the permanent precoat layer, before it passes into the liquid, a slurry of precoat material, withdrawing liquid from said slurry through the permanent layer of precoat by vacuum into the drum, machining the freshly coated precoat layer by means of a sharp cutting knife whereby a precise amount of additional precoat is assured, and removing filter cake and the added precoat layer by means of a sharp cutting knife which leaves the permanent precoat layer in trued condition for the application of slurry thereto, and substantially uncontaminated by solids from the liquid to be filtered.

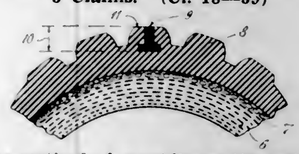
2,102,781
SELECTIVE GEARING MECHANISM AND AUTOMATIC FLUID CONTROL THEREFOR
Edward D. Bieretz, Baltimore, Md.
Application May 16, 1935, Serial No. 21,893
7 Claims. (Cl. 74—364)

1. The combination with an internal combustion engine having a transmission attached thereto provided with a driven shaft having a plurality of gear coupling elements mounted thereon, of a key associated with each coupling element for moving the same into and out of engaging position, a shifting and angularly slotted locking plate connected to each of said coupling key members, pistons connected to said shifting plates, a fluid controlling system maintained under pressure from the engine for actuating said pistons to shift the plates and keys, and manually controlled means for regulating said fluid pressure system, substantially as set forth.

2,102,782
HACKSAW
George J. Blum, Chicago, Ill., assignor to Armstrong-Blum Mfg. Co., Chicago, Ill., a corporation of Illinois
Application February 2, 1934, Serial No. 709,417
6 Claims. (Cl. 145—35)

2. A blade holder for hack saws, comprising a stem having a fixed clamping jaw rigid therewith with a flat clamping face disposed substantially on the longitudinal center line of the stem, a movable clamping jaw in opposed relation to the fixed jaw, a blade-anchoring element carried by said movable jaw, and a supporting member for the movable jaw pivoted on the stem on the opposite side of said center line from the movable jaw.

2,102,783
CONSTANT TEMPERATURE APPARATUS
Samuel A. Bokovoy, Audubon, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application January 31, 1936, Serial No. 61,834
4 Claims. (Cl. 219—19)

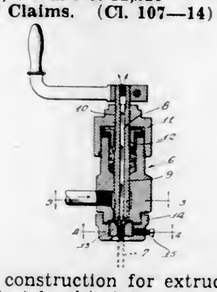


1. A constant temperature cabinet unit comprising an inner chamber, a thermo-regulator mounted contiguous the outer surface of said chamber, means comprising a thin metal sheet for removably maintaining said thermo-regulator in said position, a heater mounted about said outer surface of said chamber and about the outer surface of said metal sheet, an outer casing

spaced from said heater, and means comprising a metal strip connecting said casing and thermo-regulator in heat transfer relation for controlling

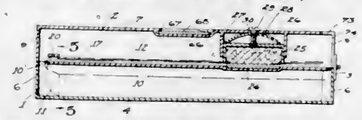
said thermo-regulator in accordance with temperature variations in the ambient surrounding said casing.

2,102,784
METHOD OF MAKING A WEAR INDICATING TIRE
Kenneth L. Bridges, New York, N. Y., assignor to Socony-Vacuum Oil Company, Incorporated, New York, N. Y., a corporation of New York
Application February 6, 1936, Serial No. 62,717
3 Claims. (Cl. 18—59)



1. The method of providing a tire with an accurately located degree-of-wear indicator which comprises the following steps: forming a tire of finished shape and dimensions having in the tread surface one or more holes of accurately predetermined dimensions and location with respect to finished tread surface, filling said holes with a material similar in physical properties but contrasting in color to the tread stock, and firmly bonding said material to the surrounding tread stock.

2,102,785
METHOD OF AND APPARATUS FOR SEDIMENTATION TESTING OF BLOOD
Clyde Brooks, New Orleans, La.
Application October 18, 1935, Serial No. 45,637
4 Claims. (Cl. 23—230)

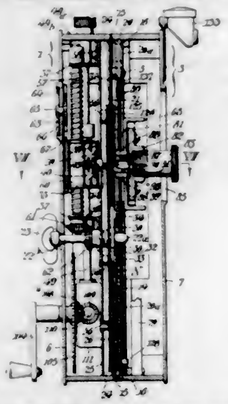


1. A blood sedimentation pipette comprising a transparent tube and a stop cock intercepting said tube intermediate the ends thereof, said tube containing a capillary bore of substantially uniform cross-section extending from said stop cock to one end of the tube, said tube being graduated from said stop cock to said end, said graduations reading from the end toward the stop-cock, said tube containing a bore extending from the stop cock oppositely to the first bore, a mouthpiece communicating with the second bore for drawing blood by suction into the capillary bore in one position of the stop cock, said stop cock being movable to cut off the suction of the capillary bore when the latter is filled with blood.

2,102,786
VENTED NOZZLE
Frank D. Campbell, Cedar Rapids, Iowa, assignor to The Quaker Oats Company, Chicago, Ill., a corporation of New Jersey
Original application November 14, 1931, Serial No. 575,086, now Patent No. 2,036,681, dated April 7, 1936. Divided and this application September 19, 1935, Serial No. 41,213
3 Claims. (Cl. 107—14)

1. A nozzle construction for extruding a tube of plastic material subject to internal pressure, comprising a casing having an inlet and an outlet for the passage of the plastic material, a core in said casing and extending into said outlet to provide an annular orifice, and a packing gland through which said core passes, said core having a vent passage affording communication between the interior of the tube and the atmosphere and passing through said packing gland.

2,102,787
SALESBOOK HOLDER
George F. Christenson, Boylston, Mass., assignor to Joseph A. Dunn, Worcester, Mass.
Application October 2, 1935, Serial No. 43,225
15 Claims. (Cl. 101—287)

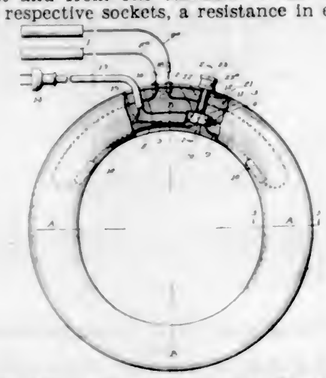


1. The combination with a salesbook holder having a writing plate on which the individual sales slips are successively positioned, and means for locating a printing plate in predetermined relation to said writing plate, of means forming a part of the holder for printing on the sales slips the indicia carried by the plate, said last means including a roller located and operative on the side of the sales slip opposite to the printing plate.

2,102,788
DISK FILM MOTION PICTURE
James J. Dilks, Jr., Philadelphia, Pa.
Application February 21, 1935, Serial No. 7,560
26 Claims. (Cl. 88—18.8)

1. A disk film motion picture camera comprising two hollow hinge-connected front and back

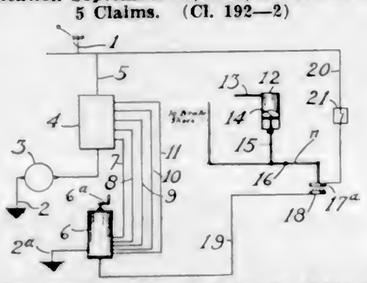
casing components jointly affording between them a space to receive a negative film disk; a rotative axis with a mounting for the film on the back component; a drive disk secured to said axis within the hollow of the back component, said disk having holes spaced by an interval corresponding to the width of the lens aperture along a spiral of which the pitch equals the height of said lens aperture; a pawling element in line with the lens aperture adapted to successively engage the holes of the disk in the back casing compo-



nent; means in the front casing component for moving the lens aperture radially of the negative film disk; and mechanism within the hollows of the two casing components with parts coordinated through the hinge connection between said components for actuating the pawling element and the lens aperture moving means to intermittently rotate the drive disk and shift the lens aperture compensatively, and for opening the lens shutter during the stationary periods of the disk.

2,102,789
MANUFACTURE OF TEXTILE YARNS AND FABRICS
Camille Dreyfus, New York, N. Y., and William Whitehead, Cumberland, Md., assignors to Celanese Corporation of America, a corporation of Delaware
No Drawing. Application October 24, 1933, Serial No. 695,048
4 Claims. (Cl. 18—54)

1. The method of forming textiles comprising filaments of cellulose acetate which comprises adding to the spinning solution, from which the filaments are formed, a dye-base containing a diazotizable amino group and a developer, forming the filaments and then diazotizing.



2,102,790
THERAPEUTIC APPARATUS
Howard B. Drollinger, South Pasadena, Calif. Application August 20, 1934, Serial No. 740,693
10 Claims. (Cl. 128—1.5)

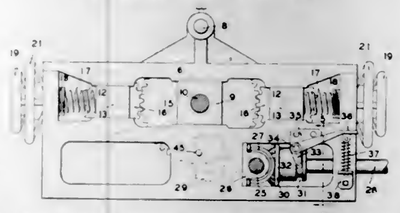
1. In combination, an electric coil adapted to be applied to the body of a patient, a contact plug adapted for quick-detachable connection to an outlet box for sinusoidal alternating electric current, conductors leading from the contact plug to the coil, a variable resistance mounted in the coil and comprising a resistor and a cooperating adjustable contact, an operating shaft for the adjustable contact projecting to the exterior of the coil, the resistor being shunted across the conductors, sockets at the exterior of the coil, conductors leading from the adjustable contact and from one terminal of the resistor to the respective sockets, a resistance in each of

the last mentioned conductors, said resistances being mounted in the coil, pins adapted for quick-detachable engagement with the sockets, conductors leading from the respective pins, and an electrode connected to each of said last mentioned conductors.

2,102,791
METHOD AND MEANS FOR PREVENTING FLAT WHEELS
George A. Ferguson, New York, N. Y. Application September 12, 1935, Serial No. 40,280
5 Claims. (Cl. 192—2)

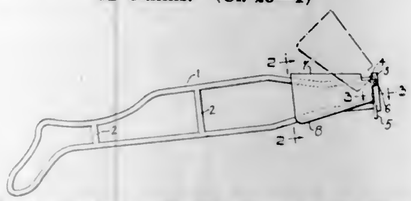
1. In a multicar electric train, in which there are at least two power-driven cars, a single multiple control circuit adapted to complete and break power circuits of the power cars at the will of a single operator, switches in said control circuit for each car and associated with the brakes thereof, whereby application of the brakes of any car in the train prevents completion of the control circuit.

2,102,792
METHOD OF AND APPARATUS FOR HANDLING HOT METAL BARS
Jerome R. George, Worcester, Mass., assignor to Morgan Construction Company, Worcester, Mass., a corporation of Massachusetts
Application May 18, 1928, Serial No. 278,732
24 Claims. (Cl. 80—42)



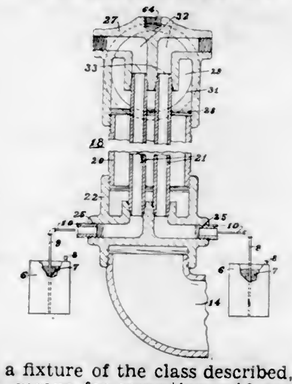
1. In the art of handling hot metal bars, as delivered flatwise longitudinally from a rolling mill, the improvement which consists in continuing the forward longitudinal delivery movement of said bars to project them longitudinally onto an inclined supporting surface, and procuring by

the movement of each bar toward said surface the progressive warping of same into a plane substantially at right angles to said surface.



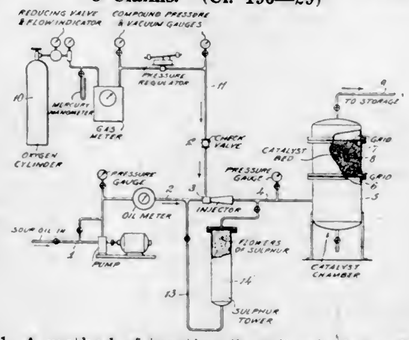
13. In apparatus of the class described, a table for the support, on edge, of bars in pack formation, means for delivering bars longitudinally to said table, and means overlying said table to guide and control the movements of said bars in the process of forming said pack.

2,102,793
WEB SPLICING DEVICE
Walter C. George, St. Louis, Mo., assignor, by mesne assignments, to Gaylord Container Corporation, St. Louis, Mo., a corporation of Maryland
Original application May 22, 1935, Serial No. 22,789. Divided and this application October 16, 1936, Serial No. 105,942
5 Claims. (Cl. 271—2.1)



1. A splicing device comprising a plurality of rolls, sliding bearings in which said rolls are mounted, springs controlling the pressure between said rolls, said rolls being connected by gearing, a brake for retarding said rolls, means for varying the tension of said springs, driving mechanism for said rolls, and a clutch device for throwing said driving mechanism into and out of operation.

2,102,794
METHOD AND DEVICE OF TREATING ARTICLES CONTAINING ORGANIC DERIVATIVES OF CELLULOSE
Bradford C. Gibbs, Cumberland, Md., assignor to Celanese Corporation of America, a corporation of Delaware
Application March 16, 1935, Serial No. 11,519
11 Claims. (Cl. 28—1)

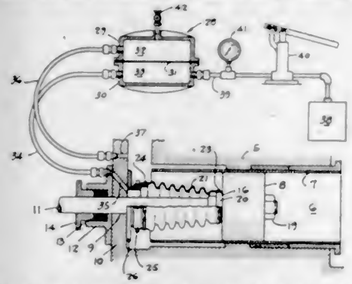


1. A method of treating hose or similar articles in a heated liquid which comprises at least partially enclosing the open end of the article in a shield which is held out of contact with the article and submerging the article and shield in a bath.

2,102,795
OIL DRAIN AND SUPPLY SYSTEM
Russell J. Gray, Minneapolis, Minn. Application March 9, 1931, Serial No. 521,288
18 Claims. (Cl. 184—1.5)

1. In a fixture of the class described, a tubular support, means for mounting said support on a floor surface, a swivelly mounted arm extending laterally from said support, an oil receiving cup on the outer end of said arm, means for conducting oil from said cup through said support and from said support to a place of deposit, a gear lubricant hose carried on said tubular support and means extending through and concealed by said tubular support to supply gear lubricant to said gear lubricant hose.

2,102,796
OIL REFINING PROCESS
John Happel, Brooklyn, and Donald W. Robertson, Queens Village, N. Y., assignors to Socony-Vacuum Oil Company, Incorporated, New York, N. Y., a corporation of New York
Application April 15, 1936, Serial No. 74,402
8 Claims. (Cl. 196—29)

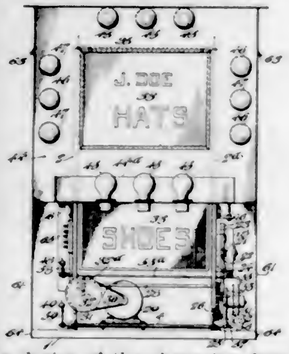


1. A method of treating "sour" petroleum distillates without the use of aqueous alkaline solutions comprising the following steps: admixing oil with a gas containing free oxygen and with elemental sulphur and passing it through a filter bed consisting of a metallic sulphide insoluble in water supported by a porous, inert carrier.

2,102,797
PISTON ROD PROTECTOR
Theodore Kenneth Helmer, Fellows, Calif. Application April 17, 1936, Serial No. 74,938
10 Claims. (Cl. 103—202)

1. In a pump having a cylinder in which a piston is reciprocated by means of a piston rod,

a flexible enclosure around the piston rod between the piston and end wall of the cylinder, means to seal the zone within the enclosure with respect



to the area around the enclosure, and means to regulate pressure within the enclosure by pressure around the enclosure.

2,102,798

ADVERTISING DEVICE

Charles Jerabek, deceased, late of Philadelphia, Pa., by Theresa Jerabek, administratrix, Philadelphia, Pa.

Application June 1, 1936, Serial No. 82,822
3 Claims. (Cl. 40—36)

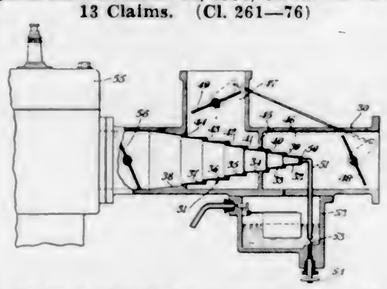
1. In a device of the character described, the combination comprising an upper magazine, a lower magazine, a plurality of card carrying frames in each of said magazines, a pair of endless guideways around which said frames travel, a pair of elevators for elevating said frames from the lower magazine to the upper magazine and for lowering said frames from the upper to the lower magazine, and means operated by said elevators for releasing said card frames in the upper magazine to permit them to be deposited on said elevators.

2,102,799

PROCESS FOR DEHYDRATING CELLULOSE NITRATE

David G. Kennedy and Joseph Keen Rulon, Parlin, N. J., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application November 8, 1934, Serial No. 752,113
2 Claims. (Cl. 260—148)



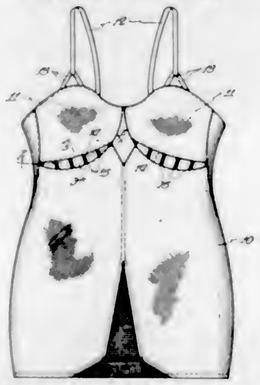
1. In the process for preparing cellulose nitrate in which the nitrated cellulose material is drowned in water and the surplus water removed, the improvement of replacing the remaining water by ethyl alcohol which comprises washing under pressure the wet cellulose material in the form of a press cake first with ethyl alcohol containing a comparatively large amount of water and then with approximately 95% ethyl alcohol until the water in the nitrated cellulose material has been replaced with about 90% alcohol, collecting the diluted alcohol from the second treatment and washing under pressure the original water wet nitrated cellulose with this alcohol in the first stage of a subsequent run.

2,102,800

METHOD OF AND APPARATUS FOR GASIFYING A LIQUID FUEL

Chester A. Killmeyer, New York, N. Y., and George L. Reichhelm, Short Beach, Conn., assignors to Frank A. Kane, Long Island City, N. Y.

Application December 12, 1934, Serial No. 757,092
13 Claims. (Cl. 261—76)



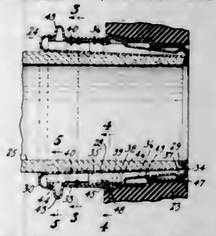
1. In an apparatus for converting a liquid fuel into a gaseous fluid, a flow conduit for conducting therein an atomized fuel stream, the conduit progressively expanding in cross-sectional area in a plurality of stages from its inlet to its outlet terminal, an inlet port at each of said stages, certain of said ports containing serrated terminals, and two independent ducts each communicating with a plurality of said ports, one of said ducts being for an atomizing medium and the other for combustion air.

2,102,801

GARMENT

Sigmund W. Kunstadter, Chicago, Ill., assignor to The Formfit Company, Chicago, Ill., a corporation of Illinois

Application July 23, 1936, Serial No. 92,079
1 Claim. (Cl. 2—30)



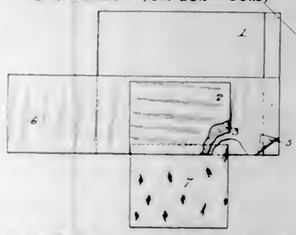
A foundation garment for women comprising a body member adapted and arranged to encompass the body of the wearer, the upper portion of said body being formed at the front with a brassière providing two pocket members, there being a separate substantially crescent-shaped ventilation opening in said body immediately below and co-extensive in length with the bottom edge of each pocket member whereby to admit of relative outward upward and transverse movement of the said pocket members relatively of the subjacent body portion of the garment when in use, and laterally spaced elastic straps only bridging the edges of the crescent shaped openings.

2,102,802

COUPLING

Gustaf Einar Lofgren, Riverside, Conn., assignor to Electrolux Corporation, Dover, Del., a corporation of Delaware

Application January 30, 1936, Serial No. 61,473
9 Claims. (Cl. 285—174)



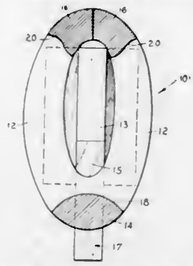
1. A detachable coupling device including spaced substantially cylindrical walls of sheet metal defining an annular space and latch mechanism mounted in said space and projecting through the outer of said walls, the interior of the inner of said walls being uninterrupted and adapted to be secured to the outside of a hose, whereby said space is out of communication with the interior of the hose.

2,102,803

HAIR WAVING PAD

Everett G. McDonough, Mount Vernon, N. Y., assignor to Zotos Corporation, New York, N. Y., a corporation of New York

Application January 7, 1933, Serial No. 650,655
5 Claims. (Cl. 132—36.2)



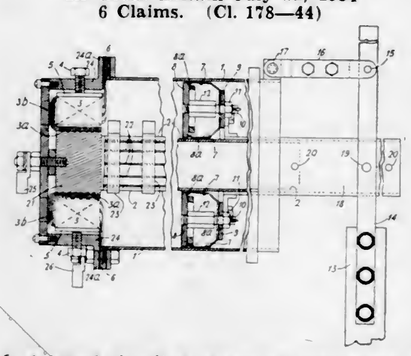
1. In a pad for permanent waving of hair, comprising an encasing sheet folded on itself to form a double portion, a relatively narrow sheet of metal foil disposed on said encasing sheet and having one of its longitudinal edges coincident with one of the edges of said folded sheet, said sheet of metal foil extending at one end beyond the folded edge of the wrapper, a relatively small sheet of absorbent material adapted to hold a solution secured to said folded sheet and extending outwardly therefrom, and a heat producing chemical pack disposed on said metal foil strip with one of its edges coincident with the coincident edges of said first mentioned sheets.

2,102,804

METHOD OF APPLYING PROTECTIVE COATINGS TO SHOES AND OTHER OBJECTS

Charles Miller, Long Island City, N. Y.; Ida Gordon Miller executrix of said Charles Miller, deceased

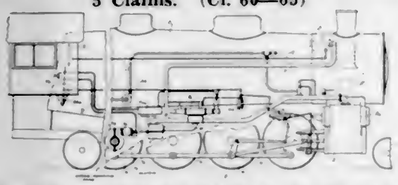
Application January 21, 1935, Serial No. 2,633
5 Claims. (Cl. 12—142)



1. The method of making shoes which comprises providing a shoe upper, applying a latex coating thereto, then removing the coating from one or more portions of the upper to permit direct access thereto in making the shoe, subjecting said last mentioned portion or portions, in the making of the shoe, to the action of a tool in direct contact therewith, and subsequently removing the remainder of said coating.

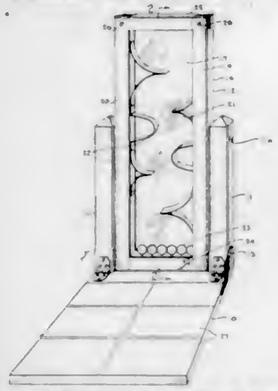
2,102,805

ELECTRICAL TUNED CIRCUIT



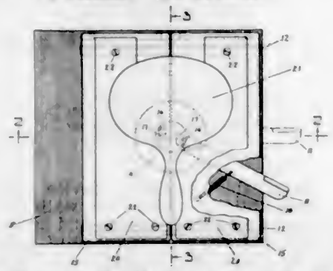
Daniel Edward O'Donovan, Chelmsford, England, assignor to Radio Corporation of America, a corporation of Delaware

Application September 7, 1935, Serial No. 39,583
In Great Britain July 21, 1934
6 Claims. (Cl. 178—44)



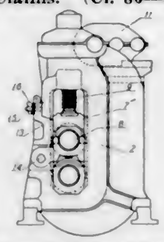
1. A tuned circuit arrangement comprising an outer tubular conductor and a second conductor positioned within said outer conductor, a plurality of fixed condensers in parallel relation connected between said inner and outer conductors, the effective lengths of said outer and inner conductors determining the inductance of said tuned circuit, and said plurality of condensers together with a capacitance existing between said outer and inner conductors over their effective lengths determining the capacity of said tuned circuit, and a bridge member slidably mounted with reference to said conductors and conductively contacting both of said conductors, whereby the natural frequency of said tuned circuit can be changed with movement of said bridge member over said conductors.

2,102,806
LOCOMOTIVE
Rudolf M. Ostermann, Kenilworth, Ill., and Arthur Williams, Munster, Ind., assignors to The Superheater Company, New York, N. Y.
Application October 30, 1936, Serial No. 108,452
5 Claims. (Cl. 60—65)



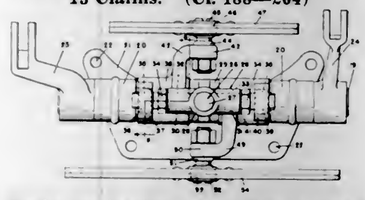
1. In a locomotive having a boiler, driving wheels and reversing gear, the combination of a turbine and a reciprocating engine both operatively connected to said driving wheels, a first steam conduit to supply steam from the boiler to the turbine, a second conduit to convey steam exhausted from the turbine to the reciprocating engine, a pressure reducing valve in said first conduit acting in response to pressure variations in said second conduit to vary the admission of steam to the turbine and thereby to keep the pressure in said second conduit approximately constant, and means to vary the point at which the pressure in said second conduit is held constant, said means acting in coordination with the reversing gear.

2,102,807
GAME
George W. Perks, Akron, Ohio
Application April 24, 1936, Serial No. 76,168
1 Claim. (Cl. 273—138)



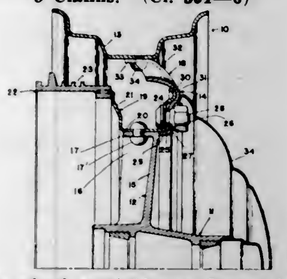
A game apparatus, comprising a supporting structure, an invertible receptacle mounted to revolve on said supporting structure and comprising an edge frame having spaced transparent opposite face walls, a series of distinguishable balls within said receptacle between said walls and visible to the game operator in all positions thereof from either side of said receptacle through either face wall thereof, a series of baffle elements within said receptacle extending from opposite side edges of the receptacle toward the center of the receptacle and adapted to rearrange the relative order of said balls when the receptacle is inverted whereby the balls will trickle by gravity down over and between the baffles from one end of said frame to the other, said baffles being so arranged that said balls trickle down through the receptacle over and between the baffles to various uncertain orders or successions across the ends of receptacle upon inversions of the receptacle, the ends of the receptacle being substantially smooth and unbroken to permit the balls to roll freely over the ends of the receptacle and to tumble over each other to various orders of succession across an end of the receptacle after each inversion of the receptacle.

2,102,808
MEANS FOR MULTICOLOR PRINTING ON ARTICLES OF IRREGULAR SHAPE
Rene P. Piperoux, Radburn, N. J., assignor to Celluloid Corporation, a corporation of New Jersey
Original application February 11, 1932, Serial No. 592,228, now Patent No. 2,076,589, dated April 13, 1937. Divided and this application July 9, 1936, Serial No. 89,780
2 Claims. (Cl. 101—407)



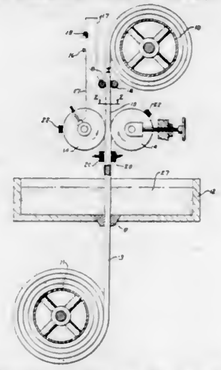
1. In a device for holding an article of irregular shape for treatment in a press, the combination of a platen adapted for sliding movement on the bed of said press, of jaw plates mounted on said platen, a replaceable mask carried by said jaw plates for holding the irregularly shaped article and means, operative by a single lateral movement, for moving said jaw plates and mask carried thereby relative to each other, whereby on the closing movement of said jaw plates the article is centered and held in the mask, the construction and arrangement being such that the mask may be quickly and easily replaced to accommodate articles of other configurations.

2,102,809
ROLLING MILL HOUSING
Jorgen Remmen, Pittsburgh, Pa.
Application March 8, 1935, Serial No. 9,965
4 Claims. (Cl. 80—55)



1. In a rolling mill, a shear type frame having windows in the sides for receiving the journal blocks of the roll necks, said windows being smaller than the diameter of the rolls and said frame having relatively small gaps in the front for the removal of the roll necks therethrough, the windows extending downwardly a sufficient distance from the bottom of the gap to receive the lower and upper journal blocks of the lower roll and the lower journal blocks of the upper roll, and said windows extending upwardly from the upper dimension of said gap a sufficient distance to permit raising the upper journal block of the upper roll a sufficient amount to clear said gap, whereby the upper and lower rolls may be successively lifted out of their bearings and withdrawn through the gap.

2,102,810
BRAKE MECHANISM
Charles A. Sawtelle, Detroit, Mich., assignor to Kelsey-Hayes Wheel Company, Detroit, Mich., a corporation of Delaware
Application May 15, 1936, Serial No. 79,993
13 Claims. (Cl. 188—204)

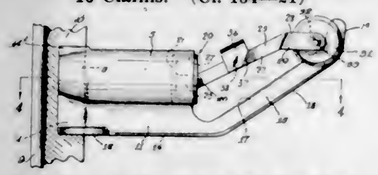


1. Brake mechanism comprising, a rock-shaft, an arm having one end fixed to the rockshaft and provided with a journal adjacent the opposite end having its axis extending at right angles to the axis of the rockshaft, a member supported intermediate the ends thereof on said journal for rocking movement about the axis of the latter and having elements adjacent opposite ends independently adjustable toward and away from the axis of the journal, and a pair of arms having their inner ends journalled on the rockshaft and having openings in the outer ends slidably receiving said elements.

2,102,811
VEHICLE WHEEL
Charles W. Sinclair, Detroit, Mich., assignor to Kelsey-Hayes Wheel Company, Detroit, Mich., a corporation of Delaware
Application May 13, 1935, Serial No. 21,241
5 Claims. (Cl. 301—6)

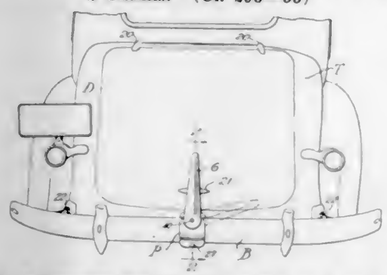
1. In a wheel, a rigid non-flexing load supporting member, an annular member substantially U-shaped in cross section encircling the load supporting member with the intermediate portion seated upon the outer end of the load supporting member and having the leg portion at the outboard side of the wheel extending beyond the load supporting member forming a shoulder, a brake flange extending axially from the leg portion of the U-shaped member at the inboard side of the wheel, a wheel body element at the outboard side of the first named leg of the U-shaped member having a portion seated upon the radial outer end of the latter leg portion and having another portion engaging the outboard side of the load supporting member adjacent the shoulder aforesaid, and means demountably securing the wheel body element to said first named leg between the portions aforesaid of the wheel body element.

2,102,812
METHOD OF AND APPARATUS FOR MAKING WELDING RODS
George T. Southgate, Forest Hills, and James G. Nicolson, Niagara Falls, N. Y., assignors, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York
Application August 14, 1934, Serial No. 739,748
Renewed May 7, 1937
15 Claims. (Cl. 29—33)



1. In combination, means for coating a wire with a material adapted to form an adhesive coat when dried, means for removing a portion of said coat at substantially diametrically opposite longitudinal portions thereof prior to the drying of the coating material, rotary means for reducing the cross-section of said wire in a direction perpendicular to the portions from which the coating has been removed, and means for rapidly drying the portions of the coating material remaining upon said wire.

2,102,813
WELDING ROD
George T. Southgate, Forest Hills, and James G. Nicolson, Niagara Falls, N. Y., assignors, by mesne assignments, to Union Carbide and Carbon Company, a corporation of New York
Original application August 14, 1934, Serial No. 739,748. Divided and this application September 12, 1936, Serial No. 100,418. In Canada August 13, 1935
11 Claims. (Cl. 219—8)

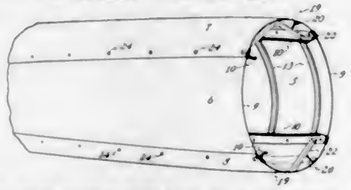


1. A welding wire comprising two transversely curved longitudinally continuous surface portions separated by two longitudinally continuous portions, said first mentioned surface portions being coated and said last mentioned portions being bare.

2,102,814
ELEVATOR GUIDE RAIL LUBRICATOR
John J. Walsh, Maple Shade, N. J.
Application May 12, 1936, Serial No. 79,330
16 Claims. (Cl. 184—21)

1. A device of the character described comprising a casing having a lubricant chamber therein, the said casing having an opening in communication with the chamber, the said opening being adapted to receive an elevator track, a piston within said lubricant chamber, a thrust rod pivotally connected to said piston, a roller mounted for rotation on said thrust rod, and an upwardly inclined guide arm extending from one end of said casing and adapted to guide and support said roller.

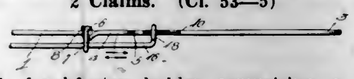
2,102,815
GRILLE GUARD
Anthony V. Weasler and Andrew C. Meyer, West Bend, Wis., assignors to Pick Manufacturing Company, West Bend, Wis., a corporation of Wisconsin
Application March 24, 1937, Serial No. 132,794
2 Claims. (Cl. 293—55)



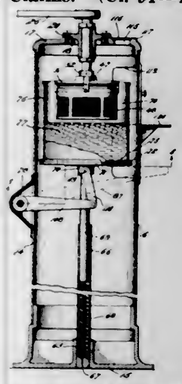
2. A bumper guard comprising a base plate adapted to be attached to a bumper bar, said base plate having a head portion, a guard plate having an axially movable pivotal mounting upon the base plate and stop means arranged to engage with the head of the base plate, and tension means holding the head of the guard and the stop means of the base plate in interfitting relationship for normally preventing swinging movement of the guard plate about its pivotal mounting.

2,102,816
LIGHTING FIXTURE
Rudolf Wendel, Roslyn Heights, N. Y.
Application April 20, 1934, Serial No. 721,442
4 Claims. (Cl. 240—52.4)

4. A lighting fixture adapted to be supported from the dull, light-diffusing surface of the wall of a room and comprising a base for attaching the fixture to the wall, an arm supported by and extending from said base, the end of the arm remote from the base extending vertically upwards and terminating in a tapped element, a plate-like member resting on said tapped element, a socket member on said plate-like member and extending above the latter, a tapped plug within the socket member, a hollow tubular casing slipped over said plug and held in position thereon, a lamp socket within said casing adapted to receive an incandescent lamp and having a threaded hollow stem passing through the plug, socket member and plate-like member and screwed into the tapped element of the arm to clamp the several parts together, said casing being cut away at the rear thereof to enable direct light from the lamp to be projected upon the light-diffusing wall, the cut-out being of such limited circumferential extent that the lamp is not visible from in front of the fixture, said fixture affording substantially unobstructed passage for light to the light-diffusing surface and thereby enabling direct light from the lamp to be projected upon such surface, said casing being otherwise closed to limit the external illumination substantially to the wall surface to the rear of the casing, said arm extending forwardly of the wall a distance sufficient to cause bright illumination of so large a wall area to the rear of the casing that substantially the whole of the casing is sharply silhouetted against the illuminated surface while no image of the source of light is reflected into the room, the source of light thus remaining invisible.



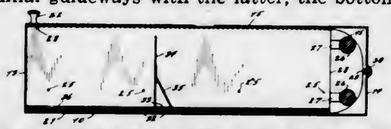
2,102,817
FUSELAGE CONSTRUCTION
Frederick R. Weymouth, Buffalo, N. Y., assignor, by mesne assignments, to Curtiss-Wright Corporation, a corporation of New York
Application April 4, 1935, Serial No. 14,550
5 Claims. (Cl. 244—119)



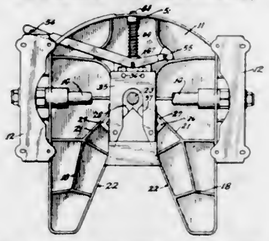
2. In monocoque fuselage construction, a joint adapted for the connection of two unit fuselage panels, one of the said panels comprising a skin section braced circumferentialy and adapted to assume principally shear loads, the other of said panels comprising a skin section braced longitudinally by continuous stringers and transversely by formers provided with apertures at one end and forming with a similarly provided adjacent edge of the said skin section a half of the said joint, the second said panel adapted principally to assume compressive and tensile loads, the first said panel provided with a longéron attached to the said skin section and circumferential bracing, having an attached bracket fitting and adapted to form therewith a second half of the said joint, apertures in the said bracket fitting adapted to aline with those of one of the said formers, apertures in the edges of both said skin sections and the said longéron, and fastening means adapted to engage the said apertures in assembled relationship of the two panels.

2,102,818
FRANKFURTER HOLDER
Norman C. Rhew, Rougemont, N. C.
Application January 11, 1937, Serial No. 120,079
2 Claims. (Cl. 53—5)

1. A frankfurter holder comprising a wire frame structure having a handle portion and a curved end portion, a slide wire member reciprocative with respect to said wire frame structure, said slide wire member having a curved end complementary to the curved end of said frame structure and coacting therewith, a looped member formed on the opposite end of said slide wire member and encircling the handle portion of said wire frame structure and serrations formed in said handle portion and engageable by said looped member for maintaining the curved end of said slide wire member in predetermined relation to the wired end of said frame structure.



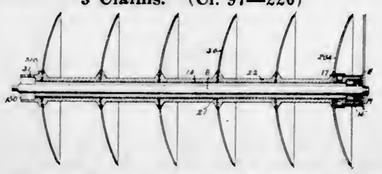
2,102,819
IMMERSING AND DRYING MACHINE
Fernando M. Ronci, Providence, R. I.
Application February 23, 1937, Serial No. 127,328
12 Claims. (Cl. 91—46)



1. In an immersing and drying machine, a casing having a side provided with an opening therein, a driving shaft rotatably mounted in the casing, a cage supported by the shaft, a container within the casing removable through the side opening and providing a lower liquid containing portion and an upper centrifuging portion, and means for effecting relative vertical movement between the container and the cage.

2,102,820
FILE
Sol Scheinman, White Plains, N. Y.
Application May 23, 1936, Serial No. 81,382
5 Claims. (Cl. 220—41)

1. A file comprising a casing consisting of two metal stampings of which one forms the outer shell and has side, bottom and end walls, the upper end portions of the side walls being bent inwardly in a horizontal plane, the other stamping being a substantially U-shaped insert supported within the shell and being provided with horizontal flanges at the top thereof spaced from the first-mentioned flanges and forming longitudinal guideways with the latter, the bottom of said insert being spaced from the bottom of the shell; a flexible cover member received within said guideways and adapted to be moved rearwardly to expose the contents of the file; and antifriction means at the rear of the file and engaged by the cover member as it is moved rearwardly to open the file, said cover member then moving into the space between the bottom of the insert and the bottom of the casing.

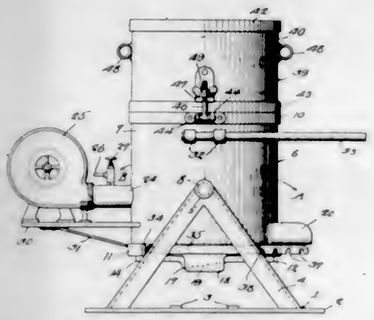


2,102,821
COUPLING DEVICE FOR TRAILERS AND TRACTORS
Carl G. Seyferth, Muskegon, Mich., assignor to West Michigan Steel Foundry Co., Muskegon, Mich., a corporation of Michigan
Application September 29, 1934, Serial No. 746,207
12 Claims. (Cl. 280—33.1)

12. In a coupling device for a trailer and tractor vehicle having a plate member on one vehicle and a king pin on the other vehicle adapted to be automatically engaged with each other, a pair of floating jaw members having arcuate recesses for automatically embracing and positively locking said king pin and mounted upon said plate for pure translational movement only relative thereto and to each other.

2,102,822
BEARING FOR DISK HARROWS
Charles T. Viau, Fresno, Calif.
Application April 7, 1937, Serial No. 135,453
3 Claims. (Cl. 97—220)

1. In a disk harrow having a frame, a tubular member on which disk blades and spacers are assembled, an axle extending through the tubular member concentric therewith, and attached at either end to the frame, a bearing consisting of



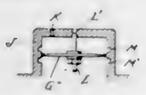
a housing having an annular recess therein, said housings being attached at either end of the tubular member with the recess positioned concentric with the tubular member, a roller bearing adapted to be fitted within the recess and around the axle, a closure adapted to enter the annular recess, said closure having annular grooves therein, and yielding rings adapted to enter said grooves, and when assembled therewith to bear against the inside wall of the recess.

2,102,823

COMBINATION FURNACE

Walter Walsh and Samuel H. Forster, Menomonie, Wis., assignors of one-half to said Walsh and one-half to said Forster

Application August 11, 1936, Serial No. 95,467
2 Claims. (Cl. 263—33)



1. In a device for smelting ferrous or nonferrous metals at the will of an operator, a tubular furnace body, a tubular extension, means for securing the extension detachably on the upper end of the body, the body having an outlet spaced from the extension and constituting an egress means for molten metal when the extension is mounted on the body and when the extension is detached from the body, means associated solely with the body for melting metal, a support, and mechanism carried directly by the body and independently of the means for securing the extension to the body, for mounting the body alone, or the body and the extension together, at the will of an operator, for tilting movement on the support.

2,102,824

BREATHING SEAL

John William White, Detroit, Mich., assignor, by mesne assignments, to Bendix Products Corporation, a corporation of Indiana

Application February 15, 1932, Serial No. 593,149
1 Claim. (Cl. 251—119)

The combination with a casing having an opening therein with cylindrical walls and with spaced annular grooves in said walls, of a flexible resilient disk extending across said casing, means for centrally supporting said disk with its peripheral edge in sealing contact with said cylindrical wall intermediate the grooves therein in the normal position of the disk whereby a deflection of said disk in either direction will break the peripheral seal.

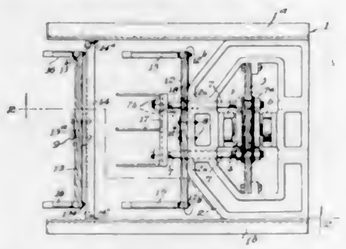
2,102,825

HYDRAULIC FLUIDS

John C. Woodhouse, Cragmere, and Arthur G. Weber, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application March 6, 1935, Serial No. 9,590
10 Claims. (Cl. 252—5)

1. A substantially non-aqueous fluid for use in fluid pressure apparatus comprising an organic solvent diluent and a compound containing the ricinoleyl radical.



2. A substantially non-aqueous fluid for use in fluid pressure apparatus comprising an organic solvent diluent and ricinoleyl alcohol.

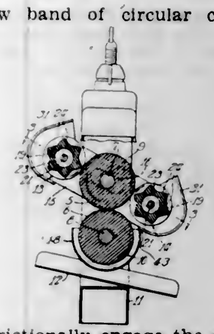
2,102,826

VIBRATORY APPARATUS

Hugh E. Wurzbach and Clyde H. Konold, Magna, Utah

Application March 23, 1936, Serial No. 70,418
13 Claims. (Cl. 198—220)

1. In a vibratory apparatus, a frame structure constituting a relatively fixed member; a vibrated member having a feed end and a discharge end and a working surface over which material is to be moved longitudinally in a direction from said feed end toward said discharge end; a plurality of elongated resilient supporting bars having their longitudinal axes extending substantially horizontally and transversely with respect to said direction, said supporting bars being spaced from one another in said direction and each being connected to one of said members at two spaced positions along the length thereof and to the other of said members at a position intermediate and spaced from said two positions, the portions of said bars adjacent the positions of connection to the vibrated member being free to vibrate along paths of vibration, each having a component in said direction; and a vibratory motor provided with reciprocating driving means operatively connected to said vibrated member at a position adjacent the connection thereof to one of said bars, to produce a vibratory motion of said vibrated member along a path defined by the paths of vibration of said bars.



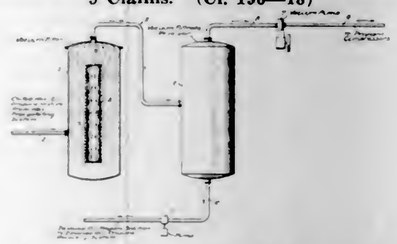
2,102,827

WRINGER

Gustaf E. Andre, Richmond, Ind.

Application June 17, 1935, Serial No. 26,956
8 Claims. (Cl. 68—32)

1. A wringer feed roll of substantially star-shaped cross section and provided with a relatively narrow band of circular cross section adapted to frictionally engage the surface of a wringer roll to be thereby driven.



2,102,828

METHOD OF DEWAXING HYDROCARBON OILS

Paul D. Barton, Scarsdale, N. Y., and Daniel B. Banks, Upper Darby, Pa., assignors, by mesne assignments, to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

Application April 16, 1934, Serial No. 720,730
5 Claims. (Cl. 196—18)

1. A method of separating finely divided wax from a chilled mixture of solidified wax and a solution of oil in a normally gaseous hydrocarbon solvent, the mixture being substantially at vaporization equilibrium for the temperature and pressure existing in the mixture, comprising introducing the mixture to a filtering zone and maintaining a sub-equilibrium pressure on the eduction side of the filtering zone such as will cause vaporization of enough solvent in the oil-solvent solution passing through said filtering zone to further lower the temperature and precipitate additional wax in the oil.

2,102,829

BRAIDED ARTICLE

Peter Horace Boivin, Granby, Quebec, Canada

Application July 6, 1936, Serial No. 88,934
1 Claim. (Cl. 96—27)

A necktie comprising a flat one-ply fabric of braided crepe yarn, the crepe yarn of the end portions of said fabric being relatively loosely braided to form non-creasing tie sections and the yarn in the intervening portion being tightly braided to form a relatively inextensible neck band portion adapted to slip easily through a collar.

2,102,830

FERTILIZER MANUFACTURE

John L. Brill, Newark, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application April 9, 1935, Serial No. 15,399
12 Claims. (Cl. 71—30)

1. A fertilizer nitrifying agent comprising a liquid containing formamide, dissolved free ammonia, urea and a relatively small quantity of water.

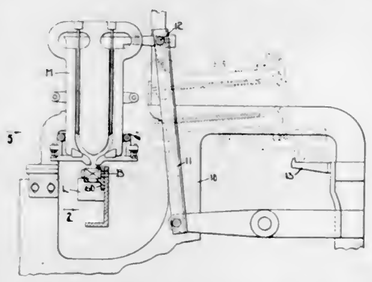
6. A method of producing a fertilizer which comprises adding to acidic fertilizer materials a liquid containing formamide, dissolved free ammonia, urea, and a relatively small quantity of water.

2,102,831

FERTILIZER MANUFACTURE

John L. Brill, Newark, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

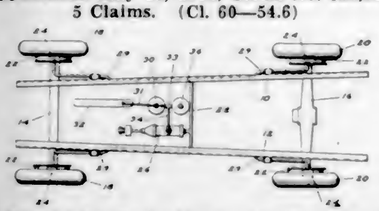
No Drawing. Application April 16, 1937, Serial No. 137,209
14 Claims. (Cl. 71—27)



1. A fertilizer nitrifying liquid containing formamide, ammonia, a relatively small quantity of water, and a water soluble salt having fertilizing value selected from the group consisting of alkali metal, alkaline earth metal, and ammonium salts.

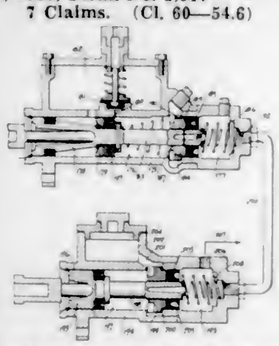
2,102,832

SHUTTLE BOX CONSTRUCTION FOR LOOMS



Benjamin W. Brouwer, Auburn, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application October 1, 1936, Serial No. 103,556
9 Claims. (Cl. 139—183)



1. In a loom, a lay, a lay end secured thereto having a horizontal picker receiving slot, a shuttle box forming element, a shuttle binder for the element, a vertical wall forming part of the element having a picker slot extending horizontally therein in the upper part of the wall, a box floor extending horizontally forwardly from the wall below the slot, and means extending through the wall below the floor to secure the element to the lay end with the slots in the lay and the wall in horizontal alignment.

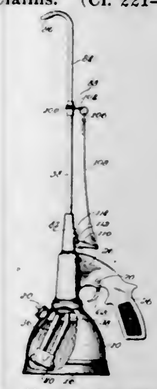
2,102,833
BRAKE
Eugene G. Carroll, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application May 18, 1932, Serial No. 612,139
5 Claims. (Cl. 60—54.6)

1. In a hydraulic braking system a master cylinder provided with a pair of spaced ports, one being a rearward port and the other a forward port, a reservoir communicating with said ports, means for normally covering one of said ports and for at times uncovering said rearward port and covering the forward port, said means comprising a piston formed with a recess which recess is normally positioned rearwardly of both of said ports but is at times moved with the piston to register with the rearward port, and including a packing cup positioned in advance of said piston and normally positioned intermediate said ports, said piston having ports through which liquid may flow on the retractile stroke of said piston.

2,102,834
BRAKE
Eugene G. Carroll, Los Angeles, Calif., assignor to Bendix Brake Company, South Bend, Ind., a corporation of Illinois
Original application November 11, 1930, Serial No. 494,993. Patent No. 2,018,912, dated October 29, 1935. Divided and this application January 14, 1935, Serial No. 1,617
7 Claims. (Cl. 60—54.6)

1. In a master cylinder for hydraulic brakes, a casing having a compression chamber and a booster chamber having substantially the same diameter as said compression chamber with a head separating said chambers, a plunger having a head sliding in the booster chamber for developing pressure therein at the commencement of the forward stroke of the plunger and having a cylindrical extension passing through the first-named head into the compression chamber, means for opening communication through the cylindrical extension of the plunger between the booster chamber and the compression chamber when the plunger is in its retracted position, and means for by-passing the liquid from in front of the head of the plunger after the pressure in the compression chamber has been boosted by the advance of the rear head of the plunger, said compression chamber having means for connecting the same to the brakes.

2,102,835
AUXILIARY WHEEL
James R. Catalina, Kansas City, Mo.
Application May 13, 1937, Serial No. 142,356
1 Claim. (Cl. 280—150)

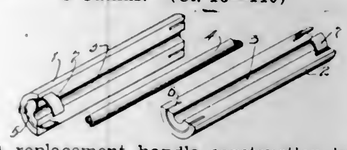


In an automotive vehicle having pneumatic tired front wheels, a knee-action assembly for supporting said front wheels, said knee-action including a pair of springs and a pair of pivoted knee-action arms, auxiliary wheels of smaller diameter than said vehicle wheels, means for pivotally mounting said auxiliary wheels on said knee-action arms at points closer to the longitudinal center line of the vehicle than said vehicle wheels and on axes below the axes of said vehicle wheels, said auxiliary wheels being supported with their peripheries clear of the ground but sufficiently close thereto that, upon deflation of the tires of said vehicle wheels, said auxiliary wheels will contact the ground to support said vehicle through said knee-action assembly, means on said vehicle for pivoting said front vehicle wheels to steer said vehicle, a tie rod for interconnecting said front auxiliary wheels, a link for connecting said tie rod with said means for pivoting said front vehicle wheels whereby, when said front auxiliary wheels or either of them is supporting a portion of the weight of said vehicle, said vehicle may be steered by the steering means for said front vehicle wheels.

2,102,836
POLISHING WHEEL
Felix G. Cyrex, Grand Rapids, Mich., assignor to J. C. Miller Co., Grand Rapids, Mich., a corporation of Michigan
Application August 17, 1936, Serial No. 96,424
2 Claims. (Cl. 51—193)

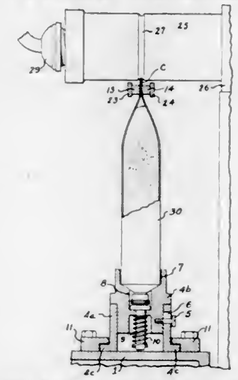
1. A polishing wheel of the class described comprising, a plurality of disks, each of said disks being parted at an angle to the face of the disk, to form a bevel, from its center to its outer edge, said disks being threaded together, said disks each being cemented to the face of the adjacent disk to form a polishing wheel, the exposed straight portions of the edge of each disk being positioned parallel to the side faces of the polishing wheel and being bent to an advancing plane axially of the partings equal to the thickness of said disks, from one of the side faces of said polishing wheel to the other side face of the wheel whereby said exposed surfaces of said disks are positioned substantially helically along the length of said polishing wheel.

2,102,837
PISTOL GRIP OIL CAN
Ernest W. Davis, Oak Park, Ill., assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia
Application December 2, 1935, Serial No. 52,456
8 Claims. (Cl. 221—51)



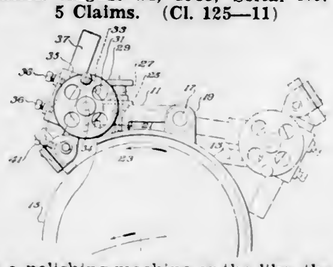
1. In an oil can, the combination of a reservoir, a handle secured to said reservoir, a discharge tube secured to said handle and projecting outwardly therefrom, the outer end of said tube being threaded and having longitudinal slots therein, a spout having one end telescoping within the outer end of said tube, and a clamping sleeve screwed over the end of said tube and constructed and arranged to contract the slotted end portion of said tube into clamping engagement with said spout.

2,102,838
PROCESS OF MAKING THERMOPLASTIC COMPOSITIONS CONTAINING RUBBER AND THE LIKE
Edward R. Dillehay, Glen Ellyn, Ill., assignor to The Richardson Company, Lockland, Ohio, a corporation of Ohio
No Drawing. Application December 6, 1934, Serial No. 756,363
16 Claims. (Cl. 106—23)



1. A process of making molding compositions which comprises mixing a hard bituminous binder with filler and fibrous materials and during said mixing incorporating into the mass a quantity of rubber in softened condition at a stage in said process where the mechanical mixing still to be done will be sufficient, having in regard the softened condition of said rubber, to incorporate said rubber into homogeneous admixture with said binder by the time of completion of said mix.

2,102,839
HANDLE CONSTRUCTION
Anna Josephine Dohrman, River Grove, Ill.
Application January 18, 1937, Serial No. 121,155
5 Claims. (Cl. 16—110)



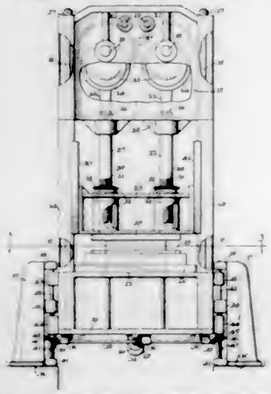
3. A replacement handle construction including mating members adapted together to surround a bail, one member having a tongue adjacent one end and a groove enterable from the other end, the second member having a groove enterable at its one end and a tongue adjacent its other end, the tongues being engaged with said grooves by relative endwise movement of said members in a direction to bring their ends into register.

2,102,840
CLOSING AND SEALING OF COLLAPSIBLE TUBES
Paul R. Fechheimer, Cincinnati, Ohio, assignor to The Karl Kiefer Machine Company, Cincinnati, Ohio, a corporation of Ohio
Application February 12, 1934, Serial No. 710,824
4 Claims. (Cl. 113—112)

1. A method of sealing a metallic collapsible tube or like thin-walled container by interfusion, which comprises supporting juxtaposed wall portions in such a way that the edges thereof are free, bringing a heated tool into contact with said edges so as to melt and interfuse said edges in an area adjacent said tool, and moving said tool and said edges relative to each other so as to cause said area of molten metal to traverse said edges, the molten metal in said area forming by its surface tension a bead of substantially greater width than said juxtaposed edges, said bead being essentially located beyond any supporting means, the tube so sealed being shorter by substantially the amount of metal in said bead than the tube before sealing.

2,102,841
WHEEL TRUING DEVICE
Rufus W. Fuller, Deerfield, Mass., assignor to Production Machine Company, Greenfield, Mass., a corporation of Massachusetts
Application August 24, 1935, Serial No. 37,703
5 Claims. (Cl. 125—11)

4. In a polishing machine or the like, the combination with a rotating wheel, a casing enclosing the wheel and provided with a clamping



abutment and lug at the top and an opening for the presentation of the work in the front thereof, a truing device comprising an arm pivoted on the lug on an axis parallel to the axis of the wheel and having a clamping face for engagement with the abutment when the truing device is swung forwardly on its pivotal support, and a truing tool mounted on the arm, the tool being projected through the opening to engage the face of the wheel when the device is swung forwardly, the device being adapted to be swung rearwardly to rest upon the casing in inoperative position distant from said opening, and means for clamping the face on the arm in engagement with the abutment on the casing to hold the truing device in fixed operative position.

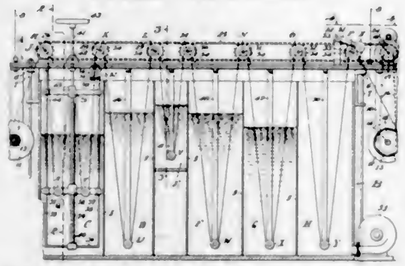
2,102,842

PRESS

Rudolph W. Glasner, Chicago, Ill.

Application October 30, 1935, Serial No. 47,441
6 Claims. (Cl. 113—38)

1. A press comprising a rigid frame structure embodying a base, a slide reciprocable towards and away from the base and exerting its operative force against said base, standards independent of and disposed outside of the frame adjacent the corners of said frame, vertical bearings carried by the standards, co-operating vertical bearings carried by the frame and arranged in alinement with the bearings of the respective standards, threaded upright members passing through the respective co-operating bearings on the standards and frame, rotatable members threaded upon said uprights and operatively connected with said frame, and means for rotating the last said members to bodily and vertically adjust said frame with respect to the standards to vary the working height of the bed, the force of the operative stroke of the slide against said bed being sustained by said frame, said upright threaded members being relieved of such force.



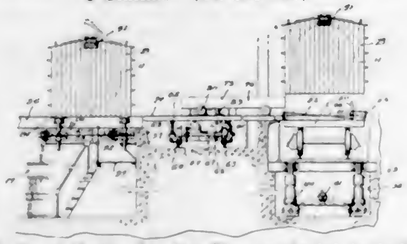
3. A press comprising a rigid frame structure embodying a base, a slide reciprocable toward and away from the base and exerting its operative force against said base, standards independent of and disposed outside of and adjacent the corners of the frame, vertical bearings carried by the standards, co-operating vertical bearings carried by and outside of the frame and arranged in alinement with the bearings of the respective standards, upright members passing through the respective co-operating bearings on the standards and frame, portions of said upright members being threaded, a member threaded upon each of the said upright members and operatively connected to the frame, one of each of the co-operating members being non-rotatable and the other being rotatable, and means for rotating the rotatable members to bodily adjust the frame and bed to vary the working height of the bed.

2,102,843

RIBBON FEEDING MECHANISM

Hugh H. Gwynne, Los Angeles, Calif.

Application May 2, 1936, Serial No. 77,524
1 Claim. (Cl. 271—2.3)



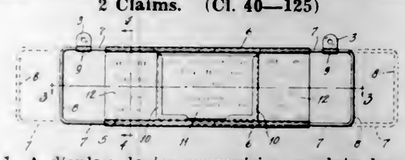
In a ribbon feeding mechanism a horizontally extending elongated carriage mounted for vertical movement, a ribbon feed reel on one end of said carriage, a ribbon take-up reel on the other end of said carriage, a plurality of feeding rollers mounted on said carriage and spaced apart longitudinally thereof around which a ribbon leading from the feed reel to the take-up reel is passed, guide means depending from said carriage adjacent the end portion thereof carrying the feed reel, a vertically movable carriage engaging said guide means, means for adjusting said last named carriage relative to the first named carriage, direction rollers on said second carriage around which a length of ribbon extending between a pair of adjacent rollers is passed, a plurality of hangers depending from said first named carriage, direction rollers on said hangers around which lengths of the ribbon extending between adjacent feeding rollers is passed, means on said first named carriage for collectively driving said feeding rollers, and means associated with said last named means for rotating said take-up reel.

2,102,844

APPARATUS FOR HANDLING LIQUID PRODUCTS

John C. Hester, Milwaukee, Wis., assignor of one-fourth to Donald A. Harris, one-fourth to Edward A. Bornfleith, and one-fourth to Godfrey Oestrich, all of Milwaukee, Wis.

Application January 4, 1935, Serial No. 380
6 Claims. (Cl. 214—38)



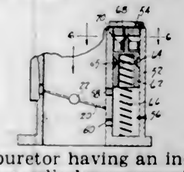
1. In a device for handling material in bulk, a receiving station having one or more pairs of spaced parallel rails, a track extending longitudinally of the receiving station and at right-angles to the rails, a roadway parallel to the receiving station, a wheeled chassis movable over the roadway, a pit in said roadway located below the track and the rails of the receiving station, a removable car body on the chassis, means in the pit for elevating the body above the chassis, said means being entirely movable in the pit below the roadway when the same are not in use, a spotting truck movable over the track having a pair of transversely extending rails movable with the truck into and out of alinement with the rails of the receiving station, a transfer truck independent of the car body and supporting truck and normally mounted on the rails of the spotting truck and movable on to the rails of the receiving station when the rails of the truck are in alinement with the rails of the receiving station, and rails for the car chassis whereby the transfer truck can be moved under the elevated body when the rails of the spotting truck are in alinement with said last mentioned rails.

2,102,845

DISPLAY DEVICE

Nelson H. Howe, St. Louis, Mo., assignor to Lewis-Howe Company, St. Louis, Mo., a corporation of Delaware

Application August 2, 1937, Serial No. 156,886
2 Claims. (Cl. 40—125)



1. A display device comprising a plate having hollow beads along its top and bottom edges, supporting frames having end members and legs slidably disposed in the respective beads, mounting devices having loops through which extend the legs of said frames and sign supporting members mounted centrally of said plate on a face thereof.

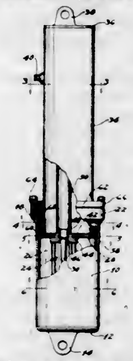
2,102,846

CARBURETOR

Scott F. Hunt, Detroit, Mich., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware

Application January 25, 1933, Serial No. 653,520
14 Claims. (Cl. 261—39)

6. In a carburetor having an induction passage and a throttle, a cylinder communicating with the induction passage anterior and posterior to the throttle, a piston in the cylinder operative in two positions to permit flow of air through the cylinder and operative in an intermediate position to obstruct such flow, said piston being subjected at its opposite ends to atmospheric pressure and to the pressure posterior to the throttle whereby it tends to move in one direction in response to a decrease in said latter pressure, and yielding means urging the piston in the opposite direction.



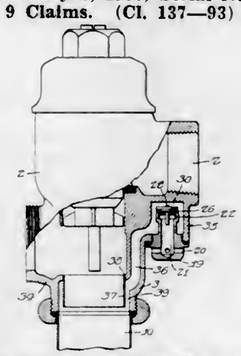
7. In a carburetor, an induction passage, and a throttle valve in said passage having apertures therein, and pressure responsive members oppositely acting to control said apertures.

2,102,847

SHOCK ABSORBER STRUT

Carl V. Johnson, South Bend, Ind., assignor to Bendix Research Corporation, South Bend, Ind., a corporation of Indiana

Application March 7, 1931, Serial No. 520,778
15 Claims. (Cl. 267—64)



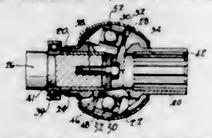
1. A shock absorbing strut comprising a streamlined cylinder having guiding surfaces arranged in arcs, the centers of which are common to both surfaces, a circular piston arranged to reciprocate within and be guided by said guiding surfaces, and a second stream line cylinder having a cross section whose minor axis is less than and whose major axis is greater than the diameter of said piston, said second cylinder being secured to said piston and adapted to reciprocated within the first named stream lined cylinder.

2,102,848

VACUUM BREAKING DEVICE

Emil J. Kocour, Chicago, Ill., assignor to Sloan Valve Company, Chicago, Ill., a corporation of Illinois

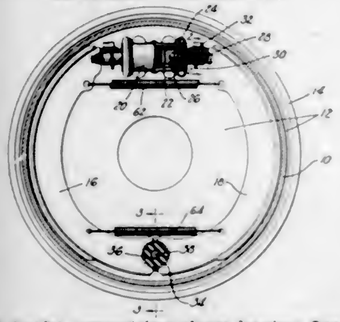
Application May 8, 1930, Serial No. 450,659
9 Claims. (Cl. 137—93)



1. The combination with a flush valve casing of a vacuum breaking device having a vertically disposed body portion through which the water from the flush valve passes, said body portion having a hollow eccentrically arranged extension which is a part of the flush valve casing, a seating element in said extension provided with a passageway communicating with the atmosphere, a closing device within the flush valve casing nor-

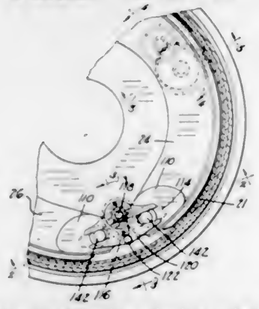
mally engaging said seating device so as to close said passageway, said extension being provided with a space above said seating device, a connection leading from said space to said body portion, and means associated with said connection for preventing the water from the flush valve from passing up to the top of said seating device.

2,102,849
METHOD OF MAKING SOAP BEADS OR THE LIKE
Vaman R. Kokatnur, New York, N. Y., assignor to Autoxygen Inc., New York, N. Y., a corporation of New York
No Drawing. Application September 7, 1935, Serial No. 39,552
16 Claims. (Cl. 87—16)



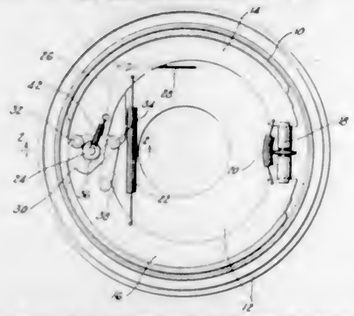
1. A method of producing soap beads or the like, which includes the step of dropping a normally solid or gelled soapy substance in molten condition into a bath of non-aqueous organic volatile cooling liquid to effect rapid cooling and case hardening of the drops into the form of beads or the like.

2,102,850
UNIVERSAL JOINT
Ernest R. Koppel, South Bend, Ind., assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application February 24, 1936, Serial No. 65,256
8 Claims. (Cl. 64—21)



1. In a constant angle velocity universal joint member including a plurality of spaced arms, a stamped splined welded longitudinally extending reinforcing insert having radially extending reinforcing segments, an apertured member having radially extending projections and a die-cast universal joint body section including a pair of spaced arms surrounding the insert the radially extending reinforcing segments and projections of the joint.

2,102,851
BRAKE
Ludger E. La Brie, South Bend, Ind., assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application March 27, 1935, Serial No. 13,330
23 Claims. (Cl. 188—78)

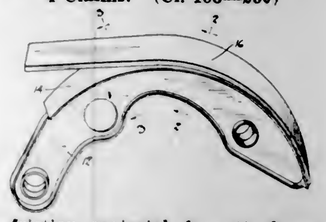


1. A brake comprising shoes having fixed anchorage means and circumferentially floating applying means at one side of the brake, and having connecting means at the other side of the brake, in combination with yielding means acting on said connecting means and which is heavy enough to take approximately one-half of the torque of one shoe and which transmits the remaining half of the torque of said one shoe to the other shoe with a servo effect.

2,102,852
BRAKE
Ludger E. La Brie, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application September 12, 1935, Serial No. 40,291
4 Claims. (Cl. 188—78)

1. A brake positioning device adapted to be mounted on a brake backing plate and comprising a fixed pin to be carried by the plate and adapted to engage and support at its end the web of a brake shoe, a roller eccentrically mounted on the pin and adapted to engage and support the rim of said shoe, and a device for turning the roller including a pinion having an operating stem extending through the backing plate.

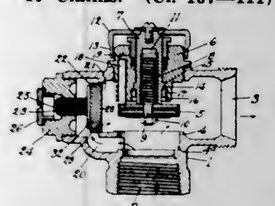
2,102,853
BRAKE
Eugene G. McDonald, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application September 26, 1932, Serial No. 634,972
13 Claims. (Cl. 188—78)



1. A brake comprising a drum, friction means having an anchorage engaging its ends and arranged to have one end anchor thereon when the drum is turning in one direction and to have the other end anchor thereon when the drum is turning in the other direction, a floating lever having a part pivotally engaging one of said ends on one side of said anchorage and having a slot encircling the anchor and elongated in the direction of the drum circumference to permit the lever to shift slightly circumferentially of the brake with said ends to permit either of said ends to anchor, a link connecting the other of said ends to a part of the lever on the other side of said anchorage.

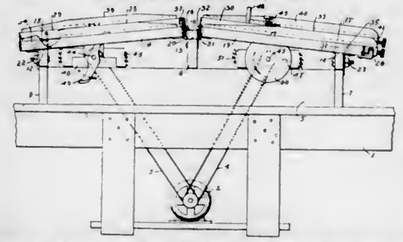
2,102,854
HALOGEN DERIVATIVES OF N-AMYL CRESOLS
George W. Raiziss and LeRoy W. Clemence, Philadelphia, Pa., assignors to Abbott Laboratories, North Chicago, Ill., a corporation of Illinois
No Drawing. Application June 22, 1934, Serial No. 731,695
2 Claims. (Cl. 260—154)

1. A n-amyl cresol which is dihalogenated on the ring.



2. A ring-halogenated aromatic compound, namely, dichloro-n-amyl-meta cresol.

2,102,855
BRAKE LINING
Adolph Rosner, Rockton, Ill., assignor to Bendix Brake Company, South Bend, Ind., a corporation of Illinois
Original application December 21, 1928, Serial No. 327,730. Divided and this application January 22, 1934, Serial No. 707,654
4 Claims. (Cl. 188—250)



1. A friction material for attachment to a brake shoe or the like and which is formed in a long strip having, when the strip is straight, parallel transversely-curved upper and lower faces presenting a concavity on the side which is to engage the shoe, which concavity tends to flatten out as the strip is bent into the arc of the shoe, and which strip is of woven material with transverse elements set under tension so that there is substantially no tendency for the material to stretch transversely under pressure.

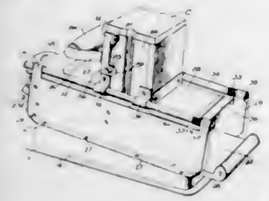
2,102,856
VALVE
Irving H. Russell, Chicago, Ill., assignor to Sloan Valve Company, Chicago, Ill., a corporation of Illinois
Application October 11, 1933, Serial No. 693,126
10 Claims. (Cl. 137—111)

9. In combination, a valve casing provided with an inlet opening and an outlet opening in communication with each other through an enlarged central chamber, a reciprocable valve member mounted within said casing to control communication between said openings, a first shoulder and a second shoulder within said casing interposed between one of said openings and the said central chamber; and a channel in said casing by-passing one of said shoulders, said valve member being positionable with respect to one of said shoulders to close communication completely between said openings, being positionable within the second shoulder to permit by-pass communication between said openings, and positionable away from both of said shoulders to permit free communication between said openings.

2,102,857
WOODWORKING MACHINE
William J. Schafer, San Jose, Calif.
Application January 19, 1937, Serial No. 121,246
1 Claim. (Cl. 144—1)

In a wood-working machine, a supporting frame including a stepped member disposed crosswise thereof on the central portion thereof, and a pair of symmetrically arranged tables associated with each step of said member and inclined outwardly and downwardly from opposite sides thereof with their outer ends supported by said frame, whereby material on any one table projecting over another table will not encounter any item on said other table.

2,102,858
CAPSULE FOR STORING FLUIDS
Peter Schlumbohm, New York, N. Y.
Application September 29, 1934, Serial No. 746,129
In France December 21, 1933
4 Claims. (Cl. 206—46)



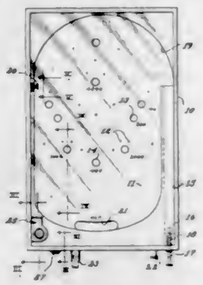
1. A destructible mercantile unit comprising an absorbent pad, a pliable rupturable wall fitting closely around and sealing said pad, and a charge of cosmetic liquid for a single application within said wall and impregnated within the pad, said pad being of such material that when impregnated with said liquid it tends to expand against said wall and to hold said wall in expanded, pad-embracing condition whereby to render the wall resistant to deformation and breakage in handling.

2,102,859
CHEESE SLICING AND DISPENSING APPARATUS
George W. Spousta, Oak Park, Ill.
Application May 15, 1937, Serial No. 142,846
14 Claims. (Cl. 31—21)

1. In a slicing machine the combination of a frame, parallel horizontal rail members adjacent

the upper end thereof, a cutter member therein positioned adjacent said rails, said cutter member having a diagonal blade, a removable gauge member, said gauge member having a diagonal forward edge, a plurality of spaced slots in the forward end of said frame, said slots adapted to receive said gauge member, gravity operated means for locking said gauge member in any of said slots,

a vertically disposed hopper journalled upon one of said rail members, said hopper having means resting upon the other of said rail members, and knife guards secured to said hopper, said hopper having a movable wall whereby forward pressure of said hopper during a slicing operation functions to securely grip material therein adjacent its lower end to hold the same during a slicing operation.



2,102,860

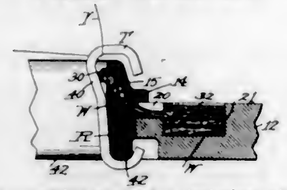
GAME APPARATUS

Harry B. Stoner and Karl Knickerbocker, Aurora, Ill., assignors to Stoner Mfg. Corp., Aurora, Ill., a corporation of Illinois

Application January 25, 1935, Serial No. 3,394

6 Claims. (Cl. 271—2.4)

1. In a game apparatus of the character described, means for issuing tokens in accordance with a player's score, said means comprising a feed wheel adapted when advanced to feed a ticket strip, latch means normally opposing forward and reverse movements of the wheel, a movable arm operable from a normal position to advance the wheel to a ticket issuing position, the latch means opposing forward movement of the wheel being released by the initial movement of said arm, the wheel in ticket issuing position being again latched against further forward and reverse movements until said arm is again actuated in a wheel advancing direction, spring means to return the arm to its normal position, power means operable to move the arm in a wheel advancing direction, and auxiliary means latching the wheel against reverse movement to normal position, once the wheel has started its advancing movement toward a ticket issuing position.



2,102,861

LUBRICATED TWISTER RING

Henry B. Stuart, Whitinsville, Mass., assignor to Whitin Machine Works, Whitinsville, Mass., a corporation of Massachusetts

Application February 4, 1937, Serial No. 124,145

1 Claim. (Cl. 118—59.5)

In the combination of a twisting ring having a vertical flange with a smooth continuous inner face and a traveler having bearing engagement with the lower part of said inner face of said ring but having its upper part disposed at an angle to said lower part and inclined inwardly and upwardly and spaced from the upper part of said inner face, that improvement which consists in providing a pair of adjacent but circumferentially spaced passages in said ring extending upward and inward through the upper part thereof to said inner face, an oil wick threaded in said spaced passages and having an intermediate connecting portion thereof extending between the inner ends of said spaced passages and lying against the upper portion of said continuous inner face of said ring and positioned to be lightly engaged by the inclined and spaced portion of said traveler as said traveler rotates on said ring, and means to supply oil to said wick.

2,102,862

METHOD OF REINFORCING A MILK-CAN NECK

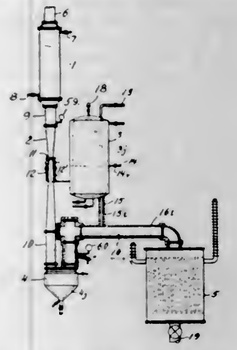
Lee Sturges, Elmhurst, Ill., assignor to Solar Sturges Mfg. Co., Bellwood, Ill., a corporation of Illinois

Application December 24, 1936, Serial No. 117,546

5 Claims. (Cl. 113—120)

1. A method of reinforcing the neck of a milk can or like article to prevent distortion due to rough use, including the steps of forming the can neck as a cylinder, forming a hoop with its upper margin flared, applying the hoop about the cylindrical neck with the upper margin of the hoop spaced downwardly from the upper margin of the neck, beading the portion of the neck above the hoop over the flared margin of the hoop, and then expanding the upper portions of the neck and hoop outwardly between the margins of the hoop to form a seat for a substantially flat lid.

2,102,863



MANUFACTURE OF PARTIAL OXIDATION PRODUCTS

Guy W. Talbert, Summit, N. J., and John D. Kerr, Forest Hills, N. Y., assignors to National Aniline & Chemical Company, Inc., New York, N. Y., a corporation of New York

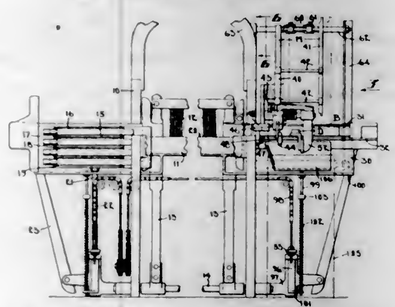
Application November 6, 1933, Serial No. 696,802

8 Claims. (Cl. 260—123)

1. In the conversion of a normally solid organic vaporizable substance to partial oxidation products by catalytic oxidation in the vapor phase with an oxygen-containing gas, the method of forming a vaporous reaction mixture of the oxygen-containing gas and vapors of said substance which comprises passing a stream of the oxygen-containing gas through a Venturi pipe, maintaining a body of said substance in molten condition, drawing said substance from said body into

said stream of oxygen-containing gas by the suction created by said stream in passing through said Venturi pipe and forming a vaporous reaction mixture, maintaining the surface level of said body substantially constant, and maintaining a substantially constant pressure on said body of said substance.

2,102,864



SUPPORT FOR WEFT REPLENISHING MAGAZINES

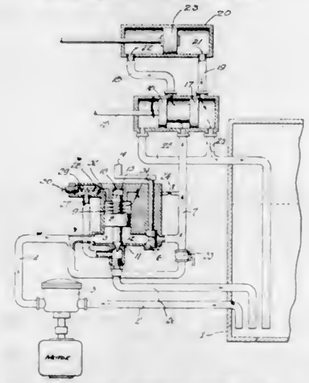
Irving H. Verry, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application April 15, 1936, Serial No. 74,519

Renewed September 16, 1937

10 Claims. (Cl. 139—232)

1. In a loom, a lay, a reserve weft magazine, a foot forming part of the magazine, means to secure the foot to the frame of the loom in a position to support the magazine in transferring relationship with respect to the lay when the latter is forward, an additional support behind the lay to engage the foot when the magazine is in inoperative position, and a pivotal support for the upper part of the magazine located behind the lay and around which the magazine is capable of swinging from the first named position to an inoperative position relatively to the lay, said pivotal support and additional support located to maintain the magazine behind the lay.



2,102,865

COMBINED FLOW CONTROL AND RELIEF VALVE

Harry F. Vickers, Detroit, Mich., assignor to Vickers Incorporated, Detroit, Mich., a corporation of Michigan

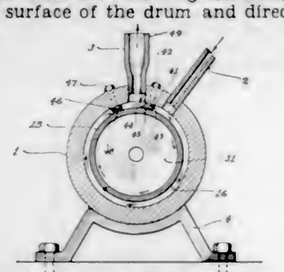
Application June 20, 1934, Serial No. 731,470

5 Claims. (Cl. 60—52)

1. In a hydraulic power transmitting system, the combination of a work member shiftable by liquid under pressure, a constant displacement pump, a reservoir, and a combined pressure flow control and relief valve unit connected in between said pump and work member, means for directing the liquid from said pump to and from said work member to control the directional operation thereof, said valve unit including a chamber for receiving liquid under pressure from said pump, a variable orifice valve member positioned between said chamber and operating line to said work member, and piston valve means forming an integral part of said unit and having a valve connected to said reservoir and a piston having one effective surface and hydraulically connected to one side of said orifice valve member and another surface connecting the pressure line to the work member for simultaneously maintaining the flow rate to said work member and varying the operating pressure in said chamber proportionately to the actual pressure required to overcome the resistance of the work member for regulating and maintaining the flow rate to said work member to predetermine and then maintain the speed of said work member at any part of its movement, and maximum pressure relief means connecting one side of said piston to the reservoir and actuated by relative pressure on opposite sides of said piston to determine the flow of liquid entirely through said orifice valve or at least partly past said piston valve.

2,102,866

CHILLING DEVICE



Charles T. Walter, Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware

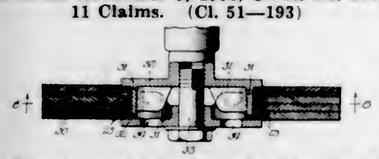
Application August 15, 1935, Serial No. 36,415

16 Claims. (Cl. 257—96)

1. A chilling device of the class described including a cylindrical shell, inlet and outlet means in said shell for the introduction and removal of a fluid product to be chilled therein and a rotatable drum arranged in spaced relation within said shell, said drum being provided with inlet and outlet means for the passage of a chilling medium

therethrough, and a scraping element rigidly mounted in fixed spaced relationship to the surface of the drum for removing solidified product from the surface of the drum and directing the

same through the outlet in the shell, said scraping element providing a surface relative to the shell inlet for directing fluid as introduced into the shell in the direction of rotation of the drum.



2,102,867

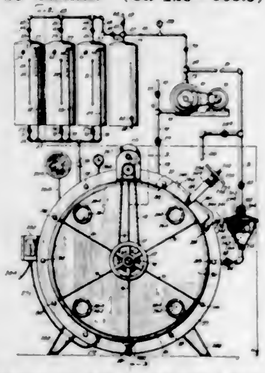
BUFFING WHEEL AND METHOD OF MANUFACTURE

John F. White, Bloomington, Ill.

Application November 5, 1936, Serial No. 109,231

11 Claims. (Cl. 51—193)

6. An open-center buffing-wheel textile-fabric member comprising in combination a confining-ring, a plurality of overlying textile-fabric layers extended through, folded over opposite sides of, and circularly confined by, said ring, the parts of said layers adjacent to said ring being gathered to absorb fullness, the inner gathered portion of said open-center member being hard and permanently transversely corrugated to provide ventilating passages.



2,102,868

LIGATURE TREATING APPARATUS

Arthur L. Waugh, Chicago, Ill.

Application October 7, 1933, Serial No. 692,643

23 Claims. (Cl. 128—335.5)

1. Apparatus of the character described comprising a housing closed to the outer air, means rotatable in said housing, and a plurality of carriers for ligature receptacles mounted on said rotatable means, said carriers comprising a detachable portion in which said receptacles are adapted to be mounted.

2,102,869

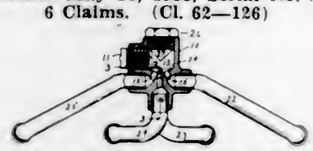
ZINC ALLOYS

Herbert Winter, Buchschlag in Hessia, Germany, assignor to The New Jersey Zinc Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application August 18, 1937, Serial No. 159,711. In Germany August 26, 1936

1 Claim. (Cl. 75—178)

An extruded zinc alloy consisting of 10 to 15% aluminum, 1.5 to 4% copper and 0.01 to 0.04% magnesium, the balance being zinc having a purity of at least 99.98%.



2,102,870

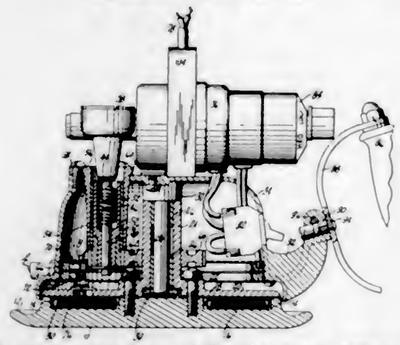
EVAPORATOR

Ernst Witzel, Racine, Wis., assignor to Young Radiator Company, Racine, Wis.

Application May 16, 1935, Serial No. 21,769

6 Claims. (Cl. 62—126)

2. In a device of the class described, comprising an evaporator having a number of coils, a refrigerant distributing head having a chamber and an inverted cone shaped seat in its bottom, outlet orifices closely spaced around the apex of said seat, each having an outlet connection to the inlet end of one of said coils, an inlet to said chamber adapted to receive the refrigerant, whereby the refrigerant is metered into said coils and permitted to expand thereafter.



2,102,871

ELECTRIC ROTARY LAUNDRY IRON

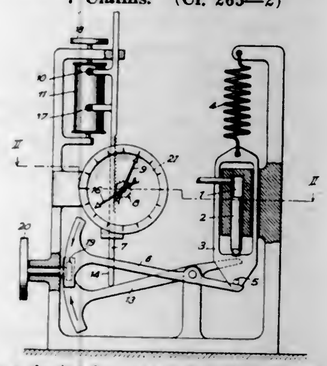
Alfred F. Yoerg, Des Moines, Iowa, assignor of one-half to Harry Schlesinger, Des Moines, Iowa

Application August 20, 1935, Serial No. 37,001

6 Claims. (Cl. 219—25)

2. In a rotary iron of the character described, an inverted, cup-shaped casing, a manipulating handle member thereon, a post projecting downwardly from the top thereof, a sole plate, a hub projecting upwardly therefrom and rotatably receiving said post, electric means for heating said sole plate, collector ring and brush means for supplying electric current to said sole plate from said casing and an electric motor carried by said casing for rotating said sole plate.

2,102,872



MEASURING DEVICE, PARTICULARLY FOR MACHINES FOR TESTING MATERIALS

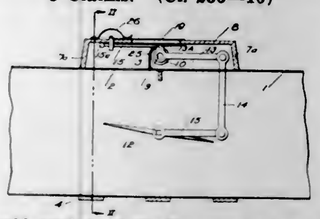
Alfred J. Amsler, Schaffhouse, Switzerland

Application September 5, 1936, Serial No. 99,646

In Switzerland March 26, 1936

7 Claims. (Cl. 265—2)

1. In a device for measuring the extreme values of periodically repeated loadings, particularly for machines for testing materials, a measuring spring having one end fixed and being subjected at its other end to the fluctuating loadings, stops connected with said other end, two pivotal feeler levers cooperating with said stops to be rocked thereby in opposite directions of rotation into end positions corresponding to two limits of loading of the extreme values to be measured, a drive cooperating with said feeler levers by frictional engagement therewith for rocking each lever in the direction opposite to the rocking movement imparted thereto by its correlated stop, measuring means associated with said feeler levers, and means for transmitting all said rocking movements of said levers to said measuring means.



2,102,873

AUTOMATIC DRAFT CONTROL

Clayton G. Anderson, Portland, Oreg., assignor of forty-nine percent to Charles P. Dougherty, Portland, Oreg.

Application January 2, 1936. Serial No. 57,090

5 Claims. (Cl. 236—16)

1. A self-contained draft control apparatus for attachment to a furnace pipe, comprising a frame to surround a pipe, a pipe damper therein, a thermostat chamber within said frame, a thermostat mounted in said chamber, a check draft positioned to admit outside air above the damper and transmission means interconnecting the thermostat, the damper and the check draft for constant cooperative movement of the damper with the thermostat and a lost motion in said transmission to effect intermittent movement of the check draft at a predetermined high temperature.

2,102,874

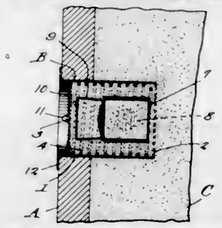
BUTTER-SUBSTITUTE MIXING AND MOLDING DEVICE

Ralph R. Auerswald, San Diego, Calif.

Application January 24, 1936, Serial No. 60,587

4 Claims. (Cl. 31—35)

3. In a butter substitute mixing and molding device, a hollow square in cross section cylinder member provided with a chamfered end provided with perforations in said chamfered end, a plunger reciprocally mounted in said cylinder, and spring latch means for holding said plunger in certain position in said cylinder, said spring latch means also serving as a cutter over the perforated end of said cylinder.



2,102,875

ROSIN SAMPLER

Lewis T. Baker, Jacksonville, Fla.

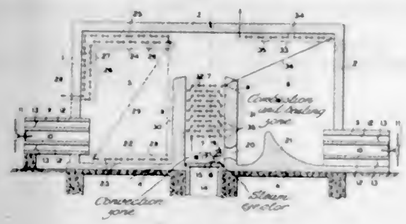
Application March 27, 1936, Serial No. 71,329

5 Claims. (Cl. 220—85)

1. A sampler including a tubular shield open at its ends, one of said ends being insertable into an opening in a barrel for snug engagement therewith, thereby to be supported rigidly within the barrel, a coil removably mounted in the shield and supported and guided thereby, a box in the coil, and a closure for the outer end of the shield.

2,102,876

HEATING OF FLUIDS



Marion W. Barnes, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

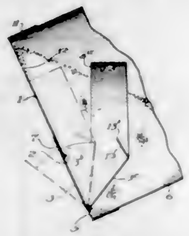
Application October 30, 1933, Serial No. 695,765

6 Claims. (Cl. 196—47)

6. A heating apparatus comprising a furnace having a pair of independently fired combustion

and heating zones and an additional heating zone communicating with both said combustion zones, a fluid conduit comprising serially connected heating tubes in one of said combustion zones, a second fluid conduit comprising serially connected heating tubes disposed in the other of said combustion zones and in said additional

heating zone, means for passing combustion gases from both said combustion zones over the tubes in said additional heating zone, and means for continuously recirculating a regulated portion of the combustion gases having passed over the tubes in said additional zone from the latter zone to said other combustion zone.



2,102,877

DEVICE FOR DISPENSING MEASURED QUANTITIES OF DIVIDED SOLID MATERIAL

Edward J. Barnett, Compton, Calif.

Application October 26, 1936, Serial No. 107,616

3 Claims. (Cl. 221—98)

1. A device for dispensing a measured quantity of divided solid material from a container, which comprises: a container wall member provided with an opening; an open-ended hopper member disposed within said opening and provided with pivotal attachment to said wall member at the side of said hopper opposite said open end, said hopper member being movable from a position substantially wholly to one side of said wall member to a position at least partly to the other side of said wall member, whereby, when said container wall member is in position with respect to a container, said hopper member may be moved between inner and outer positions in which the open end thereof is respectively positioned wholly within said container and at least partly outside said container; and guide members secured to one of the two first-mentioned members adjacent the open end of said hopper member and cooperating with said container wall member to define a material-receiving space, said guide members being so disposed as to direct material from said space into the hopper member.

2,102,878

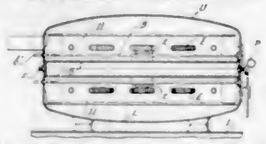
TREATMENT OF HYDROCARBON OILS

Wayne L. Benedict, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

No Drawing. Application May 23, 1936, Serial No. 81,509

7 Claims. (Cl. 196—44)

1. A process for removing copper compounds from copper-sweetened hydrocarbon oils which comprises treating the copper-sweetened oil with a solid sulfide of a heavy metal above hydrogen in the electro-chemical series.



2,102,879

SANDWICH TOASTER WITH INTERCHANGEABLE GRIDS

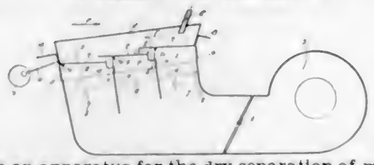
Bernhart A. Benson, Chicago, Ill., assignor to Chicago Electric Manufacturing Company, Chicago, Ill., a corporation of Illinois

Application November 27, 1936, Serial No. 112,898

16 Claims. (Cl. 53—10)

1. An electric toaster or the like comprising an upwardly open casing section having a slot in a side thereof; a grid releasably fitted on the mouth end of the said section, and means for releasably latching the thus fitted grid to the casing section; the said means comprising a latch element depending from the grid, and a latch member supported by and within the casing below the grid; the latch member having a digitably manipulable portion accessible from the exterior of the casing, and being horizontally movable to and from a position in which a part of the latch member bears downwardly on the latch element on the grid which at that time is fitted on the said casing section.

2,102,880



APPARATUS FOR DRY SEPARATION OF MATERIALS OF DIFFERENT DENSITIES

Francois Jacques Berry, Lille (Nord), France, assignor to Ateliers et Chantiers De La Manche, Dieppe, France, a corporation of France

Application January 20, 1934, Serial No. 707,447

In France January 21, 1933

1 Claim. (Cl. 209—467)

In an apparatus for the dry separation of mixed substances of different densities, a plurality of juxtaposed compartments each comprising a frame with a perforated base and with each successive base overlapping and spaced above the preceding base, means for mounting the frame on an incline, means for vibrating the frames so as to advance the bottom layer of material up the incline while the top layer of material floats down the incline under the influence of gravity, means for supplying upwardly directed air currents through the perforated base, the end of the first

base furthest from the second base providing a discharge for the heaviest materials and the opposite end of the last base of the series providing a discharge for the lightest materials, and discharging troughs between each pair of frames, each trough being at the end of a base and underlying so as to be entirely covered over by a preceding base whereby material of intermediate density may discharge in said trough by working under the preceding base after being discharged from said preceding base.

2,102,881

FRICTIONAL WIRE CONNECTER

Jasper Blackburn and James A. Weaver, Jr., Webster Groves, Mo.

Application December 20, 1933, Serial No. 703,174

8 Claims. (Cl. 173—263)

1. In a device of the kind described, the combination with a threaded bolt longitudinally slotted, the slot being extended out at one end, of a nut threadedly engaging the bolt, the nut having an interior, circumferential groove or race cutting the threads thereof, a washer embracing the bolt at the inner face of the nut as so mounted, the washer having a bearing rib extended thru the slot of the bolt, and a looped brace within the bore of the nut adapted for movement within the slot of the bolt, the extremities of the brace being turned outwardly and disposed slidably within the said race of the nut, the bight of the brace being disposed inwardly thru the nut against the said bearing rib of the washer as a support therefor.

2,102,882

FUSE LINK

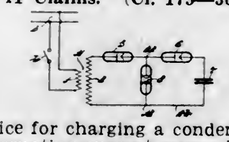
Eugene F. Boothe, St. Louis, Mo., assignor to James R. Kearney Corporation, St. Louis, Mo., a corporation of Missouri

Application April 12, 1937, Serial No. 136,285

8 Claims. (Cl. 200—117)

8. A fuse link assembly including an energy-carrying member, a fusible element electrically connected to said energy-carrying member, tubular insulating means mechanically connected to said energy-carrying member, a second energy-carrying member, a strain wire electrically connected to said fusible element and to said second energy-carrying member so as to be a fixed part of the normal electrical circuit through the fuse link assembly, means comprising a transversely extended pin formed of insulating material for mechanically connecting said strain wire to said tubular insulating means so as to relieve said fusible element of mechanical tensional strain, and a tubular element formed of electrical conducting material electrically connected to the first-mentioned energy-carrying member and embracing said tubular insulating means, said tubular insulating means and said tubular element having alined openings formed in the walls thereof, said tubular element being adapted on rupture of said fusible element to serve as a conductor for electrical energy whereby an electrical arc is produced which passes through the opening formed in said insulating means from the wall of the opening in said tubular element to the strain wire whereby said strain wire is severed by said electrical arc so as to allow the severed ends of the fusible element to be drawn apart.

2,102,883



DEVICE FOR CHARGING CONDENSERS

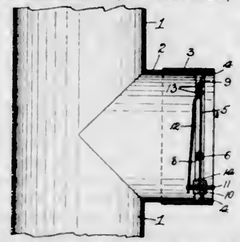
Albert Bouwers, Eindhoven, Netherlands, assignor to N. V. Philips' Gloeilampenfabrieken, Eindhoven, Netherlands

Application November 22, 1935, Serial No. 51,166

In Germany December 6, 1934

11 Claims. (Cl. 175—363)

4. A device for charging a condenser comprising, an alternating current source having a primary circuit and a no-load voltage substantially greater than the operating voltage of the condenser, a rectifier to supply unidirectional charging current to the condenser, and means to interrupt the primary circuit of said current source when the voltage of the condenser reaches its operating value.

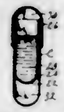


2,102,884

DRAFT REGULATOR

James L. Breese, Santa Fe, N. Mex.

Application February 19, 1937, Serial No. 126,571

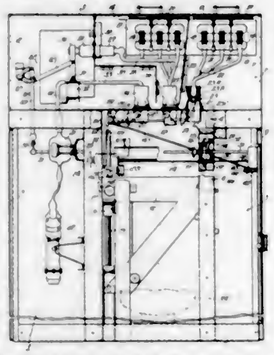


2 Claims. (Cl. 236—45)

2. An automatic draft regulator for ducts or the like which includes an inlet member adapted to communicate with said duct, a valve member pivoted in said inlet member and adapted when in one position substantially to close the inlet thereof, a thermostatic strip secured at one end

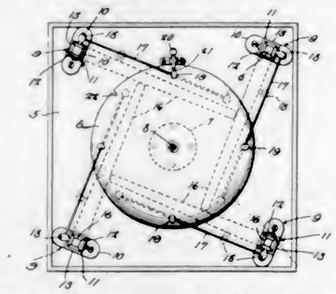
to said valve member and a weight supported on the free end of said strip, said thermostatic strip being positioned within the inlet member and being constantly exposed to temperature conditions within said duct, and being adapted thereby to move said weight in relation to said pivoted valve member, in response to temperature changes within said duct.

2,102,885
INDIVIDUAL COSMETIC CONTAINER STRUCTURE
John O. Carroll, Des Moines, Iowa
Application October 21, 1935, Serial No. 45,985
2 Claims. (Cl. 132—1)



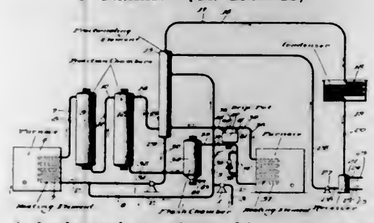
1. In an individual cosmetic container structure, an open top container for holding a sufficient quantity of cosmetic for use at one time, a shell and a cover therefor of a size to provide air chambers therein above and below said container when said shell is assembled on said container, said shell and cover being sealed relative to each other to prevent evaporation of the cosmetic from said container, said container being slidable within said shell and cover and snugly fitting the interior wall thereof to prevent flow of the cosmetic from said container to the air chamber within said shell below said container.

2,102,886
CONTAINER FOR PRESERVING EGGS
Norman G. Conner, Oakland, Calif.
Application August 31, 1936, Serial No. 98,642
1 Claim. (Cl. 229—1.5)



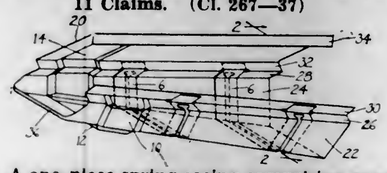
In combination, a container for an egg comprising a cylindrical fiberboard body, a metallic liner within and extending between the ends of said body, closures for the respective ends of said body each comprising a disk of metal having a channel-shaped peripheral rim in which an end of said body and said liner may be secured, one of said closures having a depressed portion therein to provide a socket in which an end of said egg may be seated, and the other of said closures having a sealable aperture therein through which air may be exhausted from said container, and means within said container for supporting said egg against movement therein, said means comprising a disk of sheet material within said body in peripheral contact with the inner surface thereof, said disk having a central aperture therein through which a portion of said egg may project, and a plurality of resilient tabs on said disk contacting the surface of said egg.

2,102,887
ELECTRICAL SWITCH GEAR
Elias S. Cornell, Evanston, and Charles A. Koerner and Roy A. Sternaman, Chicago, Ill., assignors to The Delta-Star Electric Company, Chicago, Ill., a corporation of Illinois
Application June 9, 1934, Serial No. 729,820
12 Claims. (Cl. 175—298)



1. In combination, a feeder circuit, a transfer bus circuit, a main bus circuit, an oil circuit breaker of the lift type connecting said main bus circuit with said feeder circuit, means for connecting said transfer bus circuit to said feeder circuit in parallel with the main bus only when said circuit breaker is in raised and connected position, means for lowering said breaker, and means for raising said breaker and connecting it between said transfer bus circuit and said feeder circuit, said connecting means for said transfer bus circuit being disconnectable only when said breaker has been connected by said last named means between said feeder circuit and said transfer circuit.

2,102,888
BRIDGE TABLE
Claude S. Dill, Lodge Grass, Mont.
Application December 8, 1934, Serial No. 756,693
1 Claim. (Cl. 311—99)

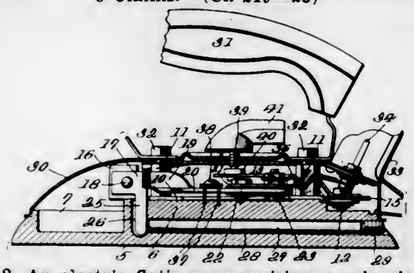


A bracket for securing a table leg to a table top, comprising a length of sheet metal material, portions of the sheet metal material being cut from the main portion thereof and extended rearwardly, providing spaced side walls and a vertical wall, a portion of the sheet metal material being extended in a horizontal position over the upper edges of the side walls and providing a base, slots formed in the base, ears rising from the upper edges of the side walls and adapted to extend into the slots where they are bent over the base, securing the upper edges of the side walls to the base, said base having openings to receive securing screws, and said bracket adapted to house the upper end of the table leg mounted within the bracket.

2,102,889
TREATMENT OF HYDROCARBON OIL
Carbon P. Dubbs, Chicago, Ill., assignor, by mesne assignments, to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application July 19, 1930, Serial No. 469,201
Renewed November 6, 1935
3 Claims. (Cl. 196—48)

1. A hydrocarbon oil cracking process which comprises passing the oil in a restricted stream through a heating zone and heating the same therein to a cracking temperature under sufficient pressure to maintain a substantial portion thereof in the liquid phase, discharging the heated oil into the upper portion of an enlarged reaction zone maintained under cracking conditions of temperature and pressure and passing the commingled vapors and liquid oil downwardly therethrough, withdrawing the vapors and liquid unvaporized oil as a mixture from the lower portion of the reaction zone and maintaining practically no liquid level in the reaction zone, separating the mixture withdrawn from the reaction zone into vapors and unvaporized oil and flash distilling the unvaporized oil by pressure reduction, subjecting vapors formed by the flushing of the unvaporized oil to a gasoline-producing vapor phase cracking operation at vapor phase cracking temperature, dephlegmating the vapor phase cracked vapors in admixture with the vapors removed from the reaction zone to condense insufficiently cracked fractions of the commingled vapors and returning resultant reflux condensate to the heating zone, and finally condensing the dephlegmated vapors.

2,102,890
SPRING COVER
Warren F. Eisenhauer, Watertown, Mass., assignor, by mesne assignments, to F. L. Jacobs Company, Detroit, Mich., a corporation of Michigan
Application October 8, 1935, Serial No. 44,034
11 Claims. (Cl. 267—37)

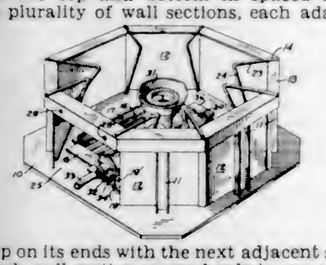


1. A one-piece spring casing comprising spaced sections engaging three sides of a spring, a cover for the fourth side integrally connected with said sections by a slack take-up device, said sections also integrally connected with a reversely turned flange on said fourth side, a complementary flange on said cover to engage said reversely turned flange, said flanges arranged to bindingly engage each other and said take-up device arranged to draw said sections closer about said spring when said cover is moved toward said spring.

2,102,891
MATERIAL FOR ARC WELDING
Lionel E. Faulkner, Hillside, N. J., assignor, by mesne assignments, to Air Reduction Company, Incorporated, a corporation of New York
No Drawing. Application July 7, 1934, Serial No 734,207. Renewed June 5, 1937
7 Claims. (Cl. 219—8)

5. An electrode for arc welding consisting of a metallic rod having a coating comprising from 17% to 78% titanium dioxide, from 13% to 52% silica and from 0% to 33% alumina and/or from 0% to 33% magnesium oxide, the total relative proportion of the last two ingredients being from 8% to 33%.

2,102,892
ELECTRIC FLATIRON
Maurice F. Fitzgerald, Winsted, Conn., assignor to The Fitzgerald Manufacturing Company, Torrington, Conn., a corporation of Connecticut
Application July 28, 1936, Serial No. 93,074
5 Claims. (Cl. 219—25)



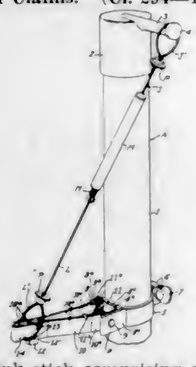
2. An electric flatiron comprising a sole plate having a heating means therefor, a supporting plate mounted on said sole plate, a lever pivotally mounted intermediate the ends thereof on said supporting plate and having a switch contact carried by one arm thereof, a switch arm mounted on said supporting plate and having a switch contact cooperating with the switch contact carried by said lever, an expansion bar disposed in direct thermal relation with said sole plate and cooperating with the other arm of said lever to actuate the lever about its pivotal axis whereby to open and close the said switch contacts upon expansion and contraction of said bar, a cover removably secured to said sole plate independently of said supporting plate, means carried by said cover and removable therewith for adjusting the relative position of the contact points whereby to control the temperature setting of the flatiron, and means detachably securing said supporting plate to said sole plate whereby the assembled supporting plate, lever, and switch arm may be removed or applied as a unit.

2,102,893
STOVE
Percy M. Forster, Berkeley, Calif.
Application September 15, 1936, Serial No. 100,886
5 Claims. (Cl. 126—36)

1. A combination wood and gas stove comprising a substantially flat base, having a central cut out portion therein and bars fastened across said opening, a substantially flat centrally apertured top member, and vessel supporting bars extend-

ing inwardly a short distance from the sides, a plurality of supporting members securing together the top and bottom in spaced relation, and a plurality of wall sections, each adapted to

overlap on its ends with the next adjacent sections and each wall section secured only to one supporting member, whereby said sections may move freely on one another as they expand or contract under the influence of the heat.



2,102,894

FUSE LINK STICK

Charles Adin Fox, St. Louis, Mo., assignor to James R. Kearney Corporation, St. Louis, Mo., a corporation of Missouri

Application October 26, 1936, Serial No. 107,725

11 Claims. (Cl. 294—19)

1. A fuse link stick comprising a pole, an element mounted on said pole and adapted to engage an end portion of a fuse link, a second element mounted on said pole in spaced relation with respect to the first mentioned element and adapted to engage the other end portion of the fuse link, and means for moving a part of said second element in a direction away from the first-mentioned element so as to hold the fuse link engaged by said elements under tension.

2,102,895

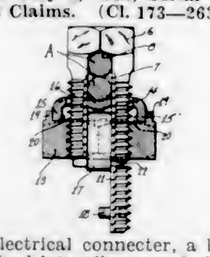
MEANS FOR DRIVING AND GUIDING FILM

Harold J. Hasbrouck, Jr., Flushing, N. Y., assignor to United Research Corporation, Long Island City, N. Y., a corporation of Delaware

Application June 27, 1935, Serial No. 28,648

4 Claims. (Cl. 271—2.3)

4. In a film guiding mechanism, the combination of a roller having a width substantially comparable to the width of film adapted to be advanced thereover and a fixed axis of rotation, a pair of rotatable rollers each having a width comparable to the edges of the film having no images thereon, means for mounting said rollers for exerting pressure on said film at said portions having no images thereon and against said first roller, and positive vernier means for adjusting the axes of rotation of said rollers with respect to the axis of rotation of said first roller.



2,102,896

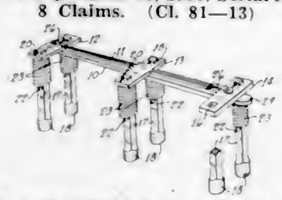
ELECTRICAL CONNECTER

Walter A. Heinrich, St. Louis, Mo., assignor to James R. Kearney Corporation, St. Louis, Mo., a corporation of Missouri

Application May 4, 1934, Serial No. 723,813

3 Claims. (Cl. 173—263)

1. In an electrical connecter, a body member including paired laterally spaced shanks, one of said shanks having a threaded continuation extending beyond the end of the other shank, a nut on said shanks, a washer carried by said nut, said washer having a diametral bridge overlying one end face of said nut, and paired fingers extending through the bore of said nut adapted to maintain said nut and washer in assembled relation, means on said nut for maintaining said nut and washer in coaxial relation, and means on said continuation, cooperable with said bridge for preventing removal of said nut and washer assembly from said body member.



2,102,897

BOLT-SETTING TOOL

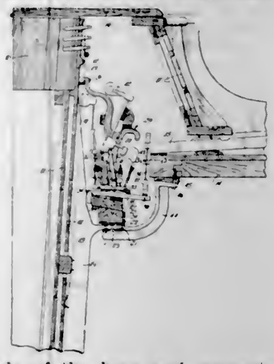
Michael Holhut, Jennings, Mo., assignor to H & H Machine & Motor Parts Co., St. Louis, Mo., a corporation of Missouri

Application September 16, 1936, Serial No. 101,004

8 Claims. (Cl. 81—13)

1. In a bolt-setting tool, a frame having a central-member and a plurality of cross-arms disposed at right angles to the central-member, means on the frame for releasably securing the frame to an automotive cylinder block, and a plurality of bolt-engaging stems yieldingly and non-rotatively mounted in each of the cross-arms for registration with the several bolt-openings in the block.

2,102,898



PIANO

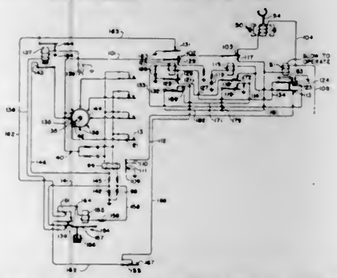
Albert A. Huseby, Oak Park, Ill.

Application October 21, 1936, Serial No. 106,716

10 Claims. (Cl. 84—240)

1. In a piano of the type described, the combination with the string plate and strings, key bed and keys fulcrumed intermediate their ends, and an action including wippens located below the level of the keys, a wippen-actuating means comprising levers pivotally supported at their rear ends by the string plate beneath the wippens, tension abstracts directly suspended from the

inner ends of the keys and connected at their lower ends to the forward ends of said levers, and wippen contact members carried by said levers located intermediate the ends thereof.



2,102,899

PRINTING TELEGRAPH SYSTEM AND APPARATUS

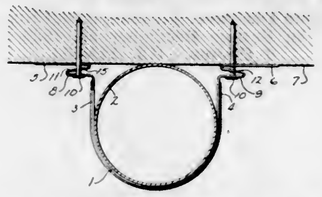
Edward E. Kleinschmidt, Highland Park, Ill., assignor to Teletype Corporation, Chicago, Ill., a corporation of Delaware

Application April 25, 1936, Serial No. 76,357

27 Claims. (Cl. 178—35)

1. In a step-by-step synchronous printing system including a series of stations, a combination transmitting and receiving apparatus at each station, each comprising a plurality of character keys, normally closed contacts associated with each key, a shaft carrying a type wheel, commutator arm, and synchronizing arm thereon, an electromagnetic device responsive under certain predetermined operating conditions to alternations of current for rotating said shaft step by step while said contacts remain closed, said shaft rotatable under said conditions until checked by the opening of the contacts by its associated key, and means associated with one of said stations effective cyclically irrespective of the character selecting function to synchronize said apparatus.

2,102,900



RESILIENT CONDUCTOR FASTENING

William Konkel, Milwaukee, Wis., assignor to Milcor Steel Company, Milwaukee, Wis., a corporation of Delaware

Application April 20, 1936, Serial No. 75,439

2 Claims. (Cl. 248—74)

2. A fastening means for articles such as conductors, conduits and the like including a metallic strap having an intermediate portion for engaging the article and end parts respectively at opposite ends of said intermediate portion and each apertured to receive a fastener such as a nail, each end part providing spaced parallel

abutment portions respectively for the nail head bearing and for a wall surface bearing and an intermediate resilient portion adapted for distortion in a manner to maintain the parallel relationship of the abutment portions at various spacings thereof.

2,102,901

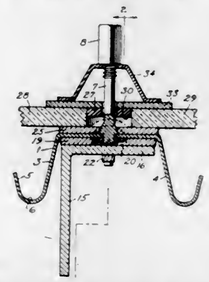
INSERT FOR RUBBER HEELS OR THE LIKE

Laurits A. Laursen, Akron, Ohio, assignor of one-half to Theophilus Karmaghan Seiberling, Akron, Ohio

Application April 11, 1932, Serial No. 604,549

2 Claims. (Cl. 36—35)

2. A reinforcing insert for use in molded composition shoe heels comprising a flat sheet metal body having a nail receiving opening therein, said body having recesses spaced around the nail opening, said recesses having constricted openings extending outwardly through the outer edge of the body.



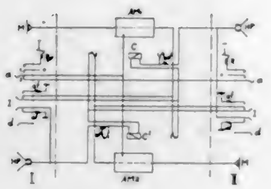
2,102,902

SKYLIGHT CONSTRUCTION

George Henry Lenke, Elmhurst, Ill., assignor of one-half to Julius J. Ohlis, Oak Park, Ill.

Application January 28, 1937, Serial No. 122,848

6 Claims. (Cl. 108—16)



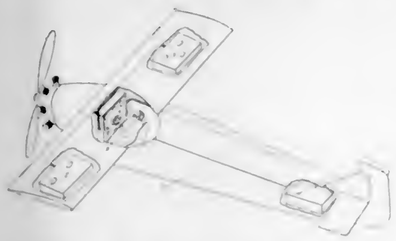
6. In skylight construction the combination of a supporting frame member; a gutter plate; an anchor bolt secured to said gutter plate; independent means to secure said gutter plate to said member; glasses mounted on opposite sides of said bolt; and bolt engaging means for holding said glasses to said plate.

2,102,903

LOUD-SPEAKING AND AMPLIFIED MICROPHONE TELEPHONE EXCHANGE

Emile Leveque, Paris, France, assignor to firm Le Telephone Prive National Société Anonyme, Paris, France, a corporation of France

Application December 27, 1934, Serial No. 759,407
In France December 30, 1933
9 Claims. (Cl. 179—1)



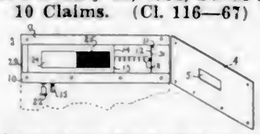
1. A telephone system comprising a plurality of stations, each including a transmitter and a loud-speaking receiver, a circuit including an amplifier connecting the transmitter at one station with the receiver at a second station, a second circuit including an amplifier connecting the transmitter at the second station with the receiver at the first station, a relay, a relay-opened switch in each circuit, the relay in one circuit controlling the switch in the other circuit, whereby, upon energizing the relay in one circuit, the switch in the other circuit will be opened to break the last-recited circuit, a manually-controlled interrupting switch at the station including the transmitter of the first-recited circuit, a circuit including said interrupting switch and shunted across the switch in said first-recited circuit, a second manually-controlled interrupting switch at the second station, and a circuit including said second interrupting switch and shunted across the switch in said second circuit.

2,102,904

RADIO RECEIVING SYSTEM FOR AEROPLANES

Sol J. Levy, New York, N. Y.

Application February 20, 1929, Serial No. 341,295
1 Claim. (Cl. 250—20)



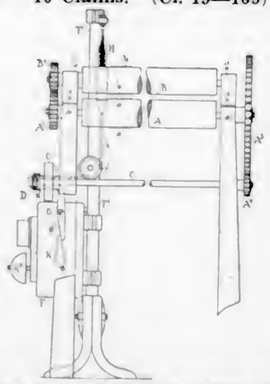
A radio receiving system for aircraft having the radio frequency portion thereof remotely situated from the operator's instrument panel in one wing of said plane, the audio amplifying stage of said set similarly situated and balanced in an opposite wing of said plane, said radio frequency portion being tuned by means controlled from said panel, said audio amplifier being controlled from said panel, said panel having visible dial indication means for showing the wave length to which said set is tuned.

2,102,905

SIGNALING APPARATUS

Frank B. MaGee, West Hollywood, Calif., assignor to United Research Corporation, Long Island City, N. Y., a corporation of Delaware

Application February 23, 1934, Serial No. 712,585
10 Claims. (Cl. 116—67)



3. Signal apparatus for facilitating the recording of start marks on separate sound and picture film records comprising a support, a movable member mounted on said support, a resilient member interconnecting said support and said movable member, means for releasably securing said movable member under control of said resilient member, and a signaling device carried by said movable member, said support comprising means emitting an audible signal upon release and contact therewith of said movable member.

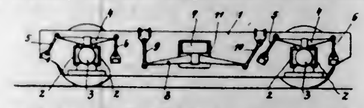
2,102,906

MEANS FOR DETECTING METALLIC AND OTHER SUBSTANCES IN TEXTILE OR FIBROUS MATERIAL

Thomas Merchant, Castleton, England

Application September 21, 1936, Serial No. 101,819
In Great Britain December 6, 1935
10 Claims. (Cl. 19—165)

1. Means for detecting metallic substances in textile material comprising a pair of driven rollers set apart and arranged in an electric circuit and fine metal projections on the surface of the rollers adapted to penetrate the material and engage any metallic substance therein thereupon establishing the circuit and stopping the travel of the material.



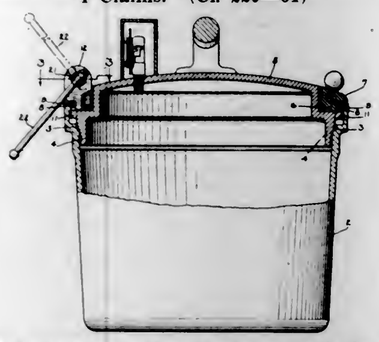
2,102,907

DAMPING THE OSCILLATIONS OF VEHICLES, IN PARTICULAR RAIL VEHICLES

Otto Mylius, Berlin, Germany, assignor to Deutsche Getriebe Gesellschaft mit beschrankter Haftung, Berlin, Germany

Application November 26, 1935, Serial No. 51,683
In Germany April 27, 1934
4 Claims. (Cl. 105—224)

1. In a car truck, a side frame having a vertical guide slot therein, a load-carrying device mounted in the guide slot to move vertically therein under varying load conditions, and suspension means connecting the load-carrying device with the side frame; said suspension means comprising a member extending longitudinally of the side frame and bearing at an intermediate part thereof against the load-carrying device, and shackle members arranged asymmetrically on opposite sides of the load-carrying device and respectively connecting the ends of the longitudinally extending member with the side frame; the said suspension means comprising said longitudinally extending member and said shackle members having at least one of said members providing a resilient connection with the cooperating members of said suspension means, and said suspension means operating to provide a force component normally tending to press the load-carrying device frictionally against a side of the guide slot to dampen relative movement of the load carrying device with respect to the side frame.



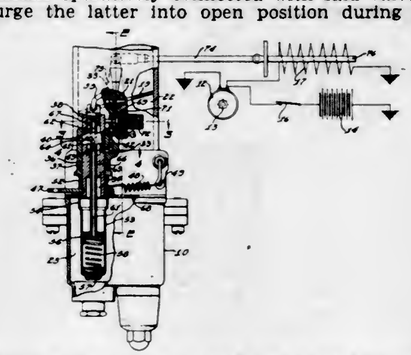
2,102,908

PRESSURE COOKER

Carl Nelson, Eau Claire, Wis., assignor to National Pressure Cooker Company, Eau Claire, Wis., a corporation of Wisconsin

Application August 19, 1935, Serial No. 36,874
4 Claims. (Cl. 220—61)

1. A pressure cooker comprising a body provided with a suitable closure, a split lock ring engageable with the closure and having means for wedgingly engaging means on the cooker body to secure the closure thereto, a stud having right and left hand threaded terminals, threaded elements adjustably mounted in the ends of the lock ring and having threaded apertures for receiving the threaded terminals of the studs whereby rotation of the stud will contract or expand the ring, said threaded elements providing means whereby the gap between the ends of the lock ring may be varied without relatively rotating the stud, thereby to compensate for wear in the parts, so that the lock ring may be expanded to tightly secure the cover to the cooker body by only slightly rotating the stud.



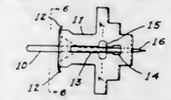
2,102,909

INTERNAL COMBUSTION ENGINE

Clyde R. Paton, Birmingham, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan

Application February 1, 1933, Serial No. 654,608
9 Claims. (Cl. 123—179)

1. In a fuel feeding system for engines, the combination with a throttle valve, of priming means operatively connected with said valve to urge the latter into open position during the priming of said engine, and engine starter mechanism connected to substantially close said throttle valve when effective.

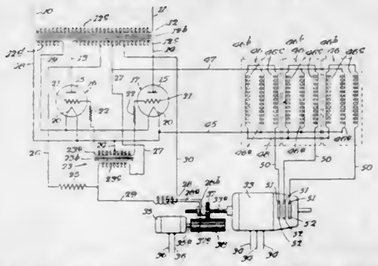


2,102,910

FEED GAUGE FOR PRINTING PRESSES

Eugene Payne, Chattanooga, Tenn.

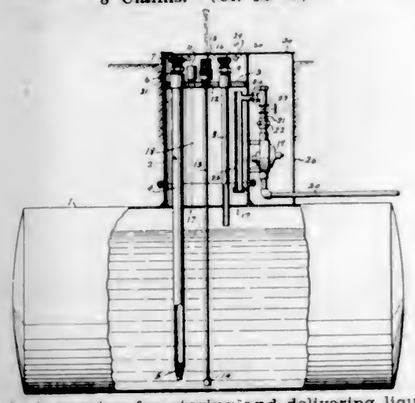
Application December 28, 1936, Serial No. 117,731
6 Claims. (Cl. 101—415)



1. A device of the character described, comprising a body portion, a head secured to said body portion, a plurality of tongue receiving openings in said head, a prong for securing said head and body to a draw sheet, and a tongue adjustably secured to said body portion and extendable through either of said openings for engagement with printing stock.

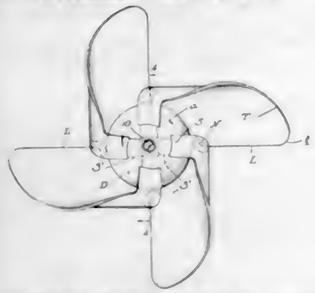
2,102,911

MOTOR CONTROL SYSTEM



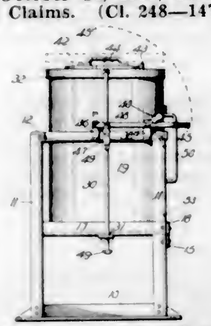
William R. Perry, Columbus, Ind., assignor to Reeves Pulley Company, Columbus, Ind., a corporation of Indiana

Application February 10, 1934, Serial No. 710,666
3 Claims. (Cl. 172—274)



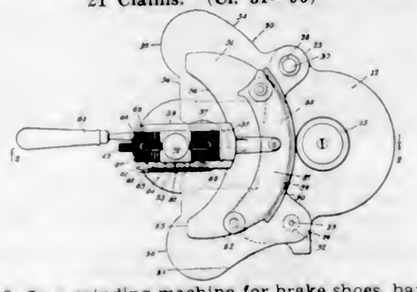
2. The combination in apparatus for controlling the speed of an alternating current motor, a circuit for said motor, an ionic relay, means for causing said ionic relay to vary the impedance of said motor circuit, a second motor running at constant speed adjacent said first named motor, and means for causing differences in the speeds of said motors to control the action of said ionic relay.

2,102,912
DISPENSING APPARATUS FOR LIQUEFIED GAS
Herbert C. Pittman, Tyler, Tex.
Application April 1, 1937, Serial No. 134,355
8 Claims. (Cl. 62—1)



1. Apparatus for storing and delivering liquefied gas comprising a storage tank, a casing associated with the tank and containing a dry gas chamber connected into the tank, an anchor plate in the casing enclosing said chamber, a filler tube anchored to the casing and extending through said chamber and into the tank and terminating adjacent the bottom of the tank, a gas vent pipe anchored to the said plate and extended through the chamber and into the tank and terminating near the top of the tank, a pressure reducing regulator connected into said chamber and a service pipe connected to said regulator.

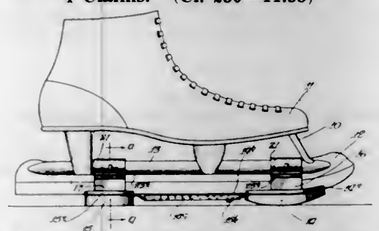
2,102,913
FAN WITH FLEXIBLE BLADES
Edward S. Preston, Chicago, Ill., assignor to Chicago Electric Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application August 29, 1936, Serial No. 98,546
10 Claims. (Cl. 170—171)



1. A pin-wheel type fan member comprising a blade-affording member formed from a sheet of flexible material and presenting counterpart wings symmetrically disposed about the center of the said member; a supporting stem including a circular flange coaxial with and bearing forwardly flatwise against the central portion of the blade-affording member; a forwardly convexed hollow dome coaxial with the said flange and having its mouth end engaging the forward face of the said central portion of the blade-affording member, the dome having equally spaced and similarly spiraling slots, equal in number to the said wings and at a common distance from the mouth end of the dome; each wing being recurved forwardly and thereafter toward the axis of the dome, and having the tip portion of the wing part adjacent to its trailing edge extending into the dome through one of the said slots; an inner clamping member detachably mounted on the said supporting stem and disposed within the dome and bearing forwardly against each of the said wing portions; and threaded means extending axially into the dome and supported by the said stem for pressing the dome rearwardly to cause the dome to clamp all of the said tips against the said clamping member.

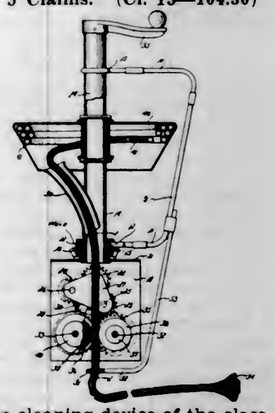
2,102,914
GARBAGE CAN
George W. Rienks and Edward T. Guilford, Denver, Colo.
Application October 14, 1935, Serial No. 44,855
5 Claims. (Cl. 248—147)

1. A garbage can support and cover operating means comprising, a vertically extending frame having means for supporting a garbage can, the frame above the support having an opening through which the can may be removed, two rods slidably connected with the frame for vertical movement, the rods being positioned on opposite sides of the frame, a cover for the top of the garbage can, carried by the rods for vertical movement, a bail having its ends pivoted to the frame, and links connecting the rods to the bail whereby when the bail is turned about its pivots, it acts as a lever and raises and lowers the cover, the bail, when the cover is on the can, being positioned to close the opening in the frame.



2,102,915
UNIVERSAL BRAKE SHOE GRINDER GUIDE
Luther C. Rishel, Los Angeles, Calif.
Application March 28, 1935, Serial No. 13,462
21 Claims. (Cl. 51—96)

3. In a grinding machine for brake shoes, having a pedestal, a grinding wheel mounted thereon,

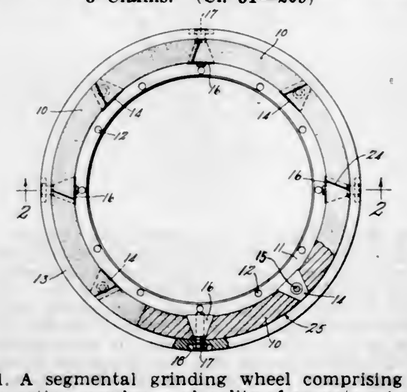


a fixed structure having an arm with a slot therein, a screw extending through the slot and having a stud threaded thereon, the screw being in radial alignment with the grinding wheel, a top plate having a second arm with a slot, an adjusting means engaging the said stud and the second arm, means to temporarily align said arms to bring the second arm into radial alignment with the grinding wheel, the said top plate having a convex curvature on its edge of a radius equal to the smallest radius of brake shoe to be ground, and means on the top plate to support a brake shoe on its edge, and a clamping means for the brake shoe, each of the arms having complementary scales, and a pointer means to indicate the radius of grinding a brake lining, the said scales being in alignment when the two arms are in radial alignment with the grinding wheel, the top plate having slide plates to support the brake shoe and complementary scales on the top plate and slide plates to indicate the radius of grinding of a brake lining.

2,102,916
ICE SKATES
Michael J. Rochford, Chicago, Ill.
Application March 27, 1936, Serial No. 71,274
4 Claims. (Cl. 280—11.38)

1. An attachment for ice skates including a ground tread unit below the skate runner, a divided receptacle for the latter, a hasp pivoted to one of the divisions and looped over the runner, and cam means operative to draw upon the hasp during the clamping action with the effect of tightening the hasp about the runner.

2,102,917
SEWER ROD
Samuel V. Rolland, Flint, Mich.
Application September 19, 1934, Serial No. 744,633
5 Claims. (Cl. 15—104.30)

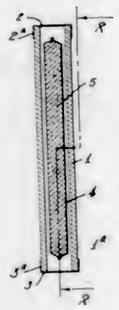


2. A pipe cleaning device of the class described comprising: a rotatable operating member; a hollow reel loosely mounted on said operating member concentrically thereof; an elongated flexible member windable into coils in said reel concentrically of said operating member and unwindable therefrom, said flexible element upon being unwound extending axially of said operating member; a supporting structure carried by said operating member and rotatable in unison therewith; a pair of feed members carried by said supporting structure and engaging opposite sides of said flexible element; means for operating said feed members upon rotation of said operating member for feeding said flexible element into and out of said reel during rotation of said operating member; and means for determining the direction of rotation of said feed members during the rotation of said operating member in one direction, said feed members being positioned axially of said operating member.

2,102,918
ART OF COMBINING RESORCINOL WITH IODINE
George Romanelli, Des Moines, Iowa
No Drawing. Application February 9, 1937, Serial No. 124,927
7 Claims. (Cl. 260—154)

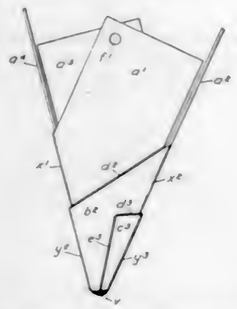
1. The art of combining resorcinol with iodine which consists in dissolving resorcinol in an inert combustible solvent, then adding iodine to the solution, then spreading the solution out thin and igniting it, then breaking up the resulting mass and allowing further evaporation.

6. The art of combining resorcinol with iodine which consists in dissolving resorcinol in an inert combustible solvent in the approximate relative proportions of one gram of resorcinol to one milliliter of the solvent, then adding approximately one half gram of iodine to the solution, then spreading the resulting liquid thinly over a suitable surface and igniting it, then allowing it to cool, breaking it up with a non-metallic implement, and allowing further evaporation by exposure to air until the mass turns to a deep orange color and thereupon dissolving the mass in distilled water to a substantially saturated solution, then evaporating the resultant solution to an amorphous crystalline mass.



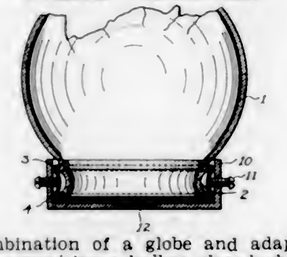
2,102,919
SEGMENTAL GRINDING WHEEL
Samuel Rusoff, Longmeadow, Mass.
Application March 11, 1937, Serial No. 130,297
3 Claims. (Cl. 51—209)

1. A segmental grinding wheel comprising a supporting member, a plurality of arcuate grind-



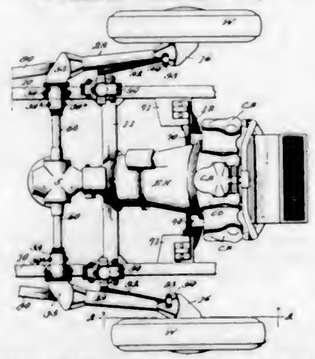
ing segments carried by the member, the segments having shouldered ends providing substantially abutting edges at their grinding surfaces and recessed end surfaces so shaped that the recessed end surfaces of adjacent segments converge away from the axis of rotation of the member, and means for securing said segments in place comprising means for restraining the segments at their outer peripheries and means for exerting an outward wedging action on said recessed converging end surfaces.

2,102,920
DRINK PREPARING MEANS
Eros M. Savage, San Jose, Calif.
Application August 10, 1936, Serial No. 95,192
5 Claims. (Cl. 99—138)



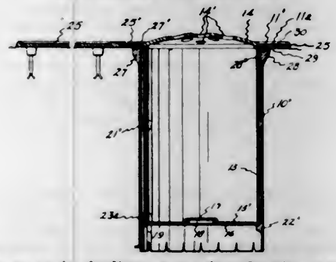
1. In a drink preparing means, a hollow tubular candy member, readily puncturable means for sealing the ends thereof, and a soluble acid and alkali positioned in said hollow candy member spaced from the walls thereof.

2,102,921
PILE SHOE
William C. Schmitt, Portland, Oreg.
Application July 25, 1936, Serial No. 92,621
6 Claims. (Cl. 61—78)



5. A metal pile shoe composed of a plurality of similar plates, each of said plates similarly preformed so as to have a tapering middle section and adjoining sections overhanging the inner face of said middle section, said plates partly nested one within the other with the middle section of each plate exposed on the outer surface of the pile shoe and with the adjoining sections of each plate secured to the middle sections of the adjacent plates.

2,102,922
METAL FITTING FOR GLASS GLOBES
Earl H. Schwab, Pittsburgh, Pa.
Application May 19, 1934, Serial No. 726,506
2 Claims. (Cl. 240—128)

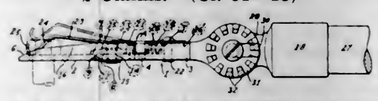


1. Combination of a globe and adaptor ring therefor comprising a hollow glass body open at one end having a neck portion at its open end, said neck being provided with a concavity, and a solid continuous metal ring having a convex portion adapted for alinement with the concavity of the globe neck and adapted to be sprung thereon, said ring being of lesser diameter than the globe neck whereby, when said ring is sprung on the globe neck, its seating surfaces will effect intimate contact, and the convex and concave portions of the ring and globe respectively will form an interlock.

2,102,923
DRIVING AND SUPPORTING ASSEMBLY FOR AUTOMOTIVE VEHICLES
Otto E. Szekely, Elmira, N. Y.
Application February 28, 1936, Serial No. 66,307
3 Claims. (Cl. 180—70)

1. A rear wheel drive and suspension for a vehicle having a load receiving structure, comprising a pair of rock arms, each having separable forward and rear heads and a connecting tube; independent wheels mounted in the rear heads for rotation; means located in the heads and tubes for driving the wheels; each forward head being individually pivotally mounted on the structure; independent springs fixedly attached at their forward ends to the said structure forwardly of the driving means and each attached at the rear end to a corresponding rock arm adjacent the rear end thereof by a connection effective for transferring relative vertical motion and permitting therewith flexing movement of the spring without substantial transfer of longitudinal forces along the corresponding spring, and motion-retarding means connecting the structure and rear heads for controlling the relative movements permitted by said springs, said motion-retarding means being constructed and arranged to be free of thrust therealong when the corresponding wheel and rock arm move relative to the structure.

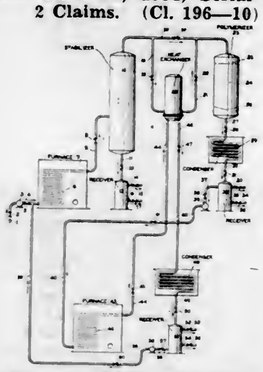
2,102,924
VASE
Albert R. Thomas, Phoenix, Ariz.
Application July 23, 1936, Serial No. 92,239
11 Claims. (Cl. 47—41)



1. A vase including, a casing having an open upper end, a receptacle slidably mounted within said casing, a lug located at substantially the mid-portion of the casing within the same, means on the lower end of the receptacle for engaging said lug, whereby the receptacle is supported within the casing so that a portion of the receptacle extends from the upper end of said casing, the receptacle having an outer diameter less than the inner diameter of the casing whereby said receptacle may undergo a tilting movement so as to disengage the means from said lug to permit the receptacle to be lowered to its lowermost position, and means at the lower end of the casing for engaging the first named means on the lower end of the receptacle to hold the receptacle in its lowermost position in the casing.

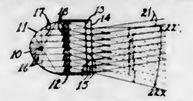
9. The combination with a marker plate having an opening therein, of a vase having means for securing said plate thereto after the vase is embedded in the ground.

2,102,925
METAL COLORING
Cortes Neal Sprankle, Oak Park, and Edward John Golec, Chicago, Ill., assignors to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
No Drawing. Application August 5, 1936, Serial No. 94,423
4 Claims. (Cl. 148—6.5)



1. A composition of matter for the coloring of metal, comprising a dilute aqueous solution of mercury bichloride and potassium chlorate, acidified with nitric acid.

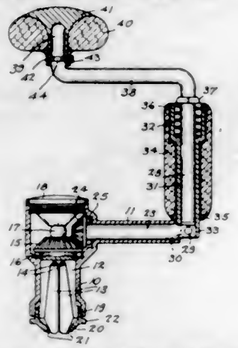
2,102,926
PIN AND BOLT HOLDER
Melvin T. Tipsord, St. Louis, Mo., assignor to James R. Kearney Corporation, St. Louis, Mo., a corporation of Missouri
Application September 16, 1935, Serial No. 40,730
2 Claims. (Cl. 81—13)



1. A bolt or pin holder comprising a pair of jaws having opposed seats between which a bolt or pin may be gripped, one of said jaws being fixed and being reduced forwardly of its rear end to a width corresponding substantially to the width of the other jaw, the other jaw being located in the same plane as the fixed jaw and being pivoted intermediate its ends to said fixed jaw, a single handle for the device which is secured to the fixed jaw, spring means that tends to move a portion of said movable jaw toward said fixed jaw, and yieldable means comprising a leaf spring for engaging a portion of a bolt or pin gripped between said jaws, said jaws being provided with curved forward edge portions so as to facilitate passage of a bolt or pin between said jaws.

2,102,927
TREATMENT OF HYDROCARBON GASES
Hans Tropsch, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application June 22, 1934, Serial No. 731,796
2 Claims. (Cl. 196—10)

1. A process which comprises stabilizing cracked gasoline distillate to separate gaseous olefins from the gasoline, contacting the thus separated gas with a polymerizing agent to produce gasoline-boiling hydrocarbons therefrom, separating the latter from residual gases, cracking the residual gases by heat treatment to produce polymerizable olefins therefrom, cooling the cracked products to separate the polymerizable olefins therefrom as liquid, and supplying said liquid to the aforesaid stabilizing step whereby it is revaporized therein and passed through the polymerizing operation together with the gaseous olefins separated from said distillate.



2,102,928
ILLUMINATING DEVICE
Harry D. Van Leunen, Wichita, Kans.
Application August 15, 1935, Serial No. 36,434
3 Claims. (Cl. 240—41.3)

1. In an illuminating device, means for producing a beam of parallel rays of light, a lens having prisms each converging a portion of the light to a focus with the foci lying in a vertical plane, and shield means comprising a pair of vertical, axially spaced apart, plates disposed one forwardly of the foci and the other rearwardly thereof, each plate having a series of horizontal slots with the upper edge of each slot in one

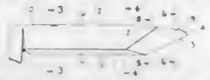


plate in a horizontal plane with the lower edge of its companion slot in the other plate; said slots being so arranged as to permit all the parallel rays refracted by the prisms to pass unobstructed thru the slots.

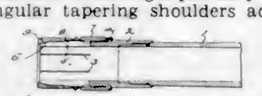
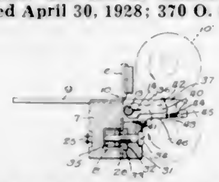
2,102,929
BRACE
James H. Wallace, Wenatchee, Wash.
Application August 7, 1936, Serial No. 94,780
7 Claims. (Cl. 145—69)

1. In a boring tool of the class described, a chuck housing; chuck means rotatable within said chuck housing; a shaft journaled in said chuck housing and extending at substantially right angles therefrom; a bearing tube for said shaft rigid with said chuck housing and forming a lever arm by which said chuck housing may be rotated when the tool is operated as an ordinary brace; driving means providing a driving connection between said shaft and said chuck; and a crank shaped handle pivotally connected with the outer end of said shaft adjustable into two positions at substantially right angles relative to each other for selectively providing rotation of said shaft or rotation of said chuck housing.



2,102,930
CUTLERY
Thomas E. Wharton, Fairfield, Conn., assignor to Remington Arms Company, Inc., a corporation of Delaware
Application April 8, 1936, Serial No. 73,209
3 Claims. (Cl. 30—353)

2. A blade comprising substantially parallel faces, a scraping edge in the plane of one of said faces formed by an edge defining face extending obliquely to said parallel faces, and a cutting edge formed by the grinding of said parallel faces in intersecting planes each of which intersects one of said faces in a line oblique to said scraping edge.



2,102,931
ADJUSTABLE GUN CHOKE
Ezekiel Field White, West Hartford, Conn.
Application December 20, 1935, Serial No. 55,395
7 Claims. (Cl. 42—79)

1. An adjustable choke for gun barrels which comprises a cylindrical shell adapted to be attached to a gun barrel and having its forward portion divided longitudinally into separate segments, said segments having a plurality of spaced tapering shoulders extending transversely across their outer faces, and a sleeve adjustably connected to and movable longitudinally of the axis of said shell, said sleeve having a plurality of spaced internal angular tapering shoulders adapted to

constantly engage said tapering shoulders on the segments for contracting said segments from parallel relation to the axis of the shell to angular relation to the axis of the shell and preventing the segments from flexing, under the impact of the charge as the gun is fired, when they are contracted from cylindrical relation.

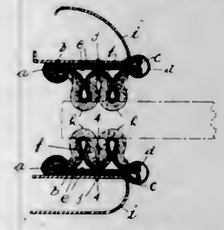
2,102,932
SENSING MECHANISM FOR TABULATING MACHINES
Lester F. Wilkinson, Garrett Park, Md.
Application July 15, 1937, Serial No. 153,733
4 Claims. (Cl. 235—61.11)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A record sensing mechanism of the character described, including a movable arm, a spring for moving said arm in one direction toward a record being sensed, a sensing finger rockably mounted on said arm, a spring relatively weak as compared to the arm-actuating spring, for holding the sensing finger in upright position to engage the record and prevent movement of said arm, and means moved by said arm when the sensing finger moves into a record perforation.

2,102,933
SPINNING LIQUOR FOR ARTIFICIAL SILKS
Samuro Yamamoto, Iriarai Machi, Ebara-gun, Tokyo-fu, Japan, assignor to Shozaburo, Hashino, Iriarai Machi, Ebara-gun, Tokyo-fu, Japan
No Drawing. Application May 4, 1932, Serial No. 609,332. In Japan May 14, 1931
4 Claims. (Cl. 134—1)

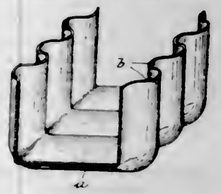
4. A spinning liquor for artificial silk comprising a solution of fibroin in an alkaline solution of a compound of at least one of the metals copper and nickel mixed with an alkylester of the class consisting of methyl acetate, amyl acetate, ethyl acetate and propyl acetate, the solution also containing an added organic compound comprising an alcohol of the class consisting of glycerine and glycol and tending to promote the viscosity of the solution.

2,102,934
FRINGED RUG
Clarence F. Arnold, Drexel Hill, Pa.
Application April 23, 1936, Serial No. 75,918
2 Claims. (Cl. 28—1)



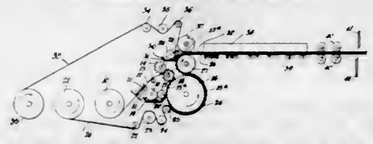
1. A rug comprising a main body portion formed from a braid wound about itself with the outer peripheral edge of the said body portion

defined by the outermost turn of the braid, a fringe consisting of a base cord having substantially the same diametrical dimension as the thickness of the braid making up the main body



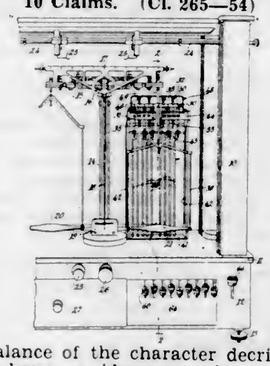
portion, and fringe strands knitted to the base cord, and means for attaching the base cord in abutting relation to the outermost turn of the braid.

2,102,935
WINDOW GLASS CHANNEL LINING
David C. Bailey, Amesbury, Mass.
Application January 21, 1937, Serial No. 121,471
9 Claims. (Cl. 296—44.5)



1. A window glass channel lining comprising a substantially flat, elongated strip of sheet metal forming a core, said core having a fabric cushioning strip on the face side thereof, secured at its edges to the opposite edge portions of the core and held at the middle thereof at the middle of the core, the portions of the strip between its middle and each edge extending outwardly from the core, in loop form, to provide a pair of longitudinally extending cushioning ribs arranged for engagement at their ends with one side of the window glass.

2,102,936
WINDOW GLASS GUIDE
David C. Bailey, Amesbury, Mass.
Application March 9, 1937, Serial No. 129,836
6 Claims. (Cl. 296—44.5)

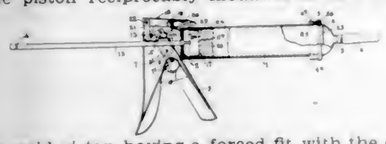


1. A bendable window glass guide comprising a channel shaped core of continuous flexible sheet metal having corrugations formed therein and extending transversely of the bottom and sides thereof and adapted for compression or expansion according to the stresses placed thereon when the channel is bent, and a cushion for the glass within said core.

2,102,937
PLYBOARD ADHESIVE
Jordan V. Bauer, Chicago, Ill., assignor to Stein, Hall Manufacturing Company, Chicago, Ill., a corporation of Delaware
Application July 26, 1935, Serial No. 33,206
5 Claims. (Cl. 134—23.4)

1. An adhesive composition of matter for corrugated paper board and other laminated paper products, comprising an aqueous suspension of a potentially adhesive inert ungelatinized amylaceous substance and a viscous gelatinized amylaceous carrier therefor, said ungelatinized material being present in the proportion of at least 15% of the total solids on a dry basis and said carrier being present in the proportion of not more than 85% of the total solids on a dry basis, and the proportion of aqueous medium with the ungelatinized material and carrier being not more than 2½ parts of medium to 1 part of total solid materials.

2,102,938
KEYBOARD BALANCE
Christopher A. Becker, Nutley, and William C. Seyter, Union City, N. J., assignors to The Torsion Balance Company, New York, N. Y., a corporation of New York
Application October 24, 1936, Serial No. 107,310
10 Claims. (Cl. 265—54)

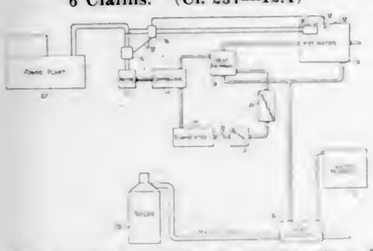


1. A balance of the character decribed, comprising a beam, a rider-supporting member depending from said beam, plungers vertically movable in the central plane of the rider-supporting member for depositing riders onto and removing them from the rider-supporting member, and means for independently moving the plungers.

2,102,939
CALKING GUN
Richard E. Bishop, South Orange, N. J., assignor to A. C. Horn & Company, Long Island City, N. Y., a corporation of New York
Application July 10, 1936, Serial No. 89,879
12 Claims. (Cl. 221—78)

1. In a calking gun for use with a tubular cartridge, the combination comprising a cylinder open at one end, means forming an annular shoulder adjacent the closed end of the cylinder against which the cartridge seats, said cartridge

being exposed at its end inwardly of said shoulder, means including a discharge cap detachably secured to the open end of the cylinder and engaging the other end of the cartridge, and a movable piston reciprocably mounted in the cylin-



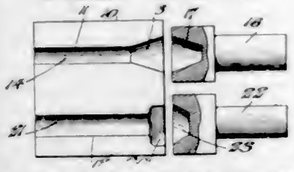
der, said piston having a forced fit with the cartridge whereby initial entry of the piston into the cartridge mutilates the exposed end of the cartridge preventing a second entry of the piston when the cap is removed so that the cartridge is ejected.

2,102,940

WATER HEATING SYSTEM

David L. Buchanan, White Marsh, Pa., assignor to Edward G. Budd Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania

Application May 1, 1936, Serial No. 77,304
6 Claims. (Cl. 237—12.4)



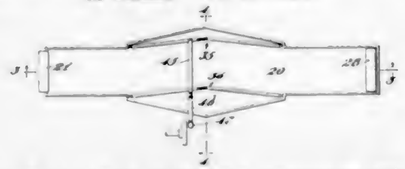
1. A domestic hot water heating system for a rail car having an electrically energized air conditioning equipment which comprises a heat exchange device in heat exchange relation with heated parts of the air conditioning equipment, means to pass water through said heat exchange device for heat transfer, an electrically energized immersion heater in heat exchange relation with the water supply, and electrical interlock means between the electrically energized immersion heater and the electrically operated air conditioning equipment, operated by the electrically energized air conditioning equipment limiting the operation of said immersion heater to periods when said air conditioning equipment is electrically deenergized.

2,102,941

METHOD OF FORMING BOLT HEADS

Harry Cadwallader, Jr., Philadelphia, Pa.

Application June 2, 1937, Serial No. 145,981
4 Claims. (Cl. 10—27)



1. The method of forming a bolt head which consists in upsetting the end of a heated rod to form a head blank of double frustum shape, reheating the shaped blank and gathering the flowing metal to form a substantially rectangular base part having a frustum shaped head blank, reheating the blank, and hammering the sides and end of said head blank to form a bolt head of predetermined shape.

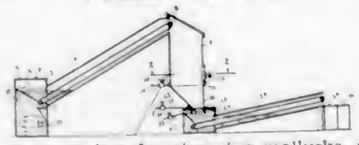
2,102,942

PROCESS AND APPARATUS FOR SHRINKING FABRICS

Sanford L. Cluett, Troy, N. Y., assignor to Cluett, Peabody & Co., Inc., Troy, N. Y., a corporation of New York

Application September 21, 1933, Serial No. 690,367
18 Claims. (Cl. 26—18.5)

1. A process of shrinking a continuous web of fabric comprising depositing the web in a massed formation in a current of liquid adapted to convey the deposited web without tension, and as the current carries the web along, agitating the traveling web in a rapid oscillating motion having reversals so abrupt as to impart violent blows thereto, to produce shrinkage thereof.



14. That method of shrinking woven fabric whose constituent yarns are substantially of vegetable origin, which comprises as steps accumulating a length of the fabric in the form of a loose mass in which the web is in a widthwise extended state and subjecting the mass while wet to rapidly repeated violent blows, first in one direction and then in the other, the blows being directed predominantly weftwise of the web, thereby to shrink the web.

2,102,943

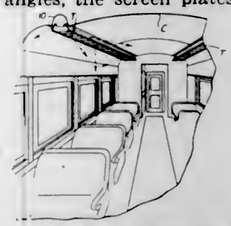
STEAM BOX

William H. Cook, Collier City, Fla., assignor to Fred Fear & Company, Brooklyn, N. Y., a corporation of New York

Application July 24, 1935, Serial No. 32,843
7 Claims. (Cl. 17—2)

1. A steam box for steaming mollusks, means for draining the juice of said mollusks from said box, an inlet through which said steam box may be filled, an outlet through which said steam box may be emptied, and a water seal for said inlet and outlet.

2,102,944



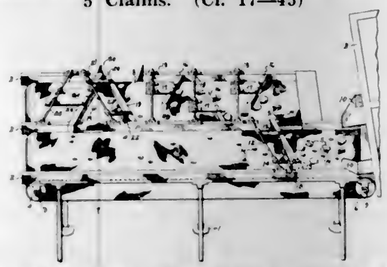
LIGHTING EQUIPMENT FOR PASSENGER VEHICLES

Leroy C. Doane, Meriden, Conn., assignor to The Miller Company, Meriden, Conn., a corporation of Connecticut

Application March 25, 1936, Serial No. 70,816
14 Claims. (Cl. 240—7.35)

1. A lighting unit for passenger vehicles comprising a light source, a longitudinally extending, inverted reflector within the ceiling of the vehicle

for reflecting light downwardly at controlled spread in transverse planes, and a screen below the reflector and light source and adapted to protrude below the vehicle ceiling, the screen comprising a plurality of vertically disposed, transversely extending, diffusing plates which screen the light source from direct observation at directions substantially angularly distant from the nadir, the inverted reflector having end portions which slope downwardly and outwardly for intercepting direct light and reflecting it downwardly at lowered angles, the screen plates condensing



the direct and reflected light in longitudinal planes without affecting its distribution in transverse planes and being substantially evenly illuminated by the scattered reflected light from the end portions of the reflector, said screen having longitudinally extending side reflector members connected with said screen plates and having their upper edges extending into said inverted reflector and spaced from the side edges for intercepting a small portion of the reflected light and redirecting it into high angles for ceiling illumination.

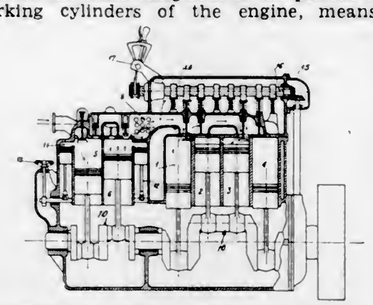
2,102,945

METHOD OF SHELLING MOLLUSKS

James H. Doxsee, Jr. and William H. Cook, Collier City, Fla., assignors to Fred Fear & Co., Brooklyn, N. Y., a corporation of New York

Application May 20, 1937, Serial No. 143,723
5 Claims. (Cl. 17—45)

1. The method of separating mollusks from their shells, which comprises steaming the mollusks to open the shells, moving them along a defined path into engagement with a barrier, and diverting the shells onto another path of travel while the meats continue along the original path of travel, whereby the shells are delivered to one point and the meats to another.



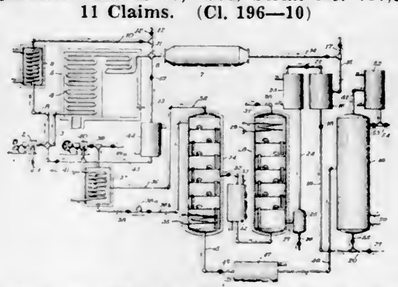
2,102,946

INTERNAL COMBUSTION ENGINE

Paul Dugelay, Paris, France, assignor to Societe d'Exploitation de Brevets pour l'Industrie, l'Aviation et l'Automobile (Sebia), Paris, France, a corporation of France

Application November 10, 1933, Serial No. 697,402
In France November 17, 1932
4 Claims. (Cl. 123—119)

1. In an internal combustion engine of the four stroke cycle type comprising an even plurality of working cylinders provided with pistons operating therein and inlet and exhaust valves and an intake manifold common to all the cylinders, in combination a piston compressor having a number of compression chambers equal to half the number of the working cylinders and an inlet and exhaust valve for each chamber, said compressor being arranged to deliver into said manifold, and the pistons thereof having connecting rods which are dephased with respect to the connecting rods of the pistons of the working cylinders of the engine, means for



transferring a part of the gaseous charge from one working cylinder to another in a cyclic order through the respective inlet valves of the cylinders and through the manifold during a substantial portion of an induction stroke of the piston of each of the respective working cylinders, in order to cause said compressor to deliver its charge into the intake manifold at regular delivering intervals, each of which commences during, and is partly simultaneous with, the period of transfer into a predetermined working cylinder and terminates after the termination of the said transfer period.

2,102,947

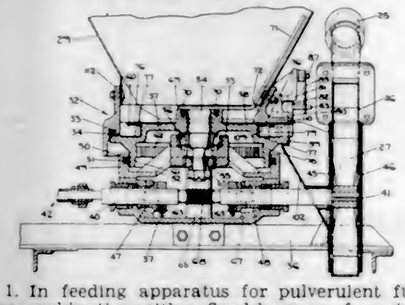
TREATMENT OF HYDROCARBONS

Gerald L. Eaton, Philadelphia, Pa., assignor, by mesne assignments, to The Polymerization Process Corporation, Jersey City, N. J., a corporation of Delaware

Application March 27, 1934, Serial No. 717,611
11 Claims. (Cl. 196—10)

1. The process of converting predominantly paraffinic normally gaseous hydrocarbons into polymers, which comprises heating said hydrocarbons under a high superatmospheric pressure to a temperature at which at least a portion of said hydrocarbons will decompose to form substantial quantities of unsaturates, cooling the heated products to a temperature to prevent further substantial decomposition and at which polymerization thereof takes place, introducing said cooled products without separation and while maintaining substantially the same pressure into

a reaction zone wherein polymerization is effected during the passage of substantially all of the cooled products therethrough, and removing the products of reaction from the zone last mentioned.



2,102,948

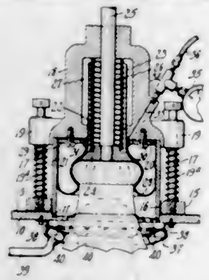
MECHANISM FOR SUPPLYING PULVERIZED FUEL TO FURNACES

Earle V. Francis, Columbus, Ohio, assignor to The Jeffrey Manufacturing Company, a corporation of Ohio

Original application January 18, 1933, Serial No. 652,347. Divided and this application May 24, 1934, Serial No. 727,270

12 Claims. (Cl. 221—125)

1. In feeding apparatus for pulverulent fuel, the combination with a fixed hopper, of a rotary disc plate forming the bottom of said hopper, an annular flange on said disc positioned below said hopper, means adjacent the bottom of said hopper cooperating with said disc and flange to provide an annular chamber into which fuel flows through an opening at one restricted position in the bottom of said hopper which extends over an arc of less than 90 degrees, a stationary deflector for guiding fuel from said plate to said opening, means providing a peripheral fuel discharge opening communicating with said annular chamber which is removed from said first mentioned opening by an arc of at least 90 degrees, and a deflector for guiding fuel from said annular chamber to said discharge opening.



2,102,949

METHOD OF MAKING AND APPLYING CAPS TO BOTTLES

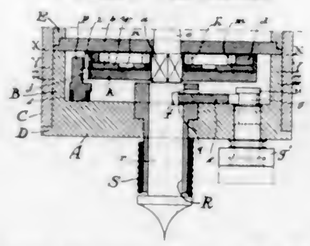
John R. Gammeter, Akron, Ohio, assignor of one-half to Susan G. Gammeter, Akron, Ohio

Application January 2, 1936, Serial No. 57,282

11 Claims. (Cl. 226—83)

1. The method of making and applying caps to milk bottles and the like which comprises forming a disc of contractible material such as a rubber hydrohalide film or the like, superimposing said disc over the open end of the bottle, maintaining said disc in engagement with the open end of the bottle and simultaneously directing heated air against the marginal portion only of said disc, pressing the heated marginal portion of said disc around the bead of the bottle to produce a crimped skirt portion having overlapping portions, and setting the skirt portion to conform to the bead and causing the overlapping portions to become adhesively interconnected to prevent accidental removal of said cap.

2,102,950



MECHANICAL TIME FUSE

Paul Girard, Lyon, France

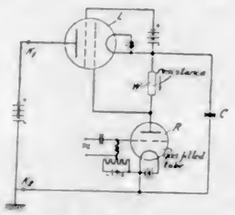
Application May 1, 1936, Serial No. 77,332

In France May 3, 1935

8 Claims. (Cl. 102—36)

1. A time fuse mechanism for projectiles including a spring-projected firing pin, means for retaining the firing pin from projection including a pivoted latch, a pair of independently rotatable discs, each having a notch in its periphery, clockwork actuated means operatively engaged with the two discs to rotate them in opposite directions and at relatively different speeds, the latch having a member adapted to enter the notches when they are in coincident register, the latch when its member enters the coincident notches releasing the firing pin and means urging said latch in a direction to cause the member to bear against the peripheries of the disks.

2,102,951



GENERATOR OF ELECTRIC RELAXATION OSCILLATIONS

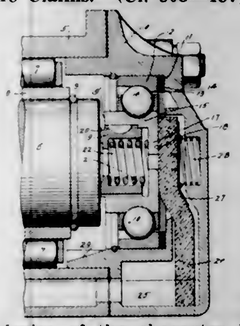
Edmund Hackenberg, Berlin-Charlottenburg, Germany, assignor to C. Lorenz Aktiengesellschaft, Berlin-Tempelhof, Germany, a company

Application July 8, 1936, Serial No. 89,649

In Germany July 11, 1935

3 Claims. (Cl. 250—36)

1. In a generator of electric relaxation oscillations, a condenser, a circuit for charging this condenser, a circuit for discharging it, and means to block up such charging circuit during the discharge of said condenser.



2,102,952

BEARING

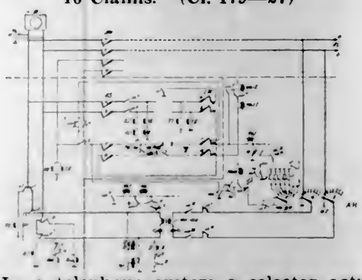
Charles Henry Hellyar, New Britain, Conn., assignor to The Fafnir Bearing Company, New Britain, Conn., a corporation of Connecticut

Application April 9, 1935, Serial No. 15,418

18 Claims. (Cl. 308—187)

1. In a device of the character indicated, a bearing box, a bearing for taking radial load, an axially movable shaft journaled therein, a separate unit handling thrust bearing comprising inner and outer concentric raceway rings with interposed anti-friction bearing members, the outer ring being supported by said box, and a member forming a sliding driving connection between the other of said raceway rings and said shaft, whereby said shaft will drive the inner ring of said thrust bearing in all axial positions of said shaft, means to supply oil to said inner ring to be slung by the latter to lubricate said bearing.

2,102,953



AUTOMATIC TELEPHONE SYSTEM

Alfred Heyduck, Berlin-Neuenhagen, Germany, assignor to Mix & Genest Aktiengesellschaft, Berlin-Schoneberg, Germany, a company

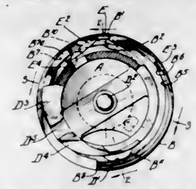
Application November 23, 1935, Serial No. 51,251

In Germany November 27, 1934

16 Claims. (Cl. 179—27)

1. In a telephone system a selector actuated by a magnet and adapted to connect a station of the system to busy lines, means at the said station for producing loop interruptions, an impulse receiving device responsive to said interruptions for causing the energization of the magnet of the selector and auxiliary means effective to continue the driving of said selector as long as said selector is connected to a non-busy line.

2,102,954



ROTARY LOOP TAKER

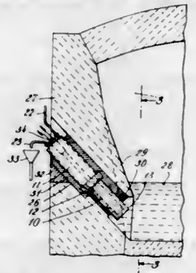
Richard K. Hohmann, Rosedale, N. Y.

Application March 2, 1937, Serial No. 128,572

7 Claims. (Cl. 112—228)

1. A new article of manufacture comprising a one piece metallic part adapted for attachment to the hook ring portion of a rotary hook sewing machine in bridging relation with the hook notch thereof, and comprising a body portion having an inclined front edge portion adjacent one end adapted to form one side of a thread loop receiving throat having its other side formed by the

hook portion of said hook ring and formed at its other end with a loop discharging spur adapted to deflect rearwardly the limb of a thread loop passing out of engagement with the rear edge of said hook in the final portion of a stitch forming operation.



2,102,955

TEMPERATURE MEASURING INSTALLATION

Philip M. Hulme, Chuquicamata, Chile, assignor to Chile Exploration Company, New York, N. Y., a corporation of New Jersey

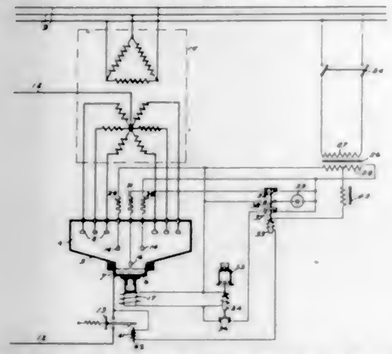
Application September 5, 1935, Serial No. 39,207

7 Claims. (Cl. 73—32)

1. A temperature measuring installation associated with a furnace for measuring the temperature of a bath of molten metal within the furnace comprisng a furnace wall having a passage extending downwardly therethrough opening into the furnace at a point below the surface of molten metal therein and opening to the exterior of the furnace above the plane of the surface of the molten metal, temperature measuring apparatus comprising a silicon carbide tube closed at its lower end mounted within the passage in such a manner that the closed end of the silicon carbide tube extends into the molten metal below the surface thereof, and cement packed between the walls of the passage and the temperature measuring apparatus above the closed end of the silicon carbide tube to hold the temperature measuring apparatus in place.

2,102,956

ELECTRIC VALVE STARTING SYSTEM



Max Hürlimann, Baden, Switzerland, assignor to Aktiengesellschaft Brown Boveri & Cie, Baden, Switzerland, a joint-stock company of Switzerland

Application July 3, 1936, Serial No. 88,719

6 Claims. (Cl. 175—363)

1. In combination, an electric valve comprising a casing enclosing a liquid cathode and an ignition anode, a solenoid having an armature adapt-

ed upon attraction thereof by said solenoid from a rest position to cause a jet of cathode material to be projected from said cathode to said ignition anode, a source of current connected with said solenoid, and a relay having a coil connected in parallel with said solenoid and having contacts

controlling therethrough the supply of current from said source to said solenoid and said relay coil whereby the supply of said current to said solenoid and relay coil is simultaneously interrupted and the said solenoid is caused to continually receive current impulses from said source.

2,102,957

ASPHALT SOLUTION

Felix Kaufler and Hilger Peter Schmitz, Munich, Germany, assignors to Dr. Alexander Wacker Gesellschaft für Electrochemische Industrie, G. m. b. H., Munich, Germany, a corporation of Germany

No Drawing. Application November 22, 1933, Serial No. 699,134. In Germany December 9, 1932

2 Claims. (Cl. 134—1)

2. A complete and stable asphalt solution comprising an asphalt of the class consisting of Gilsonite and Syrian asphalt and a solvent, said solution having a consistency suitable for a coating composition, said solvent comprising at least 90% of a paraffin hydrocarbon boiling between 50° C. and 200° C. and, for increasing the solvent action of the paraffin hydrocarbon on the asphalt, less than 10% of an organic compound having a hydroxyl or ketone group of the class consisting of diacetone-alcohol, butylenglycol-β-ethylether, butyl alcohol, glycolic acid butylester, lactic acid ethylester, ethyl-propyl-ketone, acetone, acetophenone and cyclohexanone.

2,102,958

INFANT'S BATHING DEVICE

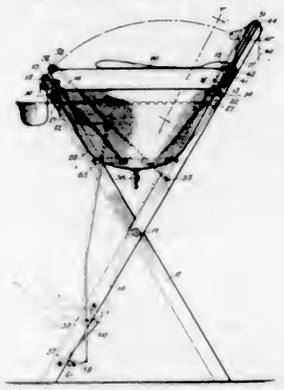
Benjamin H. Kennedy, Rochester, N. Y.

Application March 27, 1937, Serial No. 133,303

6 Claims. (Cl. 4—177)

1. In an infant's bathtub and associated dressing table and support therefor, a pair of arms pivotally connected at their upper ends to opposite ends of the dressing table and pivotally connected at their lower ends to opposite ends of the support, springs secured to opposite ends of the support and operatively connected to said arms for automatically swinging the arms towards the rear of the support and the dressing table from an active position upon the support in overlying relation with the tub to an inactive position at the rear thereof, and a foot actuated means operatively connected to opposite ends of said table and adapted when depressed to swing the table on said arms from the inactive

position at the rear of the tub to the active position upon the support in overlying relation to the tub against the tension of the said springs.



2,102,959

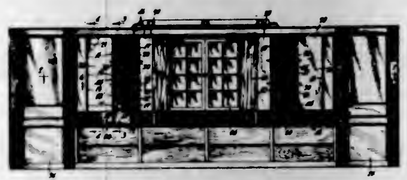
INFANT'S BATHTUB AND FOOT ACTUATED DRESSING TABLE THEREFOR

Dewey M. Kennedy, Rochester, N. Y.

Application October 8, 1936, Serial No. 104,624

4 Claims. (Cl. 4—177)

1. In an infant's bathtub and associated support therefor, a sheet of flexible material anchored along one edge to the support adjacent to and above the rear of the tub, a rod extending longitudinally of and attached to the forward free edge of said sheets, a pair of levers fulcrumed at their lower ends to the support and connected at their upper ends to the opposite ends of said rod, a yoke pivotally connected at its upper ends to the levers respectively intermediate the ends thereof, said yoke being adapted when depressed to swing the levers forwardly to thereby move the sheet from an inactive position at the rear of the tub to a stretched position overlying the tub and adapted when raised to swing the levers rearwardly to thereby move the sheet from a stretched position overlying the tub to an inactive position adjacent the rear thereof, and means on the opposite sides of the support cooperatively engaging with the yoke for guiding the same when it is depressed and for locking the yoke in depressed position and the sheet in stretched condition.



2,102,960

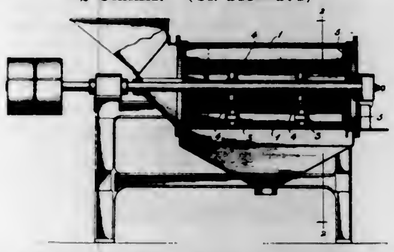
STORE DISPLAY

Claude W. Kress, New York, N. Y.

Application July 1, 1935, Serial No. 29,197

7 Claims. (Cl. 20—404)

3. A wall fixture for decorative display of merchandise comprising a frame, mirror panels carried thereby against movement and extending in substantially a common plane, parallel rigid bars between successive panels and concealing the space between said latter panels, each of said bars being provided with a series of spaced conformations so formed as to receive brackets for supporting shelves in selective position along said bars, a decorative opaque panel covering at least a portion of one of said mirror panels, and means connecting said opaque panel and one of said bars for releasably locking said opaque panel in position.



2,102,961

PULPING MACHINE

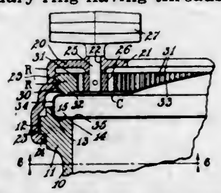
Harold R. Lewis, Baltimore, Md., assignor to Food Machinery Corporation, San Jose, Calif., a corporation of Delaware

Application September 22, 1934, Serial No. 745,115

2 Claims. (Cl. 146—174)

1. An apparatus for treating fruit and vegetable mass materials to extract juice and the like therefrom comprising a screened drum member, a rotary member located within said drum member, means for rotating said rotary member, beater blades secured to said rotary member, arcuate faces on said beater blades adapted to move adjacent said drum member, the discharge ends of said beater blades being in staggered relation, and being adjustable radially and angularly relative to said drum.

2,102,962



PRESSURE COOKER

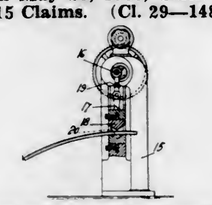
Lawrence L. Ludington, Muncie, Ind., assignor to Ball Brothers Company, Muncie, Ind., a corporation of Indiana

Application November 3, 1934, Serial No. 751,271

3 Claims. (Cl. 220—61)

2. The combination with a container having a cover seat at its open end and anchor lugs, a cover mating with said seat, and a removable cover retainer comprising, (1) a primary ring having anchor lugs mateable with the anchor lugs of the container, and a threaded portion, and (2) a secondary ring having threads mating with

the aforesaid threads and a portion restable upon the cover.



2,102,963

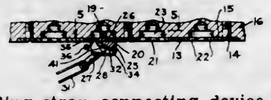
MANUFACTURE OF ARMOR PLATES

George Lee Miller, Canton, Ohio

Application May 28, 1936, Serial No. 82,295

15 Claims. (Cl. 29—148)

1. In the manufacture of armor plate, the steps of carburizing one surface of a steel plate to form a penetration-resistant case and relatively soft core, annealing the plate, reheating the plate, partially quenching the plate and while the plate retains a substantial part of the heat, distributing the stresses uniformly throughout the plate so that when the same is cooled it assumes a substantially uniform concavo-convex surface with the case on the convex side thereof, and straightening the plate by compressing the case and stretching the core.



2,102,964

SLING STRAP CONNECTING DEVICE

Oscar F. Mossberg, New Haven, Conn., assignor to O. F. Mossberg and Sons, Inc., New Haven, Conn., a corporation of Connecticut

Application September 3, 1936, Serial No. 99,251

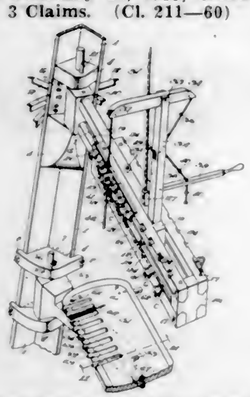
10 Claims. (Cl. 42—85)

1. In a sling strap connecting device, a sling strap swivel having a body portion, a strap supporting bail having its ends spaced apart in opposed relation within said body portion, said body portion having a tongue adapted to enter an opening in a gun part, and common means extending across the body portion between the spaced apart bail ends to releasably retain said tongue in the opening in the gun part and to prevent transverse movement of said bail relatively to said body portion.

2,102,965

MANUFACTURE OF UNSATURATED ALDEHYDES

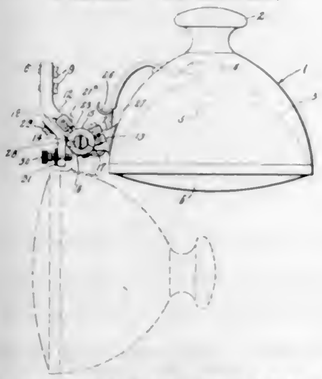
Walter Christian Meuly, New Brunswick, N. J., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware



No Drawing. Application April 20, 1936, Serial No. 75,415

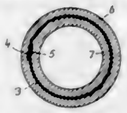
14 Claims. (Cl. 260—136)

1. The process of producing an unsaturated al-



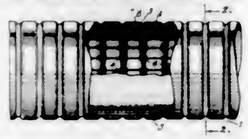
dehyde, which comprises reacting an aldehyde bisulfite having a CH_2 group next to the aldehyde radical with an aromatic aldehyde in a liquid medium and in the presence of an alkaline condensing agent.

2,102,966
COMBINATION ROD HANGER AND TUBING RACK
Paul H. Nash, Pampa, Tex., assignor of one-third to G. M. Walters, Pampa, Tex.
Application February 12, 1935, Serial No. 6,194
3 Claims. (Cl. 211—60)



1. A rod hanger including in combination with a derrick, an extensible member suspended for pivotal displacement, having rod receiving and retaining means removably mounted thereon, said extensible member comprising parallel arms swingably mounted to a leg of said derrick and whose confronting surfaces are interposed by a grooved roller engaging said surfaces, a pair of side members in which the axis of said roller is journaled and capable of longitudinal sliding movement on said parallel arms, said members each having spaced recesses for reception of said rod receiving and retaining means.

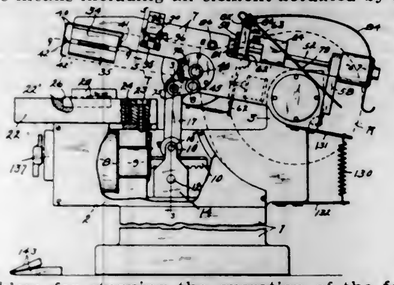
2,102,967
CONCEALABLE SPOT LAMP
Thomas W. Neel and Jay D. Blocker, Ventura, Calif.
Application June 2, 1936, Serial No. 83,084
5 Claims. (Cl. 177—329)



4. In a concealable spot lamp, a spot lamp including a casing and an electric lamp contained therein, bracket means mounting said casing upon the interior of a vehicle for movement from a concealed position to an active position at which the lamp may project its light exteriorly of the vehicle, said bracket means including a hinge, an electric circuit for said lamp, switch means actuated by movement of said hinge when said lamp is moved to active position for closing the circuit for said lamp, and adjustable stop means for limiting the movement of said lamp toward its active position.

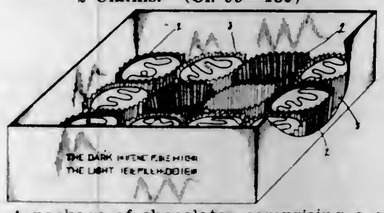
2,102,968
PROCESS FOR THE MANUFACTURE OF CONCRETE PIPES
Marius Overvad, Aarhus, Denmark
Application November 9, 1935, Serial No. 48,976
In Denmark December 28, 1934
5 Claims. (Cl. 25—154)

1. A process for manufacturing concrete pipe or the like by centrifugal casting comprising the steps of casting an outer layer in a rotary mold, inserting a metal cylinder within said outer layer, said metal cylinder being split longitudinally in at least one place, spinning the mold to expand the split metal core and compact the concrete, and casting an inner layer within said metal cylinder.



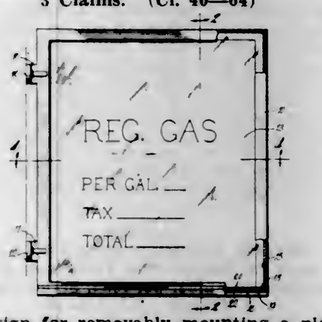
2,102,969
PIPE AND METHOD OF MAKING THE SAME
Cuyler S. Patton, Scarsdale, N. Y., assignor to Alco Products Incorporated, New York, N. Y., a corporation of Delaware
Application November 2, 1934, Serial No. 751,164
9 Claims. (Cl. 138—66)

1. A pipe comprising in combination an outer shell having projections on its inner surface, a lining engaging said inner surface and a plurality of reinforcing members disposed in said lining and connected to said projections.



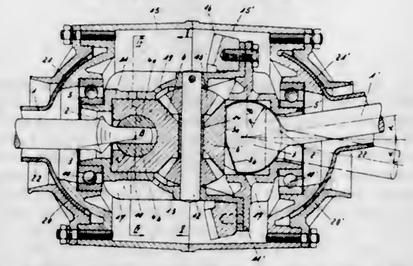
2,102,970
MACHINE FOR APPLYING TRANSFERS
Juel L. Peterson, Seneca Falls, N. Y., assignor to Caleb Smith, Seneca Falls, N. Y.
Application February 28, 1935, Serial No. 8,703
16 Claims. (Cl. 41—1)

5. In a device for applying transfers to articles of manufacture, a base, a platen mounted on the base, a carrier member mounted on the base, a heating element mounted on the carrier member, operating means for moving the carrier member toward and from the platen to bring the heating element into and out of cooperative relation with articles on said platen, feed means mounted on the carrier member for successively bringing transfer emblems into predetermined registration with the heating element, means controlled by the operating means and during said movement of the carrier member for starting the operation of the feed means, and separate means including an element actuated by the



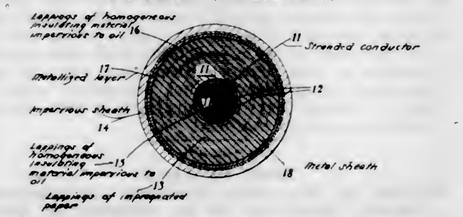
emblem for stopping the operation of the feed means at a predetermined position of the transfer emblem.

2,102,971
PACKAGING CANDY
Gordon A. Petremont, Boston, Mass., assignor to The Gobelin Company, Inc., Cambridge, Mass., a corporation of Massachusetts
Application March 20, 1935, Serial No. 11,995
2 Claims. (Cl. 99—180)



1. A package of chocolates comprising a container containing chocolates with different centers, individual cups in contact with each other holding said chocolates, said cups being of different colors and holding different centered chocolates which centers are identified by the color of the cup, and means associated with said container for indicating the relation of the colors of said cups to the nature of the centers of said chocolates held thereby.

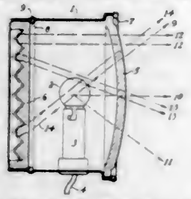
2,102,972
SIGN
Benjamin Phillips, Cincinnati, Ohio, assignor to The Phillips Pump & Tank Company, a corporation of Ohio
Application March 2, 1936, Serial No. 66,549
3 Claims. (Cl. 40—64)



1. A sign for removably mounting a placard, said sign including an internally grooved frame, said frame having a slotted side, a pair of glass panels insertable through said slotted side, packing or spaced strips interposed between said glass panels around the margins thereof, said assembled glass panels marginally supported within the groove of the frame, a slotted retaining strip inserted longitudinally of the slotted side of the frame for holding the glass panels in position but permitting insertion of the placard through the slot thereof, and a removable strip insertable adjacent said last mentioned strip over said slot therein for holding a placard in position against removal from between said glass panels.

2,102,973
UNIVERSAL JOINT
Ferdinand Porsche, Stuttgart, Germany
Application April 3, 1936, Serial No. 72,473
In Germany November 2, 1934
9 Claims. (Cl. 74—311)

1. A universal joint comprising a rotatable member formed with an extension having flat parallel surfaces parallel to the axis of rotation of said member, a second member formed with flat parallel surfaces engaging the flat parallel surfaces of said first member and formed with a cylindrical surface the axis of which is parallel to said flat surfaces, and a third member formed with a transverse bore for embracing the cylindrical surface of said second member, and means on said rotatable member including means cooperating with said third member for preventing axial movement of said rotatable member.

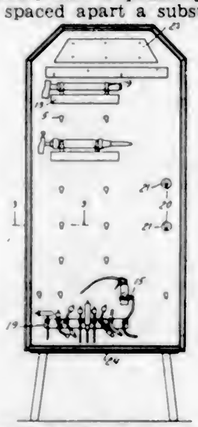


2,102,974
ELECTRIC CABLE
Denis Morrell Robinson, London, England, assignor to Callender's Cable and Construction Company Limited, London, England, a British company
Application June 12, 1935, Serial No. 26,135
In Great Britain June 22, 1934
2 Claims. (Cl. 173—266)

1. An impregnated paper insulated cable comprising a conductor having a smooth surface of non-reentrant configuration, a comparatively thin continuous covering of homogeneous insulating material impervious to oil and com-

pound, surrounding said conductor and in contact therewith, said covering comprising at least one lapping of strip, the thickness of which strip is not greater than two mils, an impregnated body of paper insulation surrounding said covering, and an impervious sheath enclosing the said body of paper insulation.

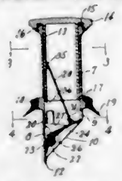
2,102,975
VISIBLE SIGNAL
Thomas W. Rolph, Newark, Ohio, assignor to Holophane Company, Inc., New York, N. Y., a corporation of Delaware
Application October 31, 1934, Serial No. 750,909
5 Claims. (Cl. 240—8.3)



1. A device adapted to produce a visible signal from either a self-contained light source or from the substantially parallel light rays from a remote extraneous light source, comprising a light-transmitting cover, a transparent universal direction-reversing reflector having a multiplicity of small prisms disposed in its rear face, the reflector being disposed behind the cover to receive substantially all the extraneous light transmitted through the cover and return it toward the cover for retransmission thereby in a beam directed toward the extraneous source, and a light source between the cover and reflector, the same areas of the surfaces of the cover being effective for simultaneously transmitting light originating in both sources, the cover member being in the form of a light concentrating lens whose focal point coincides with the enclosed light source, the lens prisms diverting the incident and reflected rays from the extraneous source equally so that the emitted reflected ray is parallel with the incident ray, the small prisms being sufficiently large for transmitting the reflected beam without substantial scattering.

2,102,976
METHOD OF MAKING REFRACTORY BRICKS
Gilbert E. Seil, Cynwyd, Pa., assignor to E. J. Lavino and Company, Philadelphia, Pa., a corporation of Delaware
No Drawing. Application September 11, 1936, Serial No. 100,384
4 Claims. (Cl. 25—156)

1. The process of making a refractory material, which comprises heating to a temperature in excess of 3100° F. a mixture of at least one aluminum silicate mineral with another alumina bearing material whereby in the resulting mixture the ratio of Al_2O_3 to SiO_2 is such that after exposure to said temperature there remains a conversion stabilized product consisting essentially of mullite crystals substantially free from weaker refractory material.

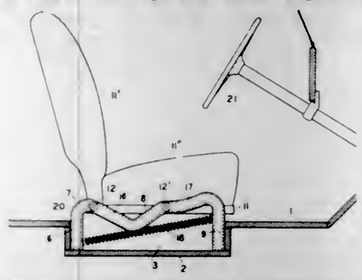


2,102,977
DISPLAY RACK
William E. Shoemaker, Freeport, and Gerthal French, Manhasset, N. Y., assignors to Sinclair Refining Company, New York, N. Y., a corporation of Maine
Application December 14, 1933, Serial No. 702,300
4 Claims. (Cl. 248—223)

2. In combination in apparatus of the class described, a rigid backing sheet having a plurality of apertures spaced apart a substantial distance and disposed in the central portion thereof, and an integral instrument-carrying means, said instrument-carrying means having on one face a plurality of spring retaining arms spaced apart a substantial distance and adapted to support and yieldingly hold an instrument and on the opposite face a plurality of supporting projections spaced apart a substantial distance

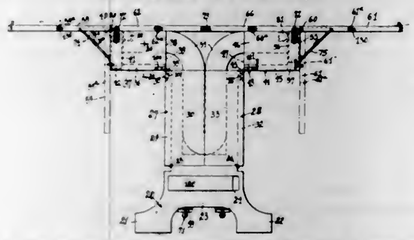
to register with said apertures, said supporting projections being proportioned to permit insertion through said apertures and to exert a pressure against the rear surface of said backing sheet upon movement downwardly parallel to the surface of said backing sheet, whereby said instrument-carrying means and an instrument yieldingly held in the spring retaining arms thereof are removably supported as a unit by said backing sheet.

2,102,978
DISPENSER
Henry G. Slining, Huntington Park, Calif.
Application June 19, 1936, Serial No. 86,132
10 Claims. (Cl. 221—23)



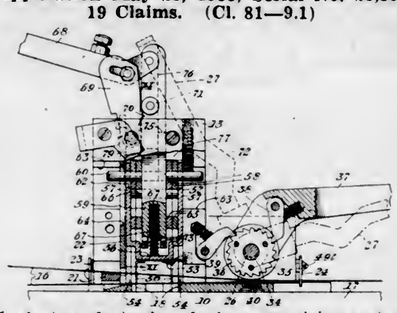
1. In a dispensing device, a hollow member carrying a blade adapted to cut an opening in a can, the hollow member being arranged to receive contents from the can through the opening cut by the blade, a removable cap for closing the hollow member, and a valve adapted to close the hollow member, the hollow member being closed at all times except for an opening into the can and except for an opening closed by the cap, and the valve and cap being spaced apart to trap a measured quantity of the contents of the can.

2,102,979
MOTOR VEHICLE SAFETY SEAT
Harry M. Smith, San Francisco, Calif.
Application November 26, 1934, Serial No. 754,766
2 Claims. (Cl. 155—9)



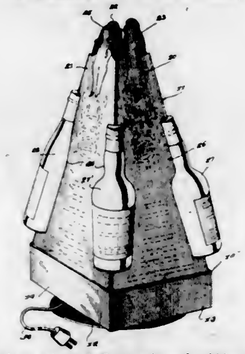
1. In a motor vehicle having a steering wheel; a pair of fixed longitudinal guides shaped to form

alined relatively steep, forwardly disposed declines at the rear thereof and substantially horizontal portions at the front thereof; a seat between said guides having means at the rear thereof engaging the declines in said guides and means at the front thereof engaging the substantially horizontal portions of said guides; re-



silient means urging said seat backward; and a stop limiting the backward movement of said seat, said seat being adapted to be displaced forwardly against the tension of said spring by the force of momentum and tipped by said guides with its rearward portion lowered with respect to said steering wheel.

2,102,980
COMBINATION BED, TABLE, AND SOFA
Ben Spanglet, Brooklyn, N. Y.
Application February 12, 1937, Serial No. 125,405
8 Claims. (Cl. 5—3)



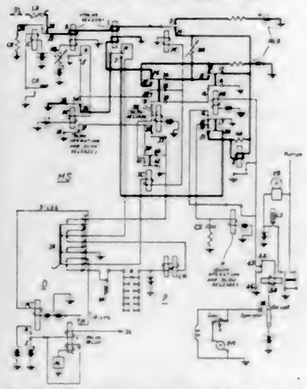
1. In a combination furniture, having a central stationary base, a plurality of springs to form parts of a spring base for a bed on said stationary base, a right hand and a left hand intermediate member, each having a base board and two side boards to form a trough like usual bed frame portion hinged at the right hand, and left hand, sides respectively of said stationary base, a plurality of springs in each intermediate section to form further parts of a spring base for a bed; a right hand and a left hand outer member of similar construction to said intermediate members and hinged to the respective right hand and left hand outer ends of said intermediate members, a right hand and left hand leg board hingedly secured to the right hand and left hand outer upper edges of the respective outer members releasable means to secure said legs in a vertical position on said outer members when desired and releasable means associated with said hinges between said members to lock said members in desired relative angular positions to one another, said members being adapted to be placed into horizontal alignment with the base to form a bed, the intermediate members adapted to be swung into vertical positions, means to hold said intermediate members in such vertical positions, the outer members adapted to extend and be held in horizontally alined positions projecting outwardly from the upper ends of the intermediate members, whereby a table support is formed, one intermediate member adapted to be swung down to horizontal position to form a seat with its associated outer member engaging the floor to form a leg for the seat.

2,102,981
STRAP TENSIONING AND SEALING DEVICE
Herman J. Spencer, West View, Pa., assignor, by mesne assignments, to Leechgrip Company, O'Hara Township, Pa., a corporation of Pennsylvania
Application May 28, 1935, Serial No. 23,895
19 Claims. (Cl. 81—9.1)

1. A strap fastening device comprising a standard, a plunger reciprocable therein, means for feeding a fastening-clip below the plunger, a strap tightening disc, and means for actuating the disc into engagement with a strap disposed beneath the plunger, said feeding means being operated by said actuating means.

2,102,982
ILLUMINATED ROTATABLE DISPLAY STAND
Fred C. Taylor, Hammondsport, N. Y., assignor to The Taylor Wine Company, Hammondsport, N. Y., a partnership, consisting of Fred C. Taylor, Greyton H. Taylor, Clarence W. Taylor, Flora Taylor Keeler, and Lucy Taylor Zimmer
Application January 12, 1937, Serial No. 120,279
6 Claims. (Cl. 211—1.6)

6. A display stand for wine bottles comprising a base, and a plurality of opaque, sheet material side walls supported on and confined by said base and joined together along their edges in substantially the form of a regular, four-sided pyramid, said sheet material being cut away adjacent the edges of the pyramid to provide apertures, one along each inclined edge of the pyramid, each of said apertures being shaped to



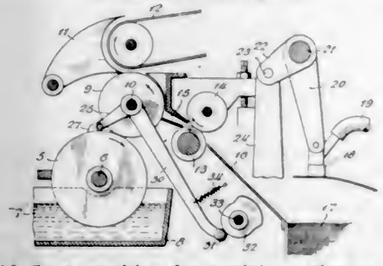
fit snugly the surfaces of a bottle to support the bottles on the edges of the pyramid in rearwardly inclined positions with a major portion of the surface of each bottle exposed exteriorly of the pyramid and a minor portion thereof concealed within the opaque side walls, certain of said apertures being shaped differently from other apertures, whereby differently shaped bottles, adapted to contain different kinds of wine, may be supported on different edges of the pyramid.

2,102,983

TELEGRAPH SYSTEM

Gilbert S. Vernam, Hackensack, N. J., and Frederick G. Hallden, Bellerose, N. Y., assignors to Postal Telegraph-Cable Company (New York), New York, N. Y., a corporation of New York

Application March 22, 1935, Serial No. 12,364
20 Claims. (Cl. 178—2)



1. A telegraph system comprising a main station and a way station connected by a line circuit, a transmitter and a receiver at each station, a source of current supply at the main station normally connected to the line during all idle periods, a source of current supply at the way station, means responsive to an initial operation of the transmitter at the way station for disconnecting the current supply at the main station and for connecting the current supply at the way station to said line.

2,102,984

MACHINE FOR APPLYING ADHESIVE

George W. von Hofe, Bound Brook, N. J., assignor to New Jersey Machine Corporation, Hoboken, N. J., a corporation of New Jersey

Application September 14, 1934, Serial No. 743,929
17 Claims. (Cl. 91—50)

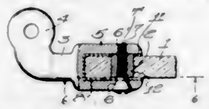
16. In a machine for applying adhesive to a sheet or web, a roller for applying the adhesive directly to said sheet, a roller for supplying adhesive to said applying roller, and means operative against said applying roller for cutting off a portion of the supply of adhesive from said supplying roller to said applying roller.

2,102,985

APPARATUS FOR LOOSENING THE SCALP

Josef Wadel, Hamburg, Germany

Application December 7, 1934, Serial No. 756,433
In Germany December 23, 1933
2 Claims. (Cl. 128—59)



1. Apparatus for promoting the growth of hair comprising an elastic cranial band adapted to be adjusted about the head at the forehead of the wearer, a pair of levers hingedly connected at one end and adapted to straddle the head of the wearer, co-operatively adjustable tensioning bands adapted to pass over the head of the wearer connecting said elastic band at the lateral portion of the head with the free ends of said levers, and means connected with the hinged ends of said levers for manually actuating the same, whereby said elastic band may be reciprocated in an upward direction and whereby the layers covering the peripheral portions of the cranium are stretched to loosen the scalp and to permit the flow of blood through the tissues.

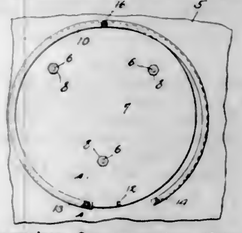
2,102,986

EYEGLASS

Tillet H. Wynne, Sr., Griffin, Ga.

Application August 31, 1936, Serial No. 98,792
1 Claim. (Cl. 88—47)

In combination with an eyeglass lens having an opening near the edge thereof, a connection having a clip provided with an opening in line with said lens opening, a lining of fusible material between the lens and clip and having an ear formed with a tube adapted to fit said opening of the lens, and a fastening screw passing through the clip and lining, and tube and formed with screw threads extending the entire length of the screw and with grooves arranged perpendicular to and cutting through said screw threads and extending the entire length of said screw.



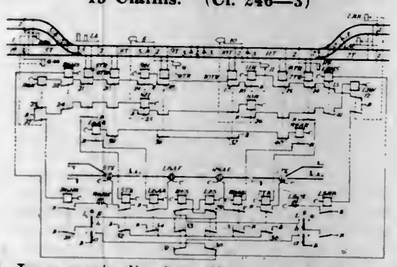
2,102,987

AUTOMOBILE REAR ADVERTISING CARRIER

Harry Armour Acy, Louisville, Ky.

Application July 6, 1937, Serial No. 152,039
4 Claims. (Cl. 40—129)

3. A carrier of the class described comprising a body portion, means for securing the body portion to a supporting surface, said body portion having openings near the lower edge thereof, a split ring member embodying spaced flanges adapted to house the periphery of the body portion, means at one end of the split ring member for removably securing the split ring member to the body portion, means at the opposite end of



the ring member for securing this end of the ring member to the body portion, said means including bolts fitted in the openings, and yieldable means on the bolts adapted to engage an advertising card positioned on the body portion, securely holding the card in position on the body portion.

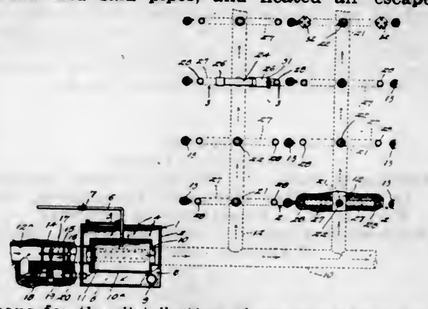
2,102,988

RAILWAY TRAFFIC CONTROLLING APPARATUS

Earl M. Allen, Swissvale, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania

Application August 15, 1936, Serial No. 96,227
15 Claims. (Cl. 246—3)

1. In a centralized traffic control system for railroads, a stretch of railway track, a signal at each end of the stretch for governing the movement of traffic into the stretch, a manually controllable signal control relay for each signal, direction selecting means for governing said signal control relays, means responsive to the operation of either signal control relay when the stretch is unoccupied for actuating said direction selecting means, means rendered effective when said direction selecting means is actuated by the signal control relay at one end of the stretch to prevent the operation of the signal control relay at the other end of the stretch, and means preventing a change in the operated condition of said direction selecting means when any portion of the stretch is occupied.



2,102,989

ORCHARD HEATING SYSTEM

Theodore W. Bose, Santa Ana, Calif.

Application June 5, 1937, Serial No. 146,683
5 Claims. (Cl. 47—2)

1. In a heat distributing system of the character described, a heating furnace including a casing and a heating unit therein, air conducting means passing through said casing over said heating unit, distributing pipes connected with said means, said means and distributing pipes being beneath the ground surface, means for forcing circulation of air through the conducting means and said pipes, and heated air escape

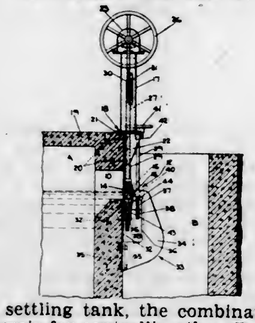
means for the distributing pipes comprising upwardly directed nipples and substantially T-shaped pipe units each coupled with a nipple and adapted to discharge heated air laterally over the surface of the ground.

2,102,990

MATERIAL TREATING APPARATUS

Robert E. Briggs, Columbus, Ohio, assignor to The Jeffrey Manufacturing Company, a corporation of Ohio

Application December 8, 1933, Serial No. 701,550
15 Claims. (Cl. 210—3)

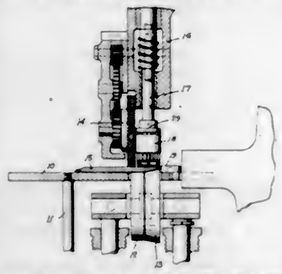


1. Apparatus for treating sewage and for separating solids from liquids comprising the combination with a stationary sedimentation tank, of a conveyor chain adapted to move through the tank, flights on the conveyor chain adapted to move settled solids laterally to and fro in the liquid from which they were settled to agitate the solids and to wash out therefrom entrapped flotant substances, and buckets on the conveyor chain adapted to remove the settled solids from the tank.

2,102,991

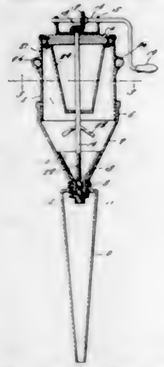
SEWAGE DISPOSAL APPARATUS

Robert E. Briggs, Columbus, Ohio, assignor to The Jeffrey Manufacturing Company, a corporation of Ohio



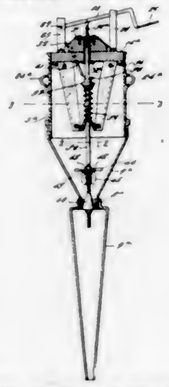
Application July 31, 1935, Serial No. 33,981
10 Claims. (Cl. 210—3)

1. In a settling tank, the combination with a duct, of a weir for controlling the effective size of



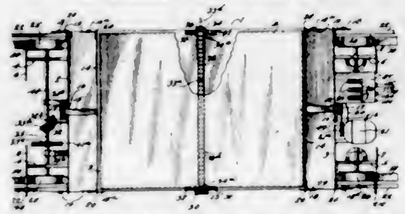
said duct, said weir comprising a member adapted to move over said duct, means comprising a pair of spaced vertical shafts for raising and lowering said member, means for operating said shafts in unison, and means for clamping said member in an adjusted position, said last mentioned means comprising a plurality of spaced vertical shafts and clamping blocks operated thereby adapted to effect a wedging action on said member.

2,102,992
ROUGHING HEAD
William C. Card, Jr., Winthrop, Mass., assignor to Compo Shoe Machinery Corporation, New York, N. Y., a corporation of Delaware
Application January 4, 1934, Serial No. 705,181
9 Claims. (Cl. 69—1)



1. In combination, a rotatable head having a bore therein to receive a roughing needle, and a guard plate secured to said head, said plate being formed with a notch in line with said bore and snugly accommodating said needle.

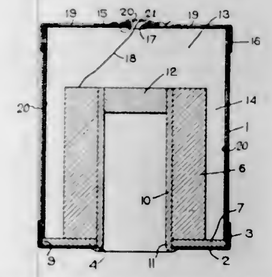
2,102,993
SODA-SPREADING MACHINE
André E. Claudel, St. Bernard, La.
Application January 22, 1936, Serial No. 60,293
2 Claims. (Cl. 221—119)



1. A fertilizer distributor comprising a container of sectional construction, said container consisting of a shell section and a conical-shaped bottom section, said bottom section having a cylindrical extension for snugly receiving one end of the shell, a closure at the opposite end of the shell, a shaft journaled through the closure and provided with manually controlled operating means at its outer end and means on the shaft at the inside of the container for mixing and treating material from the container through the conical-shaped bottom thereof, a cup-shaped structure in the lower portion of the conical-shaped section, said cup-shaped structure having a bushing-like extension, said conical-shaped section having an opening at its apex for receiving the bushing-like extension and means at the outer end of the bushing-like extension for preventing inward movement of the cup-shaped structure with respect to the bottom section.

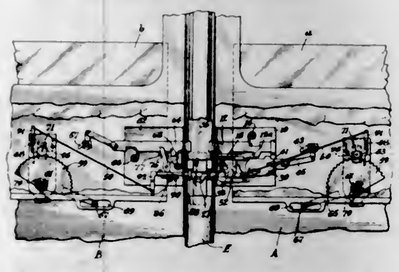
2,102,994
SODA-SPREADING MACHINE
André E. Claudel, St. Bernard, La.
Original application January 22, 1936, Serial No. 60,293. Divided and this application April 19, 1937, Serial No. 137,882
2 Claims. (Cl. 221—119)

1. A dispenser of the character described comprising a hopper provided with a tapering bottom, a vertically movable shaft in the hopper and extending through the bottom thereof, means at the upper end of the hopper for operating the said shaft, the lower portion of the shaft being provided with threads, a valve element feedable on the threaded portion of the shaft, a nut for holding the valve element against self adjusting, an agitator disposed on the threaded portion of the shaft, and a jam nut on the threaded portion of the shaft at each side of the said agitating member to prevent self adjusting of the agitating member.



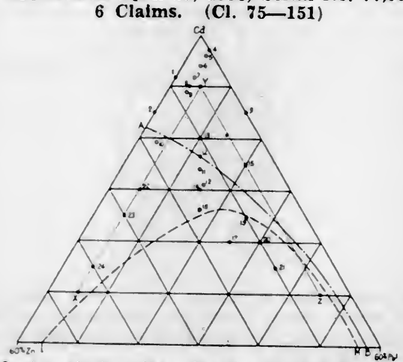
2,102,995
ARTICLE FILING AND DELIVERY SYSTEM
James W. Coombs, Whitehall, Mich.
Application October 22, 1935, Serial No. 46,154
45 Claims. (Cl. 214—16.1)

1. In a file system of the class described, a storage compartment for files, a carrier device, means on said carrier device operable to extract the file from said compartment, and means for propelling the carrier to said compartment including manually settable preselector means on the carrier for effecting a stoppage of the carrier



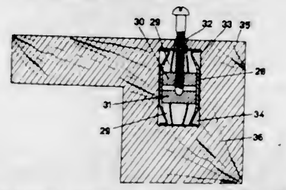
at a predetermined compartment and transfer of the propelling effort to the file extracting means at said predetermined compartment.

2,102,996
THREAD PACKAGE
Joseph Cryan, Newtonville, Mass.
Application June 10, 1936, Serial No. 84,453
8 Claims. (Cl. 242—146)



1. As an article of manufacture a thread package comprising a tube of thread wound upon a single-head spool having a tubular core and a head permanently secured thereto of substantially greater diameter than said tube of thread, a cylindrical container of fibrous material having its lower end fitting and permanently secured to said spool head and extending well beyond the upper end of said tube of thread, and a cap permanently secured to said casing provided with a central delivery opening through which the thread may be progressively unwound from said tube of thread.

2,102,997
DOOR LOCKING DEVICE FOR AUTOMOBILES AND THE LIKE
Edward D. Dall, Waukegan, Ill., assignor to Walter F. Wright, Shaker Heights, Ohio
Application February 4, 1933, Serial No. 655,180
Renewed June 8, 1937
30 Claims. (Cl. 70—264)

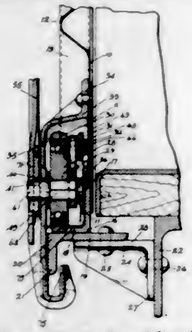


1. In combination with an automobile body, a master-door; means for locking same from the outside of the car; other doors, bolt means for said other doors; retracting means for each bolt means; dogging means for each of the retracting means, including a movable part at the edge of each door whereby its dogging means is operable; a single controller inside the car for a plurality of said dogging means; and mechanical means operative between said controller and the aforesaid parts whereby said parts are simultaneously operable from said controller.

2,102,998
LINER FOR BEARINGS
Ernest R. Darby and Philip J. Potter, Detroit, Mich., assignors to Federal-Mogul Corporation, Detroit, Mich., a corporation of Michigan
Application April 29, 1936, Serial No. 77,004
6 Claims. (Cl. 75—151)

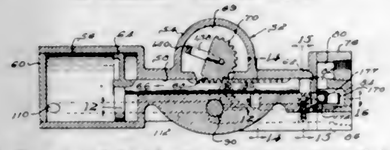
3. A cadmium-base bearing metal alloy consisting of from 5 to 45 per cent lead, 5 to 45 per cent zinc, 50 to 90 per cent cadmium, together with at least one of the metals from the group consisting of copper, silver and nickel in a relatively small percentage ranging from 0.1 to 1.0 per cent each to prevent segregation.

2,102,999
FASTENER
Abraham de Vries, Amsterdam, Netherlands, assignor to Naamlooze Vennootschap Ijzerhandel I. M. de Vries, Amsterdam, Netherlands
Application May 17, 1935, Serial No. 22,031
In Germany June 4, 1934
2 Claims. (Cl. 85—2.4)



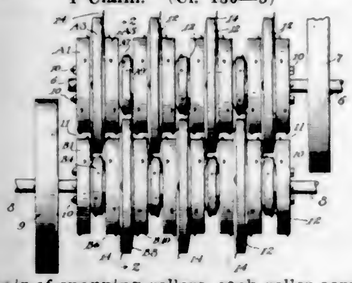
1. A fastening member for furniture fittings of the kind fixed to a support and having a plurality of fastening tongues adapted to be expanded by a mandrel inserted inbetween, comprising a sleeve provided with narrow slots forming tongues which in the unexpanded position form a substantially continuous ring, said sleeve converging inwardly toward one end, said tongues being bent outwardly at said end substantially at right angles to the sleeve axis, the ends of said bent out portions being sufficiently thin as to penetrate into the support when expanded.

2,103,000
LIFT DOOR
Frank Ditchfield, Cleveland, Ohio, assignor to The Youngstown Steel Door Company, Cleveland, Ohio, a corporation of Ohio
Application May 31, 1935, Serial No. 24,225
17 Claims. (Cl. 20—22)



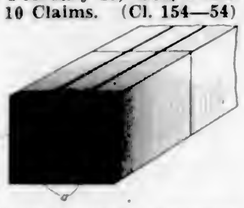
15. In a railway house car having a sliding door and a door track, spaced shafts carried by

said door, members eccentrically mounted upon said shafts for rotation therewith, the periphery of said members being circular, collars rotatably surrounding said members and being concentric



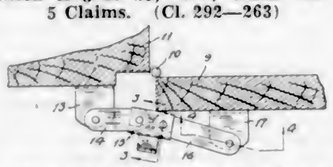
with the periphery thereof, said collars engaging said track, means fixed upon said shafts, a bar connecting said means and a lever mounted upon one of said shafts.

2,103,001
WINDSHIELD WIPER MECHANISM
Robert B. Evans, Grosse Pointe, and Earl W. Dilg and George Germann, Detroit, Mich., assignors to E. S. Evans and Sons, Detroit, Mich., a corporation of Michigan
Application August 28, 1933, Serial No. 687,062
26 Claims. (Cl. 121—164)



1. In a windshield wiper motor actuated by a fluid under pressure, in combination, a body having a pair of cylinders, one of which is a working cylinder, connected pistons in said cylinders, means for reciprocating the piston in the working cylinder, said body being formed with a pocket therein adapted to receive fluid leaking from the working cylinder and to drain such leakage into the other cylinder, and means permitting discharge of fluid compressed in said other cylinder.

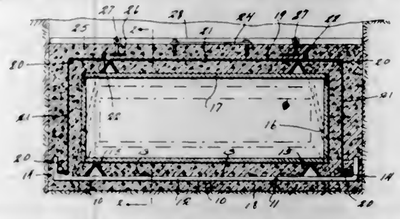
2,103,002
SNAPPING ROLLER
John Rudolph Faber, Flint, Mich.
Application April 28, 1937, Serial No. 139,575
1 Claim. (Cl. 130—5)



A pair of snapping rollers, each roller comprising a series of disks of different diameters assembled in relation beside each other to form ribs and grooves the sides of which are stepped, the peripheries of the disks being uncorrugated and the surfaces of the rollers being spaced from each other at all points to form a clear zigzag passage between the rollers, the side edges of some of the smaller diametered disks being beveled and other mating larger diametered disks having teeth projecting into the spaces produced by the bevels.

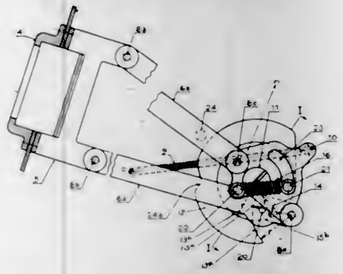
2,103,003
COMPOSITION STRIP
Albert C. Fischer, Chicago, Ill.
Application February 15, 1932, Serial No. 593,028
10 Claims. (Cl. 154—54)

1. A cellular structural member constituting a load-sustaining composite slab comprising strips of resilient sponged material wherein the cells are unbroken and elongated in shape juxtaposed with the major axes of the cells normal to the load bearing surface, and an intervening adhesive layer between said strips.



2,103,004
DOOR CHECK
George Halinka, Detroit, Mich.
Application August 29, 1935, Serial No. 38,387
5 Claims. (Cl. 292—263)

1. A door check for preventing undue opening of a door swingably mounted on a stationary structure comprising: a bracket mounted on said stationary structure; a link pivotally mounted at one of its ends to said bracket; a connecting plate pivotally connected at one of its ends to the opposite end of said link; a second link of greater length than said first link and pivotally connected at one of its ends to the opposite end of said plate; and a bracket fixedly mounted on said door and pivotally connected at the opposite end to said longer link, the pivotal points of said links and plate assuming a straight line position just prior to the authorized limit of opening of the door.

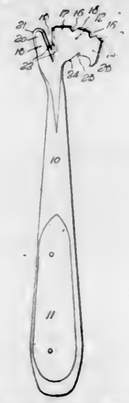


2,103,005
SEAMLESS GRAVE VAULT AND METHOD OF FORMING IT
John H. Handley, Des Moines, Iowa
Application March 18, 1937, Serial No. 131,737
3 Claims. (Cl. 72—7)

1. A grave vault having integral top, bottom, end and side walls, a base reinforcing element disposed within the bottom wall and including longitudinal and transversely extending reinforcing members, an upper reinforcing element extending throughout and embedded within the top, end and side walls and comprising longitudinal and transversely extending reinforming members, the base reinforcing element having upwardly turned end portions, the upper reinforcing element having side and end portions disposed

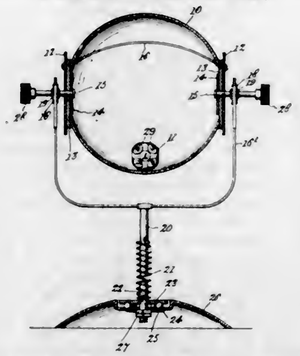
within the upwardly turned end portions of the base element, and yokes arching over the upper reinforcing element and having hooks engaging with the lower reinforcing element, the yokes being embedded within the side and top walls of the vault.

2,103,006
PROTECTIVE SHIELD FOR ELECTRICAL WELDERS
Max Helfenstein and Felix Max Hirsig, Lucerne, Switzerland
Application March 10, 1936, Serial No. 68,010
In Germany July 26, 1935
5 Claims. (Cl. 2—8)



1. A protective shield for welders comprising a cap adapted to fit on the welder's head, a shield pivotally mounted on said cap and having a window therein, said shield being pivoted to said cap on each side through a pair of links each of which is pivoted at its inner end to said cap and at its outer end to said shield, and spring means for counterbalancing the weight of said shield whereby the shield will be freely movable but remain in any adjusted position.

2,103,007
LUSTROUS PIGMENT AND METHOD OF MANUFACTURING AND USING IT
Heinz Hunsdiecker, Cologne-Lindenthal, Germany
No Drawing. Application May 5, 1934, Serial No. 724,222. In Germany August 22, 1933
4 Claims. (Cl. 134—67)



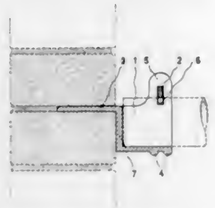
1. The process for the manufacture of a lustrous pigment, said process comprising the precipitation of lead phosphate as $PbHPO_4$ by reacting a solution of a lead salt with a solution of phosphoric acid in admixture with one of the group consisting of alcohol, acetic acid, acetone, diacetone alcohol, isopropyl alcohol and the glycol ethers, the permissive range of concentration of each reacting solution being from saturation to such relative concentration of each solution that the lead content of the two solutions combined, calculated as lead phosphate, will be at least 0.1 gram per litre.

2,103,008
COMBINATION TOOL
John J. Kinast, Beloit, Wis.
Application December 2, 1936, Serial No. 113,909
1 Claim. (Cl. 254—21)

An improvement in a tack puller of the general type comprising a substantially straight shank having a longitudinal hand-grip at its rear end and two inwardly beveled tack-straddling fingers projecting forwardly from its front end; said improvement consisting of a lateral wing integral with one of said fingers and having a convexedly curved front edge extending from the front end of said one of said fingers; whereby forward pushing of said shank will force said fingers under the head of a tack to loosen the latter, and turning of said shank toward said wing will cause the tool to rock upon said curved front edge of said wing to elevate the loosened tack.

2,103,009
AGITATOR FOR GAME ELEMENTS
Charles F. Klein, Baltimore, Md.
Application February 11, 1937, Serial No. 125,318
6 Claims. (Cl. 273—145)

1. A game element agitator, comprising a transparent body portion adapted to enclose a



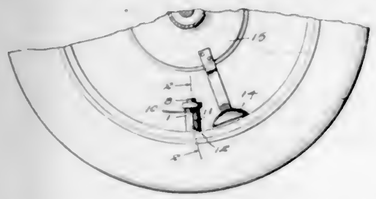
game element, a support horizontally and pivotally connected to the body portion to admit rotation of the latter to roll the game element therein, a base, and a spring stem rotatably mounted between the support and the base for admitting rotation and oscillation of the support on the base for changing the direction of rolling of the game element in the body portion as the latter is rotated.

2,103,010

WALL CONNECTER

Johan Friedrich Köhnke, Haarlem, Netherlands

Application March 21, 1936, Serial No. 70,039
In the Netherlands April 2, 1935
2 Claims. (Cl. 72—108)



1. A joist supporting bracket comprising in combination, a socket of U-section formed with a bottom, two side walls and a rear wall, and a supporting plate fixed to the top of said side and rear walls and extending at right angles to the rear wall, said plate being of greater width than said socket, and bracing members extending from said plate towards the side walls of said socket.

2,103,011

TIRE DEFLATION SIGNAL

John V. McMahon, Ness City, Kans.

Application May 16, 1936, Serial No. 80,199
2 Claims. (Cl. 116—34)

2. In combination with a wheel having a pneumatic tire thereon and an adjacent stationary portion of a vehicle body, a percussion signal carried by said stationary portion of the vehicle body, a casing carried by the felly of the wheel, said felly having an opening communicating with said casing, a spring pressed plunger slidable in said casing and having a portion engageable through said opening for contact with an inner tube, a hammer swingably carried by said casing, and releasable holding means engageable with said hammer and projecting into said casing for contact with said plunger to hold said hammer in inoperative position, the inner tube when inflated holding said plunger in retracted position, deflation of said inner tube releasing said plunger for movement outwardly through said opening, outward movement of said plunger releasing said holding means.

2,103,012

CELLULOSE ESTERS

Richard Müller, Mannheim-Neuostheim, Martin Schenck, Mannheim, and Wilhelm Wirbatz, Mannheim-Waldhof, Germany, assignors to C. F. Boehringer & Soehne G. m. b. H., Mannheim-Waldhof, Germany

No Drawing. Application March 19, 1932, Serial No. 600,060. In Germany March 24, 1931
18 Claims. (Cl. 260—101)

1. In the manufacture of cellulose esters of organic acids, the process which comprises reacting upon a cellulose material, of the group consisting of cellulose and the derivatives of cellulose having free and available hydroxyl groups, with an organic acylating agent in the presence of a substantial amount of added sulfur dioxide and of a small amount of a catalyst selected from a group consisting of perchloric acid and its salts, while maintaining a uniform temperature in the reacting zone not substantially exceeding 50° C.

2,103,013

PORTABLE SURGICAL LAMP

Patrick A. Nirdlinger, Madison, Wis., assignor, by mesne assignments, to Scanlon-Morris Company, Madison, Wis., a corporation of Wisconsin

Application December 3, 1934, Serial No. 755,795
7 Claims. (Cl. 248—123)

1. A surgical lamp comprising a substantially vertical supporting post, a bracket on the upper end of said post mounted for limited rotation about a vertical axis, a substantially horizontal bar carried by said bracket and mounted for oscillation about its own axis and for tilting movement about a horizontal axis at right angles to its own axis, a counter-weight on one end of said bar, a fork projecting from the other end of said bar, and a light projector pivotally mounted between the ends of said fork, and adjustable tension means extending through the entire length of said bar from a point beyond said counterweight, through the latter, and operatively connected to said light projector for effecting tilting movement thereof about its pivoting axis.

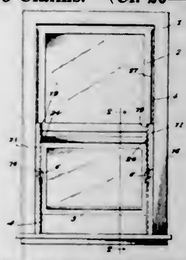
2,103,014

DELAY BLASTING CAP

Mario Palmieri, South Glastonbury, and Samuel D. Ehrlich, Glastonbury, Conn.

Application March 9, 1936, Serial No. 67,926
9 Claims. (Cl. 102—10)

1. A delay blasting cap comprising in combination, a casing, a detonating mixture therein, a heating mixture spaced from said detonating mixture, a heat conducting metal in heating proximity with said heating mixture and in contact with said detonating mixture and igniting means for said heating mixture in contact therewith.



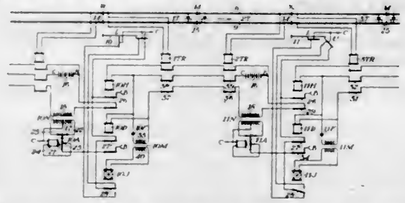
2,103,015

REVERSIBLE SASH ATTACHMENT

William E. Peters, Watervliet, N. Y., assignor of two-fifths to Matilde Castellani, Albany, N. Y.

Application February 15, 1937, Serial No. 125,854
5 Claims. (Cl. 20—49)

5. In a device of the class described, the combination with a sash, plates fastened to the side edges of said sash, each plate provided with grooves, said sash provided with a groove registering with the grooves of said plates, of runner casings engaging said sash and said plates, each runner casing provided with a hollow channel, a locking strip substantially U-shaped in cross section in each channel, and springs in each channel and exerting outward pressure on each locking strip.



2,103,016

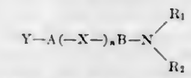
RAILWAY SIGNALING

George R. Pflasterer, Swissvale, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania

Application March 26, 1936, Serial No. 70,925
12 Claims. (Cl. 246—50)

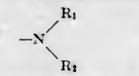
1. In combination, a section of railway track, a home and a distant relay for said section controlled over separate circuits including at least three conductors extending through the section, means controlled by traffic conditions for supplying current of one character to the circuit for said home relay when the section is unoccupied and for also supplying current of said one character to the circuit for the distant relay under certain traffic conditions in advance of said section, another circuit for said section including an auxiliary relay and at least two of said conductors, means responsive to other traffic conditions in advance of said section for supplying current of a

different character to said other circuit for selectively controlling said auxiliary relay, and traffic governing means for said section controlled by said three relays.



2,103,017

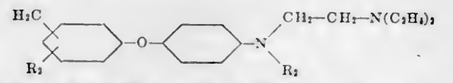
BASIC DERIVATIVES OF CYCLIC ETHER-LIKE COMPOUNDS



Bruno Pützer and Fritz Schönhöfer, Wuppertal-Elberfeld, Germany, assignors to Winthrop Chemical Company, Inc., New York, N. Y., a corporation of New York

No Drawing. Application October 17, 1931, Serial No. 569,536. In Germany October 23, 1930
12 Claims. (Cl. 260—128)

1. Basic derivatives of cyclic ethers of the formula:



wherein A stands for a radical of the class of six membered ring compounds, B stands for a radical of the class of at most bicyclic nuclear compounds, X stands for a member selected from the group consisting of oxygen and sulfur, the free linkages of each X being attached to nuclear carbon atoms of A and B, n stands for one of the numbers 1 and 2, R_1 stands for a member selected from the class consisting of aminoalkyl and alkylaminoalkyl groups, R_2 stands for a member selected from the group consisting of hydrogen, aminoalkyl and alkylaminoalkyl, Y stands for one of the groups hydrogen and

wherein R_1 and R_2 stand for the same substituents as defined above, said cyclic ethers being strong bases which are insoluble in water, soluble in organic solvents, yielding with acids salts which in general are soluble in water and are suitable for pharmaceutical purposes.

8. Basic derivatives of cyclic ethers of the formula:

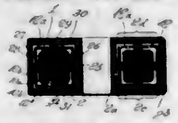
wherein R_2 stands for a member selected from the class consisting of hydrogen, aminoalkyl and alkylaminoalkyl, and R_3 stands for one of the members hydrogen and methyl, said cyclic ethers being strong bases which are insoluble in water, soluble in organic solvents, yielding with acids salts which in general are soluble in water and are suitable for pharmaceutical purposes.

2,103,018

PROCESS FOR ENHANCING THE STABILITY TO WATER OF EFFECTS PRODUCED MECHANICALLY ON TEXTILES CONTAINING CELLULOSE

Andreas Ruperti, Basel, Switzerland, assignor to Society of Chemical Industry in Basle, Basel, Switzerland

No Drawing. Application March 23, 1936, Serial No. 70,540. In Switzerland March 28, 1935
8 Claims. (Cl. 8—20)



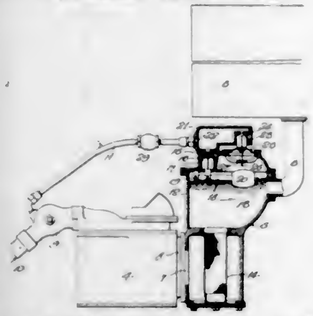
1. A process for enhancing the stability to water of effects unstable to water produced locally by mechanical means on textiles containing cellulose, which consists in esterifying the cellulose, after the effect has been produced, with retention of the structure of the cellulose.

2,103,019

SLOW ELECTROMAGNETIC DEVICE

Albert B. Rypinski, Laurelton, Long Island, N. Y.

Application March 21, 1935, Serial No. 12,292
3 Claims. (Cl. 171—242)



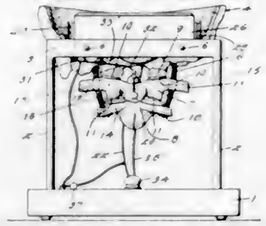
1. An electromagnetic device comprising a pair of inductively coupled and opposed windings connected in parallel one with respect to the other, said windings being formed of materials having the same temperature coefficients of resistance other than zero, said windings mounted on a core of magnetic material, one winding constituting an inner winding and the other an outer winding, said outer winding surrounding said inner winding at every point of said windings, said second winding having pancake sections bridging the gap at the ends of said first winding between said circumferential winding and said core, so that when energized, substantially all magnetism originating in either winding threads the other, and conjugate cover members enclosing said inner winding and insulating said inner winding from said outer winding.

2,103,020

SIPHON-BREAKING MEANS FOR LIQUID METERING SYSTEMS

Armas J. Saarinen, San Francisco, Calif., assignor to Granberg Meter Corporation, San Francisco, Calif., a corporation of California

Application April 10, 1937, Serial No. 136,184
6 Claims. (Cl. 221—67)



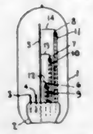
1. In a liquid metering system in which unbroken siphonic action would empty the meter, said system having an air eliminator casing through which liquid flows to the meter; means controlled partly by the liquid level in said casing and partly by the pressure within said casing for venting air and gases from said casing as it fills with liquid and for later conducting some siphon-breaking air from said casing and some siphon-breaking air from another source into a portion of the system at the outlet side of the meter.

2,103,021

CHIROPRACTIC DEMONSTRATING DEVICE

George Wesley Salsman, La Junta, Colo.

Application April 7, 1936, Serial No. 73,182
3 Claims. (Cl. 35—17)



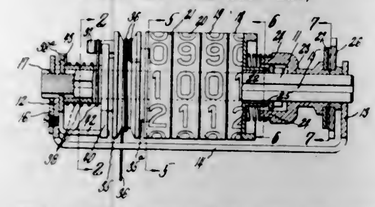
1. In a device of the character described, an occipital bone, supporting means therefor, an atlas bone in normal relation with the occipital bone, an axis bone in normal relation with the atlas, the said last two bones having openings formed in the transverse processes thereof, spring elements passing through said openings and coupling the bones for articulation, said axis bone normally having the odontoid process in opposed relation with the anterior arch of the atlas, a pair of normally touching electric contacts, one contact being on said arch and the other contact being on said process, a second pair of normally touching contacts, one of the second contacts being electrically connected with the arch carried contact and the other of the second contacts being rigid with the skull bone, and an electric circuit having both of said pairs of contacts, a source of electric potential and an incandescent bulb in series relation therein.

2,103,022

GASEOUS DISCHARGE TUBE

Alexander Senauke, New York, N. Y., assignor to Hazeltine Corporation, Jersey City, N. J., a corporation of Delaware

Application August 23, 1933, Serial No. 686,331
7 Claims. (Cl. 250—27.5)



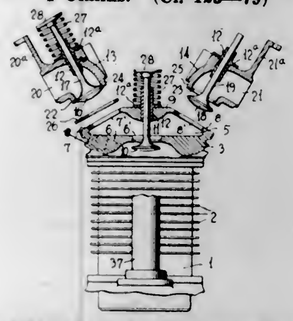
1. A gaseous discharge tube comprising an envelope containing gas at relatively low pressure, an anode, a main elongated cathode having the characteristic of producing a discharge variable in length along said cathode in response to changes in amplitude of applied anode-cathode voltages, and an auxiliary electrode therein, said auxiliary electrode having a portion located in juxtaposition to said main cathode and at a point intermediate said anode and the remote end of said cathode and having its other portions protected from current passing thereto, whereby current will not flow to said auxiliary electrode until the discharge on said cathode has reached the juxtaposed portion of said auxiliary electrode.

2,103,023

ODOMETER RESET

Walter E. Sherwood, Pepperell, Mass., assignor to Waltham Watch Company, Waltham, Mass., a corporation of Massachusetts

Application December 13, 1934, Serial No. 757,352
4 Claims. (Cl. 235—144)



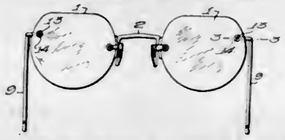
1. The combination with a counting element, of a spring retracted setting element for imparting rotation to said counting element in one direction only, manual means for turning said setting element in the direction opposite to its spring retracted movement, a stop abutment carried by said setting element, a stationary stop abutment, and an intermediate stop member movable relatively to each of said abutments and having shoulders complemental to each of said abutments.

2,103,024

INTERNAL COMBUSTION ENGINE

Thomas Noah Smith, San Antonio, Tex.

Application March 11, 1936, Serial No. 68,303
4 Claims. (Cl. 123—79)



1. An internal combustion engine comprising a plurality of parallel cylinders, a cylinder head element consisting of a one piece casting to which all of said cylinders are connected, said cylinder head being formed adjacent each cylinder with a chamber having inner and outer walls, said inner wall having a valve controlled port establishing communication between said chamber and cylinder, and said outer wall having an opening at each side of said port, and intake and exhaust valve assemblies detachably secured to said outer wall, each of said assemblies comprising a single casting co-extensive in length with said cylinder head and having a series of ports in communication with said openings, and a corresponding series of spring-closed valves mounted in said casting and controlling the flow of gases through said ports and openings.

2,103,025

EYEGLASSES

Aron S. Treger, Independence, Kans.

Application August 26, 1936, Serial No. 98,046
2 Claims. (Cl. 88—47)

1. An eyeglass of the character described, comprising a pair of lenses, a bridge connecting said lenses, said lenses each formed near their outer edge with an opening of non-circular form in peripheral outline, temple bars, and a connection between each of the temple bars and its corresponding lens, said connection comprising a single member having its forward portion formed with a lug of non-circular form in peripheral outline to fit the non-circular opening in said lens, the rearward end of said connection terminating in a cylindrical temple connecting lug, the axis of said cylindrical lug being outwardly offset from the axis of said connection, a screw threaded opening in the outer end of said lug, a fastening screw engaging said threaded opening of the lug to retain the member in place and a pivotal connection at the inner end of said member between the member and temple bar.

2,103,026

GOLF TEE

Richard Manley Van Valkenburg, Fulton, N. Y.

Application April 1, 1937, Serial No. 134,363
3 Claims. (Cl. 273—33)

1. A golf tee comprising a laminated member having incisions in its upper portion defining liftable tabs adapted to support a golf ball in elevated position on said member, said incisions intersecting and providing a slotted opening and such point of intersection forming a common fingernail receiving opening for lifting the respective tabs and integral braces struck from the tabs and extending vertically with its lower end resting on the member when said tabs are in lifted position to support the tabs in upwardly extended position.

2,103,027

GASEOUS ELECTRIC DISCHARGE LAMP DEVICE

Hans Alterthum, Berlin-Wilmersdorf, and Arved Lompe, Berlin, Germany, assignors to General Electric Company, a corporation of New York

No Drawing. Application July 6, 1937, Serial No. 152,270. In Germany July 10, 1936
1 Claim. (Cl. 176—124)

The method of operating a gaseous electric discharge lamp device comprising a container, electrodes sealed therein and an atmosphere therein of a mixture of gaseous constituents having different ionizing potentials which method consists in the step of causing a greater current flow in one direction than in the opposite direction in the device and of such magnitude that the concen-

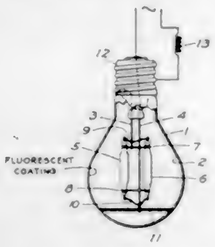
tration-drop of the filling which is caused by electrophoresis during an increase of the current strength produces a voltage increase which outweighs the voltage decrease caused in the column by the simultaneously occurring increase of the electrically charged particles and the decrease of the electrode-drops, so that the characteristic of the tube is a rising one.

2,103,028

ELECTRIC CONDUCTION DEVICE

Cornelis Bol, Eindhoven, Netherlands, assignor to General Electric Company, a corporation of New York

Application May 22, 1935, Serial No. 22,898
In Germany June 4, 1934
5 Claims. (Cl. 176—122)



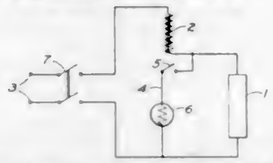
1. An electric gaseous discharge device comprising a sealed envelope, a tubular extension connected to said envelope by means of a pinch seal, and a base member affixed to the end of said extension.

2,103,029

ELECTRIC GASEOUS DISCHARGE LAMP

Leonard J. Davies, Rugby, England, assignor to General Electric Company, a corporation of New York

Application September 28, 1936, Serial No. 103,012
In Great Britain October 7, 1935
5 Claims. (Cl. 176—122)



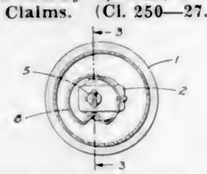
3. An electric lighting unit comprising, in combination, an envelope having fluorescent and diffusing properties, and a pair of vapor discharge devices connected in parallel and located within said envelope, whereby said unit has substantially the same light distribution regardless of which of said devices is operating within said envelope.

2,103,030

GASEOUS ELECTRIC DISCHARGE DEVICE

Eduard G. Dorgelo, Eindhoven, Netherlands, assignor to General Electric Company, a corporation of New York

Application July 10, 1936, Serial No. 89,984
In Germany July 19, 1935
3 Claims. (Cl. 176—124)



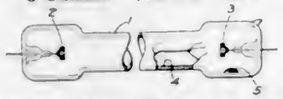
1. In combination an electric discharge device, an automatic starting means which ceases operation on the starting of said device connected in series therewith and a fuse consisting of a metal wire having a high positive thermal coefficient of electrical resistance enclosed by a sealed container having gaseous atmosphere therein, said fuse being connected in series with said starting means and across the terminals of said device to interrupt current flow through said starting means on the failure of said discharge device to start at a predetermined time after potential is applied to said device.

2,103,031

ELECTRIC GASEOUS DISCHARGE DEVICE

Ted E. Foulke, Nutley, N. J., assignor to General Electric Vapor Lamp Company, Hoboken, N. J., a corporation of New Jersey

Application February 8, 1935, Serial No. 5,670
3 Claims. (Cl. 250—27.5)



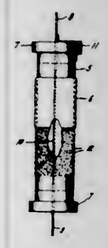
1. An electric gaseous discharge device comprising a sealed envelope containing a gaseous atmosphere, and an anode and a cathode within said envelope, said cathode being in the form of a cylinder surrounding said anode with a V-shaped indentation therein whose apex is closer to said anode than the remainder of said cylinder, the inner surface of said cylinder being coated with a substance having a low work function.

2,103,032

GASEOUS ELECTRIC DISCHARGE LAMP DEVICE

Otto Fritze, Berlin, Alfred Rüttenauer, Berlin-Halensee, and Kurt Wiegand, Berlin-Tempelhof, Germany, assignors to General Electric Company, a corporation of New York

Application November 7, 1935, Serial No. 48,736
In Germany November 13, 1934
3 Claims. (Cl. 176—122)



1. A gaseous electric discharge lamp comprising a container, electrodes sealed therein, a gaseous atmosphere therein capable of emitting visible and ultra-violet light when excited by an electric discharge therethrough and zinc-silicate mounted in light receiving relation to the discharge in said lamp, said zinc-silicate having a grain size of approximately 1 to 5 μ.

2,103,033

ELECTRON EMISSIVE ELECTRODE

George E. Inman, East Cleveland, Ohio, assignor to General Electric Company, a corporation of New York

Application August 10, 1934, Serial No. 739,270
2 Claims. (Cl. 250—27.5)

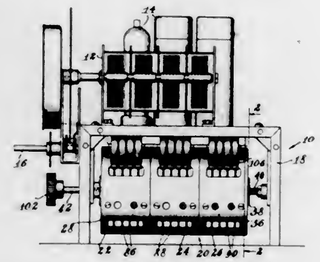
1. A unipotential glow discharge electrode comprising a hollow nickel base scabrous with discrete tiny tungsten projections, a filamentary heater mounted in said base, and a thin surfacing on said base of electron-emissive oxide material adherent in the inequalities, the depth of said material being substantially uniform over the entire discharge supporting surface of said electrode.

2,103,034

GASEOUS AND VAPOR ELECTRIC DISCHARGE DEVICE

George E. Inman, East Cleveland, Ohio, assignor to General Electric Company, a corporation of New York

Application September 11, 1934, Serial No. 743,504
13 Claims. (Cl. 176—122)



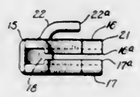
1. A positive column electric discharge device comprising an envelope containing an ionizable gaseous atmosphere therein for the starting and operation of the device; widely separated coacting main discharge electrodes in said envelope, one at least thermionic; a discharge circuit for said main electrodes, and a heating circuit for said thermionic electrode having a relatively short discharge gap thereacross in the atmosphere in said envelope; heating means in said heating circuit for said thermionic main electrode; and voltage-controlling means for said heating circuit automatically permitting thereacross a voltage sufficiently exceeding the ionizing potential of the atmosphere in the envelope, during starting, to produce a local discharge across its said gap and thereby ionize the atmosphere and start the main discharge between said electrodes, and thereafter reducing the heating circuit voltage and thus preventing objectionable persistence of such local discharge.

2,103,035

SWITCHING AND SUPPORTING DEVICE FOR ELECTRICAL APPARATUS

William P. Lear, New York, N. Y., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware

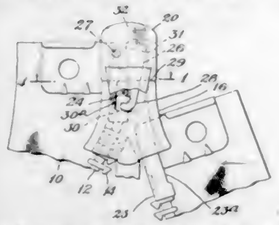
Application August 31, 1934, Serial No. 742,230
3 Claims. (Cl. 171—119)



1. In a tuning device for multi-range radio receivers, in combination, a multi-compartment drum constituted by a plurality of nested metallic chambers, a plurality of electrically disconnected interstage transformer-assemblies circumferentially disposed within each chamber and insulated therefrom, a plurality of rigid contact members connected to each transformer-assembly and projecting radially through openings in the wall of the associated chamber, a plurality of groups of fixed flexible contact members, one group for each chamber, the individual contact members of each group lying in the path of movement of the projecting contact members when the chamber assembly is rotated about its axis and serving to place in circuit the transformers corresponding to any desired adjustment, and a plurality of grounded contact members arcuately spaced apart from the flexible contact members and insulated therefrom, the said grounded contact members also so circumferentially disposed with respect to the several groups of fixed contact members that they serve to short-circuit the transformer-assemblies covering the band of frequencies just below the band at which the receiver may momentarily be adjusted to receive.

2,103,036

SLIDER FOR SEPARABLE FASTENERS

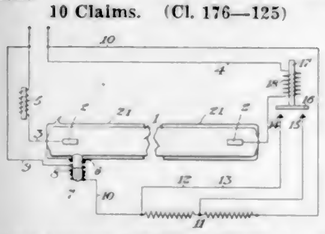


Davis Marinsky, Bronx, N. Y., assignor to Whitehall Patents Corporation, New York, N. Y., a corporation of New York

Application September 10, 1935, Serial No. 39,908
8 Claims. (Cl. 24—205)

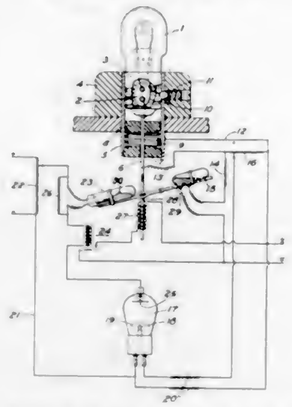
3. A slider for separable fasteners of the class described, said slider comprising a unitary molded body the outer surface of one side wall of which is flat and provided with an integral coupling loop arranged within the boundary edges of said wall, one end only of said loop being integrally united with said wall, and the other end being arranged in abutting relation to said wall.

2,103,037
SEPARABLE FASTENER
Davis Marinsky, Bronx, N. Y., assignor to Whitehall Patents Corporation, New York, N. Y., a corporation of New York
Application October 22, 1936, Serial No. 106,962
22 Claims. (Cl. 24—205)



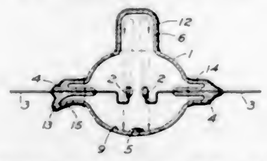
1. In separable fasteners employing stringers and a slider movable longitudinally of the stringers to couple and uncouple the same and an end stop coupling one end of the stringers, means involving coupling elements composed of rigid material on said end stop and slider for positively and detachably coupling the slider with said end stop to prevent separation of said parts when in juxtaposition to each other.

2,103,038
GASEOUS ELECTRIC ARC DISCHARGE LAMP DEVICE
Kurt Moers, Berlin-Steglitz, Germany, assignor to General Electric Company, a corporation of New York
Application July 25, 1934, Serial No. 736,940
In Germany August 24, 1933
4 Claims. (Cl. 176—122)



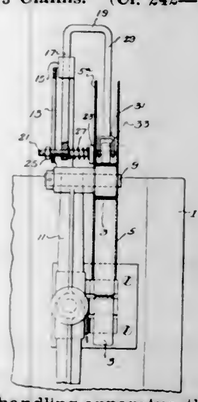
1. An arc discharge lamp comprising a container, electrodes sealed therein, a gaseous filling therein comprising cadmium vapor and hydrogen.

2,103,039
GASEOUS ELECTRIC DISCHARGE DEVICE
Marcello Pirani, Berlin-Wilmersdorf, and Martin Reger, Berlin, Germany, assignors to General Electric Company, a corporation of New York
Application May 27, 1930, Serial No. 456,235. Renewed October 12, 1934. In Germany July 10, 1929
10 Claims. (Cl. 176—125)



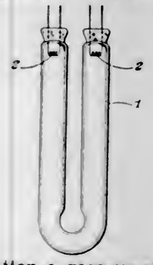
5. In an electric discharge device, a container, electrodes sealed therein, an offset chamber fused to said container containing a material vaporizable by heat, means to heat said chamber, and means to maintain said container at a higher temperature than said chamber.

2,103,040
MANUFACTURE OF RESISTANCE BODIES
Thomas J. Radcliffe, Belleville, N. J., assignor to General Electric Vapor Lamp Company, Hoboken, N. J., a corporation of New Jersey
Application December 30, 1935, Serial No. 56,797
2 Claims. (Cl. 201—63)



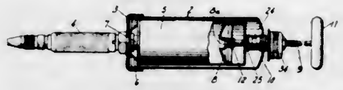
1. In apparatus for adjusting the value of a resistance which is subject to permanent change upon the application of heat, in combination, means to pass a heating current through said resistance, means responsive to the voltage drop across said resistance to interrupt the flow of said current when said resistance has attained a predetermined value, and means to prevent the operation of said interrupting means during the initial heating of said resistance.

2,103,041
GASEOUS ELECTRIC DISCHARGE LAMP DEVICE
Robert Rompe, Berlin, and Wolfgang Thouret, Berlin-Wilmersdorf, Germany, assignors to General Electric Company, a corporation of New York
Application August 21, 1936, Serial No. 97,278
In Germany August 28, 1935
4 Claims. (Cl. 176—123)



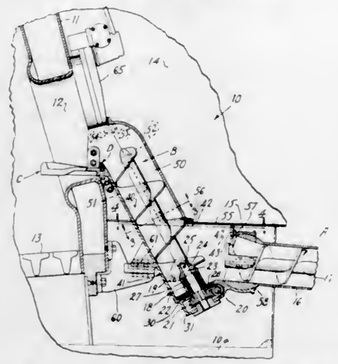
1. A gaseous electric discharge lamp device comprising a spherical container, a gaseous atmosphere therein, electrodes and electrode leads sealed therein, said electrodes being separated a distance less than the diameter of said container and being mounted adjacent the center of said container, said electrode leads being substantially in line and being fused into opposite parts of said container, and a dome-like, protruding appendage in the wall of said container above said electrodes, the axis of said appendage being substantially normal to said electrode leads and the discharge path between said electrodes to prevent the formation of light absorbing electrically conducting deposits of sputtered electrode material at other parts of said container.

2,103,042
FILM HANDLING APPARATUS
Lawrence T. Sachtleben, Camden, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application October 31, 1935, Serial No. 47,670
3 Claims. (Cl. 242—75)



1. In film handling apparatus, the combination of a supply reel mounted for normally free rotation and including a side plate, a film spirally wound on said reel, means for withdrawing said film from said reel, a brake pad mounted for movement radially of said side plate, a roller engaging the periphery of the film spiral and having connection with said brake pad, said roller being arranged to accommodate itself to said spiral periphery regardless of the diameter thereof and to cause movement of said brake pad radially of said side plate whereby the radial distance of said brake pad from the center of said reel is proportional to the diameter of the film spiral at any instant, a spring arranged to constantly press said brake pad against said side plate whereby said brake pad is adapted to restrain free rotation of said reel for maintaining the tension of the span of film between said reel and said withdrawing means constant, and means for varying the tension in said spring whereby to control the braking force applied to said side plate by said brake pad.

2,103,043
GASEOUS ELECTRIC DISCHARGE DEVICE
Pancras Schoonenberg and Josephus A. M. Smelt, Eindhoven, Netherlands, assignors to General Electric Company, a corporation of New York
Application July 22, 1935, Serial No. 32,608
In Germany July 26, 1934
3 Claims. (Cl. 176—122)



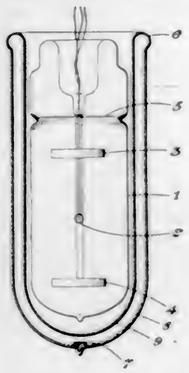
1. In combination a gaseous electric discharge device of the positive column type comprising a container, electrodes sealed therein, a gaseous atmosphere therein comprising an alkali metal vapor, and means to supply sufficient electrical energy to said device to cause a voltage drop along the positive column discharge greater than 2.2 volts per cm. and a current density in said discharge greater than 0.4 ampere per cm.^{2}, the inner surface of said container being of a borosilicate glass containing less than 10% silica and more than 11% alkali oxide.

2,103,044
LUBRICATING DEVICE
Harry R. Tear, Evanston, Ill., assignor to The Lubrication Corporation, South Bend, Ind., a corporation of Delaware
Application November 30, 1934, Serial No. 755,255
13 Claims. (Cl. 221—47.4)

10. A lubricant dispensing device for use with an interchangeable lubricant cartridge comprising, a housing to receive a cartridge, a feed screw extending into the housing and engageable with the cartridge to place the contents thereof under pressure, a threaded member carried by the housing and engaging the feed screw, and means for holding said threaded member against rotation, said means being releasable in response to a predetermined back pressure on the feed screw.

2,103,045
LOCOMOTIVE STOKER
Edwin Archer Turner, New York, N. Y., assignor, by mesne assignments, to The Standard Stoker Company, (1922), New York, N. Y., a corporation of Delaware
Application December 20, 1935, Serial No. 55,303
4 Claims. (Cl. 198—15)

1. In a locomotive, in combination, a firebox having a backhead with a firing opening therein, a cab, a deck for said cab and a stoker elevating conveyor extending from beneath said deck forwardly and upwardly to the firing opening, the angle of inclination of said conveyor with respect to the backhead being such that the extended axis of the conveyor intersects the plane of the backhead, said conveyor comprising a conduit and a screw rotatable therein, said conduit including a casing shell portion and a hopper por-



tion rigidly secured to said backhead and arranged with the casing shell portion above said deck and the hopper portion beneath said deck, said hopper and casing shell portions being approximately U-shaped in cross section, the free edges of said U-shaped portions defining a continuous opening providing access to the interior of said conduit from said cab, the lower portion of said screw being within said hopper portion and the upper portion of said screw being in said casing shell portion, and a detachable cover on said hopper and casing shell portions closing the opening thereof into the cab, said last named opening upon removing said cover permitting the screw to be removed and replaced from said cab.

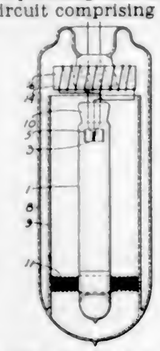
2,103,046

GASEOUS ELECTRIC DISCHARGE LAMP DEVICE

Willem Uyterhoeven and Cornelis Verburg, Eindhoven, Netherlands, assignors to General Electric Company, a corporation of New York

Application August 25, 1934, Serial No. 741,400
In Germany September 13, 1933
1 Claim. (Cl. 240—11.4)

A lamp unit comprising in combination a gaseous electric discharge lamp device and a heat conservator therefor, said conservator consisting of a double walled jacket separably mounted about said lamp and a material in the space between the walls of said jacket which material gives off gaseous matter in response to increasing ambient temperature and which returns to its original state when the temperature drops.



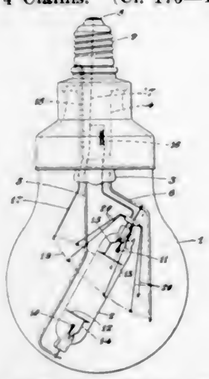
2,103,047

GASEOUS ELECTRIC DISCHARGE DEVICE

Willem Uyterhoeven and Cornelis Verburg, Eindhoven, Netherlands, assignors to General Electric Company, a corporation of New York

Application September 21, 1936, Serial No. 101,822
In Germany September 24, 1935
4 Claims. (Cl. 176—124)

1. A gaseous electric discharge device comprising a container, electrodes sealed therein and a gaseous filling therein, one of said electrodes being a main discharge supporting electrode which is electron emitting when heated and another of said electrodes being an auxiliary starting electrode, said auxiliary electrode being mounted in operative relation to said main electrode, an auxiliary starting circuit connected in parallel with the main discharge path in said device and incorporating said auxiliary electrode, said starting circuit comprising a resistance having a large positive thermal co-efficient of electrical resistance.



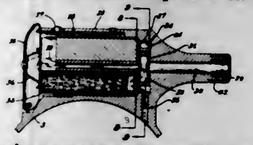
2,103,048

GASEOUS ELECTRIC DISCHARGE LAMP DEVICE

Karl Weidhaas, Berlin-Treptow, Germany, assignor to General Electric Company, a corporation of New York

Application January 9, 1934, Serial No. 705,937
In Germany January 12, 1933
4 Claims. (Cl. 176—1)

1. A lamp unit comprising in combination an envelope, an incandescent filament and a gaseous electric discharge lamp device mounted in said envelope, said lamp device comprising a straight, sealed, tubular container having electrodes mounted axially therein adjacent each end thereof and having a gaseous atmosphere therein, the longitudinal axis of said container being at an acute angle with respect to the longitudinal axis of said envelope, said filament being mounted in a plane substantially at right angles to the longitudinal axis of said discharge device, said discharge device and said incandescent filament being connected in series.



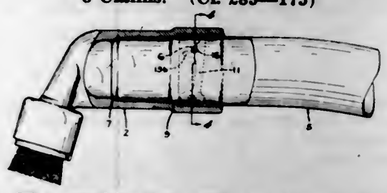
2,103,049

SUCTION CLEANER

Uncas A. Whitaker, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio

Application January 2, 1935, Serial No. 113
1 Claim. (Cl. 21—127)

In an odorizer unit, a body formed with an open ended cavity and with a passageway extending from the inner end of said cavity adapted to be connected to a source of suction, a plurality of seats in said cavity adapted to receive volatile-element-containing receptacles, receptacles adapted to contain differently scented volatile elements positioned in said seats, the inner end of said cavity forward of said receptacles being formed as a valve chamber open to said passage-



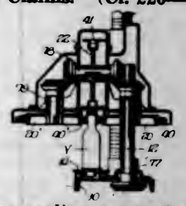
way, a second passageway connecting said chamber to atmosphere, valve means in said chamber adapted to connect selectively any one of said receptacles between said passageways so that air passing therebetween passes into contact with a volatile element, and control means operable from the exterior of said body to control manually the position of said valve.

2,103,050

DUSTING TOOL FOR SUCTION CLEANERS

Harry B. White, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio

Application February 26, 1936, Serial No. 65,768
8 Claims. (Cl. 285—175)



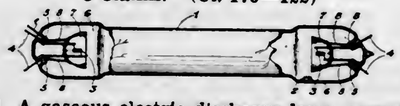
1. The combination with a pair of tubular members adapted to have their end portions connected by fitting one within the other, of a resilient bayonet type joint therefor comprising projecting lugs disposed diametrically opposite each other on the internal of said tubular members and coacting connecting members mounted within the external of said tubular members and having resilient arms provided with marginal notches adapted to contact said lugs and yieldingly lock said tubular members together in the predetermined relative rotation thereof.

2,103,051

PACKAGE SEALING APPARATUS

William P. White, Glencoe, Ill., assignor to White Cap Company, Chicago, Ill., a corporation of Delaware

Original application February 2, 1933, Serial No. 654,847. Divided and this application July 5, 1935, Serial No. 29,806
10 Claims. (Cl. 226—80)



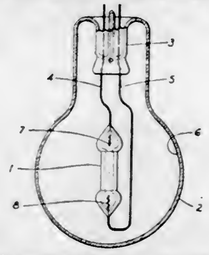
1. In package sealing apparatus, in combination, a closure-supporting means adapted to retentively support a closure, means for supporting a packing container during movement of same past said closure-supporting means, elastically deformable belts arranged to travel in contact with each other along a portion of the container's path and adapted to grasp the container between them, and means for transmitting said holding members past the closure-supporting means in the direction of the movement of the container.

2,103,052

GASEOUS ELECTRIC DISCHARGE LAMP DEVICE

Kurt Wiegand, Berlin-Tempelhof, Germany, assignor to General Electric Company, a corporation of New York

Application June 12, 1935, Serial No. 26,289
In Germany June 18, 1934
3 Claims. (Cl. 176—122)



1. A gaseous electric discharge lamp comprising a container, thermionic electrodes sealed therein, a gaseous atmosphere therein comprising a metal vapor, and a parabolic reflector therein, one of said electrodes being mounted in the focal point of said reflector, said reflector being an auxiliary starting electrode and directing the heat rays from said electrode along the discharge path in said lamp.

2,103,053

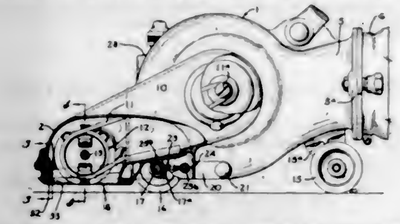
GASEOUS ELECTRIC DISCHARGE DEVICE

Nicolaas W. H. Addink, Eindhoven, Netherlands, assignor to General Electric Company, a corporation of New York

Application August 23, 1937, Serial No. 160,549
In Germany September 3, 1936
1 Claim. (Cl. 176—122)

A lamp unit comprising in combination a gaseous electric discharge lamp device and a luminescent sulphide mounted in light receiving relation to said lamp device, said material being emissive in the visible spectral ranges when irradiated by said lamp and containing halides in such small amounts that the light output and the color of the light emitted by said sulphide is substantially unaffected by said halides for a long useful operating life of the lamp unit.

2,103,054



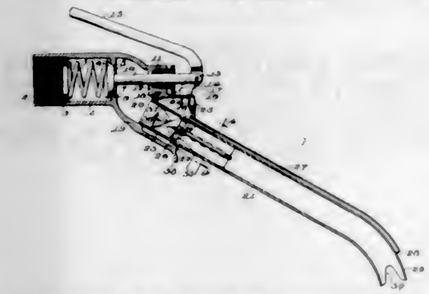
SUCTION CLEANER

Bernard C. Becker, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio

Application February 10, 1936, Serial No. 63,131
6 Claims. (Cl. 15—16)

1. In a suction cleaner, the combination of a casing having a nozzle extending transversely

thereof and open at its bottom, a plate adapted to seat over the opening to said nozzle and slotted to form a suction mouth, said plate having arms extending rearwardly and pivotally connected with said casing whereby said plate may be swung downwardly from its normal position, wheels for supporting said casing including an



axle having arms extending radially therefrom and pivotally mounted on said plate, tension means acting to retain said axle in a predetermined position relative to said plate and means mounted on said casing and adapted to engage said axle for shifting the same bodily relative to said plate.

2,103,055

LIQUID LEVEL INDICATING VALVE

Everett H. Bickley, Bala-Cynwyd, Pa.

Application February 29, 1936, Serial No. 66,385
7 Claims. (Cl. 226—66)

1. A liquid level indicator, comprising a discharge tube, having a cutaway portion in its discharge end, to permit the free flow of liquid laterally from said tube, when the outlet of said tube is obstructed by an extraneous object, an auxiliary tube having its intake end positioned in the general neighborhood of the discharge end of said first tube, said tubes communicating with each other at substantially their relatively upper end portions, such communication being within a closed chamber, a gas-actuated audible signal connecting the interior with the exterior of said chamber, and movable means in said first tube and operative under the influence of fluid flowing thru said first tube, to cause voids in such liquid and thereby draw gas thru said signal, when the intake end of said auxiliary tube is obstructed.

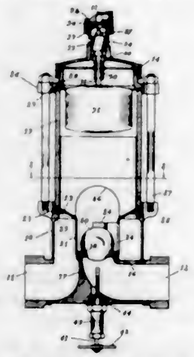
2,103,056

CUT-OUT AND JOINT THEREFOR

Theodore Birkenmaier, St. Louis, Mo., assignor to W. N. Matthews Corporation, St. Louis, Mo., a corporation of Missouri

Application October 1, 1936, Serial No. 103,523
7 Claims. (Cl. 200—115.5)

1. A cutout comprising a clamp adapted to be permanently attached to a line wire, a depending socket on said clamp, a latch associated with said socket, a fuse holder, a fuse therein, a ball extending from said fuse holder and adapted to be engaged with said socket, said latch automatically locking said ball into the



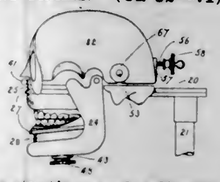
socket against normal reaction due to blowing of a fuse in the fuse holder, and means associated with said ball adapted to move the latch to releasing position when said ball is rotated as by manually pushing on the fuse holder.

2,103,057

GAS AND AIR TRAP

Jacob C. Blumer, Monroe, Wis., assignor to Freyn Engineering Company, Chicago, Ill., a corporation of Maine

Application March 4, 1935, Serial No. 9,270
12 Claims. (Cl. 137—68)



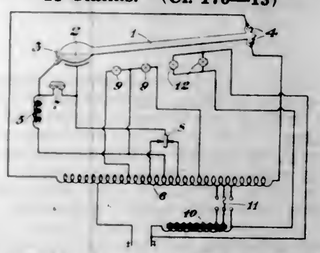
1. A device for venting gas and air from a liquid supply line, comprising a housing having an inlet for liquid and an outlet for said liquid, a member interposed between the inlet and outlet and having openings for admitting the liquid, means adapted to close said outlet but being caused to open by the flow of liquid to the housing, said openings in said member directing the initial flow of liquid upwardly to assist said means in opening the outlet, an exhaust opening in the upper portion of the housing for exhausting gas and air to the atmosphere, and an exhaust valve mechanically disconnected from said closing means and responsive to the liquid level within said housing for controlling said exhaust opening.

2,103,058

DENTURE DEMONSTRATING DEVICE

George Henry Burtenshaw, Taumarunui, New Zealand, assignor to The Dentists' Supply Company of New York, New York, N. Y., a corporation of New York

Application August 16, 1935, Serial No. 36,603
In New Zealand September 3, 1934
14 Claims. (Cl. 32—71)



7. A demonstrating and adjusting device for artificial dentures, comprising an upper jaw frame, an upper denture, means for mounting said denture in position on said frame, a lower jaw frame, means for pivotally mounting said lower jaw frame on the upper jaw frame to simulate the human jaw structure, a lower denture carried by the lower jaw frame, means for freely adjusting the position of the lower denture in a substantially vertical direction relatively to said lower jaw frame, and guiding means for confining the movement of the lower denture to a fixed substantially vertical direction relatively to the lower jaw frame while maintaining the initial occlusal surface alignment of the lower denture relatively to the lower jaw frame to simulate the displacement of an artificial lower denture in the human mouth upon shrinkage of the lower gums.

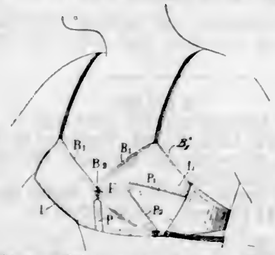
2,103,059

METHOD OF AND APPARATUS FOR OPERATING ELECTRIC DISCHARGE DEVICES

Leroy J. Buttolph, Grantwood, N. J., assignor to General Electric Vapor Lamp Company, Hoboken, N. J., a corporation of New Jersey

Application January 23, 1933, Serial No. 653,144
13 Claims. (Cl. 176—13)

1. In combination, an electric gaseous discharge device, a reactor which is adapted to be saturated in operation in series therewith, and an incandescent lamp in parallel with said reactor.



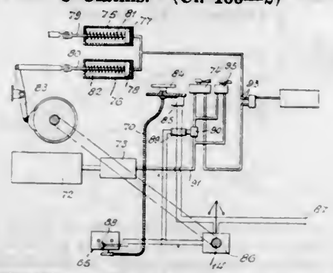
2,103,060

BRASSIÈRE

Marcel Cadolle, Paris, France

Application November 23, 1934, Serial No. 754,394
In France January 29, 1934
1 Claim. (Cl. 2—42)

In a brassière having a pair of shoulder straps and two side straps adapted to be attached to each other and two pockets for the breasts interconnected at the intermediate portion of the brassière, the combination, in each pocket, of a fabric having an edge at the side disposed along the bias and an upper peaked edge shaped as an inverted V to the apex of which one of said shoulder straps is attached, the other end of each shoulder strap being attached to one of the side straps, the lower edge of the pocket being cut on the bias of the fabric and having reinforcing stitching along the same, a side binding secured to the bias side edge of the fabric and a



pair of darts which extends radially toward the center of the pocket, said darts having their main edges cut at an angle to each other on the straight of the fabric, one dart extending from the lower reinforced edge of the brassière, one dart extending from the center of the pocket outwardly to said lower reinforced edge and the other dart extending from said center to said side binding, and both darts also converging toward said center in the direction of the straight of the fabric.

2,103,061

BRAKE SYSTEM FOR TRAINS

Friedrich Konrad Clar, Berlin-Hermsdorf, Germany, assignor to Rheinmetall-Borsig Aktiengesellschaft/Werk Borsig Berlin-Tegel, Berlin-Tegel, Germany, a corporation of Germany, and Carl Geissen, Berlin-Schoneberg, Germany

Application January 18, 1937, Serial No. 121,072
In Germany January 20, 1936
5 Claims. (Cl. 188—2)

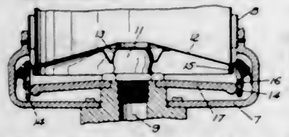
1. A braking system for trains, comprising in combination, a hydraulic brake, a frictional brake, and automatically operable means for applying said hydraulic brake only while the train is traveling at a high speed and for switching off said hydraulic brake and applying said frictional brake when the speed of said train has diminished to a predeterminable extent.

2,103,062

SHOE LAST CONSTRUCTION

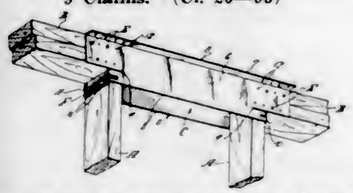
George C. Clark, Beverly Hills, Calif.

Application April 17, 1936, Serial No. 74,885
9 Claims. (Cl. 12—140)



1. A shoe last having a bottom face provided with a recess, a tacking element seated therein, said recess having a side wall provided with a

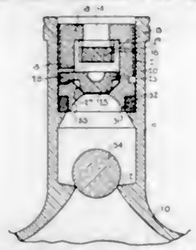
lug projecting interiorly of the recess and embedded in the tacking element, said lug having



a shoulder engaging the tacking strip below the outer edge of the side wall provided with the lug.

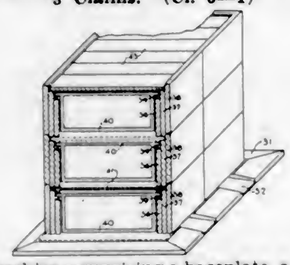
2,103,063
LUBRICATING DEVICE
Otto B. Clark, Chicago, Ill., assignor to The Lubrication Corporation, Chicago, Ill., a corporation of Delaware
Application September 5, 1936, Serial No. 99,509
11 Claims. (Cl. 221—47.1)

1. A lubricating device comprising, lubricant dispensing means, an interchangeable lubricant cartridge to supply lubricant to the dispensing means, a fastening member carried by the dispensing means and movable into and out of engagement with the cartridge to secure the cartridge to the dispensing means, a pivotally mounted disc having a cam portion engaging the fastening means to operate the same, and means for moving the disc.



2,103,064
STUD TIE
Rufus B. Clark, St. Louis, Mo.
Application November 9, 1936, Serial No. 109,854
9 Claims. (Cl. 20—95)

1. In combination with a series of studs as set up vertically in a wall and a plate secured horizontally across the upper ends of the studs, the said plate being cut out between an adjacent pair of studs, a tie bar secured horizontally across the upper ends of the plate bridging the gap in the latter, and tongues turned inwardly from the ends of the bar and secured to the studs.

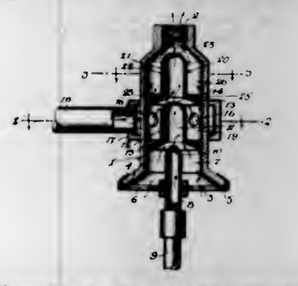


2,103,065
NONREFILLABLE BOTTLE
Samuel G. Conkling, Brooklyn, N. Y.
Application February 15, 1936, Serial No. 64,044
5 Claims. (Cl. 215—25)

1. In a device of the class described, a bottle having a body portion and a neck integral therewith, a cartridge-member mounted in said neck and made to form an integral part therewith, said cartridge-member having a chamber near the bottom thereof and an outlet from said chamber, a valve formed with an arm and reciprocatingly arranged in said chamber, the cartridge-member being made with fine tube-like recesses therein, vertically arranged between the outer surface of said cartridge-member and the neck of the bottle, one of said tube-like recesses penetrating to the chamber proper, said car-

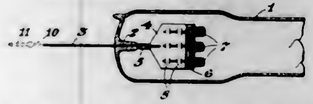
tridge-member being upon the upper part thereof formed with an outer annular recess communicating with the aforesaid tube-like recesses, and orifices horizontally extending from said annular recess to the chamber and connecting indirectly said vertical tube-like recesses with the latter, whereby to obtain an adequate air-inlet to facilitate the flow of the liquid in the bottle.

2,103,066
BEEHIVE
Einar Engelbrektsson, Brooklyn, N. Y., assignor of one-half to Eric Gross, New York, N. Y.
Application April 25, 1933, Serial No. 667,800
3 Claims. (Cl. 6—1)



1. A beehive comprising a baseplate, a rectangular four-walled housing, a detachable roof and removable vertical inset-frames suspended within the housing to form partitions and receive honey, respectively, the vertical partition-forming frames consisting each of a rectangular wooden frame, having an upper end and a lower horizontal bar, two vertical side bars, lateral suspension ears in elongation of the upper horizontal bar, groups of thin wires extending between the two lateral side bars, heavier wires at greater distances from one another extending from the upper horizontal bar to the lower horizontal bar, and distancing wedge shaped ledges and flat thickenings at the two sides of the vertical side bars to keep the partition forming frames in proper distance from the neighboring suspension frames.

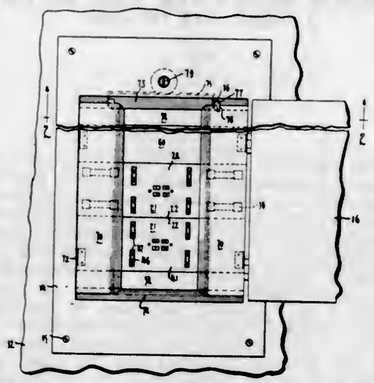
2,103,067
MIXING VALVE
Richard A. J. Evans, Chicago, Ill.
Application March 17, 1937, Serial No. 131,470
7 Claims. (Cl. 261—76)



1. An air mixing valve for oil and gas burners comprising a cylinder having a plurality of openings intermediate its length, a full opening at one

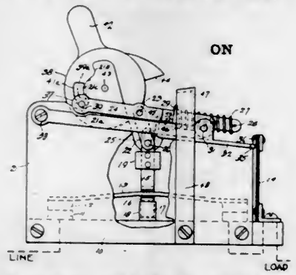
end and a restricted opening at the opposite end, an oil jet extending into said cylinder through said full open end adapted to discharge fuel under pressure, an air regulating shutter at said full open end for regulating the entrance of air around said jet, a primary mixing structure having a jet positioned in said cylinder and in line with said oil jet for receiving oil and air, said primary mixing structure having a discharge opening at the end opposite said oil jet of a size

smaller than the area covered by the fuel from said oil jet, and an auxiliary mixing structure having a jet in said cylinder spaced from said primary mixing structure, said auxiliary mixing structure having a discharge opening of less diameter than the area covered by the mixture discharged from the primary mixing structure, said opening being positioned to discharge through said restricted opening, said cylinder having air inlets intermediate its length for supplying said auxiliary mixing structure with air.



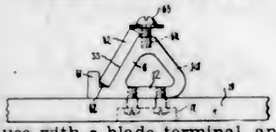
2,103,068
GASEOUS ELECTRIC DISCHARGE DEVICE
Adolf Fehse, Berlin, and Martin Reger, Berlin-Charlottenburg, Germany, assignors to General Electric Company, a corporation of New York
Application February 7, 1935, Serial No. 5,462
In Germany February 15, 1934
2 Claims. (Cl. 176—122)

1. A gaseous electric discharge device comprising a container, electrodes sealed therein, a gaseous atmosphere therein, one of said electrodes comprising a plurality of individual thermionic elements mounted in adjacent parallel positions, said thermionic elements being directly connected in parallel between a common pair of current leads sealed into said container.



2,103,069
PANEL BOARD AND PARTS THEREOF
William H. Frank, Clarence T. Hollingsworth, and Lawrence E. Fisher, Detroit, Mich.
Application December 26, 1935, Serial No. 56,227
4 Claims. (Cl. 247—10)

1. A panelboard comprising a panel having switches in a central stripe thereof and circuit protective means in side stripes thereof, a masking plate having a large opening exposing the panel with the edges of the opening adjacent edges of the panel, and means for covering the circuit protective stripes only comprising side cover plates within the masking plate opening and proportioned to extend over the circuit protective stripes only and movably mounted on side edges

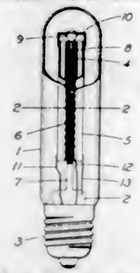


thereof, and a lock controlling said side cover plates only and accessible from in front of said masking plate.

2,103,070
CIRCUIT BREAKER
William H. Frank, Detroit, Mich., assignor to Bulldog Electric Products Company, Detroit, Mich., a corporation of West Virginia
Original application March 6, 1933, Serial No. 659,714. Divided and this application January 9, 1936, Serial No. 58,439
11 Claims. (Cl. 200—116)

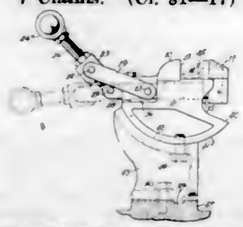
9. In a circuit breaker, a frame, a pivotally mounted link, a pivotally mounted handle pivotally connected thereto and operable to slide the link circularly about the pivotal mounting of the handle, a contact controller connected to the link, a spring for opposing movement of the link out of one position and positioned to be stressed by and on movement of the link out of that position and to move the link with a snap action into another position when so stressed and when the link has been moved partially out of the first position and towards such other portion by the handle, and means on the frame for guiding the link, in its movement, so that it slides radially of the handle pivot when it is moved circularly about the handle pivot by the handle, the spring being so positioned that it is stressed more by radial and circular movement of the link than by circular movement thereof alone, the pivotal mounting for the link being automatically releasable on a circuit abnormality to release the link and permit the spring to move it about its pivotal connection to the handle for circuit interruption.

2,103,071
ELECTRICAL CONNECTER
William H. Frank, Detroit, Mich.
Application March 7, 1936, Serial No. 67,741
7 Claims. (Cl. 173—259)



1. For use with a blade terminal, an electrical connecter comprising a body having a base engaging wall having a flange projecting upwardly therefrom and a flat face side wall also projecting upwardly therefrom, to a considerable extent, the adjacent faces of the base, the side wall, and the flange being proportioned and arranged to form an externally exposed pocket of proper dimension to fit closely the edge of the blade terminal, when the latter is inserted within the connecter and engages the aforesaid adjacent faces, and a screw threaded into the upper part of said wall at an obtuse angle to the terminal engaging flat face of the side wall so that its head causes the lower edge of the terminal to be wedged into the pocket and the flat surface of the terminal to be biased along and against the terminal engaging flat face of the side wall and towards the pocket.

2,103,072
DISTRIBUTION PANEL
William H. Frank, Detroit, Mich.
Application August 10, 1936, Serial No. 95,162
8 Claims. (Cl. 247—10)

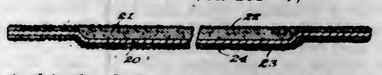


1. A panelboard comprising a panel of small cross sectional area, and a panel casing of uniform cross section considerably greater in length than the panel but only slightly greater in cross sectional area than the panel, to provide a panel enclosing portion and a panel pull box portion, the casing being made up of sheet metal conduit split longitudinally to provide a back section in which is seated the panel, and in which are laid the conductors whose terminals are connected to the panel, and a front section which forms a cover for the pull box portion and for the panel receiving portion of the back section, the front section being split transversely so that the pull box cover is separate from the panel cover, the panel cover being split longitudinally so that each part thereof, when open, exposes a narrow stripe of the panel, one narrow stripe of the panel comprising circuit protective parts arranged in a single vertical row, the other narrow stripe of the panel comprising switching parts arranged in a single vertical row.

2,103,073
GASEOUS ELECTRIC DISCHARGE LAMP DEVICE
Georg Galdies, Berlin-Pankow, Germany, assignor to General Electric Company, a corporation of New York
Application June 18, 1937, Serial No. 149,004
In Germany, June 24, 1936
1 Claim. (Cl. 176—122)

A cathode glow lamp comprising a tubular container, a gaseous atmosphere therein, electrodes sealed therein, one of said electrodes being a cylindrical mesh cathode, a cylindrical, slitted, sheet metal anode surrounding said cathode and being axially mounted with respect thereto, a rod extending along the axis of said cathode and being surrounded by said cathode and a luminescent material on said rod which material emits visible light under excitation by radiation from the cathode glow discharge between said electrodes.

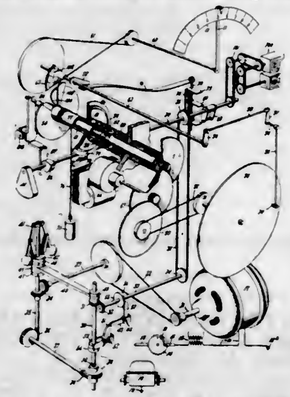
2,103,074
CLAMPING DEVICE
Ralph D. Gardner, Rockford, Ill., assignor to Whitney Metal Tool Company, Rockford, Ill., a corporation of Illinois
Application March 9, 1936, Serial No. 67,761
7 Claims. (Cl. 81—17)



1. A quick release type clamping device comprising, in combination, a fixed clamping jaw having an aperture extending therethrough, a co-operating movable jaw provided with a supporting pin slidably mounted in said aperture, said fixed jaw having a recess formed in the side thereof opposite said movable jaw, a plug slidably mounted in said recess, a threaded rod, means for pivotally connecting said threaded rod to the outer end of said plug, a member threaded on said rod, a link, means for pivotally connecting the opposite ends of said link to said member and to said supporting pin, and means including a compression spring interposed between said plug and the bottom of said recess for limiting the movement of said movable jaw toward said fixed jaw upon relative movement of said rod and said link.

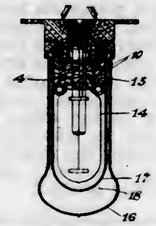
2,103,075
THERAPEUTIC PREPARATION AND METHOD OF MAKING IT
Edward A. Greenspon, Montreal, Quebec, Canada
No Drawing. Application November 23, 1936, Serial No. 112,425. In Canada May 26, 1934
14 Claims. (Cl. 167—74)

5. A method for obtaining a concentrated anti-anemic preparation from gastric material and substantially free from pepsin and like substances deleterious to the anti-anemic substance, which comprises treating fresh gastric material containing said substance with a pepsin extractant non-injurious to said anti-anemic substance to remove substantially all of the pepsin and like deleterious substances contained in the gastric material, separating off from the gastric material the said pepsin extractant with the pepsin and like deleterious substances associated therewith, and concentrating said treated gastric material.



2,103,076
SHINGLE
Norman P. Harshberger and Kathleen M. Harshberger, Scarsdale, N. Y., assignors, by direct and mesne assignments, to Bakelite Building Products Co. Inc., New York, N. Y., a corporation of Delaware
Application May 1, 1931, Serial No. 534,324
12 Claims. (Cl. 108—7)

5. A shingle element adapted for wide spaced assembly, comprising a preformed flexible fibrous base having integral portions thereof in different planes, certain of said portions creating opposite flanges of the shingle for side lapping with adjacent shingles in assembly, and another of said portions of the base between said flanges extending in a plane adjacent to that of the flanges and creating a projection extending along the central part of the shingle between the flanges and adapted to substantially prevent sagging in assembly, said base having a wear resistant surfacing upon its weather side and the shingle inwardly of the flange portions having a thickness greater than the flanges and said base and integral portions consisting of a sheet of substantially uniform thickness prior to forming.

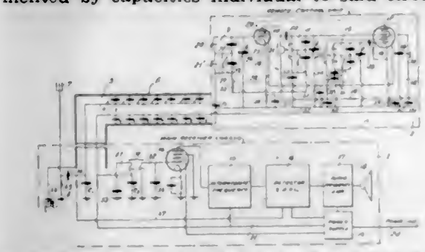


2,103,077
METER
William L. Herron, Hudson, N. Y.
Application September 24, 1936, Serial No. 102,370
16 Claims. (Cl. 73—205)

1. The combination in a device for indicating the speed of an element moving repeatedly over a predetermined path, an indicating member, a cam for determining the position of said indicating member, constant speed driving means for moving said cam at a constant speed from a predetermined starting position, actuating means for said indicating member movable into engagement with said cam to position said indicating member, a driving means for moving said indicating member actuating means into engagement with said cam, control means for said driving means operated by said moving element to start and stop said driving means to thereby position said indicating member each time said element moves a predetermined amount, whereby said member indicates the speed of said element in moving said predetermined amount, and means operated by said driving means for returning said cam to said predetermined starting position after adjustment of said indicating member for

subsequent operation by said constant speed driving means while said element moves another predetermined amount.

2,103,078
GASEOUS ELECTRIC DISCHARGE LAMP
Gilles Holst and Willem Uyterhoeven, Eindhoven, Netherlands, assignors to General Electric Company, a corporation of New York
Application October 30, 1934, Serial No. 750,713
In the Netherlands November 4, 1933
6 Claims. (Cl. 176—122)



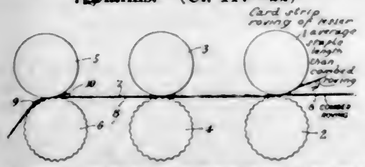
1. A lamp unit comprising in combination a gaseous electric discharge vapor lamp device and a heat conservator in which said lamp device is mounted, said lamp device comprising a container, electrodes sealed therein and a septum dividing the stem part of said container from the other parts thereof, the discharge path between said electrodes being in closer proximity to said septum than to the end parts of said container opposite said septum and said stem.

2,103,079
WAVE SIGNALING SYSTEM
John Kelly Johnson, Rye, N. Y., assignor to Hazeltine Corporation, Jersey City, N. J., a corporation of Delaware
Application November 15, 1934, Serial No. 753,103
4 Claims. (Cl. 250—20)

1. In a wave signaling system: a signal translating circuit tunable throughout a plurality of frequency bands, an antenna circuit spaced therefrom, said antenna circuit being capacitively reactive at the frequencies of tuning of said tunable circuit, a pair of cable conductors extending between said circuits, and means capacitively coupling said circuits comprising, the capacity

inherent between said cable conductors supplemented by capacities individual to said circuits

and bridged between said conductors thereat respectively.



2,103,080

PROCESS FOR PRODUCING LINEN-LIKE MATERIALS AND PRODUCTS THEREFROM

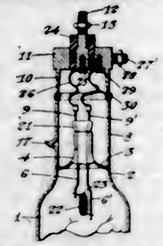
John Killars, Jr., Spartanburg, S. C., assignor, by mesne assignments, to Heberlein Patent Corporation, New York, N. Y., a corporation of New York

Application December 29, 1933, Serial No. 704,400

7 Claims. (Cl. 117—22)

1. A process for producing linen-like material from cotton which comprises taking two cotton rovings of unequal staple length, feeding the fibers of the rovings between rolls and separating the fibers of one roving at irregular intervals to form irregularly spaced neps and slubs and maintaining a substantially uninterrupted and unbroken feeding of the other roving so that it acts as a carrier to transport the neps and slubs formed, whereby the resulting combination of rovings shows irregularly spaced neps and slubs in the resulting product.

2,103,081



GASEOUS ELECTRIC DISCHARGE LAMP DEVICE

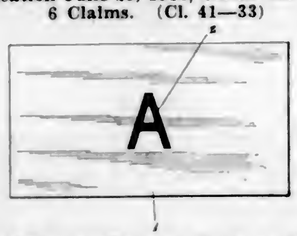
Hermann Krefft, Berlin-Friedrichshagen, Germany, assignor to General Electric Company, a corporation of New York

Application August 5, 1935, Serial No. 34,811

In Germany August 10, 1934

5 Claims. (Cl. 176—126)

1. A base for a gaseous electric discharge lamp device, said lamp device comprising a container having a stem protruding therefrom and a current lead of easily oxidizable material sealed into said stem and projecting therefrom, said base being a hollow, hermetically sealed vessel fused to said lamp container and enclosing said stem and the part of said lead projecting outwardly therefrom, said base having an electrical contact mounted thereon at the end thereof remote from said lamp container, the outwardly projecting part of said current lead in said base being attached to said contact, a portion of the structure comprising said lead and said base being flexible.



2,103,082

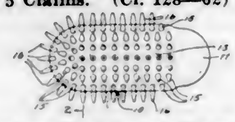
TRANSFER

Winthrop Stanley Lawrence, Rego Park, N. Y., assignor to Kaumagraph Company, New York, N. Y., a corporation of New York

Application June 25, 1934, Serial No. 732,351

6 Claims. (Cl. 41—33)

1. A heat transfer comprising a paper base having a marking, said marking being readily releasable from said base under heat and pressure and being fusible and stable at a temperature which is less than 250° C., said marking becoming substantially infusible when it is subjected to a temperature of 250° C. under pressure.



2,103,083

TEETH CLEANING AND GUM MASSAGING DEVICE

Frances I. Lynch, Yonkers, N. Y., assignor to Indexo Finger Tooth Brush, Inc., New York, N. Y., a corporation of New York

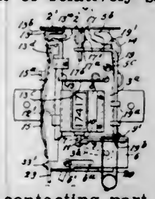
Application March 30, 1936, Serial No. 71,712

5 Claims. (Cl. 128—62)

3. A dental conditioning appliance comprising a flexible cot, a plurality of pointed projections having a uniform length on the front face of the cot, a plurality of pointed projections of a length greater than that of the first mentioned pointed projections forming a fringe about the area covered by the first mentioned projections, and a gum massaging area on the rear face of the cot.

2,103,084

FARE REGISTER



Soren Madsen, Bergenfield, N. J., assignor of one-fourth to Joseph F. O'Brien, Englewood, N. J.

Application October 19, 1935, Serial No. 45,734

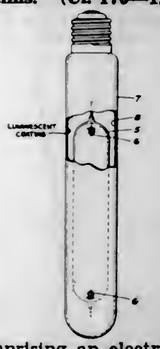
5 Claims. (Cl. 235—32)

1. In a fare register of the character specified, a casing having a coin-insertion slot, a counter-mechanism having character wheels and an actuating shaft, a pair of pivoted levers having coin-contact portions arranged at opposed ends and partially obstructing said coin-slot against the admission of coins of varying diameters, one

of said levers having a counter-actuating connection with said actuating shaft and a range of movement sufficient to produce plural or single registering movements of the counter-actuating shaft, said lever being movable by coins of varying diameters, and the other lever cooperating with said counter-actuating lever and having a coin-contacting portion spaced from the coin-contacting portion of said counter-actuating lever a distance in stationary position sufficient to cause a coin of relatively short diameter to

move the coin-contacting part of said counter-actuating lever to produce a plural registering movement of said counter-actuating shaft, latching means for retaining said cooperating lever in stationary position during insertion of a coin of relatively short diameter and releasable to cause movement thereof by a coin of relatively long diameter whereby said counter-actuating lever and said actuating shaft will be moved through a lesser distance to produce a single registering movement.

2,103,085



ELECTRIC LAMP

Alfred Hamilton McKeag and John Turton Randall, Middlesex, England, assignors to General Electric Company, a corporation of New York

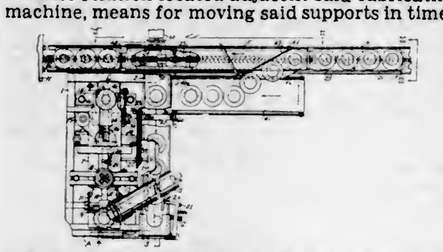
Application July 16, 1937, Serial No. 154,085

In Great Britain July 23, 1936

4 Claims. (Cl. 176—122)

2. A lamp comprising an electric gaseous discharge device containing mercury and having a coating of zinc-beryllium silicate in substantially the proportions indicated by the formula $BeO.ZnO.SiO_2$ together with 0.5% of manganese exposed to the radiations from said device, whereby the light emitted by said device when a discharge is produced therein is substantially white.

2,103,086



APPARATUS FOR MANUFACTURING POTTERY WARE

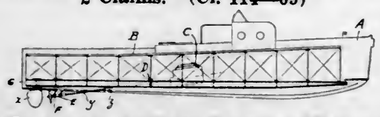
William J. Miller, Swissvale, Pa.

Application June 10, 1935, Serial No. 25,701

12 Claims. (Cl. 25—2)

1. Apparatus for the manufacture of pottery-ware comprising, in combination, a dryer having a conveyor therein and a plurality of removable mold supports, an automatic potteryware fabricating machine, conveying means on which a plurality of said mold supports may be arranged in endwise relation located adjacent said fabricating machine, means for moving said supports in timed

relation with the operation of said fabricating machine and means for automatically transferring molds from said supports to said machine for filling and means for transferring filled molds from said machine to said supports, said supports being replaced on said dryer conveyor when filled with filled molds.



2,103,087

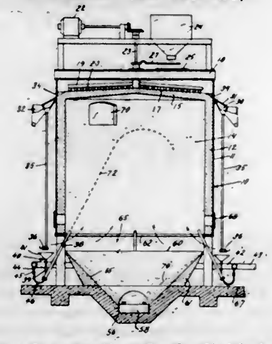
POWER BOAT

Benjamin W. Morris, Jr., Essex, Conn.

Application November 3, 1933, Serial No. 696,485

2 Claims. (Cl. 114—65)

1. In a power boat, a hull, a frame independent of the hull and extending fore and aft within the hull, non-rigid resilient means forming the sole connection between the frame and hull, a power plant mounted on the frame independent of the hull, a propeller shaft, inboard and outboard propeller shaft bearings, the power plant and propeller shaft bearings being mounted on said frame independent of said hull.



2,103,088

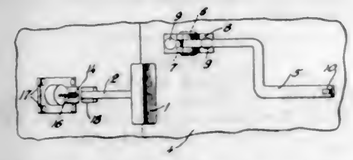
APPARATUS FOR TREATING ORES

Edwin J. Mullen, New Rochelle, N. Y., assignor to General Chemical Company, New York, N. Y., a corporation of New York

Application December 31, 1934, Serial No. 759,874

1 Claim. (Cl. 266—20)

Apparatus for roasting finely divided metal sulfides comprising a shell forming a vertically disposed combustion chamber, a plurality of sulfide



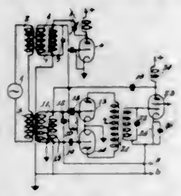
fines feeding nozzles spaced about the periphery of the shell adjacent the base thereof, said nozzles being inclined at a relatively high angle to the horizontal and opening into the combustion chamber at points higher than the inlet ends of the fines feeding nozzles, means for feeding fines into the feed nozzles to charge fines into the combustion chamber, a hopper-shaped hearth positioned beneath the combustion chamber, the upper edge of said hearth being spaced substantially from the lower edge of the shell to thereby provide a peripheral air inlet for the combustion chamber, means for discharging cinder from the hearth, and a gas outlet at the top of the combustion chamber for withdrawing gaseous products of combustion.

2,103,089

AUTOMOBILE BRAKE CONTROLLING DEVICE

Antoni Pichucki, Sydney, Nova Scotia, Canada

Application February 27, 1937, Serial No. 128,213
1 Claim. (Cl. 70—202)



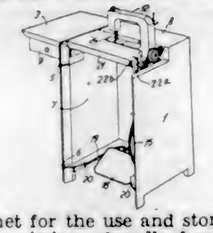
In a vehicle equipped with a pedal controlled braking system, a device to lock the brake pedal in a braking position, comprising a base to one side of the pedal and rearwardly thereof, a crank-shaped locking member hinged therein and comprising a hinged base portion and laterally offset pedal-engaging portion, provided with means to interlock with locking means above said pedal, said crank-shaped locking member being mounted in such a way as to leave foot space in front of the pedal free of any obstructions.

2,103,090

MEANS FOR AND METHOD OF GENERATING ELECTRICAL CURRENTS

Jozef Plebanski, Warsaw, Poland, assignor to Radio Patents Corporation, New York, N. Y., a corporation of New York

Application November 27, 1935, Serial No. 51,821
In Poland December 5, 1934
12 Claims. (Cl. 250—36)



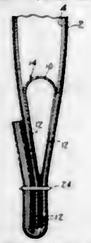
12. A method of producing periodic peak voltages comprising the steps of generating a pair of substantially sinusoidal currents of like frequency, mutually modulating said currents to derive therefrom a resultant current of distorted wave shape, amplifying the resultant current and regeneratively reacting upon one of said first currents with amplified energy derived from said resultant current.

2,103,091

CABINET FOR THE USE AND STORAGE OF AN INSTRUMENT

Ramon Casas Robert, Barcelona, Spain

Application December 1, 1936, Serial No. 113,541
In Spain February 1, 1936
2 Claims. (Cl. 312—30)



1. A cabinet for the use and storage of an instrument, consisting of walls forming a casing open at its front and top, an instrument connected with an upper stationary part of the casing by means whereby it may be suspended from said part in one position and may be swung therefrom to a raised position for use, means for supporting the instrument in the raised position, a door having a table integral therewith hinged to the casing on a vertical axis, whereby the door and table may be swung from a position in which they close the cabinet into a position wherein the door lies parallel and adjacent one of the sides of the casing and the table forms an extension of the top face of the cabinet.

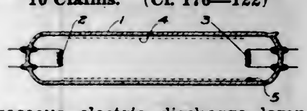
2,103,092

BAG AND METHOD OF PRODUCING THE SAME

Francis T. Robinson, Rockville Centre, N. Y., assignor to Arkell Safety Bag Company, New York, N. Y., a corporation of New York

Application August 19, 1933, Serial No. 685,808
8 Claims. (Cl. 93—35)

1. The method of forming a seam for bags of the class described which comprises turning outwardly opposed marginal portions of the walls of the bag, securing a strip by means of adhesive over said outwardly turned portions with the longitudinal central portion of the strip left unsecured, bringing said outwardly turned portions together with the strip folded over upon itself between them, folding over the longitudinal edge portions of the two walls against a side of the bag, and stitching the seam by means of a line of stitches extending through said folded edge portions and said strip, the line of stitches being spaced a distance outwardly from the edges of said unsecured central portion of the strip.



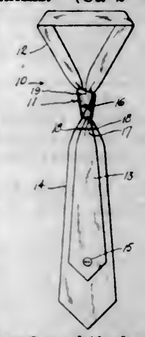
5. A bag having its edges closed by a seam comprising a strip folded longitudinally upon itself and secured by adhesive to the inner sides of the walls of the bag, with its longitudinal edges spaced inwardly from the edges of the bag and with the central portion of the strip innermost and left unsecured, said edges of the bag being folded over against the side of the bag, and a line of stitches extending through said secured edges and through the folded portions of the strip, said line of stitches being spaced outwardly from said unsecured portion of the strip.

2,103,093

GASEOUS ELECTRIC DISCHARGE LAMP DEVICE

Alfred Ruttenauer, Berlin-Halensee, Germany, assignor to General Electric Company, a corporation of New York

Application December 2, 1936, Serial No. 113,897. Renewed August 24, 1937. In Germany May 30, 1936
10 Claims. (Cl. 176—122)



1. A gaseous electric discharge lamp device comprising a container, electrodes sealed therein, a gaseous atmosphere therein comprising mercury vapor and a coating of cadmium silicate associated with said lamp, said cadmium silicate containing from 0.5 to 1% manganese.

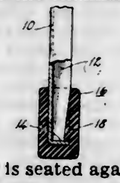
2,103,094

FOUR-IN-HAND NECKTIE

Alfred Scharlin, Brooklyn, N. Y.

Application November 2, 1936, Serial No. 108,790
6 Claims. (Cl. 2—150)

1. A four-in-hand necktie having a neckband portion, front and rear tie end portions integral therewith, a slip knot formed from said portions and maintaining said portions in relation to each other, said knot including a plurality of plies or turns transverse of the front and rear tie end portions, the front tie end extending downward through the knot, and means for interconnecting certain of said turns adjacent to the lower end of the knot to prevent opening of the knot and to permit the knot to be tightened by pulling downward on the front tie end, the said plies being otherwise free of each other to facilitate shaping of the knot.



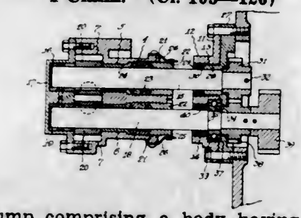
2,103,095

CUSHION FOOT FOR CHAIRS

George D. Schermerhorn, Reading, Mich.

Application May 1, 1935, Serial No. 19,263
2 Claims. (Cl. 45—137)

1. In combination with a leg channel shaped in cross section having an end wall closing said channel, a foot structure hollowed out to be received over the end of the leg and provided with an interior abutment spaced above the bottom of the foot and projecting over the top of the end wall of the leg into the channel thereof when the



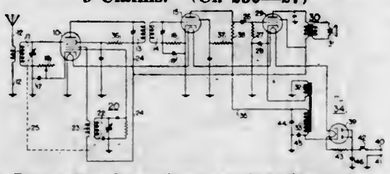
end wall of the leg is seated against the bottom of the foot.

2,103,096

WATER PUMP THRUST BEARING

David Sherwood, Grosse Pointe Park, Mich., assignor to Sherwood Brass Works, Detroit, Mich., a corporation of Michigan

Application November 25, 1935, Serial No. 51,343
1 Claim. (Cl. 103—126)



A pump comprising a body having a recess with liquid ports in one end and a pair of parallel bores opening thereinto, a back plate having bores therein, integral yokes supporting said body and plate substantially spaced apart and with respective bores therein co-axial, shafts extending through respective bores and said recess, gear pump members on said shafts within said recess, a cover plate for the recessed end of said body, said cover plate having bearings therein rotatably supporting adjacent ends of said shaft, bearings and packing elements in the bores in said body, end thrust bearings on at least one of said shafts and engaging shoulders on said shaft and said base plate, a supplemental base plate secured to the first base plate and engaging said end thrust bearings to lock the assembly together, and meshing gears on said shafts disposed externally of the supplemental base plate.

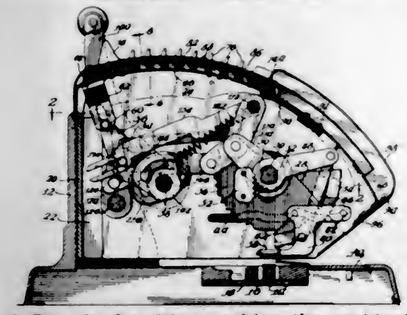
2,103,097

POWER SUPPLY SYSTEM FOR SIGNAL RECEIVERS

Benjamin Singer, Bronx, N. Y., assignor to Hazeltine Corporation, a corporation of Delaware

Application June 1, 1936, Serial No. 82,776
9 Claims. (Cl. 250—27)

7. In a signal receiver, a plurality of coupled vacuum tubes each including an anode, a cathode and a control electrode, a translating device including a pair of field windings, a pair of power input terminals adapted to be connected to either an alternating or direct current source of low voltage, and a circuit including the space current paths of said tubes in parallel, said circuit including a unidirectionally conductive device and one of said field windings connected in series between one of said terminals and a common



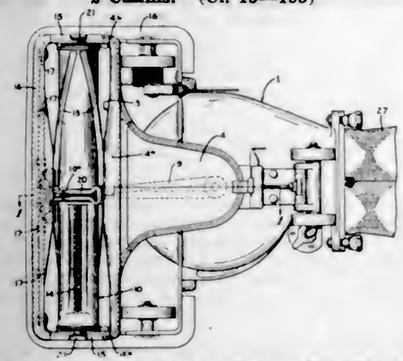
connection to the anodes of said tubes, whereby said one of said field windings is energized and is effective to smooth the space current of said tubes when said input terminals are connected to an alternating current source, and the other of said field windings being common to the anode-cathode and control electrode-cathode circuits of only one of said tubes, whereby it is energized by the space current flowing through said tube and the voltage developed thereacross provides a bias for said one of said tubes.

2,103,098

CHECK WRITER

Ole Slettevold and Clarence W. Johnson, Chicago, Ill., assignors to The Hedman Manufacturing Company, Chicago, Ill., a corporation of Illinois

Application February 15, 1934, Serial No. 711,299
15 Claims. (Cl. 101—93)



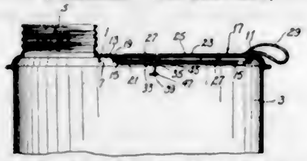
1. In a check writing machine, the combination of a printing couple, set-up mechanism, restoring mechanism for the latter, an operating handle, means for operating said printing couple upon movement of said handle in one direction from its normal position, and means for operating said restoring mechanism upon movement of said handle in a different direction from its normal position.

2,103,099

SUCTION CLEANER

Charles L. Shank and Conrad W. Traut, North Canton, Ohio, assignors to The Hoover Company, North Canton, Ohio, a corporation of Ohio

Application January 17, 1936, Serial No. 59,509
2 Claims. (Cl. 15—155)



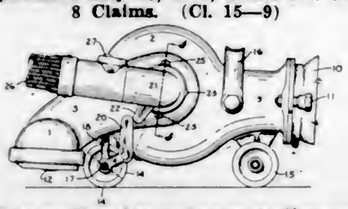
1. In a suction cleaner, the combination of a nozzle and suction creating means communicating with said nozzle, the latter having a downwardly opening mouth gradually increasing in width from its central portion outwardly toward its ends to form widened end portions of uniform width.

2,103,100

STOVE TOP

Sam Strano and Reinold E. Gehne, St. Louis, Mo., assignors to Jackes-Evans Manufacturing Company, St. Louis, Mo., a corporation of Missouri

Application February 3, 1937, Serial No. 123,831
7 Claims. (Cl. 126—217)



1. In a sheet metal stove, a sheet metal top having an opening, a downwardly extending sleeve within said opening and an inwardly extending flange from said sleeve, a sheet metal lid having a downwardly extending flange adapted to telescope said downwardly extending sleeve and rest upon said inwardly extending flange, a member connected to said top and presenting a hole inwardly of said inwardly extending flange, and a pin attached to said lid and extending through said opening, said pin being of a length adapted to permit of raising the lid from said opening and rotating it laterally on the stove top, and means at the end of the pin adapted to hold it captive within said opening and during rotation of the lid.

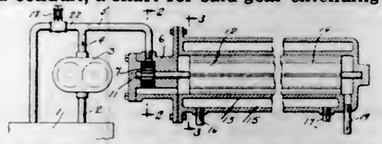
2,103,101

SUCTION CLEANER

Charles H. Taylor, North Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio

Application May 18, 1936, Serial No. 80,275
8 Claims. (Cl. 15—9)

1. In a suction cleaner having suction-creating means, a surface contacting agitator, and a body including a dusting tool seat; means to support said agitator above a surface covering undergoing cleaning, means to adjust said supporting means to raise and lower said agitator and a movable member obstructing said dusting tool seat, said movable member being connected to said supporting means and movable by manual adjustment thereof to a non-obstructing position to permit the attachment of a dusting tool unit to said seat.



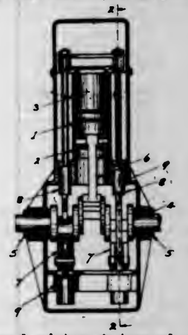
2,103,102

HEAT EXCHANGER

Ralph S. Thoresen, Darien, Conn., assignor to Petroleum Heat and Power Company, New York, N. Y., a corporation of Delaware

Application May 9, 1936, Serial No. 78,745
6 Claims. (Cl. 257—74)

1. In a heat exchange apparatus the combination of a reservoir of fluid to be treated, a heat exchange chamber, a housing therefor, a driven pump for transferring the fluid from the said reservoir to said chamber, a conduit leading from the reservoir to said pump, a conduit leading from said pump to said heat exchange chamber, a motor gear in said housing in communication with said conduit, a shaft for said gear extending into



said chamber, a rotor mounted on said shaft, the fluid from said conduit driving said motor to rotate said rotor, said rotor having projections on its surface in frictional engagement with the inner walls of the chamber whereby to circulate the fluid in said chamber and to maintain the walls free of deposits.

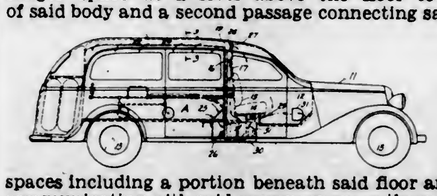
2,103,103

INTERNAL COMBUSTION ENGINE

Sydney J. Waters, Santa Monica, Calif.

Application August 17, 1934, Serial No. 740,254
5 Claims. (Cl. 123—51)

4. An opposed piston internal combustion engine comprising a crankcase, a cylinder open at its ends arranged upon the crankcase, a multiple throw crankshaft rotatably mounted on suitable bearings within the crankcase, other bearings or guides within the said crankcase positioned on that side of the crankshaft opposite the cylinder, a pair of oppositely reciprocating pistons within the cylinder, a connection directly connecting the inner piston with the crankshaft, yokes or annuli surrounding the crankshaft and having diametrically disposed extensions and mounted at opposite sides and parallel to the axis of the cylinder, the outer extension of said yokes or annuli connected to the outer piston, and the inner extension of said yokes or annuli reciprocally mounted on the guides within the crankcase, connecting links mounted on the outer throws of the crankshaft and pivotally connected to the inner extension of the yokes or annuli whereby the angularity effect of the connecting rods on the travel of the pistons is the same.



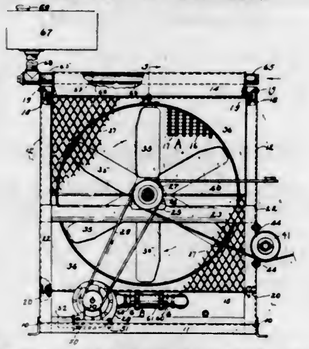
2,103,104

AIR CONDITIONER FOR VEHICLE BODIES

Fred M. Young, Racine, Wis., assignor to Young Radiator Company, Racine, Wis.

Application August 21, 1933, Serial No. 686,025
10 Claims. (Cl. 62—117)

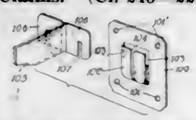
1. In a passenger automobile of the closed body type comprising a front driver's compartment and a rear passenger compartment with a partition between said compartments and a seat in said driver's compartment adjacent said partition, the combination of an air space adjacent the floor of said body and extending beneath said seat, a passage connecting said air space and passenger space at a level above the floor level of said body and a second passage connecting said



spaces including a portion beneath said floor and communicating with said passenger space through an opening in the floor of the latter, mechanical refrigerating apparatus including a cooling device in said air space and air moving means in said air space for drawing air into the latter through the last mentioned passage and returning it to said passenger space through the first mentioned passage.

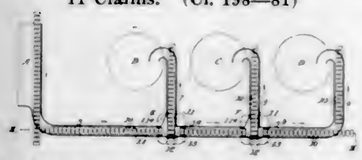
2,103,105

RADIATOR



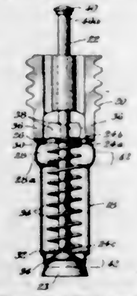
Fred M. Young, Racine, Wis.

Application April 5, 1937, Serial No. 134,928
6 Claims. (Cl. 257—259)



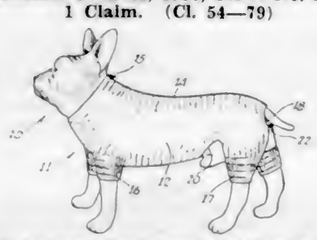
1. A device of the class described, comprising side base members, vertically positioned channels secured to the front end of said base members and having their flanges turned inwardly, a radiator core comprising upper and lower headers having tubes therebetween and a multiplicity of fins through which said tubes extend, one of said headers at its ends being secured to said channels, the ends of the other header having brackets which are slidably embraced by said channels, vertically positioned supplemental frame members secured to the rear end of said base members and extending vertically therefrom to a point midway said channels and secured thereto and having a connecting brace member between the upper ends thereof, said brace member adapted to rotatably support a fan midway the ends thereof, a transverse member secured to the rear end of said base, a multiple V belt sheave secured to the rear end of the shaft of said fan, a cooling liquid circulating pump having a V belt sheave and a belt forming an operative connection to one of the grooves of said fan sheave, a main belt idler sheave secured to one of said vertical members having means for vertical adjustment, said pump having a tube connection to said lower header.

2,103,106
BRACKET DEVICE
Anton Yurkovitch, Pittsburgh, Pa.
Application February 23, 1937, Serial No. 127,214
3 Claims. (Cl. 248—224)



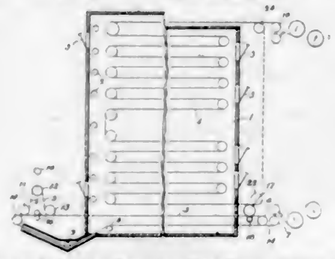
1. A bracket device comprising a plate-like member adapted to be attached to a support and having a bulged out pocket formed therein, said pocket having a narrow central slot extending throughout its length and having slots extending partway down the sides thereof and an interlocking member composed of a body portion of doubled sheet material with lateral extensions having slots extending partly up therethrough and spaced from the doubled sheet material body portion a distance which is equal to the distance of the side slots from the central slot of said pocket.

2,103,107
CONTAINER CONVEYER AND DISTRIBUTOR
Christian N. Bergmann, Pittsburgh, Pa., assignor of two-sixths to Charles M. Clarke, Sewickley, Pa.
Application September 11, 1936, Serial No. 100,304
11 Claims. (Cl. 198—81)



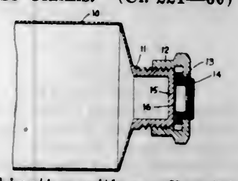
11. A bridge member for horizontal longitudinal and lateral conveyers having a plane upper surface and oppositely located clearance openings for the terminals of the longitudinal conveyers and a clearance opening for the terminal of the lateral conveyer extending between said openings.

2,103,108
PNEUMATIC VALVE
Lewis C. Broecker, Bridgeport, and John Ferguson, Southbury, Conn., assignors to Bridgeport Brass Company, Bridgeport, Conn., a corporation of Connecticut
Application December 29, 1932, Serial No. 649,254
Renewed May 18, 1937
15 Claims. (Cl. 152—12)



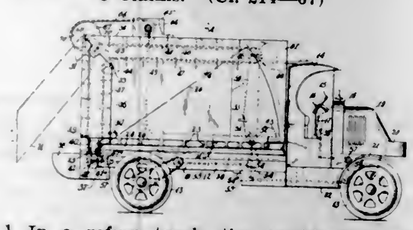
1. In combination with a valve stem having an internal, tapered, annular seat; a valve inclosing a tubular metal barrel whose side wall is outwardly bulged to form an outwardly projecting, annular, thin-walled corrugation at a zone thereof adapted to engage the tapered annular seat and become peripherally conformed thereto when the barrel is forced endwise in the valve stem.

2,103,109
ANIMAL GARMENT
Michael De Mar, New York, N. Y.
Application June 24, 1937, Serial No. 150,072
1 Claim. (Cl. 54—79)



A dog garment comprising a flat body member having parallel side edges and a front and a rear edge, said side edges having complementary fasteners secured thereto and a slider for actuating said fasteners, said body member having a pair of similar apertured foreleg-receiving portions symmetrically positioned intermediate a central line drawn transversely of the garment and said front edge and symmetrically positioned intermediate a line drawn centrally longitudinally of the garment and said parallel side edges, the rear edge of the garment being cut away along said central longitudinal line, said cut away portion being characterized by a pair of apertured rear leg-receiving portions extending from said rear edge inwardly of the garment, said body member having a cut away portion inwardly of said rear leg-receiving portions, and a strap member secured to said rear edge intermediate said rear leg-receiving portions and said parallel edges.

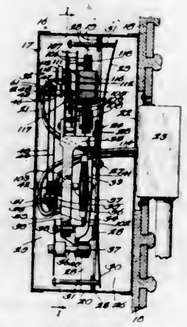
2,103,110
VERTICAL DRIER
Charles A. Dickhaut and Sterling W. Warner, New Brunswick, N. J., assignors to John Waldron Corporation, New Brunswick, N. J., a corporation of New Jersey
Application April 11, 1936, Serial No. 73,878
8 Claims. (Cl. 34—48)



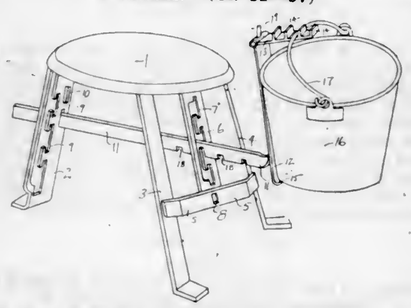
1. In a drier, a drying chamber, a plurality of carriers having mechanisms for gripping by one edge a vertical web of material and transporting the same through said chamber, means for transferring said web from one carrier to another, and means for operating said carriers at different speeds.

2,103,111
PACKAGE FOR PLASTIC MATERIALS
Edward B. Ekdahl, Irvington, N. J., assignor to Sefco Inc., Newark, N. J., a corporation of New Jersey
Application June 22, 1935, Serial No. 27,843
13 Claims. (Cl. 221—60)

1. In combination with a collapsible container for plastic material having a body portion and a neck, a cap for said neck, and a relatively inflexible nozzle member removably held in substantially fixed relation to said neck by said cap.



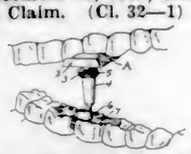
2,103,112
REFUSE TRUCK
Joseph Goodman, New York, N. Y., assignor to Automatic Truck Loader Corporation, New York, N. Y., a corporation of Delaware
Refiled for abandoned application Serial No. 513,860, February 6, 1931. This application July 31, 1937, Serial No. 156,734
5 Claims. (Cl. 214—67)



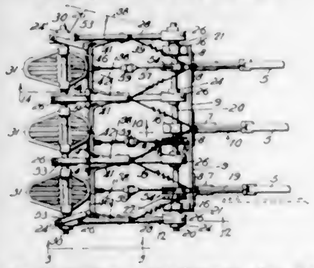
1. In a refuse truck, the combination of a truck body, means for tilting the body to dump from the rear, a loading conveyor extending across the top and rear side of said body, rack teeth upon said truck and means upon said truck body and engaging said rack teeth for automatically moving the conveyor section on the rear of the body away from the rear to allow dumping, comprising a stationary rack with a center of curvature corresponding with the pivot point of the truck body, a pinion in mesh with said rack, and a transmission system connected with said pinion and terminating in a sprocket wheel connected with a chain engaged over another sprocket upon a pintle shaft pivotally supporting the rear portion of said loading conveyor, and levers connected with said pintle shaft and said rear section for moving the rear section away from the rear of the body of the truck upon tilting of said body.

2,103,113
REGULATING APPARATUS
John C. Hornung, Glencoe, Ill., assignor to Illinois Engineering Company, Chicago, Ill., a corporation of Illinois
Application June 21, 1935, Serial No. 27,650
6 Claims. (Cl. 200—139)

1. In a switch of the class described, a contact arranged laterally of and rotatable about an axis, means to rotate the contact at a given rate, a switch member movable back and forth between limits, means for controlling movement of the member into various positions between its limits, and two resilient strips mounted on the member and extending therefrom in spaced relation and having free end portions respectively arranged at opposite sides of the path of the contact and normally positioned to allow of rotation of the contact between them when the member is at a neutral position between its limits, said end portions extending angularly toward the path of the contact for engagement with the contact so as to be deflected thereby on the member during an interval of each revolution of the contact when the member is displaced from its neutral position and so that either end portion will project into the path of the contact an extent proportional to the amount of displacement of the member from its neutral position to vary the duration of the engagement with the contact accordingly.

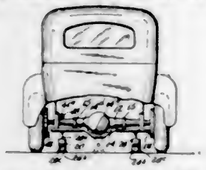


2,103,114
MILKING STOOL
Curtis A. Loveland, Youngstown, Ohio
Application July 3, 1936, Serial No. 88,760
7 Claims. (Cl. 31—57)



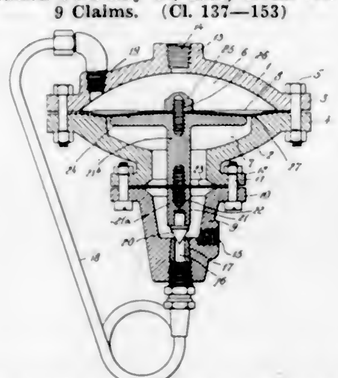
1. In a milking stool comprising a seat member, three legs supporting said seat member, a brace and a vertical bar positioned between two of said legs, said vertical bar having a plurality of notches therein, and the remaining one of said legs being provided with a plurality of openings, a notched adjustment bar slidably maintained through one of the said notches and one of said openings, an upright member attached to one end of said adjustment bar, a member hingedly attached to the upper end of said upright member and having a plurality of catches formed thereon and adapted to receive the bail of a pail, and an upturned end formed on the lower end of said upright member for receiving and holding the bottom of the said pail in position.

2,103,115
DENTAL JACK
Dan D. Mizzy and David L. Durst, Sacramento, Calif.
Application December 20, 1935, Serial No. 55,435
1 Claim. (Cl. 32—1)



A dental jack comprising a base member which is U-shaped in cross section to receive and retain a molding compound whereby the base may be seated and retained with relation to selected teeth of one jaw, a threaded pin secured to the base, a threaded sleeve adjustable thereon, and a pin on the end of the sleeve, said pin terminating in an abrupt end relatively small in cross-section, said pin end being adapted to engage a small area on the occlusal surface of a casting which is being filled or cemented into a cavity of a tooth of the other jaw.

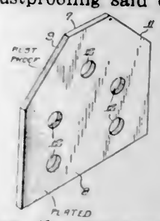
2,103,116
DAM FORMING DEVICE FOR LISTERS
Charles T. Peacock, Arriba, Colo.
Application April 7, 1936, Serial No. 73,101
57 Claims. (Cl. 97—55)



1. In a damming attachment for listers, a frame having two spaced parallel shafts, one of which is rotatably connected with the lister, an equal number of similarly spaced bearings on each shaft, corresponding bearings forming pairs, a bar connected between the bearings of each pair and a pivoted connection between the ends of the bars and the bearings whereby the frame formed by the shafts and the bars can be shifted from a rectangular parallelogram to a rhomboid.

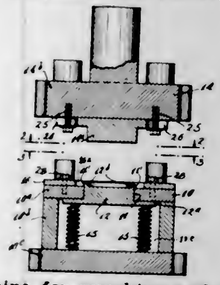
2,103,117
JACK ATTACHMENT FOR MOTOR VEHICLES
Abraham Pearlman, Brooklyn, N. Y.
Refiled for abandoned application Serial No. 104,948, October 10, 1936. This application June 23, 1937, Serial No. 149,909
4 Claims. (Cl. 254—86)

1. In conjunction with the axle of a motor vehicle, a track along the length thereof, a follower on said track, a jack hingedly mounted on said follower so as to be capable of extending downwards or horizontally, a clip for releasably holding said jack in the horizontal position, means for holding said follower from moving along said track when said clip operates, and means for holding said follower from moving along said track when said jack is extended vertically downwards.



2,103,118
VACUUM VALVE
Gregory A. Petroe, Niagara Falls, N. Y., assignor to The Mathieson Alkali Works, Inc., New York, N. Y., a corporation of Virginia
Application February 29, 1936, Serial No. 66,410
9 Claims. (Cl. 137—153)

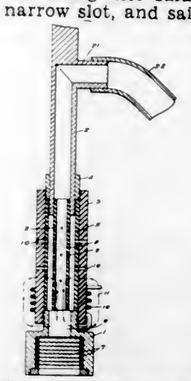
1. A safety valve for preventing the development of a sub-atmospheric pressure in a system, which comprises a housing, resilient diaphragm means having substantially the same effective area at each side sub-dividing the housing into a pair of chambers, each chamber being provided with a port, one port adapted to be connected to the system and the other open to the atmosphere, a passage independent of said ports and leading from one chamber to the other, valve means controlling said passage and including a movable valve member and a valve seat, said movable valve member having a stem with a head contacting with the diaphragm means, a connection between said diaphragm means and said stem, said diaphragm means under normal operating conditions acting through said connection to maintain said valve member on its seat to close said passage, and means formed on the inner wall of said housing for engaging said diaphragm means, said head and said last-mentioned means supporting the diaphragm means throughout substantially the entire area of one face thereof when the movable valve member is seated.



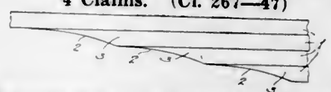
2,103,119
NONCORRODIBLE OBJECT AND METHOD OF PRODUCING SAME
Frank P. Romanoff, Chicago, Ill., assignor to Apollo Metal Works, Chicago, Ill., a corporation of Illinois
Application April 23, 1936, Serial No. 75,921
1 Claim. (Cl. 148—6)

The method of making a non-corrodible sheet metal article which comprises producing by electrolytic deposition upon the exposed portions of a metal sheet a metal coating resistant to attack by a rustproofing phosphate base solution, fabricating the thus electroplated sheet to form an article of the desired shape in which portions of the base metal of the fabricated sheet are left exposed, and rustproofing said exposed portions

without affecting the previously electroplated portions of the article by immersing the article in a rustproofing phosphate solution.



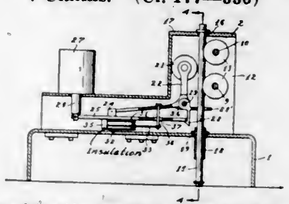
2,103,120
HEEL-BREAST COVER CUTTING AND SKIVING DEVICE
Louis Sabo and Julius Polkovics, Bronx, N. Y., assignors, by direct and mesne assignments, to Marvel Shoe Machinery Corporation, New York, N. Y.
Application November 12, 1936, Serial No. 110,438
2 Claims. (Cl. 12—17)



1. A machine for punching and tapering the heel breast covering portion of shoe soles comprising a female die having an opening formed to the shape of the proposed punched heel covering portion and having a cutting edge, a grooving element mounted within said opening and resiliently urged upwards slightly above said cutting edge, and a male die cooperative with said female die and forcing a shoe heel covering portion against said grooving element and then punching out the periphery of the grooved area to shape the heel covering portion with a bevelled edge, said grooving element having straight outer sides and projecting edges on the inner side which are inclined, and a cup shaped section within said inclined sides having outer sides in intimate contact with the inclined sides and inner sides at a different inclination in relation to the straight sides of said grooving element.

2,103,121
CIRCUIT INTERRUPTER
Joseph Slepian, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Original application January 27, 1930, Serial No. 423,660, now Patent No. 2,084,979, dated June 22, 1937. Divided and this application May 13, 1937, Serial No. 142,360
9 Claims. (Cl. 200—147)

1. In a circuit interrupter, means of insulating material including inner and outer members having an endless annularly-shaped narrow slot therebetween, a terminal member, a hollow tubular electrode extending into said endless annularly-shaped narrow slot, and said tubular electrode being slidable over said inner member away from said terminal member for drawing an arc in the endless slot.

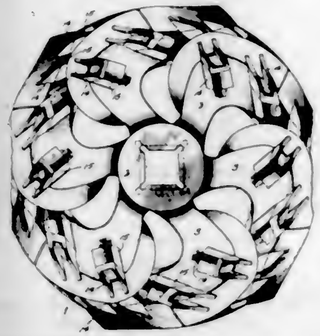


2,103,122
LAMINATED SPRING
Helmuth Stark, Berlin-Charlottenburg, Germany, assignor to Hoesch-KölnNeuessen Aktiengesellschaft für Bergbau und Hüttenbetrieb, Dortmund, Germany, a German company
Application June 27, 1935, Serial No. 28,709
In Germany June 29, 1934
4 Claims. (Cl. 267—47)

1. A laminated spring, comprising a plurality of spring leaves, the leaf ends of which are tapered in thickness in a concave manner.

2,103,123
ANNUNCIATOR
Leo J. Stevens, San Francisco, Calif.
Application May 15, 1933, Serial No. 671,038
7 Claims. (Cl. 177—336)

1. In combination with an elevator signal system including a push button and a signal light electrically connected therewith to be illuminated whenever the button is actuated, of a constant running motor, an interrupter attached thereto, rollers driven by the motor, a rod to be elevated by said rollers, an idler roller swingingly supported adjacent said rod, an electromagnet electrically connected with the push button to swing said idler roller into contact with the rod and to move the rod into engagement with the driving rollers to elevate the rod through a selected path of travel, and means associated with said rod for simultaneously disconnecting the idler roller from contact therewith when the rod reaches a



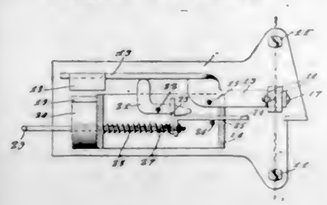
selected point in its travel and to allow the rod to drop, and for placing the interrupter in circuit with the light, to cause said light to flash at intervals.

2,103,124

CUTTER HEAD FOR SUCTION DREDGES

William H. Stires, High Bridge, N. J., assignor to Taylor-Wharton Iron & Steel Company, High Bridge, N. J., a corporation of New Jersey

Application August 3, 1934, Serial No. 738,364
1 Claim. (Cl. 37—67)



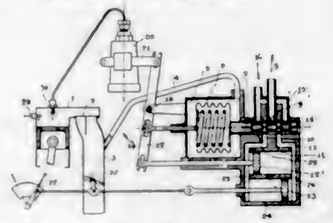
In a cutter head for suction dredges, the combination comprising a spider having a hub and a ring integrally joined by arms, and cutting blades detachably mounted on the arms and applied as aligned separable segments in edge contour fitting relation to the leading edges of the arms, the segments having paired lateral projections, and the arms having complemental recesses to establish an edge lock, said projections being continued as offset abutments with reversely ranging webs and shanks, and complemental offsets or abutments on the arms and having slots to accommodate the shanks, and means for tightening the segments by relatively securing the abutments.

2,103,125

MAGNETIC THREAD CLEANER

Nicholas Stoddard, Durham, N. C.

Application June 1, 1937, Serial No. 145,856
1 Claim. (Cl. 28—64)



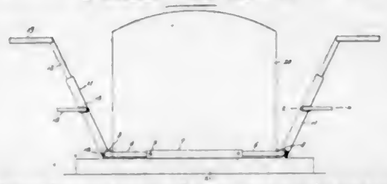
A thread cleaner comprising a support, thread guides on the support, a feeler lever pivoted on the support, feeler blades on the lever responsive to imperfections encountered in the thread to rock the lever, an armature on the opposite end of the lever, a magnet on the support adapted to attract the armature and accelerate rocking movement of the lever, a spring pressed knife slidably mounted on the support, and a dog pivoted on the support and normally holding said knife cocked, said dog being adapted to be struck and dislodged by rocking movement of the lever to free the knife for severing the thread contiguous to said imperfections.

2,103,126

DEVICE FOR AUTOMATICALLY REGULATING THE AMOUNT OF FUEL INJECTION

Shuichi Sugihara, Toda-machi, Naka-ku, Nagoya, Japan, assignor to Mitsubishi Jukogyo Kabushiki Kaisha, Tokyo, Japan

Application December 16, 1936, Serial No. 116,231
In Japan December 30, 1935
1 Claim. (Cl. 123—139)



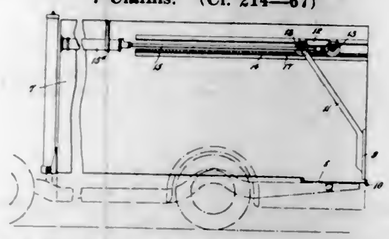
A device for automatically regulating the fuel supply comprising a bellows adapted to expand or contract responsive to the pressure of the air to be sucked into the engine cylinder, a distributing valve connected to said bellows for distributing oil under pressure, fuel injection means provided with regulating mechanism, a servo-motor including a cylinder and a piston controlled by said distributing valve for actuating the fuel injection regulating mechanism, and an accelerating device connected with the servo-motor piston comprising an auxiliary cylinder, an accelerating piston connected to the air throttle valve of the engine, oil inlet and outlet passages for said auxiliary cylinder connected to the opposite ends of said servo-motor cylinder, so that when said throttle valve is rapidly opened to rapidly accelerate the engine said servo-motor piston is rapidly moved by the rapid movement of said accelerating piston, regardless of the position of said bellows and the pressure-oil distributing valve, thereby increasing rapidly the amount of fuel injection responsive to increase of the amount of the air.

2,103,127

FLOWERPOT HOLDER

Albert J. Van Enkevoort, Milwaukee, Wis.

Application March 23, 1937, Serial No. 132,600
1 Claim. (Cl. 211—71)



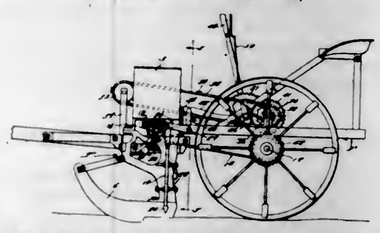
Means for supporting flowers on a tombstone comprising a frame adapted to rest on the base of the stone, means for adjusting the frame to fit around stones of different types, said means including sleeves for receiving other parts of the frame and means for fastening such other parts in the sleeves, upwardly and outwardly sloping arms connected with some of the sleeves and receptacle supporting members adjustably connected with the arms.

2,103,128

REFUSE COLLECTING VEHICLE

James Constant Walter, Warwick, England, assignor to The Eagle Engineering Company, Limited, Eagle Works, Warwick, England

Application June 14, 1937, Serial No. 148,175
In Great Britain May 7, 1936
7 Claims. (Cl. 214—67)



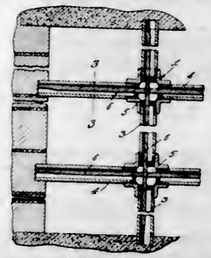
1. A refuse collecting vehicle incorporating a body for the reception of the refuse, a combined loading and closure means comprising hingedly connected loading and closure sections, the loading section being hingedly connected to the body adjacent to the floor at the rear end thereof, and means connected to the closure section of said combined loading and closure means for turning the latter about its hinge connection to the body and swinging it over the floor and toward the front of the vehicle whereby refuse deposited on the loading section of the aforesaid combined means is moved into the body and material already deposited in the body progressed towards the forward end thereof.

2,103,129

CORN PLANTER

Chester Raymond White, Mount Carmel, Ill., assignor of one-half to Max Miller, Mount Carmel, Ill.

Application May 13, 1936, Serial No. 79,580
1 Claim. (Cl. 111—30)



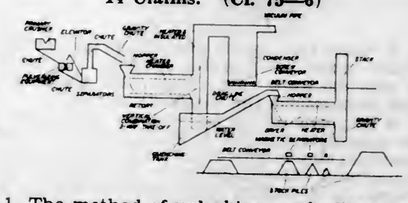
In a check row corn planter, a main frame, traction wheels supporting said frame, an auxiliary frame vertically adjustable on the main frame, seed feeding devices supported by the auxiliary frame and including a seed dropping boot movable toward and from the ground by adjustment of the auxiliary frame in opposite directions, respectively, a row marker mounted alongside said boot for independent vertical operation, means for operating said marker including a rock shaft on the main frame operatively connected to said marker, a sprocket and chain drive operated by one of the traction wheels, coacting tappet devices on said chain and shaft, respectively, means for adjusting the auxiliary frame, and means operative by said adjusting means to render the sprocket and chain drive ineffective as an incident to adjustment of said auxiliary frame to move the boot away from the ground.

2,103,130

SAFETY BAR OR GRATING

Randolph T. Windle, New York, N. Y.

Application February 8, 1937, Serial No. 124,746
1 Claim. (Cl. 189—9)



A grating comprising horizontally and vertically arranged bars each composed of a plurality of sections, couplings connecting the sections of the horizontally and vertically arranged bars to each other and of hollow formation, and cables extending through the sections of said bars and the couplings and having the ends thereof secured to the ends of the bars leaving the major portions of said cables unattached from the sections of the bars and couplings for providing sufficient slack in said cables to prevent severance thereof by a tool cutting into sections of the bars and the couplings.

2,103,131

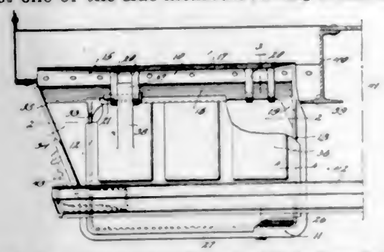
METHOD OF UNLOCKING ORE BODIES TO EXTRACT SULPHUR AND IRON THEREFROM

Harry Comer Wolf, Indianapolis, Ind., assignor to Irsugo Consolidated Mines, Limited, Indianapolis, Ind., a corporation of Canada

Application April 12, 1935, Serial No. 15,980
14 Claims. (Cl. 75—6)

1. The method of unlocking ore bodies to produce sulphur and sponge iron, which consists of continuously and completely agitating the ore which is sufficiently fine to pass through a 200 mesh screen, in a chamber in the absence of oxidizing conditions, heating said ore to a temperature of 900° F. for a sufficient length of time to dissociate the same into iron and sulphur.

2,103,132



HOPPER CAR CONSTRUCTION

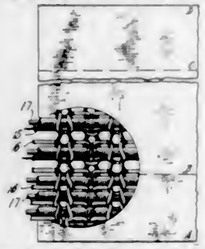
Norman B. Akitt, Troy, N. Y., assignor to Adirondack Foundries and Steel Incorporated, Watervliet, N. Y., a corporation of New York

Application December 20, 1935, Serial No. 55,488
2 Claims. (Cl. 105—253)

1. A door frame for a hopper car comprising top, bottom, and inner and outer side members, said members together forming an integral structure defining an aperture for the discharge of lading, the top member having a flat surface parallel to the general plane of the frame to facilitate attachment of a hopper sheet, a surface outwardly inclined toward the plane of said door

opening and merging with said flat surface, the free edge of said inclined surface comprising the upper margin of the discharge aperture, and at least one of the side members having a stiffening

flange in a plane parallel to said flat surface, a web connecting the free edge of said inclined surface to said side member and lying in the same plane as said stiffening flange.



2,103,133

ELASTIC FABRIC AND GARMENT

Percy Adamson, Rye, N. Y., assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey

Application June 10, 1933, Serial No. 675,190

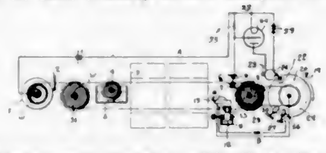
9 Claims. (Cl. 66—190)

1. A warp knit fabric comprising elastic and inelastic yarns incorporated therein in a one-in and one-out knit, said fabric also comprising elastic yarn laid-in the width of the fabric.

3. A garment of the corset type comprising a body-encircling member having a section formed of material closely knit from elastic and inelastic threads, said threads being so arranged in said garment as to permit substantial stretching by said section in all directions but providing a firm molding action transversely of the body and an easier stretch longitudinally of the garment to avoid slippage of said section relative to the body in bending.

2,103,134

APPARATUS FOR MANUFACTURING A COATED INSULATED WIRE



Takeo Akahira, Takinogawa-ku, Tokyo, Japan, assignor to Zaidan Hojin Rikagaku Kenkyujo, Tokyo, Japan

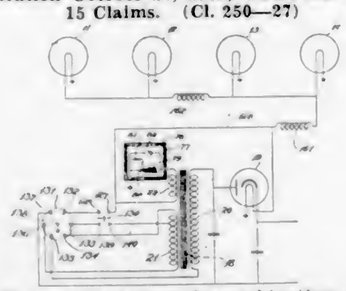
Application July 10, 1935, Serial No. 30,749

In Japan July 19, 1934

7 Claims. (Cl. 91—48)

1. An apparatus for manufacturing coated insulated wire comprising means for feeding the wire over a coating bath and through a drying device, a wet band provided in the path of the coated wire, an electric circuit including said wet band, the coated wire and a source of electricity for applying a test voltage, a time limit relay actuated by the current flowing in said circuit, a second electric circuit controlled by said time limit relay, an electromagnet coil and a spot coating device in said second circuit, a coating member in said coating device adapted to come

momentarily into contact with the wire when actuated into its operative position by said electromagnet coil.



2,103,135

RADIO RECEIVER

Edward F. Andrews, Chicago, Ill.

Application October 27, 1932, Serial No. 639,821

15 Claims. (Cl. 250—27)

1. In a radio receiver, in combination, thermionic tubes having filaments and plates, a transformer adapted to be energized from a source of alternating current or from a source of direct current, a conductor conveying current to said filaments, said filaments being arranged in parallel, an interrupter adapted continuously to interrupt the direct current supplied to the transformer, and choke coils in series in said conductor between said filaments through which coils said filaments are connected to said source of direct current when the set is operated by direct current, for the purpose of preventing the amplification through said tubes of electrical disturbances created by said circuit interrupting means.

2,103,136

METHOD FOR DETECTING CHEMICALLY REACTIVE GASES

Friedrich Karl Gustav Bangert, Lubeck, Germany, assignor to Otto Heinrich Dräger, Lubeck, Germany

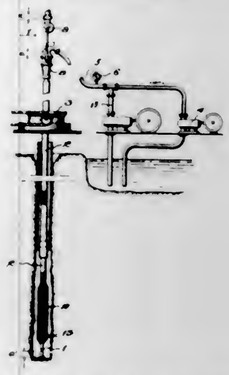
No Drawing. Application June 21, 1934, Serial No. 731,794. In Germany June 23, 1933

6 Claims. (Cl. 23—232)

1. The method of rendering detectible absorbable oxidizable gases or vapors in air or other neutral gases, which consists in bringing the gas in contact with a colorless adsorbing gel, whereby the gas is enriched on the gel, and then impregnating the gel after adsorption of the gas with an aqueous solution of an inorganic oxidation agent which changes color upon reduction.

2,103,137

ROTARY WELL DRILLING APPARATUS



Ion Basgan, Bucharest, Rumania

Application August 13, 1934, Serial No. 739,632

In Rumania May 18, 1934

3 Claims. (Cl. 255—24)

1. In rotary bore hole drilling apparatus, the combination of a drill string comprising hollow drill rods and a drill bit having a conduit therein for establishing open communication between the bore hole and the interior of the drill rods, said drill rods and drill bit rigidly secured to one another, supporting means for the drill string, a pump and a supply conduit connected up there-

to for supplying clearing liquid to the interior of the drill rods, with a second pump connected up to said supply conduit for producing pressure variations in the liquid column within the supply conduit and the drill string, so as to set up longitudinal vibrations in said liquid column and drill string.

2,103,138

PROCESS FOR HARDENING WATERPROOFING ARTIFICIAL GUT PRODUCED FROM ANIMAL FIBROUS MATERIAL

Oskar Walter Becker, Heidelberg, and Emil Weiss, Weinheim, Germany, assignors to Naturin G. m. b. H., Weinheim, Germany, a company of Germany

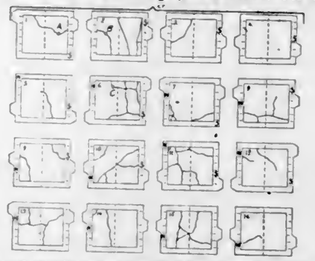
No Drawing. Application October 10, 1936, Serial No. 105,145. In Germany October 15, 1935

10 Claims. (Cl. 18—57)

1. In a process for the production of artificial gut from animal fibrous starting materials, such as hide or sinews, by converting the said starting materials into a swollen condition, shredding the swollen material, extruding the resulting swollen fibrous masses from nozzles containing annular orifices and hardening the resulting artificial gut with formaldehyde-containing liquids, the improvement which consists in treating the artificial gut with hardening liquids containing from .025 to 2% of formaldehyde, and iodine consuming substances occurring in the distillates of cellulose containing substances, said hardening liquids having an iodine value of from 3.5 to 8.5 and a pH value of from 2.5 to 3.0.

2,103,139

MAP IN BOOK FORM



Nils Olof Bergquist, Alsten, Sweden

Application October 1, 1934, Serial No. 746,452

In Sweden October 5, 1933

6 Claims. (Cl. 283—35)

1. A book comprising in combination, a plurality of pages which display sections of a large sheet obtained by dividing the sheet along parallel lines in two directions perpendicular to each other, a tab projecting from the edge portion of the majority of pages, the tabs of adjoining pages overlapping each other only partly and a mark on each of said pages indicating an adjoining section, said mark being positioned on the edge

portion of such page and at a level with the tab on the page displaying the adjoining section.

2,103,140

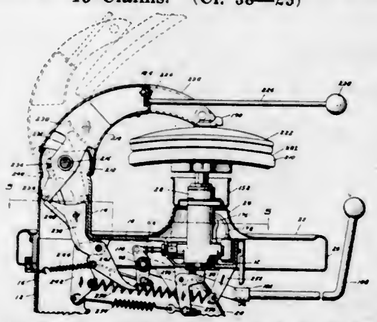
METHOD FOR THE PRODUCTION OF XANTHATES OF RESIN ALCOHOLS

William T. Bishop, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application May 16, 1935, Serial No. 21,804

11 Claims. (Cl. 260—99.11)

1. The method of producing a xanthate of an alcohol produced by carboxylic reduction of a natural resin acid, which includes reacting such alcohol with a substance from the group consisting of alkali metal hydroxides and alkali metal monoxides, and xanthating the alcoholate produced.



2,103,141

IRONING MACHINE

Herbert C. Bowen, Detroit, Mich., assignor to Hydraulic Brake Company, Detroit, Mich., a corporation of California

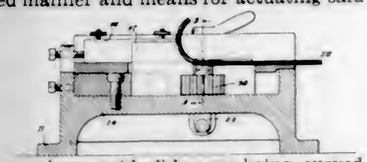
Application May 19, 1934, Serial No. 726,602

13 Claims. (Cl. 38—25)

1. An ironing machine comprising relatively movable ironing elements, a fluid pressure system for actuating one of the elements including means for producing pressure in the system, a member supporting the other element for movement into and from operative position, and means connecting the member to the pressure producing means for actuating the pressure producing means upon movement of the member to place the last mentioned element into operative position.

2,103,142

COMPACTING APPARATUS



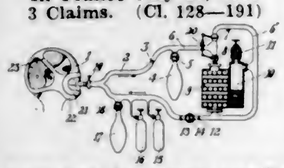
Thomas A. Bowers, Boston, Mass.

Application January 4, 1936, Serial No. 57,569

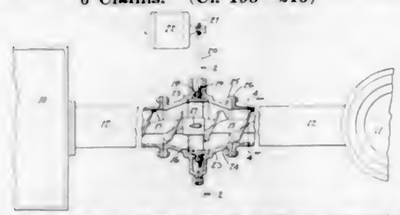
8 Claims. (Cl. 153—32)

1. An apparatus for compacting a reversely bent material comprising a pair of friction wheels

adapted to engage said material, a curved slideway for receiving the engaged material in a retarded manner and means for actuating said friction members, said slide way being curved in a vertical plane and adapted to compact the upper bends of the material faster than the lower bends.

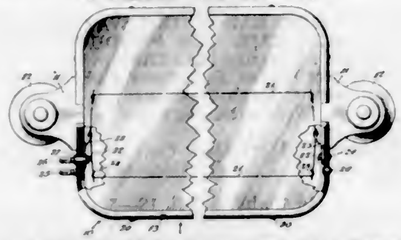


2,103,143
DIFFERENTIAL GEAR
Laverne S. Brown, Gaines, Pa.
Application September 21, 1936, Serial No. 101,874
2 Claims. (Cl. 74—315)



1. The combination with a differential gear and a pair of alined axles driven thereby, of gears on the axles on opposite sides of the differential, a gear integral with the ring gear, a countershaft, countershaft gears meshing with the gears on the axles, over-running clutches connecting the countershaft gears with the countershaft, and a gear on the countershaft meshing with the gear carried by the ring gear.

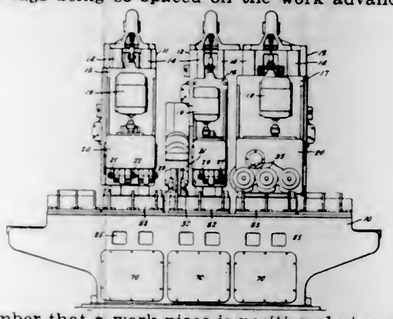
2,103,144
APPARATUS FOR GIVING ANESTHETICS
Jean Carré, Leers, France
Application June 25, 1934, Serial No. 732,349
In France July 18, 1933
3 Claims. (Cl. 128—191)



1. An apparatus for giving anesthetics in a confined atmosphere, comprising in a closed circuit, successively in the direction of the flow of gas: a main circuit and a shunt circuit, cocks in each circuit after the branchment of said shunt circuit, a common means for operating said two cocks whereby the one cock is closed when the other is opened, and whereby said cocks are opened and closed progressively, an oxygen regenerating apparatus in said shunted portion of the main circuit, an oxygen producing apparatus connected to said shunt circuit, a cock beyond the shunt circuit allowing communication with the free air, and placed immediately before a connection with a source of anesthetic under pressure, valves permitting the said determined direction of flow of gas, a connection between the said closed circuit and the mask, and a cock for closing said last mentioned connection and for communicating said mask with the free air.

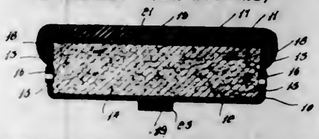
2,103,145
COAL WORM DRIVE
Haskell C. Carter, Portland, Oreg., assignor to Iron Fireman Manufacturing Company, Portland, Oreg.
Application September 17, 1934, Serial No. 744,388
6 Claims. (Cl. 198—213)

1. A device of the class described, comprising a housing having a bearing formed therein, a wheel having its rim portion occupying said bearing, said housing having portions converging toward each end, worm sections projecting from each end of said housing and drivably connected to said wheel and means for rotating said wheel.



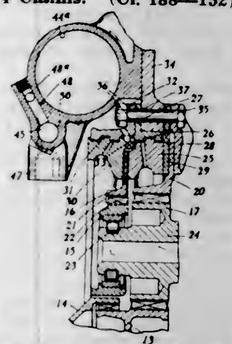
2,103,146
WINDSHIELD HEATER
Joseph H. Cohen, Bridgeport, Conn., assignor to Casco Products Corporation, Bridgeport, Conn., a corporation of Connecticut
Original application March 21, 1934, Serial No. 716,659. Divided and this application January 17, 1936, Serial No. 59,493
6 Claims. (Cl. 219—19)

1. A windshield heater comprising a frame; a resistance wire stretched across the frame; and means at the sides of the frame for supporting and connecting said resistance wire, said means including a bar having a pair of apertures, and an end of said wire passing in and out through said apertures in a tortuous path and being held to said bar by the resistance of said wire against rebending under tensional stress, the tortuous engagement of said wire-end with said bar being the sole means of holding the wire and bar together.



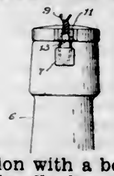
2,103,147
MACHINE TOOL
Lyndon C. Cole, Hamilton, Ohio, assignor to General Machinery Corporation, Hamilton, Ohio, a corporation of Delaware
Application June 14, 1935, Serial No. 26,550
Renewed May 10, 1937
14 Claims. (Cl. 29—33)

1. A machine adapted for cutting operation on work pieces supplied thereto comprising a base having work cutting means mounted thereon for movement to a cutting position at a cutting station, a work guide for slidably supporting work pieces for movement from a loading station to the cutting station, a work advancing member having work engaging lugs spaced thereon so that limited movement is provided between work pieces and lugs in the direction of the line of advance, the lugs being so spaced on the work advancing



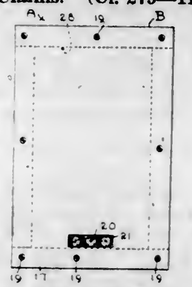
member that a work piece is positioned at a cutting station by its own inertia at the end of an advancing step by engagement with the rear portion of a lug, and means for reciprocably moving said work advancing member.

2,103,148
BASEBALL BASE
George H. Conrad, Great Bend, Pa.
Application April 1, 1937, Serial No. 134,412
3 Claims. (Cl. 273—25)



2. A baseball base comprising, a casing provided with air passages, said casing adapted to contain a filling material, a protective covering of sponge rubber secured to the upper portion of said casing, and said casing adapted to be normally distended by the filling material to cause a vacuum to draw the air through said passages into said casing.

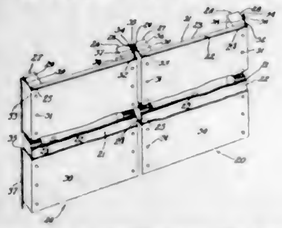
2,103,149
CONTROL OF GEARING FOR DRIVING SUPERCHARGERS ON AIRCRAFT ENGINES
Gerard Mervyn Cutler, Coventry, England, assignor to Armstrong Siddeley Motors Limited, Coventry, England
Application November 2, 1936, Serial No. 108,867
In Great Britain October 16, 1936
4 Claims. (Cl. 188—152)



1. In a brake for a two-speed planetary gearing for superchargers, an annular frame having an inner ring portion provided with a plurality of circumferentially spaced holes extending axially therethrough, a pair of rings internally threaded in opposite directions and each having a plurality of unevenly spaced holes adapted to register some of the latter holes for each fractional relative rotation of the rings, said latter rings being insertable into said frame and said latter holes adapted for registry with the holes in said frame ring, anchoring means insertable through registering holes to secure the rings together on the frame, a pair of rings externally threaded in opposite directions and adapted to engage with said internally threaded rings, means for securing said externally threaded rings together to rotate in unison and to move toward one another when one ring is rotated in one direction and away from one another when one ring is rotated in the opposite direction, and operating means secured to the said annular frame and to one of said externally threaded rings operable to produce relative rotation therebetween.

2,103,150
BOTTLE SEAL
Peter Wilson De Vore, New York, N. Y.
Application July 30, 1936, Serial No. 93,505
3 Claims. (Cl. 215—7)

2. In combination with a bottle, a closure cap, lugs extending laterally from said cap, a sealing wire on the outside of the bottle having a looped end fitted within an extension on said bottle, the free ends of said wire adapted to be twisted around one of said lugs and sealed thereon by compressing the ends of the other lugs over the wire.

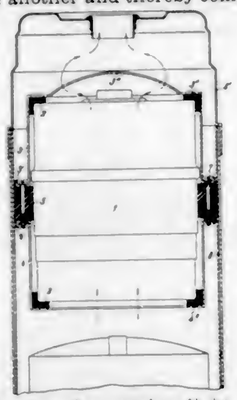


2,103,151
GAME
Roy Perry Dietrich, Bayside, N. Y.
Application September 28, 1936, Serial No. 103,013
3 Claims. (Cl. 275—113)

1. In a game apparatus, a housing including substantially paralleling side walls, substantially paralleling end walls and a top and a bottom wall normal thereto enclosing a chamber and provided with a sight opening in said top wall adjacent one side wall, and an incline within said chamber extending from one of the end walls towards said side wall, said chamber having a pocket at said sight opening, said pocket being provided with a bottom wall and substantially

vertical side walls, said incline extending to the mouth of said pocket, said incline and said walls of said pocket comprising a strip of material rigidly secured at one of its ends to said one end wall of said housing and formed into said walls of said pocket, said strip of material being rigidly secured to said side wall of said housing and extending from said top wall to said bottom wall of said housing.

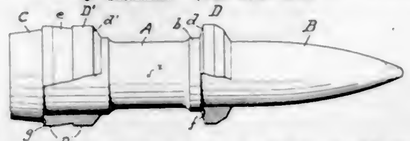
2,103,152
BUILDING STRUCTURE
Donald M. Douglass, Wilton, Conn.
Application August 27, 1936, Serial No. 98,151
13 Claims. (Cl. 189—86)



1. A structural member including a panel having a front face and a rear face; a pair of panel supporting members underlying the rear face of said panel, positioned along opposite side edges thereof; outer faces on said supporting members, extending rearwardly from said panel; and complementary metal sealing strips extending rearwardly from said panel to overlie said outer faces, adapted to cooperate with complementary metal strips on adjacent structural members to form substantially weather tight joints therebetween.

2,103,153
CASEIN COMPOUND AND PROCESS OF MAKING
Henry V. Dunham, Bainbridge, N. Y.
No Drawing. Application April 26, 1935, Serial No. 18,435. In Great Britain December 8, 1934
17 Claims. (Cl. 260—9)

1. As a product, a homogeneous combination of acid-precipitated casein with a compound selected from the group consisting of metal salts, metal hydroxides and ammonium salts, said compound being not sufficiently alkaline in reaction to constitute a solubilizing agent for casein, and which compound is capable of reacting with moist casein, said product being extruded under heavy pressure while containing less water than casein.

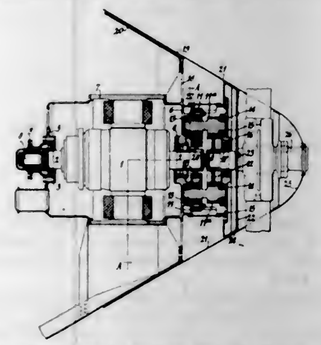


2,103,154
VACUUM CLEANER
Ernst Faber, Stuttgart, Germany
Application June 23, 1937, Serial No. 149,980
In Germany August 6, 1936
1 Claim. (Cl. 248—26)

A vacuum cleaner comprising in combination a motor and fan unit, cylindrical caps adapted to be placed over the end parts of the motor and fan unit, elastic rings of L-shaped cross-section disposed between the motor and fan unit and the caps at the corners formed by the end surfaces and the cylindrical surfaces of the two parts, at the other ends of the said caps flanges facing one another, a casing surrounding the motor and fan unit and the caps, a thick elastic ring disposed between the said flanges and bolts connecting the said flanges for drawing the flanges towards one another and thereby compressing the

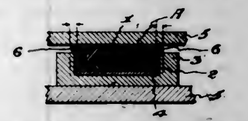
thick elastic ring for causing it to bear tightly against the motor and fan unit and against the casing.

2,103,155
PROJECTILE
Willing B. Foulke, Media, Pa., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
Application March 14, 1935, Serial No. 10,974
9 Claims. (Cl. 102—26)



1. A projectile adapted for high velocities comprising a body portion and rifling bands having a high tensile strength, the body portion being throughout of a diameter less than the bore diameter of the barrel of the gun for which it is intended by an amount in excess of the difference between the groove and bore diameters of the barrel, and shoulders on the body portion in engagement with the bands to prevent rearward movement thereof.

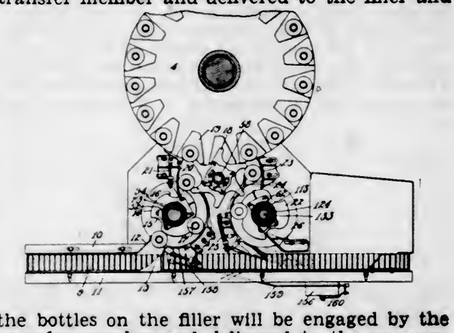
2,103,156
ELECTRIC DRIVE OF AIR-SCREW PROPELLED CARS
Hugh Fraser, Burnside, Ruthergien, Scotland, assignor to Inter Counties Limited, Glasgow, Scotland
Application September 27, 1934, Serial No. 745,824
In Great Britain February 28, 1934
1 Claim. (Cl. 74—410)



An electric drive for air-screw propelled cars and the like, comprising an electric motor having a hollow armature shaft, a casing having end covers for said motor, bearings carried by said end covers in which the hollow armature shaft is journalled, an air-screw shaft extending completely through the armature shaft, further bearings carried by the two end covers of the motor casing and in which said air-screw shaft is journalled, said air-screw shaft extending beyond one of the end covers, an air-screw fast on the extended end of the air-screw shaft, a pinion wheel fast on the armature shaft, a set of pinion wheels meshing with and arranged symmetrically around

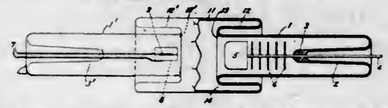
said pinion wheel, a further set of pinion wheels co-axial with and driven by the first set, each pinion wheel of one of the sets embodying fast and slipping plates held in frictional engagement with each other so that the teeth can partake of a circumferential movement relative to the axis, and a pinion wheel fast on the air-screw shaft

and with which said further set of pinion wheels mesh so as to drive the air-screw shaft without imparting any transverse thrust thereto, the fast and slipping plates ensuring that each of the intermediate pinions transmits its full share of the drive, absorbing shock and eliminating torsional vibration.



2,103,157
MANUFACTURE OF RUBBER-SOLED SLIPPERS, SANDALS, AND FOOTWEAR
Bienvenido Jaumandreu, Buenos Aires, Argentina
Application May 10, 1934, Serial No. 724,963
1 Claim. (Cl. 18—59)

A method of manufacturing rubber soled footwear and like flexible articles utilizing elastic lasts, comprising providing a mold designed to snugly fit the lower part of the upper of the article, providing an elastic last of a size to extend beyond the open end of the mold, placing an unvulcanized rubber sole in the bottom of the mold, placing the upper with the last therein on the sole within the mold, and exerting pressure on the upper and last when in the mold to compress the upper and last and expand the portion of said last extending beyond the mold over the edges of the mold to thereby hermetically seal the open end of said mold.



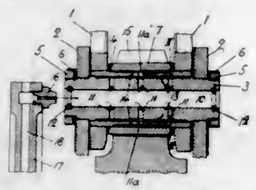
2,103,158
BOTTLE FILLING MACHINE
James Kantor, Chicago, Ill., assignor to The Liquid Carbonic Corporation, Chicago, Ill., a corporation of Delaware
Application December 29, 1932, Serial No. 649,275
17 Claims. (Cl. 226—75)

8. In a machine of the character described, the combination with a single continuously rotating transfer member, of a continuously rotating syruper, a continuously rotating bottle filler and a continuously rotating crowner grouped about said transfer member and so positioned that the bottles on the syruper will be engaged by the transfer member and delivered to the filler and

the bottles on the filler will be engaged by the transfer member and delivered to the crowner.

2,103,159
ELECTRIC DISCHARGE DEVICE
Kenneth H. Kingdon, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application February 12, 1936, Serial No. 63,533
2 Claims. (Cl. 250—27.5)

1. An electric discharge device comprising a sealed envelope of insulating material enclosing an ionizable medium and spaced electrodes, at least one of which is subject to sputtering, said envelope comprising a plurality of continuously joined cylinders in partially telescoping relation, the overlapping edges of said cylinders being radially spaced and positioned to prevent deposit of a continuous coating of sputtered material.



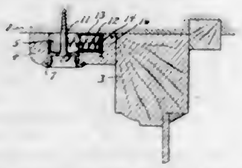
2,103,160
STABLE AQUEOUS SOLUTIONS OF ANESTHETIC SUBSTANCES AND PROCESS OF PREPARING THEM
Adolf Kircher and Max Sienz, Frankfort-on-the-Main, Germany, assignors to Winthrop Chemical Company Inc., New York, N. Y., a corporation of New York
No Drawing. Application November 1, 1934, Serial No. 751,099. In Germany November 11, 1933
12 Claims. (Cl. 167—52)

1. Aqueous sterilized solutions having, after the sterilization, a pH-value of about 6 to about 7 comprising urea and a salt of an ester of an aminobenzoic acid having an anesthetic effect.

2,103,161
LUBRICATING DEVICE FOR DRIVING CHAINS
Viggo Axel Kjær, Copenhagen, Denmark
Original application December 12, 1932, Serial No. 646,937. Divided and this application March 25, 1935, Serial No. 12,990. In Denmark January 12, 1932
2 Claims. (Cl. 184—15)

1. In a chain arrangement comprising a toothed chain wheel and a chain mounted on said wheel, said chain including links, and bushes and hollow pins connecting said links, the pins being pro-

vided with axial bores and transverse bore holes for the supply from the interior of the pin to the bearing surfaces between the pin and bush of lubricating oil which is supplied to the hollow pin from the exterior, an oil supply device arranged adjacent the chain wheel opposite the spaces between its teeth and rotating with said wheel, said oil supply device consisting of injection nozzles



permanently spaced from the chain and connected with means for supplying oil under pressure, the axial bores of said pins having a relatively large diameter and an unobstructed opening of a smaller diameter thereto from the end of the pin adjacent the oil supply device, whereby the oil discharged from said nozzles is directed wholly within the interior of the pins.

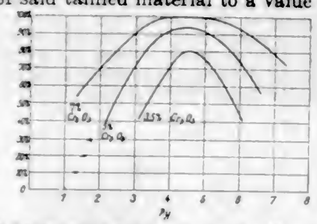
2,103,162

WINDOW STOP STRIP MOUNTING

Harry W. Lane, Syracuse, N. Y.

Application March 3, 1937, Serial No. 128,849
6 Claims. (Cl. 20—12)

1. The combination with a window frame having a sash slidably mounted therein, of a molding strip movably secured to said frame at one side of said sash, and means for normally yieldably urging said strip towards said sash, said means including a coil spring recessed in the rear face of said molding strip and having one end thereof received within a socket member adapted to be anchored to said molding strip within said recess, and a fastening member extending through said molding strip and into the contiguous face of the window frame and against which one end of the spring aforesaid is adapted to abut, there being sufficient looseness afforded between the fastening member and the molding strip to permit relative movement therebetween in a lateral direction.



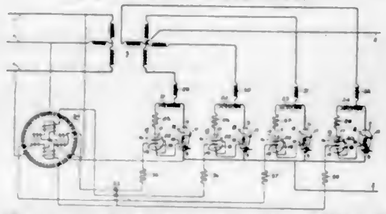
2,103,163

PROCESS FOR RENDERING FIBERS OR THREADS FROM ANIMAL COLLAGEN IRONPROOF

Gustav Lange, Weinheim, Germany, assignor to the firm Carl Freudenberg G. m. b. H., Weinheim, Germany, a society of Germany

Application April 21, 1936, Serial No. 75,655
In Germany April 25, 1935
7 Claims. (Cl. 18—54)

1. A process for rendering fibers or threads from animal collagen ironproof comprising tanning the fibers or threads with chromium compounds sufficiently to fix at least 4% of chromium oxide on said material, and adjusting the pH value of said tanned material to a value between



3 and 6, determined relative to the fixed content of chromium oxide.

2,103,164

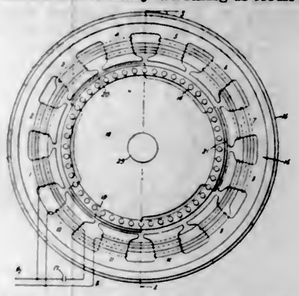
ELECTRIC VALVE CIRCUIT

Richard G. Lorraine, Scotia, N. Y., assignor to General Electric Company, a corporation of New York

Application July 1, 1936, Serial No. 88,391
5 Claims. (Cl. 175—363)

1. In combination, an electric valve having an anode, a cathode and a control member, an excitation circuit energized in accordance with the voltage appearing across the anode and the cathode of said electric valve means comprising a control electric valve for energizing said control member to render said electric valve means conductive during normal predetermined intervals of conduction, and means responsive to the current in the anode-cathode circuit of said first-mentioned electric valve means for controlling said second-mentioned electric valve means to advance the time of energization of said control member relative to the next succeeding normal interval of conduction in the event said first-mentioned electric valve means conducts current at any time other than during said predetermined intervals.

2,103,165



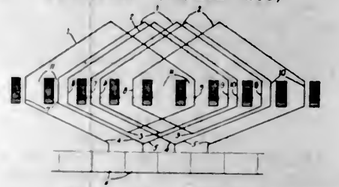
SELF STARTING SYNCHRONOUS INDUCTOR MOTOR

Frank W. Merrill, Fort Wayne, Ind., assignor to General Electric Company, a corporation of New York

Application July 22, 1936, Serial No. 91,923.
10 Claims. (Cl. 172—120)

1. An inductor motor comprising cooperating, relatively rotatable, primary and secondary members, said primary member being provided with salient magnetic pole pieces and with a multipolar alternating-current winding means for producing a rotating magnetic field, said secondary member being provided with salient magnetic pole pieces of one-half the pole number of the alternating-current winding and with an induction motor secondary winding responsive to the rotating magnetic field of the primary to produce starting torque, and means for producing a unidirectional flux in one direction only between the

primary and secondary members to which the induction motor secondary winding is nonresponsive



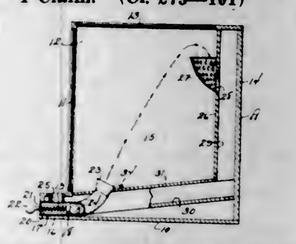
but which in combination with the rotating magnetic field causes synchronous inductor motor operation.

2,103,166

COMMUTATING TYPE ARMATURE

Wayne J. Morrill, Fort Wayne, Ind., assignor to General Electric Company, a corporation of New York

Application December 11, 1936, Serial No. 115,372
3 Claims. (Cl. 171—206)



1. A rotatable member for a dynamo-electric machine having a slotted core and a commutator, a winding including a plurality of winding elements, each of said winding elements being formed of a plurality of coils extending over a normal coil pitch and connected in series, corresponding coil sides of each of said coils of each of said winding elements being arranged in adjacent slots of said core, and each of said slots of said core having a coil side of a different coil of adjacent winding elements of said winding.

2,103,167

GAME APPARATUS

James Morrison, Trenton, N. J.

Application September 22, 1936, Serial No. 102,001
1 Claim. (Cl. 273—101)

A game apparatus comprising a casing having transparent top and front panels and providing a chamber interiorly, a front ledge on said casing at the bottom area thereof, a shooter including a barrel having a plunger working therein, an upwardly curved muzzle formed with the barrel at the inner end thereof and projected into the chamber, a striking partition arranged vertically within the chamber remote from the said muzzle and having an elevated opening therein, a basket built on the partition in confronting relation to the opening therein and protruded forwardly of said partition, and a runway leading from the opening in the partition and also from the chamber to the said ledge and opening therethrough for access thereto, the approach of the runway with respect to the ledge being inclined toward the same.

2,103,168

INTERIOR FINISHING STRUCTURE AND FASTENER

Roy H. Myers and Louis Sandoz, Ventura, Calif.

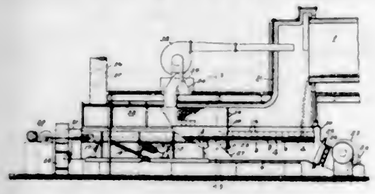
Application March 29, 1937, Serial No. 133,682
4 Claims. (Cl. 20—4)

1. A structure of the character described comprising substantially rectangular shaped finishing sections in strip form, a series of channeled members adapted to be fixed to a framework in spaced relation to each other crosswise of said finishing sections and having opposite inturned flanges longitudinally thereof, and a plurality of separate clips saddling the finishing sections and interlocked with the same and the channeled members at one or both inbent flanges thereof, respectively.

2,103,169

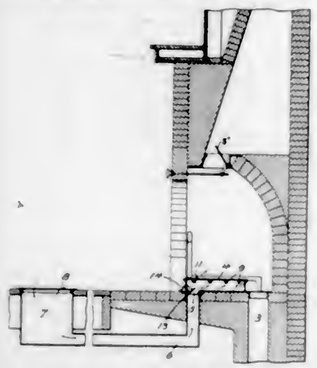
APPARATUS FOR PRODUCING SOUNDS OF A MUSICAL CHARACTER

Albert Henry Midgley, Wembley, England



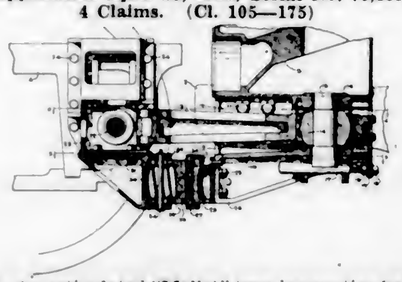
Application September 29, 1936, Serial No. 103,218
In Great Britain February 6, 1935
6 Claims. (Cl. 84—1)

1. Apparatus for producing musical sounds comprising, a secondary element consisting of concentric rings of undulating formation, one of said rings having a given number of undulations, a second ring having a number of undulations differing in number from said given ring and each successive ring having a number of undulations differing from its preceding ring, said rings being sufficient in number to cover the entire musical scale, a primary element movably mounted adjacent said secondary element means for impressing a potential across said primary element and any ring of said secondary element, means for causing relative movement between said primary element and said secondary element at one speed,—whereby undulating potentials of different frequencies are generated in said secondary element, and means associated



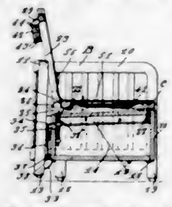
with said secondary element responsive to the undulating potentials electrostatically induced therein for producing musical notes of the entire musical scale corresponding to the combined frequencies generated in said secondary element.

2,103,170
CLINKER COOLER
Ray C. Newhouse, Wauwatosa, and Bertram H. Puerner, West Allis, Wis., assignors to Allis-Chalmers Manufacturing Company, Milwaukee, Wis., a corporation of Delaware
Application February 23, 1935, Serial No. 7,686
10 Claims. (Cl. 34—38)



3. In a cooler, a perforate support for a bed of material to be cooled, means including a duct below said perforate support for passing a current of cooling fluid upwardly through said support, and hollow side members associated with said perforate support for retaining said bed of material thereon, said hollow side members communicating with said duct and being cooled by cooling fluid entering said duct and passing through said hollow side members.

2,103,171
FIREPLACE AIR BLASTING
Oliver C. Nilson, Carthage, Mo.
Application January 19, 1937, Serial No. 121,349
4 Claims. (Cl. 126—120)

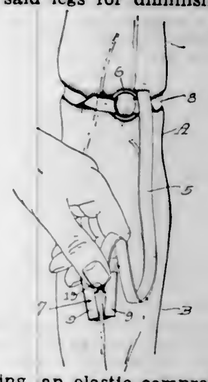


2. In combination with a fireplace having a fuel supporting means, an air discharge head located in the fireplace below the fuel carried by the fuel supporting means, said head tapering towards the rear wall of the fireplace and having air discharge openings formed in the sides thereof and the top wall adjacent the front end, hoods formed in the top wall over the openings thereof, an air intake neck formed on the head, an air pipe connected to said neck and having communication with the atmosphere within a room.

2,103,172
ARTICULATED LOCOMOTIVE
Henry K. Patjens, Yeadon, Pa.
Application April 25, 1936, Serial No. 76,455
4 Claims. (Cl. 105—175)

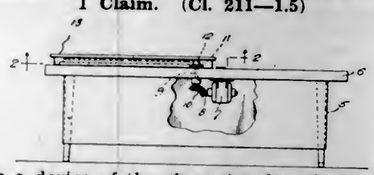
1. An articulated "Mallet" type locomotive having front and back frames with individual power producing mechanism comprising, in combination, means for pivotally connecting said power frames together in positive relation but adapted to allow vertical and lateral relative movement therebetween, elements having opposed surfaces adapted for vertical and lateral slidable contact with each other, spring means for pressing said surfaces into frictional contact with each other, and means connecting said elements respectively to said frames so that said vertical and lateral movement is transmitted from the frames to said surfaces without such movement being transmitted through said spring means.

2,103,173
SOFA BEDSTEAD
Antonio T. Pison, Molo, Iloilo, P. I.
Application November 27, 1935, Serial No. 51,919
2 Claims. (Cl. 5—40)



1. An article of furniture of the character described comprising head and foot pieces each including stationary and horizontally swinging sections, a box-like body supported by the stationary sections and arranged between the same, a rest frame carried by the box-like body and having an extensible portion for extension between the swinging sections of the head and foot pieces, means for initially moving the swinging sections of the head and foot pieces inwardly toward the box-like body for subsequently holding the extensible portion of the rest in a position to form a back support and foot operated means for latching the swinging sections of the head and foot pieces in positions when the rest frame is extended therebetween and when the latter is in back supporting position.

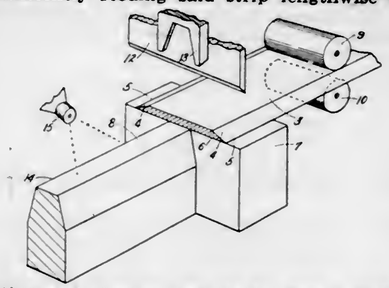
2,103,174
SURGICAL INSTRUMENT
Victor Manuel Posada, San Salvador, El Salvador
Application January 27, 1936, Serial No. 61,110
2 Claims. (Cl. 128—215)



1. A surgical appliance comprising a plate for retaining in operative position a vein, said plate

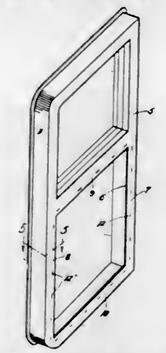
embodying in its construction a pair of legs spaced one from the other to provide an opening for receiving the vein therein, spring means connecting said legs for diminishing the width

of the opening, an elastic compressible member connected to said plate and adapted to encircle the limb of a patient, whereby upon compression of said member the vein will be enlarged in the opening of said plate.



2,103,175
ADVERTISING OR DISPLAY DEVICE
Leendert Prins, Port Washington, N. Y.
Application October 17, 1935, Serial No. 45,487
1 Claim. (Cl. 211—1.5)

In a device of the character described, a hollow base provided with a flat top member, a vertical shaft centrally journaled in and extending through said top member, a motor attached to the under side of said top member and geared to the lower end of said vertical shaft for imparting rotary motion to the latter, the lower portion of said vertical shaft and said motor being concealed within said hollow base, a flat display member resting upon and freely movable over the surface of said top member, means concealed in said display member for utilizing the rotary motion of said vertical shaft to cause movement of said display member over the surface of said top member in an irregular path, said display member being formed with an irregular endless groove in the under side thereof, said groove having a relatively narrow upper portion and a wider lower portion, said last-named means comprising rack teeth on the inner wall of the lower wider groove portion, a pinion secured on the vertical shaft and meshing with said rack teeth, and a guide roller freely journaled on the vertical shaft above said pinion and engaging the outer side wall of the narrow upper portion of the groove.

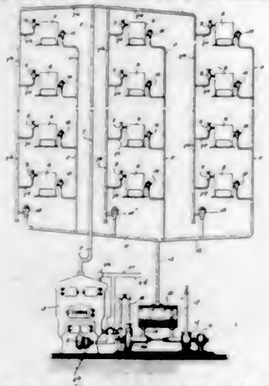


2,103,176
METHOD OF MAKING STAPLES
Howard D. Randall, Cincinnati, Ohio, assignor to The Randall Company, Cincinnati, Ohio, a corporation of Ohio
Application September 25, 1935, Serial No. 42,072
3 Claims. (Cl. 59—77)

1. The method of staple manufacture which comprises the steps of first forming a long strip of material having parallel side edges chamfered to provide opposed sharpened edges, then intermittently feeding said strip lengthwise to a

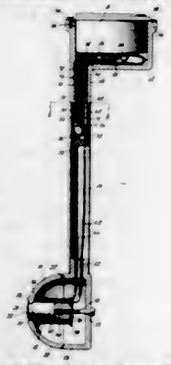
cutting and shaping mechanism which cuts off in succession short lengths of the strip and thereafter bends them to provide legs and a connecting head with the chamfered portions at the free ends of the legs.

2,103,177
MEANS FOR PANELING
Howard D. Randall, Cincinnati, Ohio
Application July 6, 1936, Serial No. 89,053
5 Claims. (Cl. 296—44)



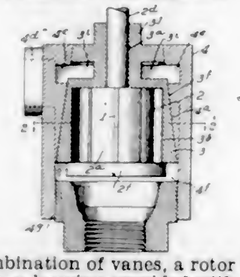
1. In a self-locating panel structure, the combination of a support to be paneled and comprising a sheet metal member having a supporting face and a back, said supporting face having a series of elongated through chisel cuts formed therein, each providing a pair of parallel continuous deformable clamping edges bulged inwardly toward the back of said member leaving the supporting face dented toward the back along substantially the length of said elongated cuts, and means including nail shanks for securing a panel to the supporting surface, the shanks each being guided by the dented areas alongside of the chisel cuts when driven therethrough to deform said clamping edges for frictionally holding the shanks.

2,103,178
STEAM HEATING SYSTEM AND METHOD OF SUPPLYING STEAM TO THE RADIATORS THEREOF
Fred I. Raymond, River Forest, Ill.
Application March 22, 1934, Serial No. 716,914
6 Claims. (Cl. 237—9)



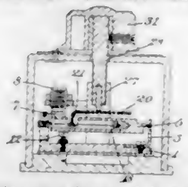
1. The method of supplying steam to a plurality of radiators connected by a system of sup-

ply piping to a source of steam supply which consists in increasing the freedom of flow of steam from the supply piping to the radiators as the differential between the pressure in the piping and the pressure in the radiators increases, and decreasing the freedom of flow of steam from the



supply piping to the radiators as the differential between the pressure in the piping and the pressure in the radiators decreases, and so controlling the said changes in freedom of flow of steam as to cause the amount of steam passing into the radiators to constitute a substantially straight line function of the said differential.

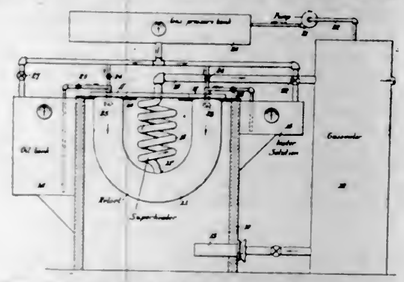
2,103,179
TESTING DEVICE
Albert M. Rennau, Hannibal, Mo., assignor of forty percent to Robert H. McKinney, Hannibal, Mo.
Application August 6, 1935, Serial No. 34,964
5 Claims. (Cl. 175—183)



1. A device of the type described comprising a hollow head, a pole piece mounted within the head and having a part extending to the exterior thereof and being adaptable to be positioned in operating proximity with a machine part being tested, a coil wound upon said pole piece, an ammeter, a tubular member connecting the ammeter with said head, and electrical connections between the ammeter and said coil and being housed within the tubular member, said tubular member and said electrical connections being separable, and an extension for operatively connecting the separated tubular member including electrical connections connectible with said separated electrical connections.

2,103,180
ROTARY MOTOR
Edwin Leroy Rice, Silver Spring, Md., assignor to Rice Manufacturing and Aerial Transport Corporation, a corporation of Arizona
Application June 15, 1933, Serial No. 675,890
14 Claims. (Cl. 121—92)

6. The combination of vanes, a rotor for carrying the vanes, a housing provided with an oblong socket adapted to receive the rotor and to form chambers between the housing and rotor, a flange upon the rotor adapted to cover the socket and form an inclosure for the chambers and means for conducting fluid outwardly over the flange to the chambers and centrally beneath the vanes.

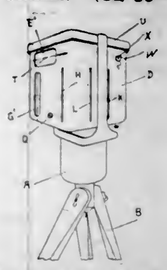


2,103,181
SNAP ACTION MECHANISM FOR OPERATING ELECTRIC SWITCHES
Thomas Guthrie Richmond, Glasgow, Scotland
Application September 22, 1936, Serial No. 102,021
In Great Britain October 17, 1935
11 Claims. (Cl. 200—138)

1. A snap action make and break mechanism comprising in combination a body, an operating member pivoted at one end to said body, a member at the other end of said body, with which the other end of said operating member makes contact, a member pivotally supported at one end on said body and at the other end on said operating member applying a resilient turning moment to said operating member in one direction, and a resilient bimetallic member mounted upon said body adapted to apply a force which creates a turning moment which is applied in the opposite direction to said operating member, movement of said operating member taking place when one turning moment overbalances the other turning moment, and the snap action being due to the overbalanced turning moment decreasing more rapidly than the other turning moment and taking place before the said operating member reaches the dead centre or neutral position.

2,103,182
PROCESS FOR MAKING GAS
Herbert E. Rider, New York, N. Y., assignor, by mesne assignments, to Henry L. Rosenfeld, Jr.
Application February 5, 1935, Serial No. 5,022
6 Claims. (Cl. 48—197)

4. The process of making a fixed gas from petroleum oil comprising heating the oil to convert it into a vapor, heating a solution of water and chemicals consisting of an acid, potassium bichromate and silver nitrate to a reaction temperature of approximately 1207° F., mixing to-



gether the oil and solution so heated while at said temperature and thereafter separating the resultant fixed gas from the products of the reaction.

2,103,183
WATER BUOYED ENGINE AND MOUNTING FOR MOTOR BOATS AND THE LIKE
Hugh M. Rockwell, Freeport, N. Y.
Application June 16, 1934, Serial No. 730,953
12 Claims. (Cl. 115—34)

1. A motor boat provided with an opening in its bottom, a complete power plant including a propeller and a shaft mounted as a unit in the bottom of a boat hull, the area of the opening in the boat hull being so proportioned that the upward pressure of the water on said area is approximately equal to the weight of said complete power plant, and a flexible and resilient water tight mounting joining the power plant directly to the boat, and permitting relative universal movement between the power plant and the boat bottom.

2,103,184
LEVELING AND SQUARING DEVICE
Carlo Roggero, Arenzano, Italy
Application March 29, 1937, Serial No. 133,742
In Germany April 6, 1936
7 Claims. (Cl. 33—72)

1. In a combined leveling and squaring device, a box, a Cardanic suspension for said box, a forked supporting member or stirrup for supporting the said box through the said Cardanic suspension, narrow horizontal slits in the upper part of the box and wider apertures or slots opposite of each of the said slits, narrow vertical slits below said horizontal slits and apertures and wider vertical apertures or slots opposite of said vertical slits and vertical cross hairs on said apertures, whereby the vertical slits come to lie all on one vertical half of the box and the wider apertures or slots are provided on the other half of the box, the said vertical slits and apertures being spaced from one another of equal angles about the centre of the device.

2,103,185
CRANKSHAFT
Edmund Rumpler, Berlin-Charlottenburg, Germany
Application December 16, 1935, Serial No. 54,646
In Germany February 10, 1934
7 Claims. (Cl. 74—596)

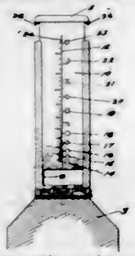
1. A crankshaft for piston engines comprising an integral and hollow one-piece cast body, hollow crank bearings and crank pins and crank arms in said body integrally formed therewith, said hollow crank bearings, pins and arms forming at least one channel, free from permanent metallic cores including tubes, extending throughout said body and occupying the major portion of the cross section thereof.

2,103,186
CHLORINATED RUBBER COATING COMPOSITION
Jacob M. Schantz, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application July 2, 1935, Serial No. 29,505
9 Claims. (Cl. 134—17)

1. A coating composition comprising a substantially homogenous solution of chlorinated rubber and "thermolyzed" tung oil, the "thermolyzed" tung oil being present in sufficient quantity to render the film deposited by said coating composition smooth, tough, and chemically resistant, said coating composition being further characterized by the fact that it will not gel on storage.

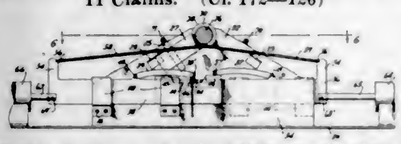
2,103,187
METHOD FOR DETECTING SMALL QUANTITIES OF GAS
August Gustav-Adolf Schröter, Hamburg, Germany, assignor to Otto Heinrich Dräger, Lubeck, Germany
No Drawing. Application May 24, 1934, Serial No. 727,373. In Germany May 24, 1933
4 Claims. (Cl. 23—232)

1. In a method for verifying the presence of small quantities of adsorbable gas or vapor in air or other gases, the steps which comprise passing the air or gases containing the adsorbable gas or vapors to be verified through a solid gas-adsorbing medium preferentially adsorbing said gas or vapor, whereby the gas or vapor to be verified is concentrated upon the gas adsorbing medium, and then applying to the medium a substance which will react with the gas or vapor concentrated upon the medium to produce a change in the appearance of the medium containing the substance.



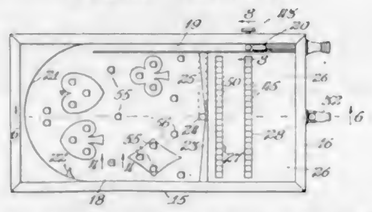
2,103,188
ANTIOXIDANT
Waldo L. Semon, Silver Lake, and Robert V. Yohe, Cuyahoga Falls, Ohio, assignors to The B. F. Goodrich Company, New York, N. Y., a corporation of New York
No Drawing. Application September 9, 1936, Serial No. 100,034
19 Claims. (Cl. 18—50)

1. The method of retarding the deterioration of an organic substance which tends to deteriorate by absorption of oxygen from the air which comprises treating the said substance with a compound having the general structural formula:



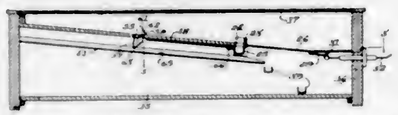
where R_1 represents an aryl radical, R_2 represents an arylene radical, and R_3 represents a bivalent radical selected from the class consisting of alkylene and aralkylene hydrocarbon radicals and dialkyl ether radicals.

2,103,189
GUN SIGHT
Samuel D. Shepard, Chevy Chase, Md.
Application January 23, 1935, Serial No. 3,127
1 Claim. (Cl. 33—51)



A gun sight consisting of two detachable parts; one part consisting of an integral U-shaped frame having means for hingedly mounting the same on a firearm, each of the vertical legs of said frame having a longitudinal groove on the inner face thereof; the second part consisting of a thin sheet metal plate having its vertical edges slidable in said grooves, said plate having a rigid bar attached to the top edge thereof with portions extending edgewise therefrom, said portions resting on the ends of said legs and having means interengaging with said legs whereby the frame around said plate is rigidified; said plate having openings for sighting, such openings including a narrow vertical slit centrally placed in said plate and distance symbolizing openings adjacent said vertical slit, said slit having slight enlargements adjacent such symbolizing openings.

2,103,190
DRIVE MECHANISM
Nathen E. Squire, Chicago, Ill.
Application January 18, 1937, Serial No. 121,075
11 Claims. (Cl. 172—126)

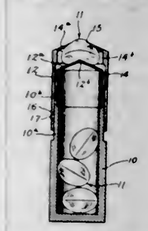


1. An electro-mechanical drive mechanism including a pendulum, switch means operable by the pendulum as it approaches the opposite limits of its oscillatory movement, a pair of oppositely disposed and reciprocable slide arms each having spring means connected with said pendulum and operable when a said arm is moved into retracted position to impart pivotal movement to the pendulum and also to urge the said slide arm out of retracted position, releasable latch means for each of said slide arms and operable to latch the same in retracted position, electro-magnetic means operable by the aforesaid switch means to move one of said slide arms into retracted position for each reversal of the pendulum's swing, each said slide arm being operable as it is moved into retracted position to unlatch the opposite arm from retracted position.

2,103,191
AMUSEMENT GAME
Edward P. Stein, Fulton D. Thornton, and Robert Morris, Chicago, Ill., assignors of one-half to John A. Russell, Chicago, Ill.
Application December 28, 1934, Serial No. 759,538
7 Claims. (Cl. 273—121)

1. An amusement game having an inclined board over which balls may be rolled to drop through holes formed in the board, an inclined alley member below the board to receive and guide the balls received from the holes, a slotted register plate at the lower end of the board, movably mounted registers carried under the plate and having depending legs located in position, at the end of the alleys to be engaged by the balls rolling down the alleys to move the registers into view under the slot in the plate, and means included in the game to temporarily hold the balls in register setting position.

2,103,192
AMUSEMENT GAME
Edward P. Stein, Fulton D. Thornton, and Robert Morris, Chicago, Ill., assignors of one-half to John A. Russell, Chicago, Ill.
Original application December 28, 1934, Serial No. 759,538, Divided and this application April 13, 1937, Serial No. 136,560
10 Claims. (Cl. 273—119)



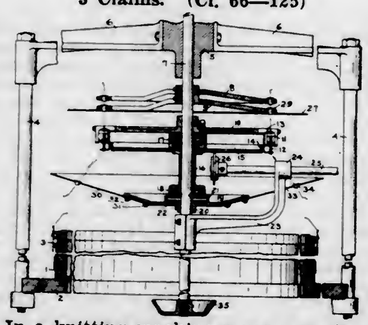
2. A game of the ball projecting type having an inclined game board provided with holes therethrough, a movably mounted closure member adjacent each of said holes and having portions operable by balls dropping through said holes to move the closure members to hole closing positions, and means movably carried below the game board for resetting said closure members into hole opening positions.

2,103,193
PROCESS FOR THE RECOVERY OF THE UNSAPONIFIABLE FRACTIONS OF OILS
Robert Preston Nichols, Miami, Fla., assignor to Edward L. Nichols, Hollywood, Fla.
No Drawing. Application September 19, 1933, Serial No. 690,107
2 Claims. (Cl. 260—153)

2. The process of recovering the unsaponifiable fractions of fish liver oil which comprises adding to and immediately mixing with the oil dry powdered sodium hydroxide, the latter being added to the oil substantially as a mass in large excess over that necessary to saponify the saponifiable fractions of the oil, so as to absorb moisture for protecting the vitamins and cause to be quickly formed a solidified mixture of soap and sodium hydroxide of requisite hardness to be reduced to a powder by a grinding operation; operating upon said solidified mixture to grind it to a powder; treating the resulting powder with a volatile liquid in which both the unsaponifiable and saponifiable fractions of the oil are soluble, but in which both the soap and sodium hydroxide are insoluble, for dissolving the unsaponified fractions of the oil from the powder; separating the powder from the resulting solution of the unsaponified fractions of the oil; and treating the powder free solution for vaporizing the volatile liquid solvent therefrom to obtain a concentration of the unsaponifiable fractions of the oil.

2,103,194
LIQUID DISPENSER AND METHOD FOR DISPENSING LIQUIDS
James Wallace Thorsen, Bronxville, N. Y.
Application October 10, 1933, Serial No. 692,956
12 Claims. (Cl. 221—1)

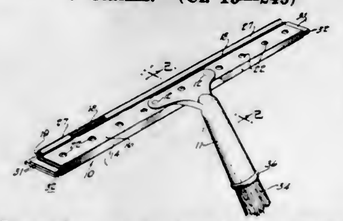
1. In a construction of the general nature of that herein described, in combination, a supporting member, and a cylindrical part fitting over said member and having an aperture formed in the end thereof, said supporting member and the end of said cylindrical part adapted to hold a capsule of liquid so that a portion thereof covers said aperture whereby when said capsule is ruptured pressure applied thereto by said cylindrical part forces some of the liquid in said capsule therefrom.



2,103,195
INSECTICIDE
Howard A. Jones, Washington, D. C., dedicated to the free use of the People of the United States of America
No Drawing. Application July 3, 1937, Serial No. 151,915
8 Claims. (Cl. 260—54)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A new chemical compound composed of a monomolecular combination of rotenone and dichloroacetic acid.

2,103,196
INSECTICIDAL OIL SPRAY
Hugh Knight, Claremont, Calif., assignor to Emulsoids, Inc., San Francisco, Calif., a corporation of Delaware
No Drawing. Application May 2, 1935 Serial No. 19,467
7 Claims. (Cl. 167—43)

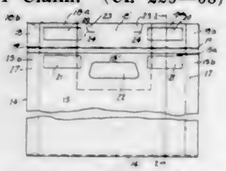


7. A tree spray composition comprising about 95% to 99% of paraffinic mineral oil, about .1% to 2.0% of toxic naphthenic acid, and about .5% to 4.5% oil soluble emulsifier.

2,103,197
DEFLECTOR FOR KNITTING MACHINES
Robert H. Lawson and William L. Smith, Jr., Pawtucket, R. I., assignors to Hemphill Company, Central Falls, R. I., a corporation of Massachusetts
Application April 18, 1935, Serial No. 17,037
In Canada October 11, 1934
3 Claims. (Cl. 66—125)

1. In a knitting machine a yarn supply and a needle bed, means positioned between the yarn supply and needle bed for accurately determining the relative feeding rates of two or more yarns including yarn driven discs rotating in jeweled bearings, a supporting member, a lint collecting member positioned on said support above said yarn driven discs and an oil deflecting member between said discs and the needle bed projecting radially of the same a distance sufficient to prevent oil from being thrown into the vicinity of said discs.

2,103,198
CLEANING TOOL
Herman Siemund, Chicago, Ill., assignor to Greenview Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application March 12, 1936, Serial No. 68,488
7 Claims. (Cl. 15—245)



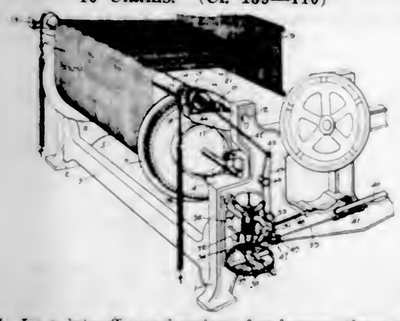
1. In a cleaning device of the character described, a U-shaped structure having means on one arm thereof for engaging a clamping bar in said structure, an angular clamping bar in said structure having means along one side for en-

gaging said means of said U-shaped structure, a cleaning member having one edge thereof positioned between the clamping bar and the opposite arm of said U-shaped structure, and means for rigidly securing said cleaning member within said U-shaped structure.

2,103,199
BAG

Howard A. Wolf, Philadelphia, Pa., assignor to Wolf Brothers, a partnership composed of Louis Wolf, Elias Wolf, Howard Wolf, and Walter Wolf, Philadelphia, Pa.

Application November 11, 1935, Serial No. 49,178
1 Claim. (Cl. 229—68)

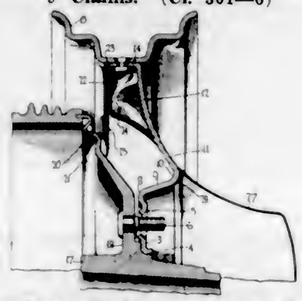


A bag for receiving articles of merchandise for carrying, being generally open at one end and having a flap extending beyond said open end, a centrally located aperture extending transversely through the bag near the open end thereof, through which the hand may be extended for holding the bag pendently; said flap being adapted to be folded over the open end of the bag and having a tab formed therein adapted to be folded into said transverse aperture in the body of the bag thereby forming central locking means, a similar gummed area on the face of said bag on either side of said transverse aperture and spaced therefrom, said areas extending near to but not quite up to the edges of the bag and of said aperture and being also spaced from the open end thereof, and a corresponding pair of similarly spaced gummed areas on the juxtaposed face of said flap and spaced from the edges thereof, whereby, by folding over the flap and pressing together the corresponding gummed areas, those portions of the bag opening which do not adjoin the transverse aperture but are spaced a substantial distance therefrom may be securely closed, and whereby the central portion of the bag opening may be closed by means of the coacting flap tab and the central transverse aperture.

2,103,200
CONSTANT TENSION LET-OFF MECHANISM

Carl D. Brown, Hopedale, Mass., assignor to Draper Corporation, Hopedale, Mass., a corporation of Maine

Application March 5, 1937, Serial No. 129,169
10 Claims. (Cl. 139—110)

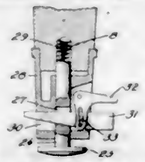


1. In a let-off mechanism for looms, the combination of a rotatable warp beam, supporting means comprising a pair of spaced parallel racks positioned above said warp beam and extending generally forwardly and rearwardly of the loom, a whip roll structure including gears meshing with and rolling along said racks, and a whip roll supported by said gears for movement therewith along with said racks, the warp sheet from said warp beam extending upwardly and forwardly about said whip roll, means yieldingly urging said whip roll rearwardly along said racks to tension the warp sheet, and let-off means for controlling the rate of rotation of said warp beam.

2,103,201
VEHICLE WHEEL

Carolus L. Eksergian, Detroit, Mich., assignor to Budd Wheel Company, Philadelphia, Pa., a corporation of Pennsylvania

Application May 1, 1934, Serial No. 723,305
9 Claims. (Cl. 301—6)

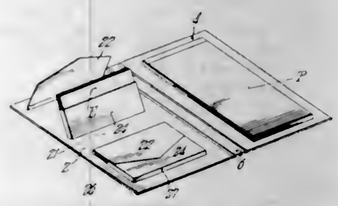


3. A vehicle wheel comprising a sheet metal front spider including a bolting-on flange and an annular portion projecting forwardly therefrom and connected through a conical nave portion into spoke portions, a hub including a flange merging into a brake drum element having a seat disposed a substantial distance radially outwardly from the periphery of the hub flange, and a sheet metal rear spider including spoke portions cooperating with the front spider spoke portions to form tubular spokes and an annulus, the latter disposed on said seat.

2,103,202
LEG ADJUSTER

Clifford H. Green, Grand Rapids, Mich., assignor to Automatic Instrument Company, a corporation of Michigan

Application October 24, 1933, Serial No. 694,987
2 Claims. (Cl. 45—139)



1. In a table leg adjustment comprising a ferrule for mounting on the lower end of the leg, the ferrule having a transversely grooved bore, a foot having a similarly grooved stem slidable in the bore, the stem being smaller in diameter than the bore, and a cam rotatably mounted in the side of the ferrule and having a lever arm projecting from the ferrule accessible for manual operation to wedge the stem over against the opposite side of the bore.

2,103,203
PORTFOLIO

Oscar W. Jolly, Holyoke, Mass., assignor to Springfield Photomount Company, Holyoke, Mass., a corporation of Massachusetts

Application September 4, 1936, Serial No. 99,460
2 Claims. (Cl. 206—63)

1. As a new article of manufacture, a portfolio of the class described comprising in combination, a substantially flat support member, covering material secured to and overlying a surface of said member, said covering material being provided with a pair of substantially parallel slits spaced apart a certain distance, and a longitudinal pocket-forming member of foldable material inserted into said slits so as to have an intermediate portion disposed between the support member and the portion of the covering material between the slits and end portions at opposite ends of the intermediate portion disposed above the covering material, the said pocket-forming member being folded along lines extending between the said intermediate and end portions whereby the end portions may swing relative to the surface of said support member.

2,103,204
LUBRICATING GREASE AND METHOD FOR ITS PRODUCTION

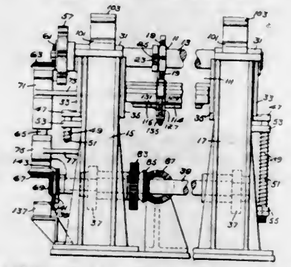
Donald A. Lister, Brunswick, Ga., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application August 21, 1936, Serial No. 97,174
11 Claims. (Cl. 87—9)

1. A lubricant comprising a lubricating oil admixed with a metallic salt of a rosin which has been subjected to treatment with a hydrogenation catalyst at an elevated temperature in the absence of added substances capable of reducing the unsaturation of the metal under the conditions of treatment.

2,103,205
ART OF SHRINKING FABRICS

Latimer D. Myers, Cincinnati, Ohio, assignor to Emery Industries, Inc., Cincinnati, Ohio, a corporation of Ohio



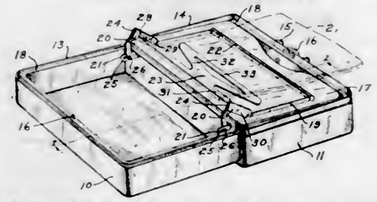
No Drawing. Application October 19, 1935, Serial No. 45,833
15 Claims. (Cl. 26—18.5)

1. In the art of shrinking fabrics mechanically, the step of treating cotton fabrics which are differentially repellent to water, prior to the time that they are shrunk, to render such fabrics uniformly receptive to water in the mechanical shrinking process, which step comprises, treating the fabric to be shrunk with an aqueous solution comprising oil soluble mineral oil sulphonates and stable mineral oil.

2,103,206
APPARATUS FOR WELDING NAILS TO A METAL BODY

William T. Ober, Marblehead, Mass., assignor to Thomson-Gibb Electric Welding Company, Lynn, Mass., a corporation of Massachusetts

Application November 5, 1936, Serial No. 109,345
2 Claims. (Cl. 219—4)

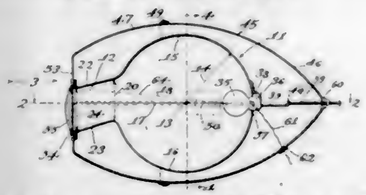


1. A machine for welding nails to a metal strip or the like, comprising a series of coaxially mounted, rotatable nail carrying turrets having each a plurality of equally spaced, radial nail holders adapted each to receive and carry a nail, a turret shaft on which said turrets are mounted and by which said turrets are turned, means for holding a metal strip adjacent said turrets and parallel to the axis thereof, said carriers being angularly fixed on said shaft to bring the nail holders of successive carriers in an aligned spaced serial relation and said nail holders, when said shaft is turned, moving in paths lying in spaced planes at right angles to said shaft and to said strip, vertically sliding heads in one of which each opposite end of said turret shaft is mounted, columns in which said heads are mounted for vertical sliding movement, means also carried by one of said heads for turning said shaft, thereby simultaneously to turn said turrets and present a longitudinal series of nail holders in operative relation to said strip with their nails at right angles to and the nail heads adjacent said strip, means coordinately to move said sliding head and thereby said shaft and turrets to press the heads of the series of nails against said metal strip in spaced relation lengthwise the same, and means for passing a welding current simultaneously through the entire series of nails and contacting portions of said strip to weld the nails thereto.

2,103,207
TRAVELING BAG

Frank J. Sullivan, Oshkosh, Wis.

Application June 6, 1934, Serial No. 729,168
2 Claims. (Cl. 190—41)



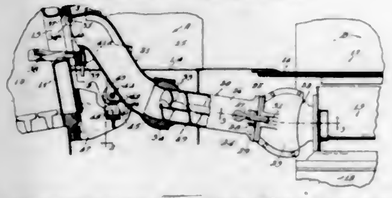
1. A traveling bag, comprising, hingedly connected sections swingable into end-to-end alinement, a garment folding frame having side arms provided with reversely bent ends and a transverse bar rigidly interconnecting the opposite arm ends, brackets secured to one of said sections

adjacent the hinge connection thereof and means pivotally supporting said bent frame arm ends on said brackets, the bent ends of said frame arms being formed to clear the hinged walls of said sections and to position said bent arm portions a considerable distance above the upper ends of said walls when the bag is wide open and said frame has been swung over the other section in which position the reverse bend enables the side arms to lie parallel with said other section, and one or more garment hangers attachable directly to said bent arm portions remote from said bar.

2,103,208

NONGLARE HEADLIGHT

John A. Von Wald, Los Angeles, Calif.
Application July 7, 1936, Serial No. 89,273
5 Claims. (Cl. 240—41.3)

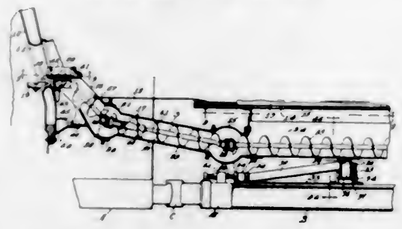


1. A headlight comprising a reflector substantially circular on its vertical diameter, the rear portion being circular on its horizontal diameter but the forward portion on the horizontal diameter having an outward somewhat spiral curve, a structure forming a channel extending outwardly from the forward portion of the reflector, said channel having side walls diverging symmetrically from a vertical plane through the center of the reflector, a lamp mounted on the rear portion of the reflector with its center located substantially at the intersection of the vertical longitudinal plane and horizontal longitudinal plane through the reflector, the said channel having upper and lower walls sloping downwardly and merging with the side walls to form somewhat of an oval considered in a vertical transverse plane, the line of divergence of the side walls of the channel being substantially on a line from the center of the lamp.

2,103,209

STOKER CONVEYER

Howard P. Anderson, Erie, Pa., assignor to The Standard Stoker Company, Inc., (1922), a corporation of Delaware
Application July 18, 1931, Serial No. 551,605
Renewed February 6, 1937
19 Claims. (Cl. 198—15)

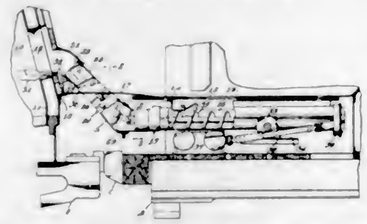


1. In combination, a firebox backwall having a firing opening therein, an upwardly extending conduit section delivering to said opening, a hinge having its axis substantially parallel with said backwall and connecting the forward end of said conduit with said backwall, said conduit adjacent its fuel receiving end carrying supporting means, and an arcuate track for said supporting means permitting swinging movement of said conduit about the axis of said hinge.

2,103,210

LOCOMOTIVE STOKER

John W. Myers, Roanoke, Va., assignor, by mesne assignments, to The Standard Stoker Company, Inc. (1922), a corporation of Delaware
Application February 5, 1932, Serial No. 591,126
Renewed April 23, 1935
20 Claims. (Cl. 198—15)

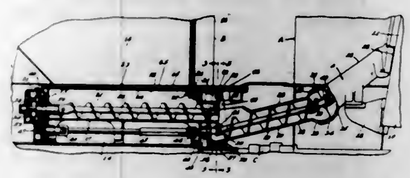


1. In combination, with an intercoupled locomotive and tender, the former having a firebox and the latter a fuel bin, a flexible conduit system extending from said bin to said locomotive and arranged to deliver fuel to the firebox thereof comprising a conduit section slidably mounted on said locomotive to permit fore and aft movement of said conduit system with respect to said firebox and a second conduit section flexibly connected to the first named section and being fixedly mounted on the tender with respect to longitudinal movement thereof and pivotally mounted on the tender about transverse and vertical axes, and means preventing vertical and transverse movement of the first named conduit section.

2,103,211

LOCOMOTIVE STOKER

Charles J. Surdykowski, Tuckahoe, N. Y., now by judicial change of name Charles J. Surdy, assignor to Standard Stoker Company, Inc., (1922), a corporation of Delaware
Application May 25, 1932, Serial No. 613,363
17 Claims. (Cl. 110—101)

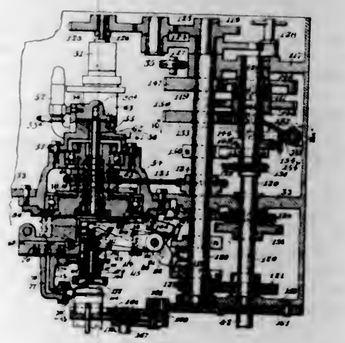


14. In combination with a locomotive having a firing opening in the backwall thereof, a tender for said locomotive, a bridging element extending between the locomotive and tender and supported by them at its ends, said bridging element at one of said ends being hingedly supported, a fuel conduit section communicating with said firing opening, said conduit section extending through said bridging element and being supported thereby.

2,103,212

CONVEYER

Edwin Archer Turner, New York, and Charles J. Surdy, Tuckahoe, N. Y., assignors, by mesne assignments, to The Standard Stoker Company Inc., (1922), New York, N. Y., a corporation of Delaware
Application June 27, 1936, Serial No. 87,622
6 Claims. (Cl. 198—15)

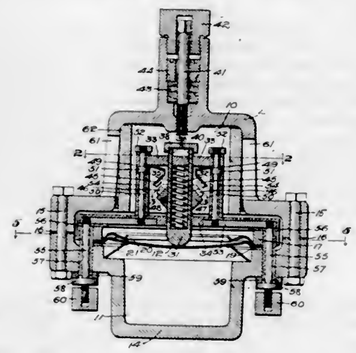


1. In an intercoupled locomotive and tender, a conveyer of constant length extending between the locomotive and tender, one end of said conveyer being flexibly supported on one of said vehicles and having an unvarying longitudinal relation therewith, the opposite end of said conveyer being disposed on the other of said intercoupled vehicles, means for supporting the last named end of said conveyer on such vehicle, said means including a member pivotally supported on such vehicle to swing on a horizontal transverse axis only, the last named end of said conveyer being pivotally supported on said member for movement about a vertical axis, and means restraining axial rotation of said conveyer.

2,103,213

CONTAINER SEALING MACHINE

Irving E. Black, Frederick J. Hoffer, and Henry B. Silver, Brooklyn, N. Y., assignors to Plastic Seal Corporation, Brooklyn, N. Y., a corporation of New York
Application December 29, 1934, Serial No. 759,784
36 Claims. (Cl. 226—80)

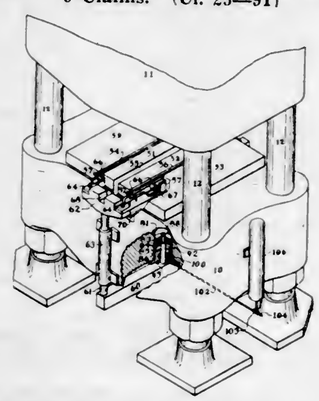


1. In a container sealing machine having a container support and means for discharging sealing fluid about the joint between a container and its closure upon the container support, said support and discharging means being relatively movable, and means for causing relative movement between the container support and the discharge means, first in one direction and thereafter in another direction.

2,103,214

FLUID PRESSURE RESPONSIVE DEVICE

John R. Coffin, West Medford, Mass., assignor to Barostat Company, Boston, Mass., a corporation of Massachusetts
Application August 24, 1929, Serial No. 388,154
7 Claims. (Cl. 137—156)



1. In a fluid pressure responsive device, the combination of a casing, a diaphragm therein dividing said casing into two distinct, non-communicating chambers each substantially isobaric within its boundaries, and means in one chamber, actuated by said diaphragm, such chamber being provided with the sole means for connection of the device with a fluid pressure system, the second chamber having all its joints or connections enclosed within and terminating within the first chamber.

2,103,215

PRESS FOR MOLDING SHAPED ARTICLES

Arnold M. Cook, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts
Application September 30, 1936, Serial No. 103,404
9 Claims. (Cl. 25—91)

1. A power press for molding shaped articles comprising two press platens, power mechanism for moving one of the platens towards the other, an elevator adapted to hold a mold between the platens and means for yieldingly supporting the elevator against the pressure of the movable platen.

2,103,216

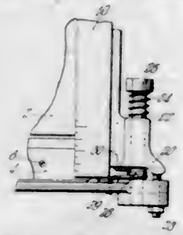
CALCIUM SULPHATE PLASTERS

John Stanley Dunn, Norton-on-Tees, and Victor Lefebure, London, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain

No Drawing. Application January 23, 1936, Serial No. 60,542. In Great Britain January 28, 1935

8 Claims. (Cl. 106—34)

1. A plaster mix capable, when gauged with water, of setting with a uniformly coloured surface and substantially without laitance, comprising a coloured unset plaster constituent and a proportion of an already set plaster constituent containing colour incorporated prior to setting, the said set plaster constituent being less finely divided than the unset plaster constituent, both the unset plaster constituent and the set plaster constituent containing the same pigment.



2,103,217

CUTTING APPARATUS

William H. Ford, East Longmeadow, Mass., assignor to Milton Bradley Company, Springfield, Mass., a corporation of Massachusetts

Application October 17, 1936, Serial No. 106,100

2 Claims. (Cl. 164—44)

1. A cutting device of the class described comprising in combination, a support, a stationary knife on said support, a rotatable and reciprocable shaft associated with said support, a movable knife carried by said shaft for swinging downwardly towards said stationary knife and upwardly away therefrom as said shaft rotates, a coil spring extending around said shaft and urging the shaft to reciprocate in one direction to bring said movable knife against said stationary knife, and another coil spring extending around said shaft having a part in engagement with said movable knife urging the knife upwardly and outwardly away from said stationary knife, all adapted and arranged whereby said movable knife is automatically caused to act against said stationary knife as the former is moved downwardly by manual engagement therewith and to move upwardly out of engagement with said stationary knife when released from manual engagement.

2,103,218

HEAT-RESISTANT YARN AND HEAT-RESISTANT CORD AND PROCESS FOR MAKING SAME

Eugene C. Gwaltney and Leon A. Graybill, Macon, and Russell B. Newton, Columbus, Ga., assignors to Bibb Manufacturing Company, Macon, Ga.

No Drawing. Application October 3, 1935, Serial No. 43,454

22 Claims. (Cl. 117—2)

1. The process of manufacturing heat resistant cotton cord which consists in twisting single cotton yarns into a ply, saturating the plied yarns to soften the natural gums and waxes of the cotton fiber, and twisting while wet the saturated plied yarns under tension just short of breaking point to fuse the fibers with the softenend gums and waxes retained therein.

2,103,219

CONTROLLED CATALYTIC OXIDATION

Leslie G. Jenness, Brooklyn, N. Y.

No Drawing. Application January 30, 1935, Serial No. 4,095

6 Claims. (Cl. 23—2)

1. A mixture of manganese oxides capable of substantially completely oxidizing carbon monoxide in the presence of hydrogen and oxygen without substantial oxidation of said hydrogen, said mixture being prepared by dissolving MnO from a manganese oxide consisting essentially of Mn_2O_3, and reducing the remaining MnO_2 at a temperature below approximately 150° C. to produce a mixture of manganese oxides having less than one and more than one third atom of available oxygen per atom of manganese.

5. The method of substantially completely removing carbon monoxide from admixture with hydrogen which comprises contacting a mixture of carbon monoxide and hydrogen in the presence of oxygen with an oxidizing material capable of oxidizing said carbon monoxide without substantial oxidation of hydrogen, said material being prepared by removing MnO from particles of Mn_2O_3 without shattering the particles, and prior to said contacting reducing the remaining MnO_2 at a temperature below approximately 150° C. to a mixture of manganese oxides having less than one and more than one third atom of available oxygen per atom of manganese.

2,103,220

CONTROLLED OXIDATION

Leslie G. Jenness, Brooklyn, N. Y.

No Drawing. Application March 4, 1935, Serial No. 9,264

4 Claims. (Cl. 23—210)

1. The process of substantially completely oxidizing carbon monoxide from gases containing hydrogen and carbon monoxide without oxidizing said hydrogen, which comprises alternately contacting said gases and gases containing free oxygen with a mixture of manganese oxides to alternately reduce and reoxidize said oxides, said carbon monoxide being oxidized during the reduction of said oxides, said oxides having been previously reduced from manganese dioxide at a temperature below 175° C. so that they contain less than one and more than one-third atom of variable oxygen per atom of manganese, discontinuing each oxidation of said carbon monoxide before the available oxygen of said oxidation falls to one-third of an atom of available oxygen per atom of manganese and discontinuing each reoxidation of said oxides before the available oxygen thereof increases to one atom of available oxygen per atom of manganese.

2,103,221

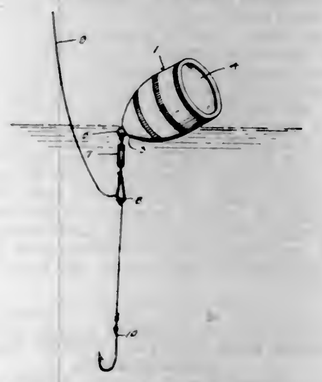
OXIDATION CATALYSTS AND PROCESS

Leslie G. Jenness, Brooklyn, N. Y., assignor to Intermetal Corporation, Newark, N. J., a corporation of Delaware

No Drawing. Application November 14, 1935, Serial No. 49,821

3 Claims. (Cl. 23—234)

3. An oxidizing agent for substantially completely oxidizing carbon monoxide in the presence of hydrogen without oxidizing substantial quantities of hydrogen, which comprises, compressed granules of a mixture of approximately 50 to 75% of powdered copper and finely divided manganese oxide containing more than one-third atom and less than one atom of available oxygen per atom of manganese and prepared by leaching manganous oxide from manganese sesqui-oxide to produce manganese dioxide, and reducing said manganese dioxide at a temperature between approximately 100 and 175° C.



2,103,222

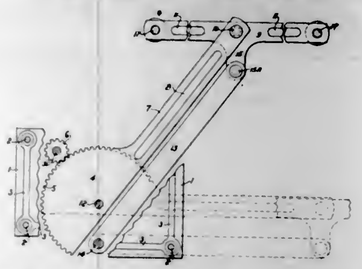
FISHING FLOAT

Moses F. Nelson, Highland Falls, N. Y.

Application April 14, 1936, Serial No. 74,380

2 Claims. (Cl. 43—49)

1. A float for use in still fishing, comprising an elongated body of buoyant material which is cut square across at one end and tapers to a blunt point at the opposite end, means secured in said point facilitating the attachment of a fishing line thereto, and means formed in the material of the body at the first mentioned end for producing a momentary water-free area thereover as the float is drawn downwardly beneath the water surface whereby the entrance of the water into said area will develop a signaling sound.



2,103,223

WINDOW CONTROL MECHANISM

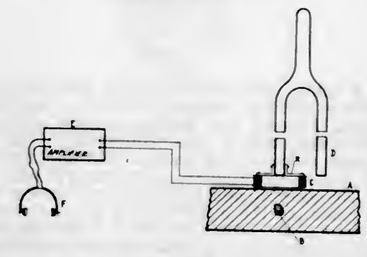
John H. Roethel, Detroit, Mich.

Application March 21, 1931, Serial No. 524,298

12 Claims. (Cl. 268—126)

1. In a window regulating mechanism, the combination of a horizontally movable member adapted to be connected to a window, a support, a gear rotatable on said support and having a projecting arm pivoted to said member for moving the window vertically, and a second arm parallel to the first arm and pivoted to the support and member at vertically spaced points equidistant from the axis of rotation of said gear and the pivot of the first arm to said member.

2,103,224



APPARATUS FOR TESTING MAGNETIZABLE WORKPIECES

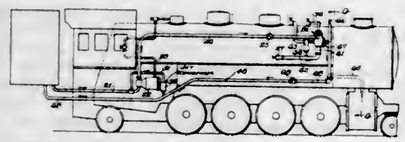
Eugen Schweitzer, Wiesbaden-Biebrich, and Siegfried Kiesskalt, Frankfort-on-the-Main-Hochst, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the Main, Germany

Application May 22, 1933, Serial No. 672,306

In Germany May 23, 1932

2 Claims. (Cl. 175—183)

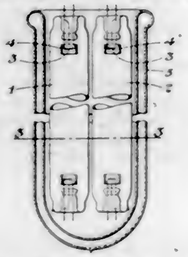
1. An apparatus for discovering inhomogeneities in magnetizable workpieces which comprises at least one magnet for magnetizing the workpiece, an inductive coil to be placed in inductive relation to the workpiece, means for causing the inductive coil to oscillate and means of rendering perceptible the current produced in the inductive coil.



2,103,225

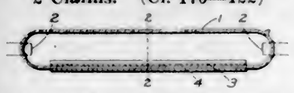
BOILER FEED APPARATUS

Verl E. McCoy, Chicago, Ill., and Ralph W. Anderson, Wauwatosa, Wis.; said McCoy assignor to Wilson Engineering Corporation, Chicago, Ill., a corporation of Delaware



Application June 6, 1935, Serial No. 25,218

3 Claims. (Cl. 122—442)



1. In combination with a locomotive boiler, means including a pump for withdrawing feed water from a supply source and delivering it at a pressure exceeding the existing boiler pressure, means for temporarily increasing the water velocity and decreasing the static water pressure to a range below the pressure of exhaust steam from the locomotive cylinders, means controlled by the delivery pressure of said pump for regulating said water pressure and velocity, means for introducing cylinder exhaust steam into said water while at said lowered pressure, and means for decreasing the velocity of the water and raising its pressure after said introduction of exhaust steam to an excess over the boiler pressure and delivering the same into the boiler.

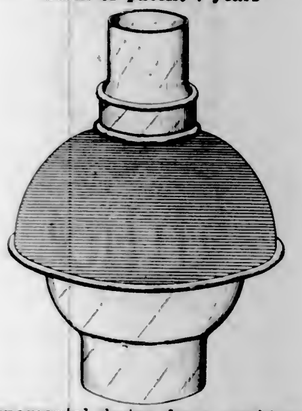
2,103,226
GASEOUS ELECTRIC DISCHARGE LAMP DEVICE
Marl Johan Druyvesteyn, Willem Uyterhoeven, Cornelis Bol, and Martinus van Dam, Eindhoven, Netherlands, assignors to General Electric Company, a corporation of New York
Application March 14, 1934, Serial No. 715,462
In Germany March 31, 1933
3 Claims. (Cl. 240—11.4)

3. A lamp unit comprising in combination, a luminous, tubular element having a vaporizable material therein and having parallel parts, an hermetically sealed heat conservator for said luminous element, the walls of said luminous element being separated from the walls of said conservator, each of said parallel parts being a heating means for the other of said parts to localize the light obstructing deposits of the condensed metal in each part of said luminous element at places on said parts other than those places adjacent the other of said parts during the operation of said luminous element.

2,103,227
GASEOUS ELECTRIC DISCHARGE LAMP DEVICE
Marl J. Druyvesteyn, Eindhoven, Netherlands, assignor to General Electric Company, a corporation of New York
Application August 16, 1937, Serial No. 159,428
In Germany August 28, 1936
2 Claims. (Cl. 176—122)

1. A gaseous electric discharge device comprising a container, electrodes sealed therein, a quantity of vaporizable metal therein the vapor of which is luminosity producing during the operation of the device, the inner wall of said container being resistant to the hot, ionized metal vapor and being subject to attack by the unvaporized portion of said metal, a condensing surface on said container and a material inert with respect to said metal in any state interposed between said surface and the unvaporized portion of said metal and covering said surface to protect said surface from the deleterious effects of said unvaporized metal.

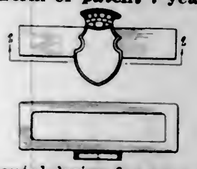
2,103,228
WHITE CLOUDED VITREOUS ENAMEL
Ignaz Kreidl, Vienna, Austria
No Drawing. Application April 8, 1933, Serial No. 665,193. In Austria April 20, 1932
3 Claims. (Cl. 106—36.2)



1. In a method of producing a metallic article having thereon a coating of clouded vitreous enamel having an opacity substantially greater than that which could be produced with the frit used and clay alone, and in which a substantial part of the increased opacity is contributed by gas bubbles retained in the enamel, incorporating in the enamel slip containing clay a gas-evolving agent which, upon the firing of the enamel, evolves gases which are retained in the enamel at the firing temperature thereof in the form of bubbles of such sizes and number as to contribute a substantial increase to the opacity, said gas-evolving agent being selected from the group consisting of highly polymerized hydrocarbons, substitution products thereof, dispersions of such highly polymerized hydrocarbons and substitution products thereof, resins, pitches, tars and asphalts.

2,103,229
PROCESS FOR MAKING WHITE CLOUDED IRON ENAMEL
Ignaz Kreidl, Vienna, Austria
No Drawing. Application November 7, 1933, Serial No. 697,068. In Austria November 28, 1932
4 Claims. (Cl. 106—36.2)

1. In a method of producing a metallic article having thereon a coating of clouded vitreous enamel having an opacity substantially greater than that which could be produced with the frit used and clay alone, and in which a substantial part of the increased opacity is contributed by gas bubbles retained in the enamel, incorporating in the enamel slip containing clay, a gas-evolving agent which, upon the firing of the enamel, evolves gases which are retained in the enamel at the firing temperature thereof in the form of bubbles of such sizes and number as to contribute a substantial increase to the opacity, together with a glossing agent for the enamel, selected from the group consisting of hydrochloric acid, ammonium chloride and compounds capable of yielding hydrochloric acid.



DESIGNS
DECEMBER 21, 1937

107,496
DESIGN FOR A COMBINED CHIMNEY AND LAMP SHADE
Sylvester A. Baker, San Francisco, Calif.
Application June 1, 1937, Serial No. 69,649
Term of patent 7 years

The ornamental design for a combined chimney and lamp shade substantially as shown and described.

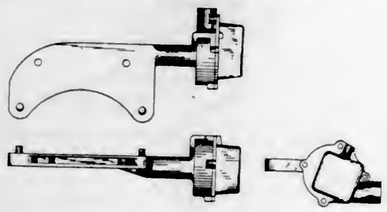
107,497
DESIGN FOR A MONOGRAM NAPKIN RING
Pauline Brady, Newark, N. J.
Application October 16, 1936, Serial No. 65,320
Term of patent 7 years

The ornamental design for a monogram napkin ring, as shown and described.

107,498
DESIGN FOR A PENCIL TIP
William Cook, New York, N. Y., assignor to Eagle Pencil Company, New York, N. Y., a corporation of Delaware
Application October 15, 1937, Serial No. 72,211
Term of patent 7 years

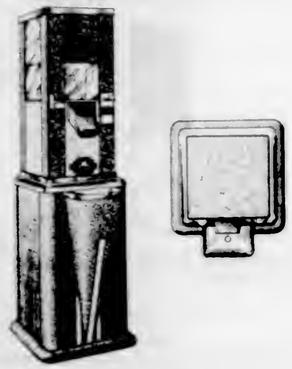
The ornamental design for a pencil tip, substantially as shown.

107,499
DESIGN FOR A PENCIL TIP
William Cook, New York, N. Y., assignor to Eagle Pencil Company, New York, N. Y., a corporation of Delaware
Application October 15, 1937, Serial No. 72,212
Term of patent 14 years



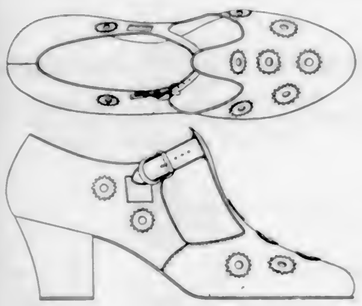
The ornamental design for a pencil tip, substantially as shown.

107,500
DESIGN FOR A PENCIL TIP
William Cook, New York, N. Y., assignor to Eagle Pencil Company, New York, N. Y., a corporation of Delaware
Application October 15, 1937, Serial No. 72,213
Term of patent 14 years



The ornamental design for a pencil tip, substantially as shown.

107,501
DESIGN FOR A TOILET ODOR EXPELLER CASING
Gaspé H. Davis, Van Nuys, Calif.
Application September 15, 1937, Serial No. 71,639
Term of patent 3½ years



The ornamental design for a toilet odor expeller casing substantially as shown.

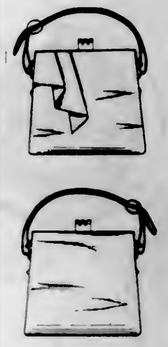
107,502
DESIGN FOR A CORN POPPING MACHINE CASE
George A. Delf, St. Louis, Mo., assignor, by mesne assignments, to Floyd I. Roach, Kansas City, Mo.
Application October 25, 1937, Serial No. 72,406
Term of patent 3½ years

The ornamental design for a corn popping machine case as shown.

107,503
DESIGN FOR A SHOE
Walter Ebling, Rochester, N. Y., assignor to E. P. Reed & Co., Rochester, N. Y., a corporation of New York
Application October 29, 1937, Serial No. 72,519
Term of patent 3½ years

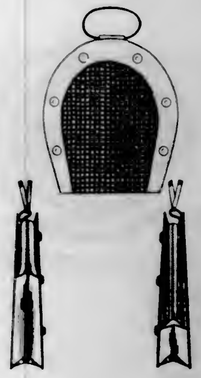
The ornamental design for a shoe, as shown.

107,504
DESIGN FOR A BOWL
Louis Farber, Yonkers, N. Y.
Application April 30, 1937, Serial No. 69,082
Term of patent 3½ years



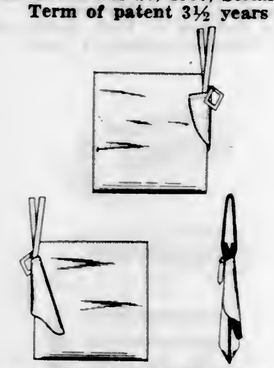
The ornamental design for a bowl, substantially as shown.

107,505
DESIGN FOR A HANDBAG
Henri Felmann, Chicago, Ill.
Application November 16, 1937, Serial No. 72,918
Term of patent 3½ years



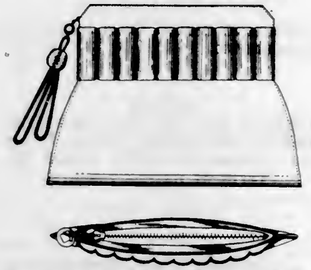
The ornamental design for a handbag, substantially as shown and described.

107,506
DESIGN FOR A HANDBAG
Henri Felmann, Chicago, Ill.
Application November 18, 1937, Serial No. 72,976
Term of patent 3½ years



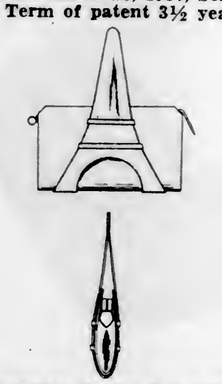
The ornamental design for a handbag, substantially as shown and described.

107,507
DESIGN FOR A HANDBAG
Henri Felmann, Chicago, Ill.
Application November 18, 1937, Serial No. 72,977
Term of patent 3½ years



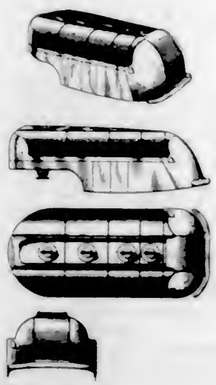
The ornamental design for a handbag, substantially as shown and described.

107,508
DESIGN FOR A HANDBAG
Henri Felmann, Chicago, Ill.
Application November 20, 1937, Serial No. 73,039
Term of patent 3½ years



The ornamental design for a handbag, substantially as shown.

107,509
DESIGN FOR A HANDBAG
Henri Felmann, Chicago, Ill.
Application November 20, 1937, Serial No. 73,040
Term of patent 3½ years



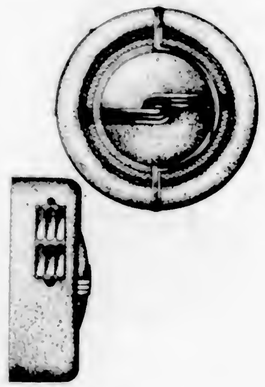
The ornamental design for a handbag, substantially as shown and described.

107,510
DESIGN FOR A HANDBAG
Henri Felmann, Chicago, Ill.
Application November 20, 1937, Serial No. 73,042
Term of patent 3½ years

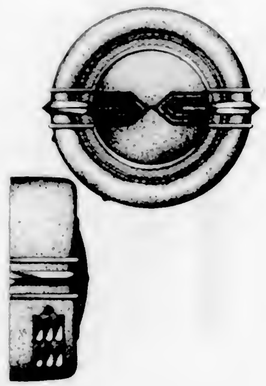
The ornamental design for a handbag, substantially as shown and described.

107,511
DESIGN FOR A TRAILER TANK
Ralph D. George, Kansas City, Mo., assignor to Butler Manufacturing Company, Kansas City, Mo., a corporation of Missouri
Application October 9, 1937, Serial No. 72,092
Term of patent 14 years

The ornamental design for a trailer tank substantially as shown.



107,512
DESIGN FOR AN AUTOMOBILE
Delbert W. Graber, Salem, Oreg.
Application August 28, 1937, Serial No. 71,376
Term of patent 7 years

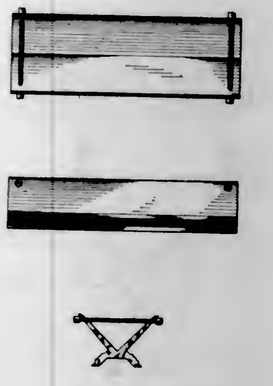


The ornamental design for an automobile as shown.

107,513
DESIGN FOR AN AUTOMOBILE HEATER OR THE LIKE
George R. Graff, Toledo, Ohio, assignor of one-half to John E. Goerlich, Toledo, Ohio, and one-half to The Defiance Pressed Steel Company, Marion, Ohio, a corporation of Ohio
Application November 3, 1937, Serial No. 72,598
Term of patent 7 years

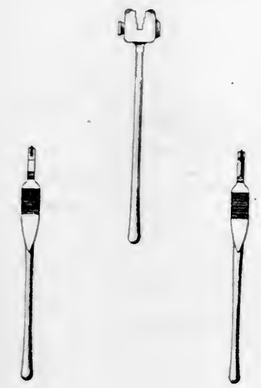
The ornamental design for an automobile heater or the like, substantially as shown.

107,514
DESIGN FOR AN AUTOMOBILE HEATER OR THE LIKE
George R. Graff, Toledo, Ohio, assignor of one-half to John E. Goerlich, Toledo, Ohio, and one-half to The Defiance Pressed Steel Company, Marion, Ohio, a corporation of Ohio
Application November 3, 1937, Serial No. 72,599
Term of patent 7 years



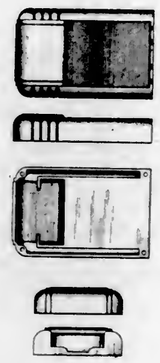
The ornamental design for an automobile heater or the like, substantially as shown.

107,515
DESIGN FOR A WHEEL FOR A ROLLER SKATE OR THE LIKE
Edward A. Grange, Alexander F. Kaptuller, and Erwin J. Schmidt, Chicago, Ill., assignors to Allied Engineering Company, Chicago, Ill., a corporation of Illinois
Application May 26, 1937, Serial No. 69,564
Term of patent 14 years



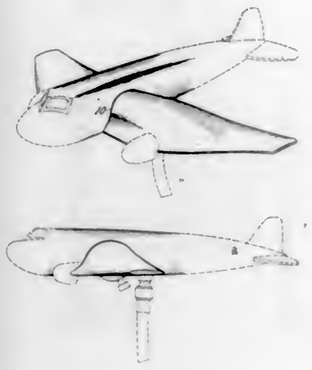
The ornamental design for a wheel for a roller skate or the like substantially as shown.

107,516
DESIGN FOR A FOOD SERVER OR SIMILAR ARTICLE
Lurelle Guild, Noroton, Conn., assignor to Kensington, Incorporated, New Kensington, Pa., a corporation of Pennsylvania
Application January 16, 1937, Serial No. 67,098
Term of patent 3½ years



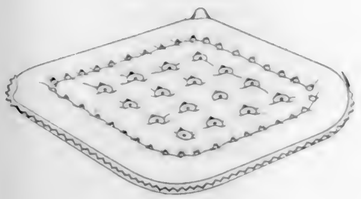
The ornamental design for a food server or similar article, as shown.

107,517
DESIGN FOR A GLASS CUTTING TOOL
Homer G. Hamilton, Des Moines, Iowa
Application March 29, 1937, Serial No. 68,470
Term of patent 14 years



The ornamental design for a glass cutting tool substantially as shown.

107,518
DESIGN FOR A DESK MEMORANDUM SHEET HOLDER
Oscar F. Holmgren, White Plains, N. Y., and William B. Petzold, Providence, R. I., assignors to Autopoint Company, Chicago, Ill., a corporation of Illinois
Application September 24, 1937, Serial No. 71,772
Term of patent 14 years

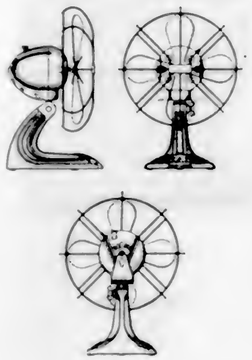


The ornamental design for a desk memorandum sheet holder substantially as shown.

107,519
DESIGN FOR A LAMP
Frank F. Holstein, Chicago, Ill.
Application June 4, 1937, Serial No. 69,671
Term of patent 3½ years

The ornamental design for a lamp; substantially as shown and described.

107,520
DESIGN FOR A CUSHION
John Herbert Johnson, Toronto, Ontario, Canada, assignor to K & W Rubber Corporation, Delaware, Ohio
Application August 16, 1937, Serial No. 71,104
Term of patent 14 years

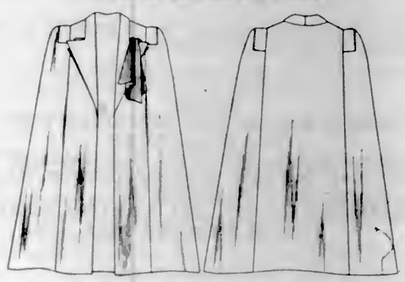


The ornamental design for a cushion, as shown and described.

107,521
DESIGN FOR A PENCIL
Richard Kropsch, Budweis, Czechoslovakia, assignor to Koh-I-Noor Bleistiftfabrik L. & C. Hardtmuth, Budweis, Czechoslovakia, a Firm, composed of Frantisek Hardtmuth mladsi, Jan Herring-Frankensdorf, Dr. Bedrich Herring-Frankensdorf, Matylda Lamezan-Salins, Anna Hardtmuthova starsi, Anna Hardtmuthova mladsi, and Marie princezna de Rohen
Application April 28, 1937, Serial No. 69,015
In Czechoslovakia December 9, 1936
Term of patent 7 years

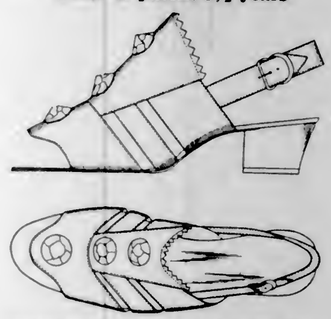
The ornamental design for a pencil, as shown and described.

107,522
DESIGN FOR AN ELECTRIC FAN
Ralph E. Kruck, Springfield, Mass., assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania
Application August 28, 1937, Serial No. 71,366
Term of patent 7 years



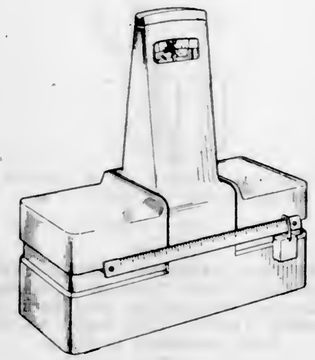
The ornamental design for an electric fan substantially as shown and described.

107,523
DESIGN FOR A CHARM OR THE LIKE
Walter Lampl, New York, N. Y.
Application October 23, 1937, Serial No. 72,393
Term of patent 14 years



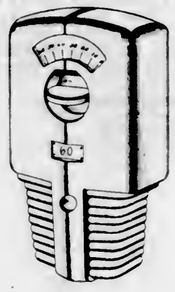
The ornamental design for a charm or the like, as shown.

107,524
DESIGN FOR A CAPE
Benjamin Lefrak, New York, N. Y.
Application November 4, 1937, Serial No. 72,610
Term of patent 3½ years



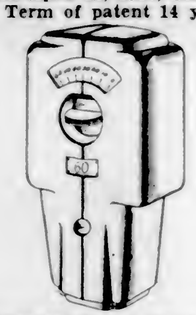
The ornamental design for a cape, substantially as shown, and described.

107,525
DESIGN FOR A SHOE
Jacob Levine, New York, N. Y.
Application November 20, 1937, Serial No. 73,046
Term of patent 3½ years



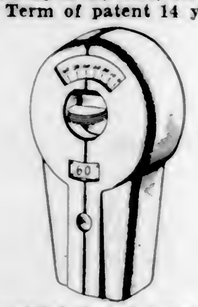
The ornamental design for a shoe, substantially as shown.

107,526
DESIGN FOR A SCALE CASING
John McLeod Little and Harold L. van Doren, Toledo, Ohio, assignors to Toledo Scale Manufacturing Company, Toledo, Ohio, a corporation of New Jersey
Application November 12, 1937, Serial No. 72,825
Term of patent 14 years



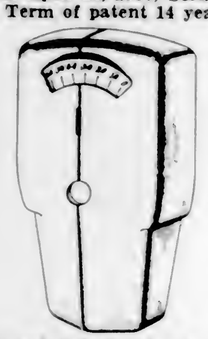
The ornamental design for a scale casing as shown.

107,527
DESIGN FOR A PARKING METER HOUSING
Raymond Loewy, New York, N. Y., assignor to The Karpark Corporation, New York, N. Y.
Application April 12, 1937, Serial No. 68,703
Term of patent 14 years



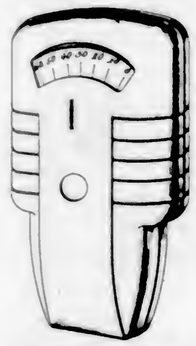
The ornamental design for a parking meter housing, as shown and described.

107,528
DESIGN FOR A PARKING METER HOUSING
Raymond Loewy, New York, N. Y., assignor to The Karpark Corporation, New York, N. Y.
Application April 12, 1937, Serial No. 68,704
Term of patent 14 years



The ornamental design for a parking meter housing, as shown and described.

107,529
DESIGN FOR A PARKING METER HOUSING
Raymond Loewy, New York, N. Y., assignor to The Karpark Corporation, New York, N. Y.
Application April 12, 1937, Serial No. 68,705
Term of patent 14 years

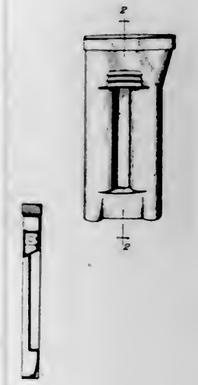


The ornamental design for a parking meter housing, as shown and described.

107,530
DESIGN FOR A PARKING METER HOUSING
Raymond Loewy, New York, N. Y., assignor to The Karpark Corporation, New York, N. Y.
Application April 12, 1937, Serial No. 68,707
Term of patent 14 years

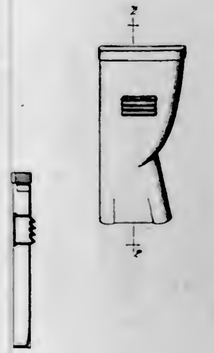
The ornamental design for a parking meter housing, as shown and described.

107,531
DESIGN FOR A PARKING METER HOUSING
Raymond Loewy, New York, N. Y., assignor to The Karpark Corporation, New York, N. Y.
Application April 12, 1937, Serial No. 68,708
Term of patent 14 years



The ornamental design for a parking meter housing, as shown and described.

107,532
DESIGN FOR AN END STANDARD FOR THEATER CHAIRS
Raymond Loewy, New York, N. Y., assignor to Heywood-Wakefield Company, Gardner, Mass., a corporation of Massachusetts
Application May 26, 1937, Serial No. 69,551
Term of patent 3½ years



The ornamental design for an end standard for theater chairs substantially as shown.

107,533
DESIGN FOR AN END STANDARD FOR THEATER CHAIRS
Raymond Loewy, New York, N. Y., assignor to Heywood-Wakefield Company, Gardner, Mass., a corporation of Massachusetts
Application May 26, 1937, Serial No. 69,552
Term of patent 3½ years

The ornamental design for an end standard for theater chairs substantially as shown.

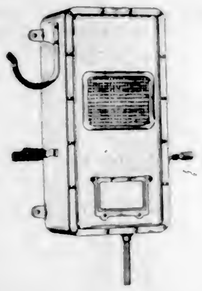
107,534
DESIGN FOR AN END STANDARD FOR THEATER CHAIRS
Raymond Loewy, New York, N. Y., assignor to Heywood-Wakefield Company, Gardner, Mass., a corporation of Massachusetts
Application May 26, 1937, Serial No. 69,553
Term of patent 3½ years

The ornamental design for an end standard for theater chairs substantially as shown.

107,535
DESIGN FOR A MOUTHPIPE KEY FOR A SAXOPHONE
Hugh W. Loney, Elkhart, Ind., assignor to C. G. Conn, Ltd., Elkhart, Ind., a corporation of Indiana
Application September 27, 1937, Serial No. 71,805
Term of patent 14 years

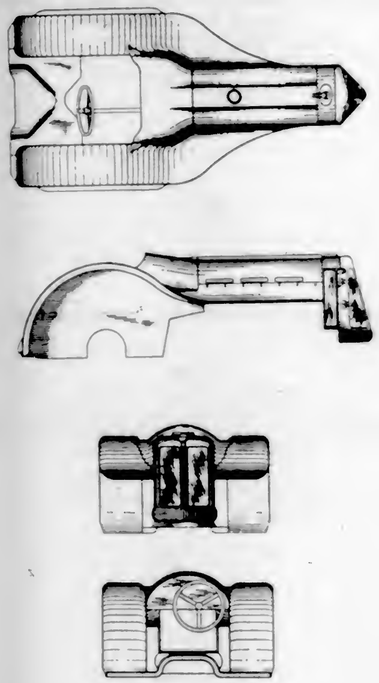
The ornamental design for a mouthpipe key for a saxophone, as shown.

107,536
DESIGN FOR A SHOE
Edwin W. McCain, St. Louis, Mo.
Application November 19, 1937, Serial No. 73,021
Term of patent 3½ years



The ornamental design for a shoe substantially as shown.

107,537
DESIGN FOR A SHOE
Edwin W. McCain, St. Louis, Mo.
Application November 19, 1937, Serial No. 73,022
Term of patent 3½ years



The ornamental design for a shoe substantially as shown.

107,538
DESIGN FOR A TELEPHONE CASING
Thomas McCann, Brooklyn, N. Y.
Application May 29, 1936, Serial No. 62,897
Term of patent 14 years

The ornamental design for a telephone casing, as shown and described.

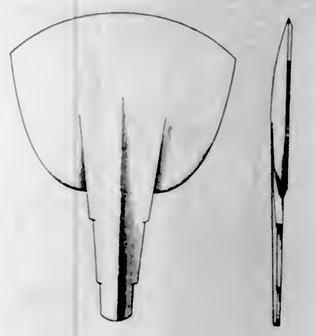
107,539
DESIGN FOR A TRACTOR BODY
Elmer McCormick, Waterloo, Iowa, assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application July 29, 1937, Serial No. 70,728
Term of patent 14 years

The ornamental design for a tractor body, as shown.

107,540
DESIGN FOR A MILK PAIL
Thomas D. McHale, Los Angeles, Calif.
Application September 7, 1937, Serial No. 71,494
Term of patent 14 years

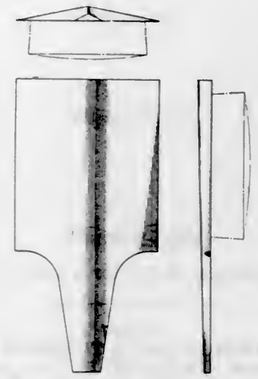
The ornamental design for a milk pail, as shown.

107,541
DESIGN FOR A BOTTLE
James E. Moore, Los Angeles, Calif., assignor to Maywood Glass Co., Los Angeles, Calif., a corporation
Application September 28, 1937, Serial No. 71,844
Term of patent 7 years



The ornamental design for a bottle, as shown.

107,542
DESIGN FOR A BOTTLE
James E. Moore and Benjamin H. Koons, Los Angeles, Calif., assignors to Maywood Glass Co., Los Angeles, Calif., a corporation
Application September 28, 1937, Serial No. 71,845
Term of patent 7 years

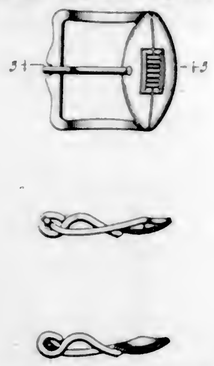


The ornamental design for a bottle, as shown.

107,543
DESIGN FOR A MIRROR OR SIMILAR ARTICLE
Peter Muller-Munk, Pittsburgh, Pa., assignor to Illinois Watch Case Company, Elgin, Ill., a corporation of Illinois
Application October 22, 1937, Serial No. 72,374
Term of patent 7 years

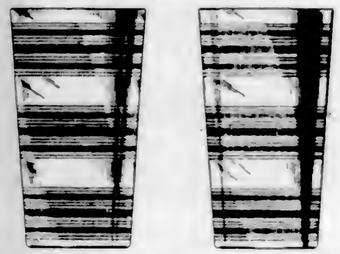
The ornamental design for a mirror or similar article, as shown.

107,544
DESIGN FOR A BRUSH OR SIMILAR ARTICLE
Peter Muller-Munk, Pittsburgh, Pa., assignor to Illinois Watch Case Company, Elgin, Ill., a corporation of Illinois
Application October 22, 1937, Serial No 72,375
Term of patent 7 years



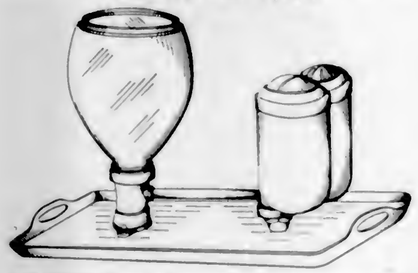
The ornamental design for a brush or similar article, as shown and described.

107,545
DESIGN FOR A CHAIR
John B. O'Connor, Aurora, Ill., assignor to Lyon Metal Products, Incorporated, Aurora, Ill., a corporation of Illinois
Application October 21, 1937, Serial No. 72,356
Term of patent 7 years



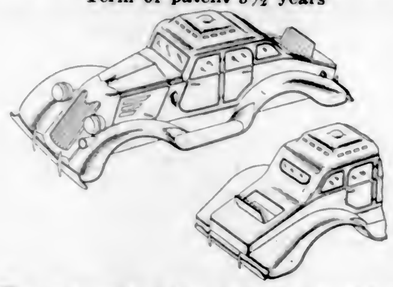
The ornamental design for a chair, substantially as shown.

107,546
DESIGN FOR A BUCKLE
Edgar V. Penn, Madison, N. C.
Application October 18, 1937, Serial No. 72,295
Term of patent 7 years



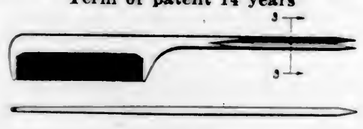
The ornamental design for a buckle, as shown.

107,547
DESIGN FOR A TUMBLER
Ralph Peters, Clarksburg, W. Va., assignor to Hazel-Atlas Glass Company, Wheeling, W. Va., a corporation of West Virginia
Application October 20, 1937, Serial No. 72,339
Term of patent 7 years



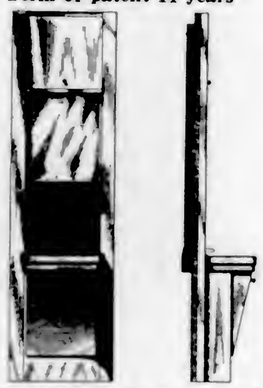
The ornamental design for a tumbler, as shown and described.

107,548
DESIGN FOR A HUMIDIFIER
Elmer A. Reid, Morrisville, Pa.
Application March 16, 1937, Serial No. 68,202
Term of patent 7 years



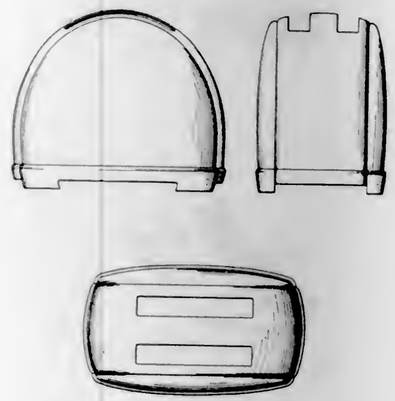
The ornamental design for a humidifier substantially as shown and described.

107,549
DESIGN FOR AN AUTOMOBILE BODY
Robert Rogers, Detroit, Mich.
Application October 7, 1936, Serial No. 65,191
Term of patent 3½ years



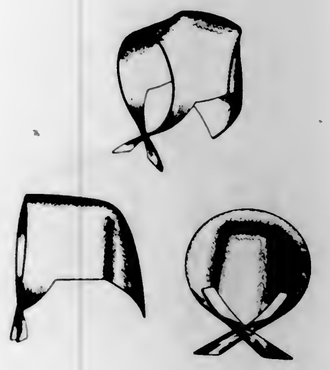
The ornamental design for an automobile body as shown and described.

107,550
DESIGN FOR A CURLING COMB
Elsa C. Ruckdeschel, New York, and William N. Brady, Piermont, N. Y., assignors to American Hard Rubber Company, New York, N. Y., a corporation of New York
Application June 11, 1937, Serial No. 69,792
Term of patent 14 years



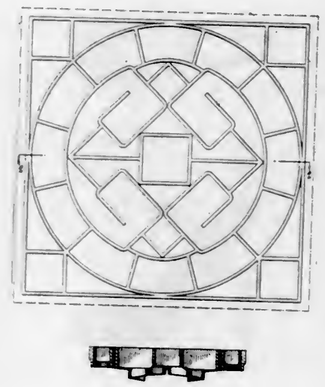
The ornamental design for a curling comb as shown and described.

107,551
DESIGN FOR A COMBINED LAVATORY AND CABINET
George Sakier, New York, N. Y., assignor to The Accessories Company, Inc., New York, N. Y., a corporation of Delaware
Application November 13, 1936, Serial No. 65,884
Term of patent 14 years



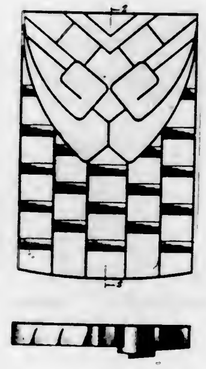
The ornamental design for a combined lavatory and cabinet, as shown.

107,552
DESIGN FOR A TOASTER
George T. Scharfenberg, Chicago, Ill., assignor to Chicago Flexible Shaft Company, Chicago, Ill., a corporation of Illinois
Application September 27, 1937, Serial No. 71,806
Term of patent 7 years



The ornamental design for a toaster, substantially as shown.

107,553
DESIGN FOR A HAT
Elizabeth Schoen, New York, N. Y., assignor to Debway Hats, Inc., New York, N. Y.
Application November 1, 1937, Serial No. 72,568
Term of patent 7 years

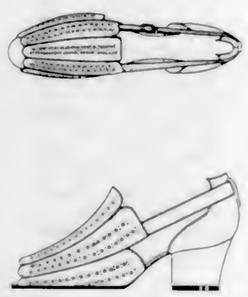


The ornamental design for a hat, as shown.

107,554
DESIGN FOR A BAFFLE ELEMENT FOR LIGHTING FIXTURES
Edward F. Sibbert, Brooklyn, N. Y., assignor to S. H. Kress and Company, New York, N. Y., a corporation of New York
Application July 1, 1937, Serial No. 70,203
Term of patent 14 years

The ornamental design for a baffle element for lighting fixtures, substantially as shown and described.

107,555
DESIGN FOR A BAFFLE ELEMENT FOR LIGHTING FIXTURES
Edward F. Sibbert, Brooklyn, N. Y., assignor to S. H. Kress and Company, New York, N. Y., a corporation of New York
Application July 1, 1937, Serial No. 70,204
Term of patent 14 years



The ornamental design for a baffle element for lighting fixtures, substantially as shown and described.

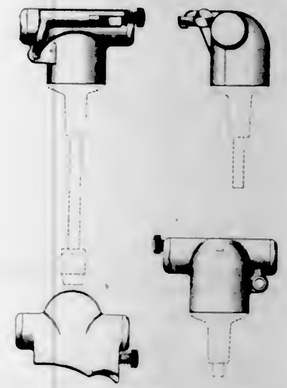
107,556
DESIGN FOR A SHOE
Harry Sobel, New York, N. Y.
Application November 13, 1937, Serial No. 72,841
Term of patent 3½ years

The ornamental design for a shoe, substantially as shown.

107,557
DESIGN FOR A SHOE
Harry Sobel, New York, N. Y.
Application November 13, 1937, Serial No. 72,842
Term of patent 3½ years

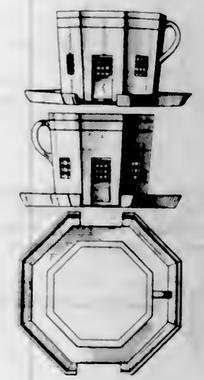
The ornamental design for a shoe, substantially as shown.

107,558
DESIGN FOR A SHOE
Harry Sobel, New York, N. Y.
Application November 13, 1937, Serial No. 72,843
Term of patent 3½ years



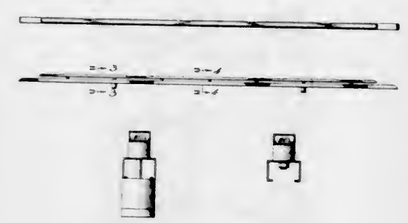
The ornamental design for a shoe, substantially as shown.

107,559
DESIGN FOR AN ELECTRIC CONTROLLING DEVICE
Clifford Brooks Stevens, Milwaukee, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware
Application October 22, 1937, Serial No. 72,369
Term of patent 14 years



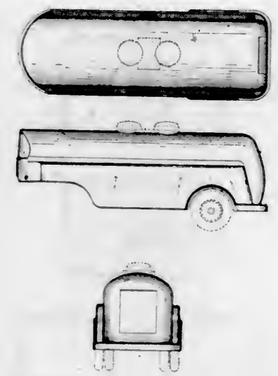
The ornamental design for an electric controlling device, substantially as shown.

107,560
DESIGN FOR A POWER-DRIVEN HAND TOOL UNIT
Donald D. Taylor, Duncannon, Pa.
Application March 31, 1937, Serial No. 68,502
Term of patent 14 years



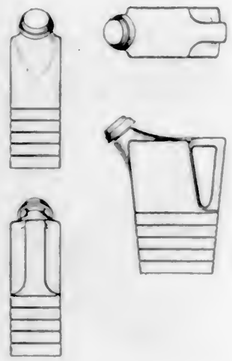
The ornamental design for a power-driven hand tool unit, as shown and described.

107,561
DESIGN FOR A BUILDING
Daniel G. Terrie, Rockville Centre, N. Y.
Application October 12, 1937, Serial No. 72,135
Term of patent 14 years



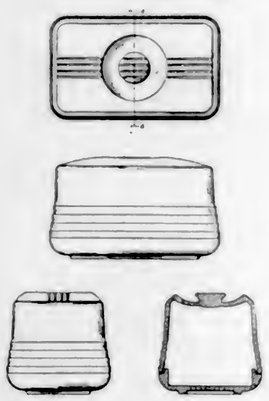
The ornamental design for a building, as shown.

107,562
DESIGN FOR AN AUTOMOBILE HOOD ANTENNA
Van E. Thompson, Dearborn, Mich.
Application September 18, 1937, Serial No. 71,682
Term of patent 7 years



The ornamental design for an automobile hood antenna substantially as shown.

107,563
DESIGN FOR A VEHICULAR TANK
Frederick G. Thwaits, Wauwatosa, Wis., assignor to The Heil Co., Milwaukee, Wis., a corporation of Wisconsin
Application August 30, 1937, Serial No. 71,386
Term of patent 14 years

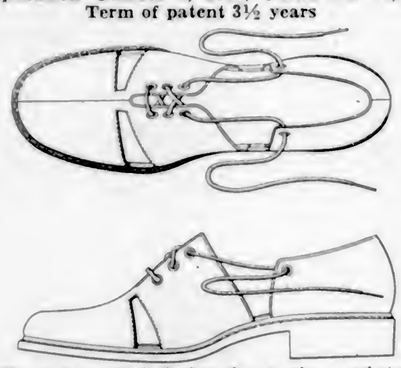


The ornamental design for a vehicular tank, substantially as shown and described.

107,564
DESIGN FOR A PITCHER OR SIMILAR ARTICLE
Walter Karl Titze, San Francisco, Calif., assignor to Universal Potteries, Inc., Cambridge, Ohio, a corporation of Ohio
Application October 29, 1937, Serial No. 72,517
Term of patent 14 years

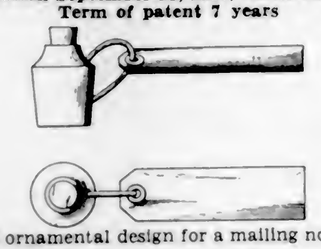
The ornamental design for a pitcher or similar article as shown.

107,565
DESIGN FOR A COMBINED REFRIGERATOR DISH AND COVER OR SIMILAR ARTICLE
Walter Karl Titze, San Francisco, Calif., assignor to Universal Potteries, Inc., Cambridge, Ohio, a corporation of Ohio
Application October 29, 1937, Serial No. 72,518
Term of patent 14 years



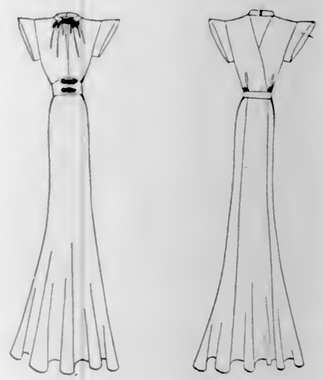
The ornamental design for a combined refrigerator dish and cover or similar article as shown.

107,566
DESIGN FOR AN ATOMIZER
Frederic A. Vuillemenot, Toledo, Ohio, assignor to The De Vilbiss Company, Toledo, Ohio, a corporation of Ohio
Application November 15, 1937, Serial No. 72,871
Term of patent 7 years



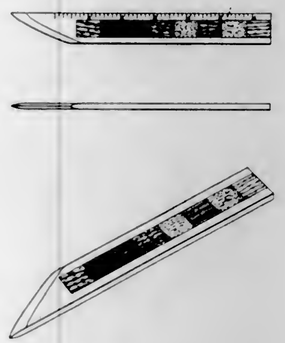
The ornamental design for an atomizer, substantially as shown and described.

107,567
DESIGN FOR A SHOE
Burton L. Wales, Abington, Mass., assignor to The Stetson Shoe Company, Inc., Weymouth, Mass., a corporation of Massachusetts
Application October 7, 1937, Serial No. 72,036
Term of patent 3½ years



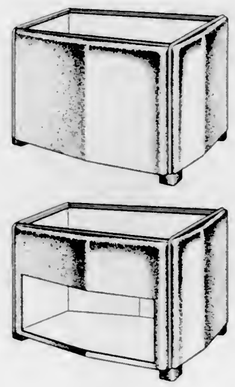
The ornamental design for a shoe, substantially as shown.

107,568
DESIGN FOR A MAILING NOVELTY
Chester E. Walker, Branson, Mo.
Application September 13, 1937, Serial No. 71,578
Term of patent 7 years



The ornamental design for a mailing novelty as shown.

107,569
DESIGN FOR A DRESS
Irene Welch, New York, N. Y.
Application October 19, 1937, Serial No. 72,301
Term of patent 3½ years



The ornamental design for a dress, substantially as shown and described.

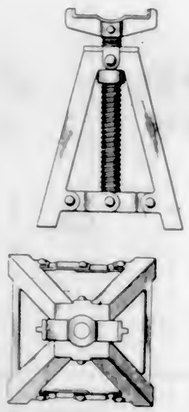
107,570
DESIGN FOR A COMBINED EDUCATIONAL LETTER OPENER AND RULER
Reinhold V. Erk, Waynesville, N. C.
Application November 17, 1936, Serial No. 65,985
Term of patent 7 years

The ornamental design for a combined educational letter opener and ruler, as shown and described.

107,571
DESIGN FOR A REFRIGERATOR CABINET BODY
Chester A. Frick, Muncie, Ind., assignor to Glascock Brothers Mfg. Co., Muncie, Ind., a corporation of Indiana
Application July 6, 1937, Serial No. 70,268
Term of patent 7 years

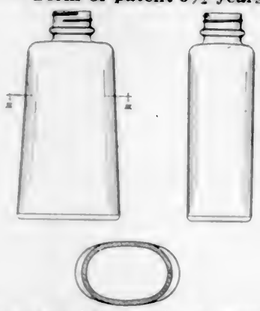
The ornamental design for a refrigerator cabinet body, as shown.

107,572
DESIGN FOR A SLIP
Sol B. Hochman, New York, N. Y.
Application November 27, 1937, Serial No. 73,210
Term of patent 3½ years



The ornamental design for a slip substantially as shown.

107,573
DESIGN FOR A SLIP
Sol B. Hochman, New York, N. Y.
Application November 27, 1937, Serial No. 73,212
Term of patent 3½ years

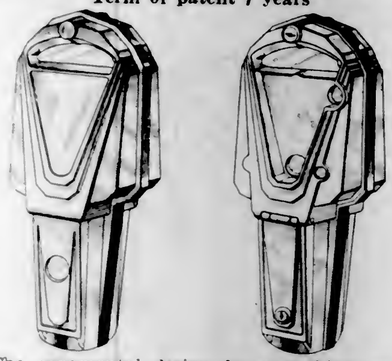


The ornamental design for a slip substantially as shown.

107,574
DESIGN FOR AN AXLE STAND
Alvin L. Johnson, Ottawa Hills, Ohio, assignor to The Logan Gear Company, Toledo, Ohio, a corporation of Ohio
Application May 6, 1937, Serial No. 69,206
Term of patent 7 years

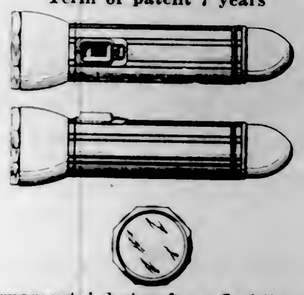
The ornamental design for an axle stand as shown.

107,575
DESIGN FOR A GLASS BOTTLE
Lawrence J. Kihn, Pittsburgh, Pa., assignor to J. T. & A. Hamilton Company, a corporation of Pennsylvania
Application September 17, 1937, Serial No. 71,657
Term of patent 3½ years



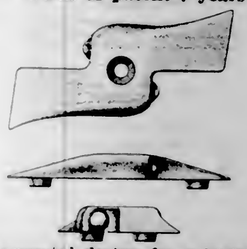
The ornamental design for a glass bottle substantially as shown.

107,576
DESIGN FOR A STATUETTE OR SIMILAR ARTICLE
Nelson A. Long, Duluth, Minn.
Application February 1, 1936, Serial No. 60,952
Term of patent 14 years



The ornamental design for a statuette or similar article as shown.

107,577
DESIGN FOR A PARKING METER HOUSING
John B. McGay and George E. Nicholson, Tulsa, Okla., assignors to Dual Parking Meter Company, Oklahoma City, Okla., a corporation of Delaware
Application December 14, 1936, Serial No. 66,522
Term of patent 7 years

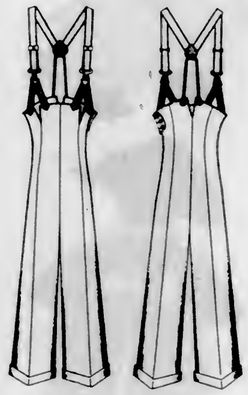


The ornamental design for a parking meter housing, as shown.

107,578
DESIGN FOR A FLASHLIGHT CASING
Howard M. Price, Toledo, Ohio, assignor to The Bridgeport Metal Goods Manufacturing Company, Bridgeport, Conn., a corporation of Connecticut
Application March 26, 1937, Serial No. 68,410
Term of patent 7 years

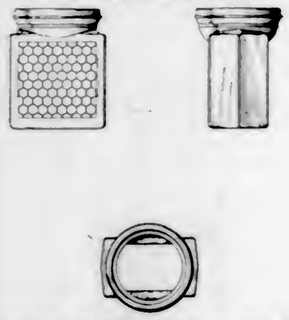
The ornamental design for a flashlight casing, substantially as shown and described.

107,579
DESIGN FOR A HIGHWAY MARKER
Fred T. Ranney, Kansas City, Mo.
Application October 14, 1937, Serial No. 72,167
Term of patent 7 years



The ornamental design for a highway marker as shown.

107,580
DESIGN FOR A BOTTLE
Julian Shoor, Hartford, Conn., assignor to General Distilleries Corporation, Hartford, Conn.
Application October 28, 1937, Serial No. 72,476
Term of patent 7 years

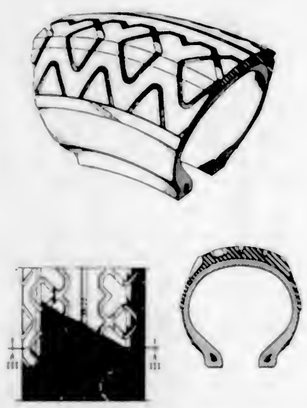


The ornamental design for a bottle as shown, and described.

107,581
DESIGN FOR COMBINATION SLACKS AND SUSPENDERS
Mortimer Solomon, New York, N. Y.
Application November 10, 1937, Serial No. 72,748
Term of patent 3½ years

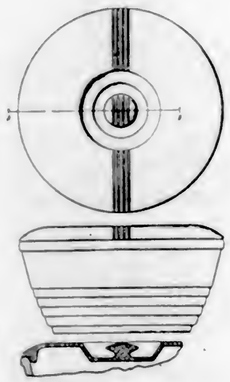
The ornamental design for combination slacks and suspenders substantially as shown.

107,582
DESIGN FOR A JAR OR SIMILAR CONTAINER
Walter F. Straub, Chicago, Ill., assignor to W. F. Straub & Company, Chicago, Ill., a corporation of Illinois
Application April 26, 1937, Serial No. 68,971
Term of patent 14 years



The ornamental design for a jar or similar container substantially as shown and described.

107,583
DESIGN FOR A TOY DOLL
Jacob Swedlin, Brooklyn, N. Y., assignor to J. Swedlin, Inc., New York, N. Y., a corporation of New York
Application April 29, 1937, Serial No. 69,040
Term of patent 7 years

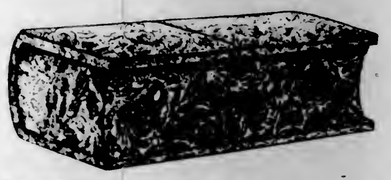


The ornamental design for a toy doll, as shown.

107,584
DESIGN FOR A PNEUMATIC TIRE
Sheldon P. Thacher, Grosse Pointe Park, Mich., assignor to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware
Application August 24, 1937, Serial No. 71,299
Term of patent 7 years

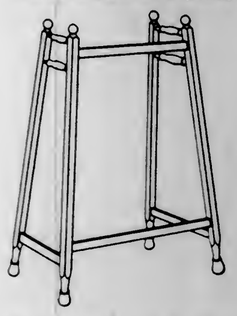
The ornamental design for a pneumatic tire, as shown.

107,585
DESIGN FOR A COMBINED BOWL AND COVER OR SIMILAR ARTICLE
Walter Karl Titze, San Francisco, Calif., assignor to Universal Potteries, Inc., Cambridge, Ohio, a corporation of Ohio
Application October 29, 1937, Serial No. 72,516
Term of patent 14 years



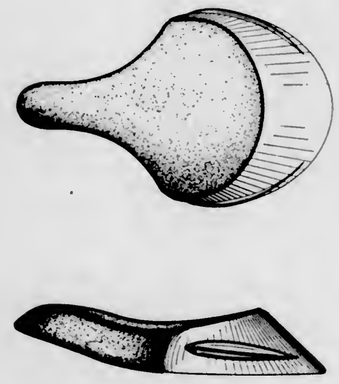
The ornamental design for a combined bowl and cover or similar article, as shown.

107,586
DESIGN FOR A BOTTLE
Julian H. Toulouse, Toledo, Ohio, assignor to Owens-Illinois Glass Company, Toledo, Ohio, a corporation of Ohio
Application May 17, 1937, Serial No. 69,386
Term of patent 14 years



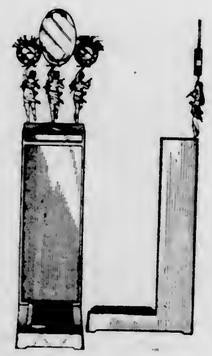
The ornamental design for a bottle substantially as shown.

107,587
DESIGN FOR A BURIAL CASKET
Ramoń J. Treviño, Albuquerque, N. Mex.
Application October 21, 1937, Serial No. 72,352
Term of patent 7 years



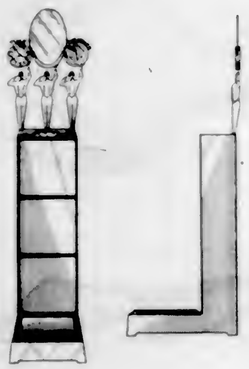
The ornamental design for a burial casket, as shown and described.

107,588
DESIGN FOR A WALKING SUPPORT FOR INVALIDS
Karl R. Vaught, Indianapolis, Ind.
Application October 15, 1937, Serial No. 72,205
Term of patent 7 years



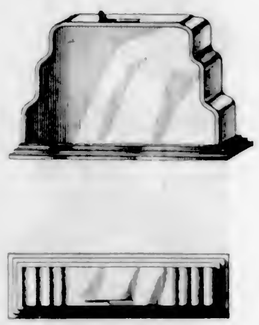
The ornamental design for a walking support for invalids, as shown.

107,589
DESIGN FOR A SADDLE
Charles R. Waldron, Norwalk, Ohio, and Roland W. Faulhaber, Alma, Mich.
Application April 7, 1937, Serial No. 68,607
Term of patent 7 years



The ornamental design for a saddle, substantially as shown and described.

107,590
DESIGN FOR A THEATER LOBBY ADVERTISING DEVICE
Arthur A. Young and Arthur R. Telser, Chicago, Ill.
Application February 13, 1937, Serial No. 67,655
Term of patent 14 years

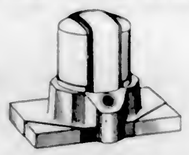


The ornamental design for a theater lobby advertising device as shown.

107,591
DESIGN FOR A THEATER LOBBY ADVERTISING DEVICE
Arthur A. Young and Arthur R. Telser, Chicago, Ill.
Application April 12, 1937, Serial No. 68,702
Term of patent 14 years

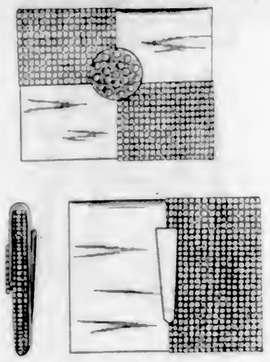
The ornamental design for a theater lobby advertising device as shown.

107,592
DESIGN FOR A COIN BANK
David H. Zell, Brooklyn, N. Y.
Application April 21, 1937, Serial No. 68,910
Term of patent 14 years



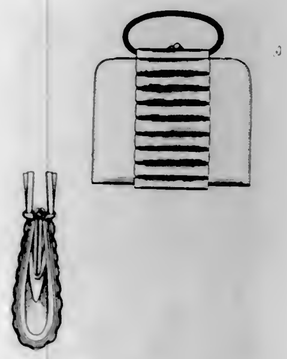
The ornamental design for a coin bank, as shown.

107,593
DESIGN FOR A TEXTILE FABRIC
John W. H. Brooks, Philadelphia, Pa.
Application November 24, 1937, Serial No. 73,163
Term of patent 3½ years



The ornamental design for a textile fabric, substantially as shown.

107,594
DESIGN FOR A COMBINATION DESK UNIT
Robert H. Cromwell, Los Angeles, Calif.
Application September 4, 1937, Serial No. 71,481
Term of patent 14 years



The ornamental design for a combination desk unit, substantially as shown and described.

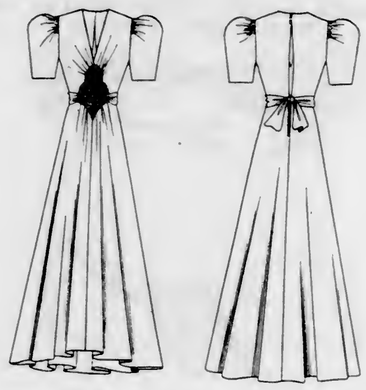
107,595
DESIGN FOR A HANDBAG
Henri Felmann, Chicago, Ill.
Application November 30, 1937, Serial No. 73,261
Term of patent 3½ years

The ornamental design for a handbag, substantially as shown.

107,596
DESIGN FOR A HANDBAG
Henri Felmann, Chicago, Ill.
Application November 30, 1937, Serial No. 73,262
Term of patent 3½ years

The ornamental design for a handbag, substantially as shown, and described.

107,597
DESIGN FOR A TEXTILE FABRIC
Robert S. Gentile, New York, N. Y.
Application November 20, 1937, Serial No. 73,043
Term of patent 3½ years



The ornamental design for a textile fabric, substantially as shown and described.

107,598
DESIGN FOR A DISH OR SIMILAR ARTICLE
William H. Gerth, New York, N. Y., and Albert Krautheim, Selb, Germany, assignors to Oneida, Limited, Oneida, N. Y., a corporation of New York
Application October 9, 1937, Serial No. 72,101
Term of patent 14 years

The ornamental design for a dish or similar article as shown and described.

107,599
DESIGN FOR A DRESS
Mercedes Hall, New York, N. Y.
Application November 8, 1937, Serial No. 72,683
Term of patent 3½ years

The ornamental design for a dress, substantially as shown, and described.

107,600
DESIGN FOR A SWEATER
Sol Kurtz, New York, N. Y.
Application August 7, 1937, Serial No. 70,905
Term of patent 3½ years

The ornamental design for a sweater substantially as shown.

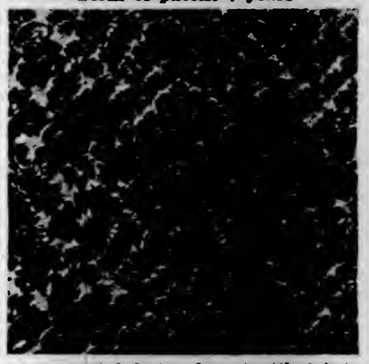
107,601
DESIGN FOR A COAT
Henry Miller, New York, N. Y.
Application November 22, 1937, Serial No. 73,082
Term of patent 3½ years

The ornamental design for a coat substantially as shown.

107,602
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Murray Planco, New York, N. Y.
Application September 13, 1937, Serial No. 71,592
Term of patent 3½ years

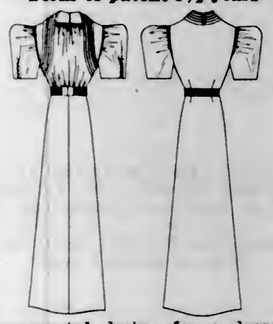
The ornamental design for a shoe or similar article substantially as shown and described.

107,603
DESIGN FOR A TEXTILE FABRIC
Walter Ross, New York, N. Y.
Application November 30, 1937, Serial No. 73,276
Term of patent 3½ years



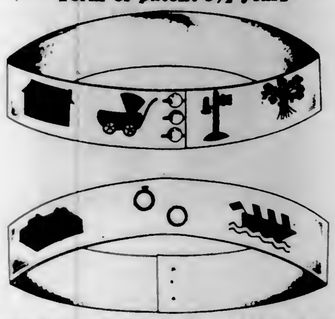
The ornamental design for a textile fabric substantially as shown and described.

107,604
DESIGN FOR A TEXTILE FABRIC
John W. Snowden, Philadelphia, Pa.
Application November 23, 1937, Serial No. 73,128
Term of patent 3½ years



The ornamental design for a textile fabric, substantially as shown.

107,605
DESIGN FOR A TEXTILE FABRIC
Mark Turpan, West New York, N. J.
Application November 24, 1937, Serial No. 73,168
Term of patent 7 years



The ornamental design for a textile fabric, substantially as shown.

107,606
DESIGN FOR A DRESS
Augusta Waxberg, New York, N. Y.
Application November 10, 1937, Serial No. 72,754
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

107,607
DESIGN FOR A BELT
Albert I. Beldoch, New York, N. Y.
Application November 19, 1937, Serial No. 73,018
Term of patent 3½ years

The ornamental design for a belt substantially as shown.

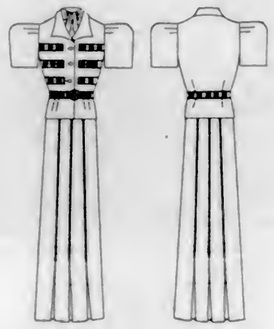
107,608
DESIGN FOR A TEXTILE FABRIC
John W. H. Brooks, Philadelphia, Pa.
Application November 23, 1937, Serial No. 73,127
Term of patent 3½ years

The ornamental design for a textile fabric, substantially as shown.

107,609
DESIGN FOR A DRESS
Sally Cicardo, New York, N. Y.
Application November 18, 1937, Serial No. 72,973
Term of patent 3½ years

The ornamental design for a dress, substantially as shown and described.

107,610
DESIGN FOR A DRESS ENSEMBLE
Carl Colcord, New York, N. Y.
Application October 29, 1937, Serial No. 72,493
Term of patent 3½ years

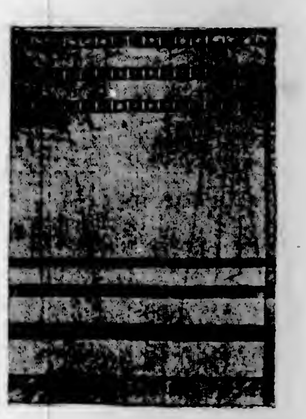


The ornamental design for a dress ensemble substantially as shown and described.

107,611
DESIGN FOR A DRESS
Tora Coleman, New York, N. Y.
Application November 16, 1937, Serial No. 72,907
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

107,612
DESIGN FOR A DRESS
Tora Coleman, New York, N. Y.
Application November 16, 1937, Serial No. 72,908
Term of patent 3½ years



The ornamental design for a dress substantially as shown.

107,613
DESIGN FOR A KNITTED VEST
Nathan Cooper, Brooklyn, N. Y., assignor of one-half to Ladislaus Robaczynski, Brooklyn, N. Y.
Application June 22, 1937, Serial No. 69,978
Term of patent 7 years

The ornamental design for a knitted vest as shown and described.

107,614
DESIGN FOR A CURTAIN
Gustave F. Erhard, Scranton, Pa., assignor to The Scranton Lace Company, Scranton, Pa., a corporation of Pennsylvania
Application October 15, 1937, Serial No. 72,185
Term of patent 3½ years

The ornamental design for a curtain substantially as shown and described.

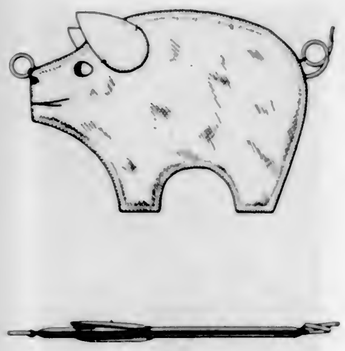
107,615
DESIGN FOR A TEXTILE FABRIC
Morris Forman, New York, N. Y.
Application November 22, 1937, Serial No. 73,086
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown and described.

107,616
DESIGN FOR A TEXTILE FABRIC
Robert S. Gentile, New York, N. Y.
Application November 20, 1937, Serial No. 73,044
Term of patent 3½ years

The ornamental design for a textile fabric, substantially as shown and described.

107,617
DESIGN FOR A TEXTILE FABRIC
Edward P. Hullings, Mount Holly, N. J.
Application November 24, 1937, Serial No. 73,165
Term of patent 3½ years

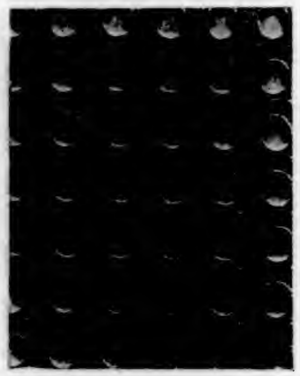


The ornamental design for a textile fabric, substantially as shown.

107,618
DESIGN FOR A DRESS
Philip Schlessel, New York, N. Y.
Application November 11, 1937, Serial No. 72,804
Term of patent 3½ years

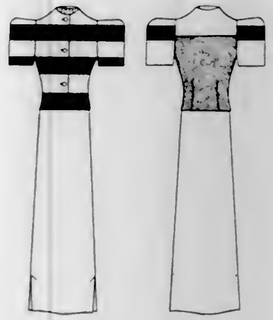
The ornamental design for a dress, substantially as shown and described.

107,619
DESIGN FOR A POT HOLDER OR THE LIKE
May Marshall Sieverling, Burdett, Kans.
Application July 20, 1937, Serial No. 70,543
Term of patent 3½ years



The ornamental design for a pot holder or the like as shown.

107,620
DESIGN FOR A DRESS
Marie Eileen Smith, New York, N. Y.
Application November 10, 1937, Serial No. 72,742
Term of patent 3½ years

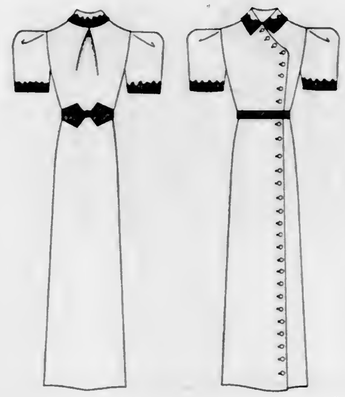


The ornamental design for a dress, substantially as shown, and described.

107,621
DESIGN FOR AN EMBROIDERED FABRIC
Irving Stiglitz, New York, N. Y.
Application November 17, 1937, Serial No. 72,945
Term of patent 3½ years

The ornamental design for an embroidered fabric, substantially as shown.

107,622
DESIGN FOR A DRESS
Victor Tomshinsky, New York, N. Y.
Application November 16, 1937, Serial No. 72,910
Term of patent 3½ years

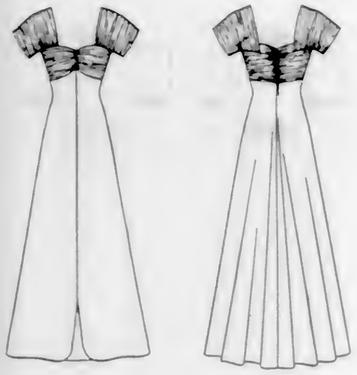


The ornamental design for a dress, substantially as shown and described.

107,623
DESIGN FOR A TEXTILE FABRIC
Mark Turpan, West New York, N. J.
Application November 24, 1937, Serial No. 73,169
Term of patent 7 years

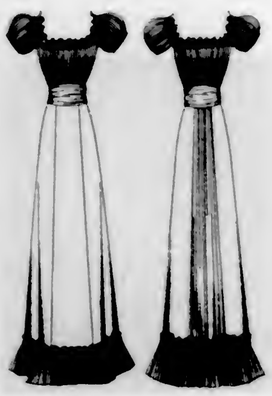
The ornamental design for a textile fabric, substantially as shown.

107,624
DESIGN FOR A DRESS
Harry Zinn, New York, N. Y.
Application November 16, 1937, Serial No. 72,913
Term of patent 3½ years



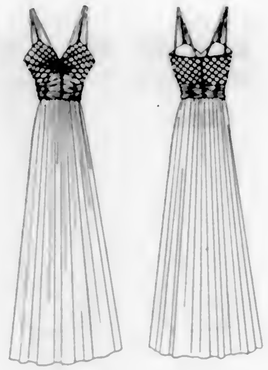
The ornamental design for a dress, substantially as shown.

107,625
DESIGN FOR A TEXTILE FABRIC
John W. H. Brooks, Philadelphia, Pa.
Application November 24, 1937, Serial No. 73,164
Term of patent 3½ years



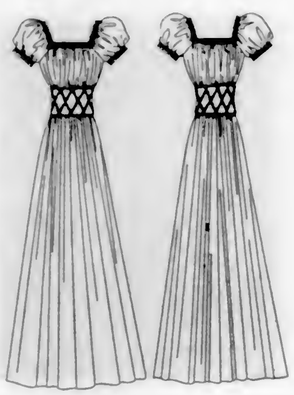
The ornamental design for a textile fabric, substantially as shown.

107,626
DESIGN FOR A DRESS
Sylvia Comolli, New York, N. Y.
Application November 18, 1937, Serial No. 72,974
Term of patent 3½ years



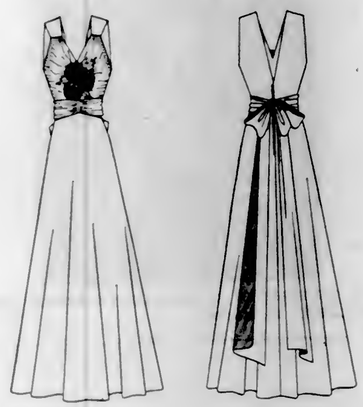
The ornamental design for a dress, substantially as shown and described.

107,627
DESIGN FOR A DRESS
Jack Greenman, New York, N. Y.
Application November 24, 1937, Serial No. 73,148
Term of patent 3½ years



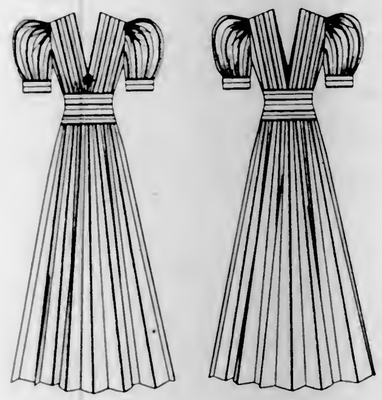
The ornamental design for a dress, substantially as shown.

107,628
DESIGN FOR A DRESS
Jack Greenman, New York, N. Y.
Application November 24, 1937, Serial No. 73,149
Term of patent 3½ years



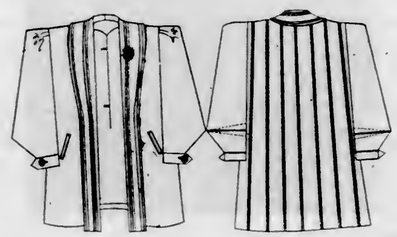
The ornamental design for a dress substantially as shown.

107,629
DESIGN FOR A DRESS
Jack Greenman, New York, N. Y.
Application November 24, 1937, Serial No. 73,150
Term of patent 3½ years



The ornamental design for a dress substantially as shown.

107,630
DESIGN FOR A DRESS
Mercedes Hall, New York, N. Y.
Application November 18, 1937, Serial No. 72,978
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

107,631
DESIGN FOR A DRESS
Mercedes Hall, New York, N. Y.
Application November 18, 1937, Serial No. 72,979
Term of patent 3½ years

The ornamental design for a dress, substantially as shown and described.

107,632
DESIGN FOR A COAT
Henry Miller, New York, N. Y.
Application November 22, 1937, Serial No. 73,083
Term of patent 3½ years

The ornamental design for a coat substantially as shown.

107,633
DESIGN FOR A DRESS
Mollie Stone, New York, N. Y.
Application November 17, 1937, Serial No. 72,946
Term of patent 3½ years

The ornamental design for a dress, substantially as shown and described.

107,634
DESIGN FOR A TEXTILE FABRIC
Mark Turpan, West New York, N. J.
Application July 13, 1937, Serial No. 70,383
Term of patent 3½ years

The ornamental design for a textile fabric, substantially as shown.

107,635
DESIGN FOR A TEXTILE FABRIC
Mark Turpan, West New York, N. J.
Application November 23, 1937, Serial No. 73,129
Term of patent 7 years

The ornamental design for a textile fabric, substantially as shown.

Drawings

PRECAUTIONS TO BE OBSERVED IN FORWARDING DRAWINGS TO THE UNITED STATES PATENT OFFICE

Where drawings are to be filed in connection with an application for Letters Patent in the United States Patent Office, each sheet, before it can be accepted by the Office as a part of the application, must be signed in the name of the inventor at the lower right-hand corner, either by him or by an attorney whose written authorization from the applicant is filed in connection with the application. The signatures should never be written on a line parallel with the longer edges of the sheet, one of the shorter edges being always regarded, for the purpose of locating the signatures, as the lower edge of the sheet. The signatures must all be within the margin of the sheet and below the lines of the drawing. The title of the invention should be written with pencil on the back of each sheet of drawings.

When there are filed on the same day two or more applications by the same inventor, each of the documents and drawings belonging to the same application, should have placed thereon the same letter or number, which should be different from the letter or number placed upon those of any other of the applications.

It is desirable that all parts of the complete application, including the drawings, be deposited in the Office at the same time. Should, however, the other parts of the application be filed before the drawings are sent, the latter when forwarded should be accompanied by a letter stating the number of sheets inclosed, and that the drawings are to be filed with the other parts of the application, giving the date at which such other parts were filed in the Office, the name of the inventor, and title of the invention. If the application has received a serial number, that should also be given, and it should be indorsed with pencil on the back of each sheet of drawings. The letter should also state, if such be the case, that the new drawings are to be substituted for those previously filed.

Attorneys—Disbarment

(Order No. 3,402)

U. S. PATENT OFFICE, *Washington, D. C., June 25, 1937.*

Acting under the provisions of section 487 Revised Statutes of the United States (U. S. C. title 35, sec. 11) Herman Tischer, of 428 East 92d Street, New York, N. Y., whose registration is number 12,927, is hereby disbarred from practice before the United States Patent Office.

CONWAY P. COE,
Commissioner.

In the District Court of the United States for the District of Columbia

IN THE MATTER OF THE DISBARMENT OF HERMAN TISCHER

Disbarment No. 74

FINAL DECREE

This case came on to be heard on the appeal of Herman Tischer from the order of the Commissioner of Patents and having been argued and considered, it is adjudged, ordered, and decreed that the order of the Commissioner of Patents disbarring Herman Tischer from practice before the Patent Office be, and the same is, hereby affirmed.

November 30, 1937.

ALFRED WHEAT,
Justice.

Attorneys—Reinstatement

Order No. 3,416

U. S. PATENT OFFICE, *Washington, D. C., Dec. 15, 1937.*

Order No. 3,098 of January 31, 1929, disbarring Lyle N. Gillis from practice before the United States Patent Office, is hereby revoked and Mr. Gillis is reinstated and given his former registration No. 4,943 on the records of this Office.

CONWAY P. COE,
Commissioner.

DECISIONS IN PATENT AND TRADE-MARK CASES

U. S. Court of Customs and Patent Appeals

THE EMERSON ELECTRIC MANUFACTURING COMPANY *v.* EMERSON RADIO & PHONOGRAPH CORPORATION

No. 3,779. Decided June 21, 1937

[90 F.(2d) 331]

1. TRADE-MARKS—OPPOSITION—FAILURE OF OPPOSER TO PLEAD CORPORATE NAME CLAUSE OF STATUTE.

Where an opposer in the notice of opposition failed to set up the name clause of section 5 of the statute, *Held* that it waived its right to oppose the registration on the ground that the mark is a part of opposer's corporate name.

2. SAME—ELECTRIC DEVICES GENERALLY AND RADIO RECEIVING SETS NOT GOODS OF SAME DESCRIPTIVE PROPERTIES.

Electric machinery and devices generally, particularly motors, fans and motor generators used for radio transmission, *Held* not to be goods of the same descriptive properties as radio receiving sets and parts thereof.

3. SAME—OPPOSITION—PRIORITY OF USE.

Applicant held entitled to registration of mark consisting of the reproduction of a treble clef and words "Emerson Radio and Television" for use on radio receiving sets, etc., since applicant entered the field using the name "Emerson" as an essential part of its trade-mark years before opposer manufactured similar goods.

APPEAL from the Patent Office. Affirmed.

Mr. Lawrence C. Kingsland, Mr. Edmund C. Rogers, and *Mr. Estill E. Ezell* for the Emerson Electric Manufacturing Company.

Messrs. Darby & Darby, Mr. Samuel E. Darby, Jr., and *Mr. Louis D. Fletcher* for Emerson Radio & Phonograph Corporation.

GRAHAM, *P. J.:*

The appellee, Emerson Radio & Phonograph Corporation, a corporation of the State of New York, filed an application for the registration of a trade-mark, claimed to have been used in connection with the sale of

"radio receiving sets, television receiving sets, radio-television receiving sets, and parts thereof, viz., tubes, eliminators and loud speakers,"

continuously since about July 1, 1927. The trade-mark consisted of a representation of a treble clef, under which were the words "Emerson Radio and Television." The words "Radio and Television," appearing upon the mark, were disclaimed

"apart from the mark as shown in the drawing."

The Emerson Electric Manufacturing Company, a corporation of the State of Missouri, filed notice of opposition, alleging damage because of said opposed registration. The specific grounds of opposition stated in the notice are—

(1) That the opposer is the manufacturer of electrical equipment, including

"electric motors, electric fans, including portable, wall, ceiling, floor and exhaust types, furnace blowers, forge blowers, organ blowers, and hair driers, electric generators, electric motor-generators, electric switches, including manually operated and automatically controlled types, rotary transformers, illuminating cylinders, electrically operated coffee mills, electrically operated air and water pumps, electrically operated lathes, electrically operated buffers and grinders, electrically operated dental engines, electric power units for sewing machines, electrically operated humidifiers, electrically operated air washers, and radio 'B' power units";

that it has been in business under substantially the same name

"since in or about the year 1890,"

in which name "Emerson" was the distinctive feature.

(2) That it has continuously marketed its goods with the name "Emerson" prominently displayed thereon since "in or about 1890."

(3) That opposer is the owner of three trade-mark registrations, No. 111,931, dated August 15, 1916; No. 112,418, dated September 5, 1916; and No. 199,433, dated June 9, 1925.

The first of these registrations, all of which appear in the record, is one by The Emerson Electric Manufacturing Company, of the mark "Emerson," said to have been used continuously since 1890, in connection with the sale of

"electric motors, electric fans, including fans of portable, wall, ceiling, and floor types, electric exhaust-fans, electric forge-blowers, electric generators, electric motor-generators, knife-switches, switchboards, panel-boards, fuse-boards, transformers, rotary transformers, illuminating-cylinders, watch-demagnetizers, electric organ-blowers, electric hair-driers, electrically-operated coffee-mills, electrically-operated air and water pumps, electrically-operated lathes, electrically-operated buffers and grinders, electrically-operated furnace blowers, electrically-operated hacksaws, and electric motors and power-transmitters for sewing-machines, in Class No. 21, Electrical apparatus, machines, and supplies."

The second of these registrations was by The Emerson Electric Manufacturing Company, the mark being the word "Emerson," which is claimed to have been used continuously since 1890 in connection with the sale of

"dental lathes, dental engines, and buffers and grinders for dentists' use, in Class 44, Dental, medical, and surgical appliances."

The third of said registrations covers a mark consisting of the representation of a pyramid, superimposed upon which were the words

"Fans
Emerson
Motors
Built to Last."

The words "Fans," "Motors," and "Built to Last" were disclaimed apart from the trade-mark as shown. This mark was claimed to have been continuously used by the registrant since December 6, 1924, in connection with the sale of

"nonoscillating electric fans, oscillating electric fans, electric ceiling fans, electric column fans, electric ventilating fans, electric exhaust fans, and electric motors, in Class 21, Electrical apparatus, machines, and supplies."

The applicant filed an answer to the opposition in which, among other matters, it is denied that the opposer manufactures radio receiving sets, television receiving sets, radio-television receiving sets

and parts thereof, viz., tubes, eliminators and loud speakers; that the

"'Radio B Power Units' referred to in the said paragraph 1 of the opposition were not manufactured or sold by opposer until long after applicant had manufactured and sold its goods aforesaid bearing applicant's mark."

Further, it avers that the

"opposer did not at any time, prior to applicant, sell or offer for sale any radios, radio parts or radio products of any kind and never used the name 'Emerson' thereon; and never used said name upon goods such as those manufactured or sold by applicant."

The issuance of the three trade-marks pleaded in the opposition is admitted, but opposer's title thereto is not admitted. The answer denies that the goods,

"radio receiving sets, television sets, radio-television receiving sets, and parts thereof comprising tubes, eliminators and loud speakers,"

are of the same descriptive properties as the goods upon which the opposer has used its trade name of "Emerson." Confusion and damages are denied. Denial is also made that opposer is entitled to a monopoly of the use of the word "Emerson" on complete radio receiving sets in combination with phonographs, and the like.

Further answering, applicant insists that it and its predecessors, through whom it derived title, were the first to use the word "Emerson" on any of the apparatus named in its application, and that the opposer knew and assented to such use, and is estopped thereby.

The answer also pleads five registrations which it claims to own, as follows:

"No. 108,287, Jan. 25, 1916; No. 130,063, Apr. 6, 1920; No. 155,412, May 30, 1922; No. 225,976, Mar. 29, 1927; No. 131,902, May 25, 1920."

The first of these, No. 108,287, registered January 25, 1916, is a registration of a mark consisting of the words "Victor H. Emerson," in script, claimed to be used continuously since July 1, 1915, in connection with the sale of phonographic machines and sound records. This registration was by Emerson Phonograph Company, Inc. No. 131,902, registered May 25, 1920, is the registration of a mark consisting of a representation of a treble clef, in connection with the sale of phonograph records, alleged to be continuously used since July, 1918, and made by Emerson Phonograph Company, Inc. No. 130,063, registered April 6, 1920, is a registration of a mark consisting of a representation of a shield, in black and white, with the word "Emerson" written across the top, alleged to be used in connection with the sale of phonograph records continuously since May, 1918, and made by Emerson Phonograph Company, Inc. No. 155,412, registered May 30, 1922, is a registration of a trade-mark consisting of a representation of a treble clef, superimposed upon a phonograph record and the words "Emerson Records," alleged to be used in connection with the sale of phonographs and phonograph records continuously since June 3, 1918, made by Emerson Phonograph Company, Inc. No. 225,977, registered March 29, 1927, is the registration of a trade-mark, consisting of the representation of a treble clef, with the words "Emerson Phonoradio," and a scroll underneath the same, alleged to be used in connection with the sale of complete radio receiving sets adapted to combination with phonographs since March 14, 1924, which registration was made by Wasmuth-Goodrich Company.

Both parties took testimony.

The Examiner of Interference was of opinion that two questions were involved: First, the likelihood of confusion, and, secondly, whether the mark sought to be registered is the name of a corporation. As to the name clause, the Examiner of Interferences was of opinion that the parties were engaged in the sale of products of the

"same general character,"

and that the use

"of the notation 'The Emerson Electric Manufacturing Company' as a name, enables the opposer to qualify under the name clause of section 5."

The Examiner also found that the opposer was the prior user of the mark. Having come to the conclusion that the goods of the respective parties, while the question was

"within the twilight zone,"

were of the same descriptive properties, the Examiner of Interferences sustained the opposition and refused registration.

[1] On appeal, the Commissioner called attention to the fact that the name clause was not set up in the notice of opposition. This is true, and hence, as said by the Commissioner, must be considered as waived by the opposer. This doctrine was announced in *Rookwood Pottery Co.* v. *Wilhelm Company*, 43 App. D. C. 1, 212 O. G. 1691. The appellant argues at length that it has set up this ground of opposition in its notice, and quotes considerable portions of said notice in an attempt to substantiate this theory. These portions contain general allegations about the use of the name "Emerson" in connection with the sale of its goods, but, in our opinion, these cannot be treated as a proper pleading of the corporate name clause sufficient to advise the office that appellant was relying thereon. The word "Emerson" was not, and is not, the complete corporate name of the appellant. The Supreme Court, in *American Steel Foundries* v. *Robertson, Commissioner, et al.*, 269 U. S. 372, 342 O. G. 711, discussing the corporate name clause, said, in part:

> The provision, therefore, that no mark consisting merely in the name of a corporation shall be registered is to be construed in harmony with those established principles in respect of the appropriation of corporate names to which we have referred. Where the appropriation of the corporate name is complete, the rule of the statute, by its own terms, is absolute and the proposed mark must be denied registration without more. But where less than the whole name has been appropriated, the right of registration will turn upon whether it appears that such partial appropriation is of such character and extent that, under the facts of the particular case, it is calculated to deceive or confuse the public to the injury of the corporation to which the name belongs.
>
> The fact, for example, that the articles upon which the mark is used are not of the same description as those put out by the corporation, is entitled to weight, since the probability of such confusion and injury in that situation obviously is more remote than where the articles are of like kind. The cases, naturally, present varying degrees of difficulty for the application of the rule. Primarily, the power and the duty rests with the Commissioner of Patents to determine the question in each case in the exercise of an instructed judgment upon a consideration of all the pertinent facts.

In the case cited, the word in question was "Simplex," which was not the complete name of any particular corporation, but a part of many, and registration of a trade-mark containing the word was allowed.

The Patent Office, for a considerable period, has required the specific pleading of the corporate name clause. *In re Zinsmaster Baking Company*, 17 T. M. Rep. 554; *George W. Luft Co., Inc.*, v. *Integrity Hosiery Co.*, 14 U. S. P. Q. 292.

The appellant insists that the Commissioner may reject registrations on matters ex parte, and not pleaded in an opposition proceeding, and cites cases such as *Quaker State Oil Refining Co.* v. *Wolverine-Empire Refining Co.*, 23 C. C. P. A. (Patents) 827, 81 F.(2d) 245, 465 O. G. 244.

Under the pleadings in this case we do not think the opposer is in position to raise that question here.

The Commissioner considered that, following our recent case of *All-American Mohawk Corporation* v. *Rollinson*, 22 C. C. P. A. (Patents) 1301, 77 F.(2d) 926, 461 O. G. 472, the goods were not of the same descriptive properties, that there was no proof of confusion, and that the opposition should be overruled and registration be permitted.

From this decision the opposer has appealed. On April 5, 1937, we entered judgment affirming the judgment of the Commissioner. 24 C. C. P. A. (Patents) 1115, 89 F.(2d) 349. A petition for rehearing was duly filed, and, on May 29, 1937, the petition was granted, without reargument. The matter has again been carefully considered by the court.

It appears from the record that the general business of the appellant, The Emerson Electric Manufacturing Company, is the manufacture and sale of electric motors, electric fans, and other apparatus and appliances of similar nature, the sale of which is nation wide and international. The products have been extensively advertised. It appears from the testimony of the witness Finch that the name "Emerson" has been used in connection with equipment, particularly on dental, medical, and surgical appliances, since 1900. It is also shown that use has been made of the various registered trade-marks hereinbefore mentioned, by the appellant, at various times covering the period from the first of said registrations. The goods with which said marks were used were goods as specified in the various registrations, and consisted of a general line of electric apparatus and fixtures, particularly motors, motor-generators, and fans. The company has never manufactured or sold phonographs or radio apparatus, except in two instances, where it is claimed radio apparatus was produced and sold under its marks, namely, in 1931 and following, when it produced a special dynamotor for radio apparatus, and motor-generator sets for use with radio equipment which were produced in 1921 and subsequently. One of these motor-generators is shown in Exhibit 9. The illustration shows the device to be a motor and generator, connected by a jointed coupling and which devices were offered for sale with an output of from 500 to 1,500 volts D. C., or 100 to 400 watts, for use on 60 cycles or direct current. The overall dimensions of channel mountings ranged from 17¼ x 5 inches to 22½ x 5 inches, and the sets were advertised to be "Motor-Generator Sets for Radio Transmission," with this comment:

> The rapid development of the wireless telephone and telegraph has resulted in a demand for high-grade quiet-running generating equipment for operation on commercial circuits to furnish the higher voltages required for the operation of transmitting tubes.

The special dynamotor is shown by Exhibit 10. This is described as

"Emerson 'B' Power Unit, 32-Volt Direct Current For Operating Radios from 32-Volt Farm Lighting Plants Replaces 'B' Batteries—Maintains the Original Volume, Tone and Reception Qualities of the Radio."

Electric motors for use with phonographs have been supplied since 1911, but the name "Emerson" was not used thereon until 1921. The machines with which these motors were installed were of the automatic, coin-operated, entertainer type of large size, such as are installed in restaurants, and so forth.

During the years since the appellant and appellee have been doing business concurrently, the only confusion which has occurred, so far as the record discloses, has been the missending of some fifteen or twenty letters through the mails.

On the part of the appellee, the record shows that the appellee, and its predecessors in title, have been, since 1916, engaged in the manufacture and sale of phonographs and records therefor, under the mark of "Emerson," in one form or another, as shown by the registrations hereinbefore stated. Recently, the sale of phonographs and records has been discontinued. Appellee's claim of title is not in dispute.

In 1923, the appellee and its predecessors in title entered the radio receiving set field and have, since that time, continuously sold radio receiving sets. These were first sold under said Trade-Mark No. 225,976, registered March 29, 1927, in the name of Wasmuth-Goodrich Company, and later that part of the business, together with the trade-mark, was duly transferred to appellee. The appellee was incorporated on October 15, 1924, under its present name, and since that time has dealt in radio receiving sets and phonograph sets and records, at all times using a trade-mark in which the word "Emerson" was associated, until about July 1, 1927, when the pending mark was adopted, and since when it has been continuously used.

[2] The first question presented for consideration is as to the descriptive properties of the respective goods of the parties. The goods which were being manufactured and sold by appellant when appellee entered the phonograph, and, later, the radio receiving set field, consisted of electric machinery and devices generally, particularly motors and fans. It had established its standing and good will upon these goods. The only thing it had built or sold prior to appellee's entrance into the field which might be considered to be of the same descriptive properties as phonographs or radio receiving sets, was its motor-generators of 1924. However, these devices, if used for radio purposes, were used for radio transmission and not for receiving, and had

no function for the latter purpose. They could not, therefore, be said to be "radio receiving sets * * * and parts thereof." As to the goods sold and manufactured by appellant at that time, we are of opinion that they were not goods of the same descriptive properties as those included in the present application. The goods were used for different general purposes. Motors are used mostly for commercial and public utility purposes. Fans are for ventilation. The number of devices named in the first registrations of appellant are of a different character and used for different purposes than a radio receiving set which is used for amusement and entertainment. They are sold at different places, the latter usually at music or radio retail stores, the former usually at wholesale, to jobbers or to contractors.

The case of *Williams Oil-O-Matic Heating Corporation* v. *Westinghouse Electric & Manufacturing Company*, 20 C. C. P. A. (Patents) 775, 62 F.(2d) 378, 430 O. G. 628, is in point. This was an opposition case. The applicant was attempting to register the mark "Adjust-O-Matic" for use on adjustable and thermostatically controlled electric sadirons—flatirons. The opposer set up use of the trade-marks "Oil-O-Matic" and "Dist-O-Matic," on electrically operated and thermostatically controlled liquid fuel burning devices. As to whether the goods were of the same descriptive properties, we said:

> The goods of the parties are household utilities. They are adapted to be connected to the electric-light circuit, and are thermostatically controlled. They are not similar, however, in any other respect. They differ greatly in cost, use, appearance, and structure and, of course, are not competitive.
>
> Were it not for the fact that they are thermostatically controlled, we dare say that no one would contend that sadirons possess the same descriptive properties as either fuel-burning devices or refrigerators.
>
> In this connection, it may be observed that electric toasters, heating pads, waffle irons, table grills or sandwich toasters, and possibly other articles of household utility are electrically operated and thermostatically controlled. Is it possible that those articles and either fuel-burning devices or refrigerators possess the same descriptive properties merely because they are electrically operated and thermostatically controlled? Might it not with equal force be argued that all electrically operated devices belong to the same class for trade-mark purposes?
>
> We are of opinion that the mere attachment of automatic temperature regulators does not so change the character of sadirons as to give them, within the principles heretofore referred to, the same descriptive properties as either electrically operated and thermostatically controlled refrigerators or fuel-burning devices, and that the Commissioner of Patents reached the right conclusion.

The case last reviewed was cited with approval in *Meredith Publishing Company* v. *Scott & Sons Company*, 24 C. C. P. A. (Patents) 956, 88 F.(2d) 324.

As we have seen, the special dynamotor is for use with radio equipment, also called "radio 'B' power unit," and was first produced by appellant in 1931. The Commissioner states in his decision that it is "fairly apparent" that "it had been permanently discontinued before the application was filed." A more careful search of the record fails to disclose this fact, and, while this fact may have been made apparent to the Commissioner in oral argument, or otherwise de hors the record, we must consider the matter on the record. It is doubtless true that this apparatus, performing the same function as a set of "B" batteries in a receiving set, is of the same descriptive properties as "radio receiving sets * * * and parts thereof."

[3] We are unable to see, however, in what way this becomes important in this case. The appellee entered the radio receiving sets field in 1923 and 1924, using the name "Emerson," as an essential part of its trade-mark, eight years before the appellant produced its radio "B" power unit, and has continuously occupied it since that time, extensively advertising its product and its trade-mark. Having entered this field first, there appears to be no reason why it should not be allowed to register the trade-mark which it has been using, according to its application, continuously since about July 1, 1927.

The decision of the Commissioner of Patents is affirmed.

Affirmed.

HATFIELD, J., did not participate in this case.

U. S. Court of Customs and Patent Appeals

IN RE HENSCHELL

No. 3,834. Decided June 21, 1937

[90 F.(2d) 357]

PATENTABILITY—GRATER.

Claims for a grater *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Mr. E. Hume Talbert and *Mr. Francis G. Boswell* for Henschell.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

GRAHAM, *P. J.*:

Ferdinand A. Henschell, the appellant, filed an application in the United States Patent Office on April 20, 1932, for a patent on certain alleged new and useful improvements in graters. His claims were denied by the Examiner, and, on appeal, by the Board of Appeals. The appellant has appealed, bringing here three rejected claims, 13, 14, and 15, for review. Claims 13 and 14 are typical, and here follow:

> 13. A grater comprising a perforate sheet having grating teeth arranged in partial bounding relation to its perforations, said teeth comprising bulged portions of the sheet which give the teeth arcuate form both in the plane of the sheet and in planes perpendicular to the plane of the sheet, the edges of those portions of the sheet constituting the teeth being zones of cylindrical surfaces whose centers are the centers of the perforations.
>
> 14. A grater comprising a perforate sheet having its perforations arranged in parallel rows transversely of the sheet and being provided with grating teeth arranged in partial bounding relation to said perforations, said teeth comprising bulged portions of the sheet which give the teeth arcuate form both in the plane of the sheet, and in planes perpendicular to the plane of the sheet, the edges of those portions of the sheet constituting the teeth being zones of cylindrical surfaces whose centers are the centers of the perforations, the teeth at the perforations of adjacent rows being respectively on diametrically opposite sides of said rows.

The device disclosed by the appellant is a grater made of sheet metal and consists of an oblong sheet with marginal molded edges and turned over ends for easy handling. Upon the face of the grater are a number of teeth caused by transverse lines of perforations across the face of the grater.

The rejections were upon two references, namely, Silvestre (French), 634,732, November 30, 1927, and Rowley, 1,845,522, February 16, 1932.

The tribunals of the Patent Office contend that the disclosure of appellant is fully met by the references. On the other hand, the appellant contends that the rejected claims will not read upon the devices of the references.

There is considerable discussion about the method by which the grating teeth are formed. This is material only as bearing upon the shape and structure of the teeth. The appellant's counsel admits in his brief that the Board of Appeals has properly explained, in its opinion, the method of construction of the teeth, as follows:

> The disclosure relates to a so-called grater in which the grating elements are formed with respect to the body in a manner to produce a grating action as distinguished from a shredding action when a condiment, fruit or vegetable is moved back and forth over the grating surface. As disclosed, the grating teeth are semi-cylindrical in form produced by a punching action, which is illustrated in Figs. 4 and 5 of the drawing. On the right-hand side in Fig. 5 the die block 19 is cut away at the side of the opening 22 so that the punch on that side bends the metal downward from the plate 10 to the position as shown at 20 and then cuts the edge of the tooth portion in a semi-cylindrical form having a surface perpendicular to the plane of the sheet 10. In the disclosure, these teeth are arranged in rows with the tooth portions back to back in adjacent rows. The arrangement is also such that the teeth are in staggered relation with reference to adjacent rows or different pairs of rows.

The tribunals of the Patent Office seem to be of opinion that there is no practical difference, or, at least, no patentable distinction, between the teeth of the graters in Rowley and Silvestre and those of the appellant. The method of construction used by the appellant has just been stated.

Rowley constructs his teeth as follows: A number of cylindrical perforations are punched in a metal plate, perpendicularly. The plate is then stamped so that the portion at one side of each round perforation will be pushed outward to form a sort of bulge below the opening to facilitate the passing of the particles through the opening. Necessarily this bulging formation leaves an edge which is arcuate, both in the plane of the sheet and in planes perpendicular to the plane of the sheet.

The French patent to Silvestre employs another method. Here a bent plate of metal is punched into a series of perpendicular holes. The portion of metal between these holes is then pushed upward and outward to form a surface which will present a toothed edge in both directions. The grater, therefore, presents a series of double-toothed perforations, and will grate the substance desired to be treated when moved in either direction.

The appellant argues that the principal patentable distinction between his particular construction and those of the reference patents lies in the fact that the inner edges of the teeth of his grater are in a plane perpendicular to the plane of the surface of the grater. This is true, and, in our opinion, it is not met by either of the references. It must be manifest that when the punch goes through the metal in appellant's construction, half of the perforation is not punched out until the surface of the metal is depressed to the point where the balance of the cut may be done in a manner which will bevel the edge of the tooth to a sharp exterior edge.

That the Board of Appeals so understood the disclosure of appellant is apparent from its statement in its decision, as follows:

> * * * As disclosed, the grating teeth are semi-cylindrical in form produced by a punching action, which is illustrated in Figs. 4 and 5 of the drawing. On the right-hand side in Fig. 5 the die block 19 is cut away at the side of the opening 22 so that the punch on that side bends the metal downward from the plate 10 to the position as shown at 20 and then cuts the edge of the tooth portion in a semi-cylindrical form having a surface perpendicular to the plane of the sheet 10. * * *

The difficulty with appellant's position is, however, that this particular limitation is not disclosed in any of the claims. Claim 13, for instance, recites, in part,

> "the edges of those portions of the sheet constituting the teeth being zones of cylindrical surfaces whose centers are the centers of the perforations."

Similar language is found in rejected claims 14 and 15. So far as is apparent from the claims, the cylinders and cylindrical surfaces may not be perpendicular to the plane of the grater surface. A cylinder may lie in an oblique plane and still satisfy the language

> "whose centers are the centers of the perforations."

The particular feature, therefore, upon which the appellant so strongly relies, although disclosed by him in his specification, is not claimed in this application, and hence he can have no benefit from it here. The right of appellant to a patent depends not only upon what his device will do, but what he claims for it. *In re Molyneaux*, 17 C. C. P. A. (Patents) 573, 35 F.(2d) 68, 388 O. G. 785.

In our opinion, the other features and limitations of the rejected claims are found in the reference patents Rowley and Silvestre.

There is, therefore, in our opinion, nothing patentable claimed in the rejected claims, and the decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

KING *v.* BURNER

No. 3,807. Decided June 21, 1937

[90 F.(2d) 343]

INTERFERENCE—PRIORITY.

Record reviewed and *Held* that K. did not have a full and complete conception of the invention in issue prior to the conception and reduction to practice of B., the senior party, and *Held* that priority was properly awarded to the latter.

APPEAL from the Patent Office. Affirmed.

Messrs. Parker, Carlson, Pitzner, and *Hubbard, Mr. George L. Chindahl* and *Mr. Lincoln B. Smith* for King.

Mr. John L. Jackson, Mr. Arthur H. Boettcher, and *Messrs. Brown, Jackson, Boettcher, and Dienner* for Burner.

HATFIELD, *J.*:

This is an appeal in an interference proceeding from the decision of the Board of Appeals of the United States Patent Office reversing the decision of the Examiner of Interferences awarding priority of invention to appellant.

The interference is between appellant's application, Serial No. 376,332, filed July 6, 1929, and appellee's application, Serial No. 242,367, filed December 24, 1927.

Appellant's application was assigned to the King Mechanism and Engineering Company of New York, hereinafter referred to as the King Company, and appellee's application was assigned to the Western Wheeled Scraper Company of Aurora, Illinois, hereinafter referred to as the Western Company.

Of the seventeen counts in issue, Nos. 3 to 19, inclusive, Nos. 3, 5, 10, and 15 are illustrative. They read:

3. A dump car comprising an under body, a tilting bed mounted thereon for dumping to either side of said underbody, a power cylinder comprising a thrusting element, and motion transmitting mechanism connecting said thrusting element with said bed and comprising means for establishing a direct connection between said thrusting element and said bed during the initial part of the dumping operation, and means for multiplying the motion transmitted from said thrusting element to said bed during the latter part of the dumping operation.

5. A dump car comprising an under body, a tilting bed mounted thereon for dumping to either side of the car about laterally spaced fulcrums, and tilting mechanism at each side of the car each comprising a power cylinder for tilting said bed, and motion transmitting mechanism comprising a lever through which the power of said cylinder is transmitted to said bed, said lever swinging bodily with said bed during the initial part of the dumping operation, and means movably connected with the underbody for causing said lever to pivot relative to said bed for increasing the movement transmitted thereto during the latter part of the dumping operation.

10. In a dumping device embodying a dumping body characterized by a low load carrying position and by a high dumping position, and a base for supporting the dumping body, the combination of the sides or a side of the dumping body attached thereto in such a manner as to permit outward and downward opening of the side by gravity, and power means for effecting movement of the body in dumping and righting and embodying mechanism for applying maximum force directly to maximum burden and indirectly applying a diminished force to extended movement of a diminished burden and including a system of levers inoperative during initial dumping movement and operative thereafter.

15. In a railway dump car, the combination of an under-frame structure, a dumping body mounted thereon for tilting to either side, and reciprocatory power means positioned beneath said body and operable to impart the movement thereof directly to said body to initiate tilting thereof and to impart amplified movement of the power means to complete the tilting thereof.

As appellant is the junior party, the burden is upon him to establish proof of priority of invention by a preponderance of the evidence.

The invention in issue consists of a combination of elements, all of which are old, with the possible exception of the so-called Achilles lever device, included in the dumping mechanism, and is described broadly in the counts, for example, count 3, as

"means for multiplying the motion transmitted from said thrusting element to said bed during the latter part of the dumping operation."

With reference to the invention defined by the involved counts, the Board of Appeals said:

The main feature of the new combination is the provision of power tilting means in which a piston rod, or mechanism at its head, of the vertically arranged power cylinder acts directly on the bottom of a side of the car to start the tilting movement and comprises a lever mechanism combined with the piston rods which subsequently or towards the end of the tilt of the body comes into play and provides a multiplication of the movement over that which would be imparted directly by the piston rod. This increased throw takes place near the end of the tilt where less force is necessary. The delayed action is accomplished by the provision of the lost motion connection in the mechanism so that the lever becomes effective only at the end of the stroke.

• • • • • • •

Each of the counts involved here on appeal includes in some scope the fundamental features, that is, the power tilting mechanism. In count 15 it is stated in very broad scope substantially in terms as two means, as means operable to impart movement directly to the car body and means to complete the tilting thereof. In the other counts it is defined in varying scope and rather specifically in some, as in count 5. Each of the counts 3 to 19 have been construed as requiring that the power means act directly on the car body first and indirectly towards the end of the tilting movement.

The lever mechanism is referred to in the record as "the Achilles lever."

It appears from the record that, on October 27, 1924, the King Company and the Western Company entered into a contract—appellant's Exhibit No. 1—whereby the King Company agreed to grant to the Western Company an exclusive license to manufacture railway dump cars under certain patents then owned or controlled by the King Company, and the Western Company agreed to exert its best endeavors to develop and improve what is referred to in the exhibit as the "King car"; to build such a car; and to use its best efforts to create a market for it.

It is unnecessary, due to the views we hold, to state all of the obligations of the respective parties to that contract. It is sufficient to say that it was agreed that, upon the building and testing of such a car, the Western Company might terminate the contract. The car was built, and, it is agreed by the parties, was a failure. Thereafter, on October 15, 1926, the contract was terminated by the Western Company.

It is agreed that the "King car" did not embody the involved invention.

It is claimed by counsel for appellant that, during the year 1925, appellant disclosed to the Western Company certain sketches or drawings and written descriptive matter, disclosing the so-called Achilles lever mechanism in proper relation to the other elements involved in the appealed counts.

It appears from the record that, in the summer of 1926, the witness Benbow, chief engineer of the Western Company, interviewed appellee, who at that time was living in Columbus, Ohio, relative to appellee's employment by the Western Company for the purpose of designing a railway dump car, and that, for reasons not important here, appellee was unable to accept such employment until December 3 of that year, at which time he became an employee of that company.

It is claimed by counsel for appellant that, as appellant disclosed the invention in issue in confidence to the officials and employees of the Western Company, and as appellee designed a dump car embodying appellant's invention shortly after he became an employee of that company and later filed an application for a patent for that invention for the benefit of the Western Company, knowledge of appellant's invention must be imputed to appellee, and that, therefore, appellee is not an original and independent inventor of the subject matter in issue.

The circumstances surrounding appellee's employment by the Western Company, the fact that he stated in his preliminary statement that he conceived the invention defined in some of the counts in issue as early as December 10, 1926, at which time he and the witness Benbow, who was thoroughly familiar with appellant's disclosure to the Western Company, were on a trip together, and other facts and circumstances disclosed by the record are claimed by counsel for appellant to conclusively establish that appellee derived the invention from appellant.

In holding that appellant disclosed the invention defined by the counts in issue to the Western Company in 1925, long prior to the alleged date of appellee's conception, the Examiner of Interferences said:

It is not disputed that the drawings offered as King's Exhibits 20 and 21 and the letter, Exhibit 22, were produced by King in 1925. Since Burner's earliest alleged date of conception is 1926 it follows that, if these exhibits disclose the invention in issue, King was the first to conceive it.

The exhibits in question are thought to support the counts, in substantially the manner set forth in King's brief (pages 11 to 31). This detailed application need not be repeated here but it may be noted that Exhibit 20 suggests the use of a link, instead of a roller, for transmitting the motion of the lever to the tilting bed and that the use of spaced fulcrums is conventional as pointed out in the brief of each party (Burner, page 14; King, page 17). The gravity side doors recited by count 10 are equally conventional. Except for these elements, each of the counts seems fairly satisfied by King's Exhibit 21.

It is objected by Burner that this sketch does not show the details of the manner in which the device is to be applied to the car. This, of course, is true, but the sketch was directed to men skilled in the art and it was therefore unnecessary to present a working drawing to scale. *It is thought to be clear that a skilled mechanic, familiar with dump cars of the type involved, could readily proportion the parts and apply the device with no other information than that given by the King exhibits under consideration.*

• • • • • • •

The exhibit [21] is merely an illustrative sketch and it was evidently intended that the exact proportioning and positioning should be worked out later. As already noted, the last mentioned steps are thought to lie within the province of a skilled mechanic. It is possible that some experimentation might be necessary to determine the best proportions, but this would not raise the matter to the dignity of invention. • • • For the purposes of this controversy it is sufficient that the King exhibits under consideration would enable a mechanic to construct an operative device satisfying the counts.

• • • • • • •

It seems advisable to reiterate at this point that the counts are not drawn to proportions of parts nor to the details of the structure by which the "Achilles lever" is applied to the dump car. They cover the broad application of this device to the car and their allowance must have been predicated on the idea that this application was patentable. [Italics ours.]

The Examiner of Interferences further held that as the invention in issue was disclosed by appellant to the officials and employees of the Western Company, knowledge of it must be imputed to appellee; that, therefore, appellee was not an original and independent inventor of the subject matter in issue, and, accordingly, awarded priority of invention to appellant.

Relative to appellant's conception of the invention in issue and his disclosure of it to the officials and employees of the Western Company, the Board of Appeals, in its decision reversing the decision of the Examiner of Interferences, stated:

Among the numerous items suggested by King to the Western Company in the extensive correspondence are found a few sketches and some descriptive matter which only quite vaguely and indefinitely refer to what King designated an "Achilles lever" mechanism. These may be identified as King's Exhibits 15, 20, 21, 22, 29, 40, 54, 61, 120, and 256. The merits of these exhibits have been discussed at great length in the briefs of both parties and it is not believed necessary to repeat the same here in detail. *It seems to us after careful consideration that the sketches are exceedingly indefinite and are far from disclosing anything which would be at all directly usable or without very extensive further research and modification probably constituting invention.* This conclusion appears warranted from the amount of experimentation and consideration which had to be given to this feature of invention by Graner and Knab in reducing it to any kind of operable device in the summer of 1928 when King concluded to prepare application for same. [Italics ours.]

The Board held that appellee was an original and independent inventor of the subject matter defined in the appealed counts; that, if it be assumed that appellant conceived the invention in 1925, he was not diligent in reducing it to practice, and, accordingly, awarded priority of invention to appellee.

It will be observed from the quoted excerpt from the decision of the Examiner of Interferences that he stated that the

"counts are not drawn to proportions of parts nor to the details of the structure by which the 'Achilles lever' is applied to the dump car."

It should be thoroughly understood throughout the consideration of the issues in this case that the involved invention is not the "Achilles lever" mechanism, but consists rather of a combination of elements, including the "Achilles lever" mechanism, in such relation to each other as to make an operable dump car.

Accordingly, the first question presented for our consideration is whether appellant disclosed such a combination of elements to the Western Company in 1925. If he did, the question of originality will need to be considered. If, on the contrary, he did not disclose such a combination, it will then be necessary to determine whether, from what he did disclose, the involved invention would be obvious to one skilled in the art.

We have given careful consideration to all of appellant's exhibits—sketches or drawings and written descriptive matter, his testimony, and other evidence of record relative to his disclosure to the Western Company in 1925, and we think it clearly appears that, although he disclosed to the engineers and officials of the Western Company the general idea of the use of the so-called Achilles lever mechanism in the building of a dump car, he did not disclose an operable combination of elements.

Counsel for appellant have argued at considerable length that by properly proportioning and rearranging the parts, it would have been a simple matter to have made an operable dump car from appellant's disclosure.

The Examiner of Interferences held that appellant's Exhibit No. 21, which is a sketch disclosing a contact roller on a piston rod, the roller to bear against the body of the car (at some point not disclosed) at the beginning of the dumping operation, the so-called Achilles lever pivoted on the piston rod, a link pivoted to the Achilles lever, and another link pivoted on the underframe of the car by means of a bracket, and a pivotal connection between such links, was not a working drawing; that it was merely an illustrative sketch; and that it was evidently intended by appellant that

"the exact proportioning and positioning should be worked out later. As already noted, the last mentioned steps are thought to lie within the province of a skilled mechanic. It is possible that some experimentation might be necessary to determine the best proportions, but this would not raise the matter to the dignity of invention."

As hereinbefore noted, the Board of Appeals, referring to appellant's sketches, stated that they were exceedingly indefinite and were far from disclosing anything that could be used

"without very extensive further research and modification probably constituting invention,"

and that it was supported in that view by the amount of experimentation and consideration given to that particular feature of the invention by appellant's engineers, Graner and Knab, before they were able to produce an operable structure.

It appears from the record that appellant was not an engineer; that he was not engaged as a mechanic in designing or constructing railway dump cars; that he was employed by the New York Central Railroad Company; that he was president of the King Company, which company had no office or plant; that that company never built any railway dump cars; and that its business was that of developing

"patents and licenses thereunder, for dumping vehicles, and so forth."

It further appears, as stated in the brief of counsel for appellant, that, in January, 1927, appellant did not have any

"complete drawings which could be turned over to a patent draftsman for the production of patent drawings";

and that he

"had many rough sketches and indicative drawings and diagrams and cardboard models, all fragmentary, so far as the illustration of a complete railway dump car was concerned, and a large mass of descriptive letters and notes."

Counsel for appellant further stated, probably in explanation of the long delay in the preparation and filing of appellant's application, that it

"required engineering study of all the elements of the contemplated car, and of their relation to one another, as, for example, the relation of the car body and its rolling supports to the underframe, the relation of the car body to the dumping mechanism, the relation of the drop door and door-operating mechanism to the car body and the dumping mechanism, the time relation of the car body locking and unlocking mechanism to the operation of the other mechanisms, and the valves required for the supply and control of the compressed air used for unlocking and dumping the car body."

It appears from the record that, on October 18, 1926, three days after the Western Company had terminated its contract with the King Company, appellant, his patent attorney, Cole, his patent draftsman, Waldheim, and Ansart, a patent solicitor, conferred relative to the preparation of an application for a patent; that, as early as December, 1926, on the advice of his patent attorney, appellant engaged L. P. Graner and Max Knab, engineers in the employ of the Sprague Railway Safety Control and Signal Company of New York, to assist him in the preparation of a patent application; that appellant acquainted his engineers with the details of dump cars; that he turned over to them all of his notes, sketches, and descriptive matter, theretofore disclosed to the Western Company; and that, although appellant could not control all of their time, he frequently urged his engineers, draftsman, and patent attorney to do their work as quickly as possible.

It is contended by counsel for appellant that appellant, his engineers, draftsman, and patent attorney were diligent in reducing the invention to practice from January 1, 1927, to July 6, 1929, when appellant's application was filed in the Patent Office.

As appellant's patent attorney, his engineers, and draftsman were not called as witnesses, we are not informed as to the length of time and the amount of labor and experimentation it required to develop a combination of elements, including the Achilles lever mechanism, in such relation to each other as to make an operable dump car. It seems strange indeed that, under all the circumstances, we are not afforded that information. There is no evidence of record that it was possible for appellant's engineers to develop the invention in issue from information given them by appellant. On the contrary, there is evidence—appellant's Exhibit No. 216, hereinafter quoted—tending to establish that they could not do so.

In view of the fact that it is insisted by counsel for appellant that appellant, his engineers, draftsman, and patent attorney were diligent from January 1, 1927, to July 6, 1929, when appellant's application was filed, we think it is fair to assume that they were unable to produce a combination of elements, including the Achilles lever mechanism, in such relation to each other as to make an operable dump car from the sketches or drawings and written descriptive matter disclosed by appellant to the Western Company in 1925. No other conclusion is possible, we think, in the light of the facts and circumstances appearing of record.

It may be observed, furthermore, that, long prior to June 20, 1928, appellant had had full opportunity to examine the Western Company's trucks which embodied the invention in issue, and to observe them in operation. Nevertheless, on June 20, 1928, Graner, one of appellant's engineers, wrote to appellant—appellant's Exhibit No. 216—as follows:

We made tests with the Achilles lever model and found the following:

The dumping both of the fully loaded and the empty car proceeds satisfactorily until the Achilles lever itself comes into play which corresponds to about the last three inches of the piston stroke. At this point the required force is very great. This is due to two reasons: One, of the unfavorable leverage of the Achilles lever which, of course, cannot be cured, and the other, due to binding.

The binding is caused by the fact that the Achilles lever being free on one of its ends starts the operation at an unfavorable angle and gives to the pressure of the piston rod—respectively the intermediate lever—whereby the piston rod tends to push the Achilles lever instead of raising it.

It looks to us as if this binding can be overcome—at least partly by either providing a stop for the Achilles lever or by anchoring its free end.

We shall proceed in this direction. • • •

Carbon copy to Mr. Cole.

On appellant's Exhibit No. 244, which consists of drawings dated July 24, 1928, and shows the "Achilles lever mechanism" in proper relation with other parts of the truck, we find the following notation: "Explained to Mr. King and me today, July 24, 1928, by Mr. Knab. [signed] John Waldheim."

We think it is clear from the record that appellant did not have a full and complete conception of the invention in issue prior to appellee's conception and reduction of it to practice in 1927, and that, therefore, he could not have disclosed it to appellee's assignee, the Western Company, either in 1925 or 1926.

We are of opinion that the Board of Appeals reached the right conclusion. Accordingly, its decision is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE HUNTZICKER

No. 3,826. Decided June 21, 1937

[90 F.(2d) 366]

1. PATENTABILITY—AFFIDAVITS AS TO WHAT INVOLVES INVENTION NOT CONSIDERED.

"It has been repeatedly held by this court that statements contained in an affidavit relative to affiant's belief that a device involves invention would not be considered."

2. SAME—CENTRIFUGAL PUMPS, BLOWERS, ETC.

Certain claims for improvements in centrifugal pumps, blowers, etc., *Held* patentable over the prior art.

APPEAL from the Patent Office. Reversed.

Mr. Reeve Lewis and *Mr. Philip Mauro* for Huntzicker.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

HATFIELD, *J.*:

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Primary Examiner rejecting the appealed claims, Nos. 32 and 34 to 44, inclusive, in appellant's application for a patent for an alleged invention relating to improvements in centrifugal pumps, blowers, and similar machines.

Claim 44 is illustrative of the appealed claims. It reads:

44. A combined pump and pump driving electric motor unit including in combination, a combined supporting frame and casing; a single shaft rigid from end to end and adapted to have both rotary movement and limited longitudinal movement in opposite directions; spaced bearings supporting said shaft in said frame-casing for both rotary and longitudinal movement and with the ends of the shaft extending or projecting beyond both of its said bearings; an electric motor having its field mounted on said frame-casing and its armature surrounding said shaft between its said spaced bearings; means connecting said armature to said shaft to cause the same to rotate together; a pump casing forming part of said frame-casing and having an opening through which one propecting [projecting] end of the shaft freely passes into the interior of said pump casing; a rotary pump member within said pump casing and secured to said end of the shaft; cooperating sealing surfaces on said shaft and pump casing respectively and adapted to be engaged and disengaged by longitudinal movement of the shaft to open and/or close said opening in the pump casing through which said shaft passes to the interior of said casing; and means at the other projecting end of the shaft acting automatically to longitudinally shift the shaft in one direction to disengage said sealing surfaces while the motor is driving the shaft and to shift the shaft in the other direction to engage said sealing surfaces when the motor is not driving the shaft.

The references are: Spencer, 917,971, April 13, 1909; Carrier, 1,575,970, March 9, 1926; Hollander, 1,707,613, April 2, 1929; Wilfley, 1,756,323, April 29, 1930.

The references are fully described and applied to appellant's combination in the decisions of the Primary Examiner and the Board of Appeals.

Appellant's alleged invention is stated by the Primary Examiner to be a

"sealing mechanism for the shaft opening of a motor driven centrifugal pump. The usual stuffing box wastes power in friction. To eliminate this waste, applicant replaces the stuffing box with cooperating sealing rings on the shaft and the casing, respectively, said rings being held in contact to seal the pump shaft opening by a spring when the unit is not operating. When the unit is operating, a pair of weights which rotate with the shaft slide the shaft axially to separate the sealing rings. The pump is so constructed that there is very little tendency for liquid to leak out of the shaft opening when the unit is operating, even though the sealing rings are not in contact. The pump casing is supported from and by one of the motor end bells, and the pump impeller is mounted directly on the motor shaft. To accommodate the sliding movement of the shaft, one of the motor shaft bearings slides in its housing, while the other is fixed in the housing and on a sleeve which is keyed to the shaft to prevent its rotation relative thereto, while permitting the shaft to slide in the sleeve. The governor weights are pivoted to the sleeve and have arms contacting the end of the shaft to move the latter for separating the rings."

It is clear from the appealed claims and from the references of record that appellant's combination, as defined broadly in the appealed claims, consists of elements, all of which are old in the art.

In his decision rejecting the appealed claims, the Primary Examiner, among other things, said:

Arrangements for moving a pump shaft axially to unseal the shaft opening when the unit is operating are well known in the art, as shown by the Wilfley patent, owned by the assignee of this application, and by Carrier (rings 18, 19, and the governor of Fig. 7 or mechanism 60 to 63 of Fig. 2). Applicant admits that such mechanisms are old, but bases his claim for a patent on the fact that his shaft carries not only the pump impeller, but the motor armature as well.

• • • • • • •

Spencer and Hollander show motors which support the pump casings and are provided with shafts carrying the pump impellers, just as in applicant's device. Spencer and Hollander use stuffing boxes instead of the centrifugally operated seal claimed by applicant. In view of the fact that such seals are old, as shown by Wilfley, the Examiner considers it an obvious and unpatentable expedient to replace the Spencer and Hollander stuffing boxes with relatively movable rings as in Wilfley, and to slide one of the rings and the shaft in Spencer or Hollander by mounting on the ends of their shafts a centrifugal governor like Wilfley's. The latter's governor could be bodily incorporated in Spencer or Hollander by mounting their motor armatures on the equivalent of Wilfley's sleeve 11, or by placing the equivalent of sleeve 11 at the end of the Spencer or Hollander shafts, as applicant does. The Examiner fails to find any patentable novelty in the fact that the shaft carries not only the impeller but the motor armature as well. The presence of the armature adds no complications and requires no alteration of structure to accommodate it.

All of the appealed claims, therefore, were rejected on the patents to either Spencer or Hollander, in view of Wilfley, as stated in the Examiner's decision. The Examiner also rejected the claims on Wilfley, in view of Spencer or Hollander, holding that it was unpatentable to add to Wilfley, who disclosed the sealing means, referred to in the quoted excerpt from the Examiner's decision, the elements in the disclosures of Spencer and Hollander, each of which shows a shaft on which the impeller and the motor armature are both mounted.

The Examiner further rejected claims 34, 36, and 38 to 42, inclusive, on either Spencer or Hollander in view of Carrier, who, he stated, disclosed

"how to replace the stuffing boxes of the main references with slidable sealing rings, and to mount at the right hand end of their pump shafts a governor device for sliding one ring and the shaft."

In its decision, the Board of Appeals, among other things, said:

We see no basic idea in such combination as the movable shaft releasing at certain speeds a sealing engagement of elements is just as effective whether the electric motor is mounted on the same shaft of the pump, as in the Spencer and Hollander patents, or whether the pump is operated from other means as in the patents to Carrier and Wilfley. It seems to us the essential features of the

rejected claims are found in the Wilfley and Carrier patents and simply to add to the construction of these patents a motor drive with the armature of the motor mounted on the main shaft of the pump, is not only suggested in the prior art but is of no moment in the combination of elements set forth in the claims on appeal. We have examined appellant's brief and affidavits submitted and see no good reason for taking a contrary view to that of the Examiner.

It may be said at this point that claims 28, 30, and 33, which define specifically and in detail the combination of the elements, as disclosed by the references, were allowed by the Primary Examiner. The appealed claims, however, were held to be unpatentable by the Examiner, because they broadly define appellant's combination.

Counsel for appellant filed an affidavit by appellant, and also other affidavits by persons skilled in the art.

[1] It has been repeatedly held by this court that statements contained in an affidavit relative to affiant's belief that a device involves invention would not be considered. It is true that the affidavits of record contain statements to that effect, nevertheless, they are helpful in that they explain how the involved invention differs from the references, the difficulties that would be encountered, and that experimentation would be required to combine the elements disclosed in the patents to Spencer and Carrier with those disclosed in the patents to Hollander and Wilfley, in order to secure a successful combination, such as disclosed by appellant.

It is agreed by the Solicitor for the Patent Office that counsel for appellant has correctly and succinctly stated the issues in his brief as follows:

> There having been known
> (*a*) Structures such as shown in the Spencer and Hollander patents having a common shaft for both pump and motor, said shaft being immovable endwise and entering the pump housing through a stuffing box; and
> (*b*) Structures like those of the Wilfley and Carrier (which do not show a combined pump and driving motor unit) wherein the pump shaft (not a shaft common to both pump and driving motor) is movable longitudinally to open and close sealing means.
> it then became "an obvious and unpatentable expedient", and noninventive for applicant to devise or create his combined pump and driving motor unit structure having its longitudinally movable shaft common to both the pump and driving motor and sealing means opened and closed by said longitudinal movement, instead of a shaft immovable endwise and not acting to open and close sealing means but rotating in a stuffing box.

In the foregoing quoted statement, counsel for appellant was attempting to state, somewhat ironically we suppose, the views of the Patent Office tribunals relative to appellant's alleged invention.

It clearly appears of record that appellant's combination is new, useful, and commercially successful. Whether it was obvious to one skilled in the art, as held by the tribunals of the Patent Office, is the primary issue before us.

Considering the appealed claims in the light of the facts of record, we are constrained to hold that appellant's combination, although defined broadly in the appealed claims, was not obvious to one skilled in the art.

We find nothing in the references to suggest that appellant's new, useful, and commercially successful device might be constructed by combining some of their elements. We are of opinion, therefore, that the appealed claims involve invention and are patentable.

For the reasons stated, the decision of the Board of Appeals is reversed.

Reversed.

LENROOT, *J.*, did not participate in the decision of this case.

U. S. Court of Customs and Patent Appeals

JAMES *v.* CLAYTON, KERRICK, AND STADT

No. 3,857. Decided June 21, 1937

[90 F.(2d) 337]

1. INTERFERENCE—MOTION TO SHIFT BURDEN OF PROOF.
   Earlier application of J. relied on by him in motion to shift the burden of proof *Held* not to disclose the invention in issue.
2. SAME—DILIGENCE.
   Where the junior party J. was the first to conceive the invention but the evidence failed to establish that he made any attempt to reduce to practice between August 9, 1930 and October 6, 1931, when he filed his application, *Held* he was not diligent from immediately prior to C.'s filing date May 2, 1931, and thereafter until October 6, 1931.
3. SAME—CONSTRUCTION OF ISSUE.
   "It is well established that counts in an interference must be given as broad a construction as their language will reasonably permit. However, if the language of the counts is ambiguous, it must be read in the light of the specification in which the counts originated."
4. SAME—PRIORITY—RIGHT TO MAKE CLAIMS.
   Held that the senior party C. et al. are entitled to make the claims in issue and that priority was properly awarded to it.

APPEAL from the Patent Office. Affirmed.

Messrs. Kenyon and Kenyon, Mr. Drury W. Cooper, Mr. Maurice A. Crews, Mr. H. Frank Wiegand, and *Mr. Lee B. Kemon* for James.

Mr. Charles M. Thomas and *Mr. Ford W. Harris* for Clayton et al.

HATFIELD, *J.:*

This is an appeal in an interference proceeding from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Examiner of Interferences awarding priority of invention to appellees.

The interference involves the application of Benjamin Clayton, Walter B. Kerrick, and Henry M. Stadt, Serial No. 534,533, filed May 2, 1931, and an application of Edward M. James, Serial No. 567,220, filed October 6, 1931.

The invention in issue relates to a process for the purification of vegetable and animal oils, and is sufficiently described in the counts in issue. Of the three counts in issue, Nos. 1, 2, and 3, Nos. 1 and 3 are illustrative. They read:

> 1. In the purification of vegetable and animal oils containing free fatty acid, a continuous process comprising intimately mixing a measured quantity of oil with a measured quantity of alkali for a period of less than five minutes, thereafter passing the mixture continuously through a heated conduit to raise its temperature to a degree which will facilitate centrifugal separation and then promptly centrifugally separating the refined oil from the resulting sludge and residual solution.
>
> 3. A process for the purification of vegetable and animal oil containing free fatty acid, comprising continuously feeding in measured quantities separate streams of said oil and an alkali to a mixing zone, continuously advancing said oil and alkali to a mixing zone, continuously advancing said oil and alkali while in intimate physical contact through said mixing zone to effect a thorough admixture thereof, in passing the mixture discharging from the mixing zone as a continuously advancing stream restricted in cross section through a continuous elongated passageway, in raising the temperature of the mixture during its passage through said elongated passageway to a degree sufficient to facilitate its subsequent centrifugal separation, and in subjecting the mixture discharging from said passageway to centrifugal separation to separate the refined oil from resulting sludge and residual solution.

Counts 1 and 2 originated in appellant's application. The claim constituting count 3 was added to the interference on motion of appellees under rule 109 of the rules of practice in the United States Patent Office.

Counsel for appellant moved to dissolve the interference as to counts 1 and 2 on the ground that appellees were not entitled to make them; opposed the addition of the claim constituting count 3 on the same ground; and moved to shift the burden of proof, claiming that a prior application of appellant, Serial No. 517,112, filed February 19, 1931, disclosed the invention in issue.

The Examiner of Interferences denied appellant's motion to dissolve and his motion to shift the burden of proof, and granted appellees' motion to add count 3.

[1] In denying appellant's motion to shift the burden of proof, the Examiner of Interferences said that there was no statement in appellant's application, Serial No. 517,112,

> "as to the length of time of mixing, nor as to the nature of the means in which heating takes place, nor as to whether centrifuging is to take place promptly, with respect to all of which the counts contain limitations."

In affirming the Examiner's decision as to that issue, the Board of Appeals stated:

> Appellant urges the James application Serial No. 517,112, filed February 19, 1931, presents as good a disclosure of the invention expressed in the interference counts as will be found in the Clayton application. The James earlier application emphasizes a special reagent for the purification of fatty oils, namely, an aqueous solution of a poly-sodium phosphate. The specification is very general as to the procedure of mixing the oil and alkali and seems to state that the process may be employed in continuous or batch operation. In this interference we are concerned with an improvement in a continuous process.
>
> The Examiner in considering the question of shifting the burden of proof properly stated that certain steps in the process as defined in the issues are not disclosed in the very general statements of the earlier James application. This application states nothing of an intimate mixture for a brief period and then passing through a heated conduit and promptly into a centrifuge. This application does not describe particularly a quick purification of the oil by a continuous operation. We are satisfied the Examiner's decision as to this earlier James application is warranted.

The only claim made here by counsel for appellant is that if appellees' application discloses the invention defined by the appealed counts, appellant's application, Serial No. 517,112, also discloses it.

[1] We are in entire agreement with the tribunals of the Patent Office that that application of appellant does not disclose the invention defined by the appealed counts.

In his decision of October 10, 1935, the Examiner of Interferences, after a careful consideration of the evidence in the case and the applications of the parties, concluded that appellant was entitled to a date as early as May 14, 1930, for conception of the invention; that, due to the views he held, it was unnecessary to determine whether appellees conceived the invention prior to their filing date—May 2, 1931; that weekly reports made by appellant to the Sharples Specialty Company, his employer and assignee, on a series of experimental tests conducted by him on an apparatus—appellant's Exhibit No. 1—from April to August 9, 1930, established that he failed to reduce the invention to practice during that period; that, although appellant was the first to conceive the invention, he was the last to reduce it to practice; and that, as he was lacking in diligence during the critical period, that is, from immediately prior to May 2, 1931—the filing date of appellees' application—and thereafter, until he filed his application—October 6, 1931—appellees were entitled to an award of priority of the invention, provided they could make the counts in issue.

With reference to the right of appellees to make the involved counts, the Examiner of Interferences referred to the evidence of record and appellees' specification, and held that appellees were entitled to make the counts in issue, and, accordingly, awarded priority of invention to them.

In its decision, the Board of Appeals discussed at considerable length the evidence relative to appellant's activities in his attempt to reduce the invention to practice, then, after quoting from some of the reports made by appellant as to his progress in his experimental work, among other things, said:

> In considering an improvement in a method of purifying cottonseed oil, the results might be satisfactory in certain respects and not in others and it could hardly be said that such experiments were so satisfactory as to present a reduction to practice especially if the experimenter himself indicated dissatisfaction. This is especially true as it may be uncertain as to the actual results desired. Appellant urges he was seeking especially good results and that the results obtained in his experiments were satisfactory to a certain extent. This is questionable though James, in some experiments, carried out the individual steps of the process as called for by the counts. If the results were evidently unsatisfactory to the operator, how can it be said that such results are a satisfactory reduction to practice? What if James actually carried out the individual steps of the process as defined in the issues of the interference and got no particular results, could it be said that he reduced to practice under such conditions? We believe the Examiner's position as to James' reduction to practice is warranted as the last experiments were seemingly much the same as to results as the first, and the final report indicated these tests would be continued at some future time. Furthermore, it must be remembered such tests were made in an experimental apparatus • • •,

and, accordingly, affirmed the holding of the Examiner of Interferences that appellant had not reduced the invention to practice prior to his filing date, and that he was not diligent from immediately prior to the filing of appellees' application—May 2, 1931—and thereafter, until he filed his application—October 6, 1931.

With reference to the right of appellees to make the counts in issue, the Board quoted the following from appellees' specification:

> "It is obvious, however, if the alkali is introduced closer to the oil supply A, which may be remote from

the heater 3, premixing with the oil will take place in the pipe A' before reaching the heater 3 and step two,"

then said:

Appellant urges vigorously there is no statement of intimate mixing of the alkali with the oil before entry of the mixture into the heater and that all the reaction takes place in the heater coil. He points to a statement in line 18, page 6, that the reagent pumped into the line A' "in measured quantity enters the oil in filamentary form and performs its previously described reactions during step two." Appellant notes also that in the testimony of various witnesses for Clayton et al., it is stated the reactions take place in the heating coil and no special emphasis laid on any special mixing of the oil and the alkali before passing into the heater.

Appellee, on the other hand, submits evidence by experts to show in *injecting alkali into a flowing stream of oil (the word "injecting" is found in line 2 of page 6 of the specifications) a certain mixture of the oil and alkali would occur and when this mixture is passed through meter 14, pump 2, air chamber 9 and the various valves and connections between the point of entry of the alkali to the oil and the heater, intimate mixture of the oil and alkali will naturally occur.* Clayton et al. definitely describe a premixing of oil with the alkali before the mixture reaches the heater and this is apparent from the quotation from the specification above noted. We must then define the term "intimately" as associated with mixing. What is the difference between *mixing* and *intimately mixing* and is the mixture of the oil and alkali in the Clayton disclosure intimately mixed? This raises a question of degree of mixing. How can a definite line be drawn between substances intimately mixed and premixed? We find no satisfactory reason for holding the oil and alkali mixed in the Clayton pipe connections may not be described as intimately mixed. If appellant intended to cover mixing in an agitator to produce a smooth emulsion, we believe other language would be more appropriate. We realize that James provided a special agitator for closely mixing and associating the oil with the alkali and probably by this operation the process is improved, but we do not understand there is any unexpected result from this intimate mixing. We have not overlooked the fact that Clayton describes a fine division of alkali and diffusion of the alkaline solution within the oil in the heater coils, but this is after the oil and alkali have been thrown together and mixed before passing to the heater and is evidently a further mixing action. Clayton also emphasizes the importance of control of heat not greater than 100° F. which has an effect in the next step of centrifuging as the product is said to be "foots showing practically no free oil" and more easily divided into constituent gums, resins, etc.

It would appear in the statements of objects of invention in the specifications of both parties that they are attempting, at least, to obtain the same purification of vegetable and animal oils and especially cottonseed oil. We feel constrained, therefore, to hold the Clayton et al. application supports the counts of the interference. (Italics ours, except the words "mixing" and "intimately mixing.")

and, accordingly, affirmed the decision of the Examiner of Interferences awarding priority of invention to appellees.

Exhibits 12 and 14 summarize appellant's weekly reports, beginning April, 1930, and ending July 26, 1930, of the experimental tests made by him in an effort to reduce the invention to practice. In his report for the week ending July 26, 1930, appellant stated:

Centrifugal refining of cottonseed oil

The laboratory refinings on the samples of oil made to correct for the increase in free fatty acid show extremely high losses, although the colors are good.

Two final runs thru the small scale apparatus with tri-sodium phosphate show very greatly improved losses, but dark colors. We are, therefore, definitely abandoning tri-sodium phosphate for cottonseed oil, but shall continue to use it with other oils.

• • • • • • • •

We planned during the coming week to make larger runs to check losses on the two samples of cottonseed oil, and we have also ordered a sample of Cochin cocoanut oil for tri-sodium phosphate refining.

We shall also investigate mixtures of tri-sodium phosphate and sodium hydroxide as refining agents, and expect to try out sodium phenolate as a demulsifying agent.

There is nothing in any of those weekly reports to indicate that appellant had successfully reduced the invention to practice. On the contrary, they definitely establish that, as late as July 26, 1930, he had not done so.

In his Exhibit 17, a report for the week ending August 9, 1930, appellant stated:

Centrifugal refining of cottonseed oil

Work on this *problem* has been *suspended* in order to clean up outstanding work in the laboratory. It will be continued as soon as possible. (Italics ours.)

There is no evidence of record that appellant made any further attempt to reduce the invention to practice prior to his filing date.

On April 7, 1931, Mr. A. B. Cooper, an employee of the Sharples Specialty Company, appellant's assignee, wrote a "daily report" to his employer—appellant's Exhibit 21—directing attention to the work being done by appellees with a "super centrifuge" manufactured by the Sharples Specialty Company. The report was concluded with the following statement:

I do not know what patents Dr. Stadt has applied for, but if he has not applied for patents covering *this application* of our machine it might be well to look into the matter. It may be that this problem has all been gone over at the factory, but if not, it seems that this application would bear looking into. (Italics ours.)

On April 24, 1931, appellant, James, wrote to Mr. J. H. Wilcox, San Francisco office, with reference to appellees' process for refining cottonseed oil, appellant's Exhibit 23, and stated that he had read Cooper's report—appellant's Exhibit 21—with much interest; that one of the first things he did upon his return to Philadelphia was to study

"the possibility of continuous refining, separating the resulting soap stock with a super centrifuge";

and that—

This work was carried out during the early part of 1930, *and was only laid aside on account of press of other business*, notably the continuous treating of lubricating oil.

It is unfortunate that Cooper was not able to get more data. For instance, it would be extremely interesting to know the exact amount of caustic used in his test, the percentage of free fatty acid in the crude cottonseed oil, the refining loss to be expected by regular commercial method, also the color produced under these conditions, and finally the refining loss and color produced by the continuous method. (Italics ours.)

Appellant thereupon explained the method employed in his experimental work as follows:

Crude cottonseed oil and caustic were fed at a definite rate into a small mixer in which they were thoroly mixed, the time of such mixing being controlled. From the mixer they passed into a heater formed of a copper coil surrounded by a glycerine bath maintained at temperature slightly above the boiling point of water. In this coil the emulsion formed by mixing the caustic and the oil was heated to approximately 70° C. and the emulsion partially broken. From the heater the broken emulsion passed to a laboratory super centrifuge, equipped with a special adjustable bowl, in which separation took place into clear oil and soap stock.

and, with reference to the results he had obtained in reducing the invention to practice, said:

I found that I was able to get soap stock which was readily discharged when I used caustic soda strength of 4, 6, and 8° Baume, (from 2 to 4% NaOH content). I used these extremely weak caustic solutions in order to minimize saponification of neutral oil as much as possible, *but unfortunately the volume handled was very large.*

My principal difficulty was the fact that with the dilute caustic I obtained such a large volume of soap stock that although the neutral oil content in per cent was low, *actually the refining loss was high.*

• • • • • • •

Another troublesome point was the building up of an emulsion between the soap stock and the oil in the bowl, and in view of the fact that the adjustments obtainable with the No. 1 machine are not nearly so fine as those possible with the No. 6 machine, *I was unable to obviate this difficulty.*

The colors which I obtained were excellent, and quite equal to those produced by refining the oil by the standard method.

So far as patent protection is concerned, continuous refining is covered by U. S. Patent No. 1,457,072 issued to the DeLaval Company on the 29th of May, 1923. This patent is of doubtful value and I believe could be readily gotten around, but [confidential] would probably effectively prevent our obtaining good patent protection on the process. I shall be extremely interested in hearing of any further results which Cooper may get, and shall be glad to assist you in evaluating the process by every means in my power.

I strongly urge that the following points be covered in future reports if the information can be obtained.

First—Free fatty acid of crude treated,

Second—Strength and percentage of caustic used,

Third—Color and refining loss obtained when the oil is refined by standard method,

Fourth—Color and refining loss obtained when the oil is refined in the continuous apparatus and the soap stock separated with a super centrifuge,

Fifth—Neutral oil content of the soap stock discharged from the centrifugal. (Italics ours.)

It is argued by counsel for appellant that Exhibit 23 fully discloses the invention in issue, and that it was shown to Clayton and to Stadt, two of the appellees.

Clayton denied having seen or read the contents of the exhibit, and stated that, had he known that appellant was working on a process for "Centrifugal refining of cottonseed oil", he would have had nothing further to do with him or his assignee, the Sharples Specialty Company.

Dr. Stadt stated that the only part of the exhibit he recalled having seen was the last portion of it where appellant requested information concerning the five points in which he was particularly interested.

Assuming for the purpose of this decision, that appellant did disclose the invention in that exhibit, it, nevertheless, clearly appears from appellant's statements contained therein that, as late as April 24, 1931, he had failed to reduce the invention to practice. Furthermore, on May 20, 1931, eighteen days after appellees had filed their application, Mr. J. H. Wilcox addressed a letter to Mr. F. T. Sharples, Philadelphia, appellant's Exhibit 22, wherein it was stated that the Sharples Specialty Company had recently sold a No. 6 super centrifuge to appellees. Mr. Wilcox gave a rather detailed description of appellees' process, and enclosed a sketch, which the Examiner of Interferences held disclosed the involved invention. Appellant admitted that he had seen the sketch and the letter about the time they were received by Mr. Sharples.

As hereinbefore noted, there is no evidence of record to establish that appellant made any attempt to reduce the invention to practice subsequent to August 9, 1930, and prior to the filing of his application—October 6, 1931.

[2] We are in agreement with the concurring decisions of the Patent Office tribunals that appellant was not diligent from immediately prior to appellees' filing date—May 2, 1931—and thereafter, until he filed his application—October 6, 1931.

We come now to the only remaining issue in the case, that is, the right of appellees to make the counts in issue.

Each of the tribunals below decided that issue in favor of appellees.

Although other matters have been discussed by counsel, the only question of importance involved in that issue is whether "intimately mixing" the oil and alkali, as stated in count 1, or effecting a "thorough admixture thereof", as stated in count 3, is disclosed in appellees' application by the language "premixing the oil and caustic" before heating. In other words, the question is whether the premixing of the oil and alkali before heating, as stated in appellees' application, is a sufficient disclosure of the language of the claims—"intimately mixing" and a "thorough admixture thereof" before heating.

As stated in the decision of the Board of Appeals, appellees submitted evidence by experts, who performed "*inter parte* tests" in the presence of appellant's representatives, and who testified that intimate mixtures of oil and alkali were produced by appellees' process.

In appellees' specification it is stated, as hereinbefore noted, that

"It is obvious, however, if the alkali is introduced closer to the oil supply A, *which may be remote from* the heater 3, premixing with the oil will take place in the pipe A' before reaching the heater 3 and step two." (Italics ours.)

Referring to premixing and intimately mixing, the Board stated:

"This raises a question of degree of mixing. How can a definite line be drawn between substances intimately mixed and premixed? We find no satisfactory reason for holding the oil and alkali mixed in the Clayton pipe connections may not be described as intimately mixed. If appellant intended to cover mixing in an agitator to produce a smooth emulsion, we believe other language would be more appropriate."

[3] It is well established that counts in an interference must be given as broad a construction as their language will reasonably permit. However, if the language of the counts is ambiguous, it must be read in the light of the specification in which the counts originated.

The word "mix" is defined by the lexicographers as follows:

1. To cause a promiscuous interpenetration of the parts of, as of two or more substances with each other, or of one substance with others; to unite or blend into one mass or compound, as by stirring together; hence, to combine (any material or immaterial things); to mingle; blend; as to *mix* flour and salt; to *mix* wines; • • •

4. To form by mingling; to produce or prepare by the stirring together of ingredients; to compound. (Webster's New International Dictionary.)

I. *t.* 1. To cause to unite promiscuously into one mass, assemblage, or body; incorporate closely and indiscriminately together; mingle so as to render separately indistinguishable; as, to *mix* breeds of animals; to *mix* water with whisky. • • • 3. To produce by incorporating different ingredients; make by mingling; as to *mix* dough. • • •

II. *i.* 1. To become promiscuously united or blended; become incorporated together into one body; as, gases *mix;*

• • • (Funk & Wagnalls New Standard Dictionary.)

The word "blend" means "To unite intimately." See Webster's New International Dictionary.

It will be observed that the word "mix" means a "promiscuous interpenetration" of two or more substances with each other, "to unite or blend [them] into one mass or compound." It is clear, therefore, that the term "intimately mixing" is, to say the least, included within the dictionary definitions of the term "mix".

The word "admixture" means the "Act of mixing, or the compound formed by mixing, different substances together; mixture." See Webster's New International Dictionary.

Accordingly, there is no distinction in meaning between the terms "intimately mixing" and "a thorough admixture", as called for in the appealed counts, and "premixing", as used in appellees' specification.

Counsel for appellant argue that the term "intimately mixing" should be narrowly interpreted.

In view of the fact that that term is not ambiguous, we have no authority to give it other than its broad meaning. See *Swain* v. *Booth*, 295 Fed. 236; *Hagen* v. *Cords*, 24 C. C. P. A. (Patents) 1128, 88 F.(2d) 998, 1000.

We agree with the statement of the Board of Appeals that

"If appellant intended to cover mixing in an agitator to produce a smooth emulsion, we believe other language would be more appropriate."

However, the counts in issue are not so limited, and we cannot read such a limitation into them.

[4] For the reasons stated, we are of opinion that appellees are entitled to make the claims constituting the counts in issue. Accordingly, the decision of the Board of Appeals is affirmed.

Affirmed.

LENROOT, *J.*, concurs in conclusion.

U. S. Court of Customs and Patent Appeals

THE COSHOCTON GLOVE COMPANY

v.

BUCKEYE GLOVE COMPANY

No. 3,796. Decided June 21, 1937

[90 F.(2d) 660]

1. TRADE-MARKS—USE AS A GRADE MARK NOT A TRADE-MARK USE.
   Use of notation "Buckeye" by The Coshocton Glove Company in connection with its trade-mark "Co-Shoc" *Held* to be only as a grade mark and not as a technical trade-mark.
2. SAME—INTERFERENCE—OWNERSHIP PREREQUISITE TO RIGHT OF REGISTRATION.
   "It is fundamental that ownership of a mark is a prerequisite to its registration, and it seems to us that if it develops during the hearing of an interference proceeding that ownership may not be claimed by either party thereto, it becomes the duty of the Commissioner, or the officials acting for the Commissioner, so to declare and deny registration to both."
3. SAME—INTERFERENCE AND OPPOSITION DISTINGUISHED.
   "One distinction between a trade-mark interference proceeding and a trade-mark opposition proceeding is that in the latter one does not have to show ownership of a mark in order successfully to oppose its registration to another, while in the former (which does not involve any question of damage) ownership by one or the other of the parties must be established in order to secure registration."
4. SAME—INTERFERENCE—NEITHER PARTY ENTITLED TO REGISTRATION.
   "It is our view that, under the facts developed here, neither party has shown itself entitled to claim ownership and, therefore, exclusive use of the mark. Appellant did not own the mark at the time of filing its application because it had not used it as a technical trade-mark. This it did not attempt to do prior to the date claimed by appellee. On the other hand, appellee, at the time it claims to have adopted the mark, had no right to appropriate it to its exclusive use because of appellant's prior use of it to indicate a grade, or model, of its merchandise."
5. SAME—SAME—APPEALS—QUESTIONS NOT RAISED MAY BE DECIDED.
   Where questions decided by court on appeal were not decided by tribunals below nor raised in the reasons of appeal but are inherent in the case and should have been considered below *Held* "We have no doubt of this court's authority to take the course here taken, and regard it our duty to construe the statute and point out what we consider its proper application to the facts of the case."
6. SAME—SAME—NEITHER PARTY ENTITLED TO REGISTRATION—CASE REMANDED TO THE PATENT OFFICE.
   Award of priority to Buckeye Glove Company adjudging it to have the right to registration reversed and the case remanded to the end that proper entries may be made in the Patent Office in accordance with the view of the court that neither party is entitled to registration.

APPEAL from the Patent Office. Reversed and remanded.

Mr. George E. Kirk for The Coshocton Glove Company.

Mr. Charles W. Owen and Messrs. Owen & Owen for the Commissioner of Patents.

GARRETT, *J.*:

This is a trade-mark interference proceeding in which, by appeal, appellant brings to us for review the decision of the Commissioner of Patents, speaking through the Assistant Commissioner of Patents, awarding priority and adjudging right of registration to appellee, this being a reversal of the decision of the Examiner of Interferences.

The mark sought to be registered by both parties consists of the word "Buckeye" for use on work gloves. Specifically, appellant's application recites "for work gloves and work mittens of fabric, leather, and combinations thereof," while the petition of appellee recites, "for work gloves of fabric, leather, and combinations thereof."

Appellant's application, Serial No. 311,721, was filed March 4, 1931. It was twice amended, and, in its amended form, alleged use of the word "since as early as March, 1928." The application seems to have stood rejected ex parte by the Examiner, upon certain references not here important, for a long period, and the record is not clear as to just when the word was finally determined ex parte to be registrable. The declaration of interference recites that notice of appellant's application was published May 1, 1934.

The application of appellee, Serial No. 351,795, was filed May 24, 1934, with use alleged by it and its predecessors "since as early as November 1st, 1930," which was prior to appellant's filing date. From the interference declaration it is learned that notice of appellee's application was published August 14, 1934. Apparently, no opposition proceeding was instituted by appellant.

It may here be said that appellant before us raises a question as to appellee's derivation of title. The record bearing upon this has been examined with the result that we do not think appellant's contention upon this point should be sustained.

It appears from a letter of the Examiner, under date of June 15, 1934, that appellee at some time following the filing of its application requested interference with the application of appellant and in this letter the Examiner further said:

The application [of appellee] is being passed to publication. At the end of the publication period, this application and Serial No. 311,721 will be forwarded to the Interference Division of this Office.

Action in application Ser. No. 311,721 is being suspended for a period of sixty days, and said applicant is being notified.

The record contains a letter from the attorney for appellant, filed September 17, 1934, in which it was said:

'In Office action of June 20, 1934, this case was suspended for a period of sixty days. Inasmuch as the case has passed publication on May 1, 1934, without opposition, it is asked that further delay not occur herein and that this case be passed to registration forthwith.

Both parties took testimony and various documentary exhibits were filed on behalf of both. It is not found necessary to review the evidence in detail. It is sufficient to say that it established use of the mark by appellant prior to its use by appellee, but appellant's use of it was as a *grade* mark, not as a technical *trade-mark*, while appellee used it as a technical *trade-mark*.

[1] Appellant's trade-mark is "Co-Shoc" and an exhibit on file shows it prominently displayed in an oval which contains a picture of a bear, beneath which are the words "A Bear for Wear." The words "Big Bear" appear in parentheses in the oval beneath "Co-Shoc" and above the bear picture. Also in the oval are the words "Work Gloves", the first word to the left and the last to the right of the picture. Underneath the oval, contacting with its lower edge, is a strip upon which is imprinted the word "Buckeye". The evidence shows that, upon other types of appellant's gloves, instead of "Buckeye" the respective strips bear the imprints "The Colonel", "Skout", "Storm King", etc. Appellant is shown to have made many different types of gloves.

The Examiner of Interferences held, in effect, that the use of the mark "Buckeye" by appellant constituted both a grade mark and trade-mark use, citing *Williams Evangeline Confection Co.* v. *U. R. S. Candy Stores*, 54 App. D. C. 68, 294 Fed. 999, 320 O. G. 451, and *Paris et al.* v. *W. W. Stewart & Sons*, 57 App. D. C. 95, 17 F.(2d) 683, 363 O. G. 453, and also our case of *John Wood Manufacturing Co.* v. *Servel, Inc.*, 22 C. C. P. A. (Patents) 1370, 77 F.(2d) 946, 461 O. G. 948. The Commissioner points out that the latter case was an opposition proceeding. It may also be pointed out that the *Paris* v. *Stewart & Sons* case, supra, was a cancellation proceeding. The other case so cited was an interference proceeding involving the mark "Evangeline" for candy, but it appeared there that, in the words of the court:

• • • By that name the candy has been ordered, by the trade and sold by the retailers. *No other mark has been used on the carton.* Nor has any witness said it was ever treated as a grade mark. The name, in our judgment, clearly indicates origin of the candy. [Italics ours.]

In other words, the court there found that the use of the mark was a trade-mark use. We agree with the Commissioner that such a finding as to use of the instant mark by appellant would not be justified by the record before us.

We are, however, unable to agree with the Commissioner as to certain other declarations in his decision.

In the case of *Wood Manufacturing Co.* v. *Servel, Inc.*, supra, an opposition proceeding, we sustained the Commissioner of Patents in holding, in effect, that the use by the appellee there of a word as a grade mark, or identification mark, for refrigerators precluded the appellant in that case from obtaining registration of the word as a trade-mark upon goods of the same descriptive properties.

Referring to that case, the Commissioner, in his decision in the instant case, said:

The distinction between that case and this lies in the fact that the prevailing party to an interference must necessarily be entitled to registration of his mark, whereas an opposer need only prove that he would be damaged by registration to his adversary.

It is not understood just what is meant by the phrase "prevailing party," as used in the foregoing holding. If it be meant that upon a mere showing of priority in use of a mark, with a claim of ownership, the party making such showing and claim becomes the prevailing party and thereby necessarily entitled to register the mark, we are unable to agree.

Section 7 of the Trade-Mark Registration Act, so far as pertinent to the issues of this case, reads:

Whenever application is made for the registration of a trade-mark • • • for registration of which another has previously made application • • • the Commissioner • • • may declare that an interference exists as to such trade-mark, and in every case of interference • • • he shall direct the Examiner in charge of interferences to determine the question of the *right of registration* • • •.

The Commissioner *may refuse to register* • • • *both of two interfering marks*, or may register the mark, as a trade-mark, for the person first to adopt and use the mark, *if otherwise entitled to register the same* • • •. [Italics ours.]

[2] It is fundamental that ownership of a mark is a prerequisite to its registration, and it seems to us that if it develops during the hearing of an interference proceeding that ownership may not be claimed by either party thereto, it becomes the duty of the Commissioner, or the officials acting for the Commissioner, so to declare and deny registration to both.

[3] One distinction between a trade-mark interference proceeding and a trade-mark opposition proceeding is that in the latter one does not have to show ownership of a mark in order successfully to oppose its registration to another, while in the former (which does not involve any question of damage) ownership by one or the other of the parties must be established in order to secure registration. The sustaining of an opposition is equivalent to a holding that the party seeking to register is not the owner of the mark, but it does not follow that the opposing party necessarily is the owner.

There are, to be sure, certain questions which a Primary Examiner must determine before an interference may be declared. Patent Office rule 51 provides:

> 51. Before the declaration of interference, all preliminary questions must have been settled by the Examiner in charge of trade-marks, and the trade-mark which is to form the subject matter of the controversy must have been decided to be registrable, and must have been published at least once in the Official Gazette of the Patent Office.

The preliminary questions so required to be determined are determined in the light of the Patent Office records only, and, in the very nature of things, the finding by a Primary Examiner that a mark is registrable is tentative. He cannot know what facts outside the Patent Office records subsequently may be shown which will affect the right of registration.

Section 7, supra, clearly makes it the duty of the Examiner in charge of interferences, and ultimately of the Commissioner upon appeal to him, "to determine the question of the right of registration." We think this brings before them for consideration all the questions originally passed upon by the Primary Examiner and all facts which may be developed in the trial of the interference, including, as of course, the fundamental question of ownership.

If it be found in the case at bar that a state of facts exists which precludes both parties from claiming ownership of the mark, of what avail is an award of priority to either? Indeed, how can there be an award of priority, in the meaning of the statute, where there is no ownership? Incidentally, it may be remarked that the decision of the Commissioner in this case not only adjudges appellee "to be the prior user of the mark" but further declares that it is "entitled to the registration thereof."

Notwithstanding this, the suggestion was offered during the hearing and consideration of this case by us, that, should the decision of the Commissioner be affirmed, appellant might still oppose the registration in an opposition proceeding. That is a matter upon which we need not pass here, but it may be pointed out that the statute requires that notice of opposition "shall be filed within thirty days after the publication of the mark sought to be registered," and that, according to the record, as has been already recited, notice of appellee's application was published August 14, 1934.

Also, it was suggested that the way would be open to appellant, after appellee's mark be registered, to institute cancellation proceedings. It is not our province in this proceeding to consider that question, nor do we regard it necessary even were we at liberty so to do.

[4] It is our view that, under the facts developed here, neither party has shown itself entitled to claim ownership and, therefore, exclusive use of the mark. Appellant did not own the mark at the time of filing its application because it had not used it as a technical trade-mark. This it did not attempt to do prior to the date claimed by appellee. On the other hand, appellee, at the time it claims to have adopted the mark, had no right to appropriate it to its exclusive use because of appellant's prior use of it to indicate a grade, or model, of its merchandise. *Wood Manufacturing Co.* v. *Servel, Inc.*, supra.

Such being the case, we think it was the duty of the Commissioner to exercise the authority vested in him by section 7, supra, and refuse registration to both parties, which automatically would have dissolved, or vacated, the interference.

It has been the long-settled practice for the Commissioner, in an opposition proceeding, to determine, ex parte, and without reference to issues raised by the notice of opposition, that a proposed mark is not subject to registration. There is no express provision for this in section 6 of the Trade-Mark Registration Act, the section providing for opposition proceedings, but in section 7 it is provided that

> "in every case of interference or opposition to registration"

the Commissioner

> "shall direct the Examiner in charge of interferences to determine the question of the right of registration • • • and of the sufficiency of objections to registration • • •."

Also, it is said

> "The Commissioner may refuse to register the mark against the registration of which objection is filed,"

and, as has been seen, the section contains the express provision that the Commissioner

> "may refuse to register both of two interfering marks,"

which necessarily means denial of registration to both parties.

[5] A further suggestion has been offered that to reach the conclusion which we have reached, it is necessary for us to pass upon questions not considered by the tribunals below and not raised in the reasons of appeal. So far as this may seem to be correct, it is sufficient to say that the questions which we decide are inherent in the case and hence should have been considered below. Had they been considered and passed upon there, the conclusion of both the Examiner of Interferences and the Commissioner of Patents might have been different, and upon any appeal taken, the reasons of appeal would have been stated in accordance with the issues resulting from the decision.

We have no doubt of this court's authority to take the course here taken, and regard it our duty to construe the statute and point out what we consider its proper application to the facts of the case.

[6] Since the decision of the Commissioner in this case reversed the decision of the Examiner of Interferences, the end which, in our opinion, should be reached cannot be attained through the mere reversal by this court of the Commissioner's decision. That, in legal effect, would amount to a reinstatement of the decision of the Examiner of Interferences which, we think, was also erroneous. The order is, therefore, that the decision of the Commissioner of Patents be reversed and the cause remanded, to the end that proper entries may be made in the Patent Office in accordance with the views herein expressed.

Reversed and remanded.

U. S. Court of Customs and Patent Appeals

IN RE FISCHER

No. 3,802. Decided June 21, 1937

[91 F.(2d) 219]

1. PATENTABILITY—ALLOWANCE OF BROADER CLAIMS TO APPLICANT IN PRIOR PATENT—EFFECT OF.
   Where the applicant contended that because of the allowance to him of broad claims in a prior patent he should be allowed the more specific claims on appeal *Held* "The general rule is that patentability of a claim may not be based upon the allowance of other claims in another application."
2. SAME—PAVING STRUCTURE AND METHOD.
   Claims for a paving structure and method of constructing same *Held* unpatentable over the prior art.
3. SAME—FUNCTION OR RESULT.
   "Patentability of a claim must be found in the structure or method or composition described, and not in the function performed or the results secured."

APPEAL from the Patent Office. Affirmed.

Mr. Albert F. Robinson for Fischer.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

LENROOT, *J.:*

This is an appeal from a decision of the Board of Appeals of the United States Patent Office, affirming a decision of the Examiner, rejecting claims 1 to 17, inclusive, of appellant's application for lack of invention over the cited prior art. No claims were allowed. Both method and structure claims are involved.

Claims 1 and 5 are illustrative of the involved claims and read as follows:

> 1. The method of constructing a paving structure comprising forming a foundation layer, superposing a surfacing layer over the foundation layer, and providing a groove in one of the layers, whereby a crack is caused to develop in the other layer substantially coincident with the groove.
>
> 5. A paving structure comprising a foundation layer, a surfacing layer superposed on the foundation layer, and a groove formed in one of the layers containing waterproofing material to define a joint seam in both layers and seal same.

The references relied upon by the Board of Appeals are: Wright et al., 1,021,082, March 26, 1912; Gundlach, 1,484,303, February 19, 1924.

The Examiner also rejected the claims upon a patent issued to appellant February 21, 1933, No. 1,898,943, but he was reversed upon this ground of rejection by the Board of Appeals.

The alleged invention is concisely described by the Board of Appeals as follows:

> The subject matter of the appealed claims is a paving structure and a method of making same and consists of a foundation layer provided with an expansion joint filled with expansion joint material and an upper finishing layer. The lower layer is stated to be of cement laid in slabs and separated at intervals by a crack in which is placed a plastic bituminous material which is admitted to be old. Over the top of this first layer is placed a continuous finishing layer which may be of some asphaltic material. After the pavement has been laid, it is assumed that a crack will form in the top layer immediately over the expansion joint provided in the bottom layer so that, when expansion takes place, the expansible material in the lower layer will be caused to ooze into the crack formed in the upper layer.

The patent to Wright et al. discloses an expansion joint for use in a pavement, the same to be inserted between the slabs forming the lower layer of the pavement. A top layer over the slabs is provided. The expansion joints to be inserted between the slabs of the lower layer are formed by a casing filled with asphaltum or other suitable semi-solid material. The joints are so formed as to permit the spreading of the material, upon expansion of the slabs of the pavement, downward and laterally, with a minimum of spreading upwardly toward the top of the pavement. The patent states:

> • • • the main objects of this invention are to provide an improved form and construction for expansion joints of the character described; to provide an improved casing or container for the filling material, of such form that the filling material may be placed in position in advance of the concrete, and thus obviate the necessity of using wooden mold strips; to provide an improved construction whereby the width of the joint at its open side may be reduced to a minimum, whereby there will be in the interior of the joint an expansion space into which the filling material may flow when subjected to pressure by expansion of the adjacent concrete blocks, and whereby the abutting faces of the concrete blocks will be shaped in such manner that the expansion of the blocks will force the filling material to flow toward the expansion space *rather than be squeezed out at the top;* • • • [Italics ours.]

The patent to Gundlach discloses a pavement consisting of spaced sections of a lower layer of concrete, having interposed between the sections preformed expansible strips or slabs of an asphalt mixture, the strips or slabs being reinforced by a core of material of greater rigidity than the asphalt of which the strips or slabs are made. Over the lower layer is placed a monolithic finishing layer.

The Examiner rejected all of the claims as involving no invention over the patents to Gundlach or Wright et al., and also rejected the claims as involving no invention over the claimed subject matter of a patent issued to appellant, No. 1,898,943. As hereinbefore noted, the Board of Appeals reversed the action of the Examiner as to the rejection on appellant's prior patent, but affirmed the rejection on the patents to Wright et al. and Gundlach.

Appellant contends that the claims in his said patent are generic claims involving the broad invention, and that therefore the more specific claims here involved should have been allowed.

[1] The general rule is that patentability of a claim may not be based upon the allowance of other claims in another application. *In re Fischer*, 18 C. C. P. A. (Patents) 1076, 47 F.(2d) 794, 409 O. G. 563; *In re Lawson*, 22 C. C. P. A. (Patents) 1016, 75 F.(2d) 633, 457 O. G. 4.

Obviously, if the claims here involved do not involve invention over the references, the decision of the Board of Appeals must be affirmed.

[2] We have some doubt as to whether the disclosure in the patent to Wright et al. is sufficient to warrant the rejection of appellant's claims, but we are clear that the claims are unpatentable over the patent to Gundlach. We can find no material distinction in structure or method between the claims here involved and the pavement disclosed by Gundlach. In that patent, as in appellant's application, a pavement is disclosed comprising a lower layer divided into sections having spaces between them, which spaces are filled with an expansible material, and an upper or finishing layer monolithic in character.

Appellant's application has a single drawing which is substantially identical with Figure 5 of the drawings of the Gundlach patent. Appellant's counsel has pointed out no difference in structure between the pavement of Gundlach and that disclosed in appellant's application, nor is any difference in method disclosed that is material here. In his brief it is stated:

> Gundlach 1,484,303 is somewhat similar to the disclosure of the Wright et al patent. It shows in Figure 4 a paving structure composed of rigid elements spaced apart with an expansion joint strip 12 inserted therebetween. Figure 5 shows substantially the same structure as Figure 4, but with a surfacing layer superposed over the foundation layer. There is no disclosure that the surfacing layer is adapted to crack over the expansion joint strip 12. The patentee states that his expansion joint strip provides for the necessary contraction and expansion of the sections "without danger of cracking." (R., p. 31, line 27.) In view of this it cannot be assumed that the patentee intends for the surfacing layer in Figure 5 to crack or to crack immediately above the expansion joint strip. Moreover, there is no disclosure that even if a crack does develop in the surfacing layer that the expansion joint material will flow into the developed crack, waterproofing and sealing same.

It will be observed from the foregoing quotation that reliance is placed, not upon difference in structure between the pavement disclosed by Gundlach and that disclosed by appellant, or in the method of producing the same, but rather upon the function or operation of the particular structure. Surely there is no invention in discovering that a pavement will or will not crack at certain points under certain circumstances. It is clear to us that, if appellant's structure will cause cracks to form in the upper layer of the pavement coincident with the waterproofing material in the lower layer, into which cracks the waterproofing material will flow, exactly the same thing will happen in a similar structure such as disclosed in the Gundlach patent.

[3] Patentability of a claim must be found in the structure or method or composition described, and not in the function performed or the results secured. *In re Skaupy & Pulfrich*, 21 C. C. P. A. (Patents) 712, 67 F.(2d) 492, 438 O. G. 987.

The decision of the Board of Appeals is affirmed. Affirmed.

Patent Suits

[Notices under sec. 4921, R. S., as amended Feb. 18, 1922]

1,141,402, R. D. Mershon, Electrolytic apparatus employing filmed electrodes; 1,784,674, same, Film formation and operation of electrolytic condensers and other apparatus, C. C. A., 1st Cir., Doc. 3233, *R. D. Mershon et al.* v. *Sprague Specialities Co.* Petition for rehearing denied, and the decree of Circuit Court of Appeals filed Aug. 23, 1937 vacated. Adjudicated Patents

(C. C. A. Mass.) Mershon patent, No. 1,141,402, for electrolytic apparatus employing filmed electrodes, claim 5 *Held* invalid. *Mershon* v. *Sprague Specialties Co.*, 92 F.(2d) 313.

(C. C. A. Md.) Cimorosi patent, No. 1,467,755, for toy torpedo, was not *Held* invalid and infringed. *Commercial Novelty Co.* v. *Victory Fireworks & Specialty Co.*, 92 F.(2d) 299.

(C. C. A. Mass.) Mershon patent, No. 1,784,674, for film formation and operation of electrolytic condensers and other apparatus, claims 10 and 12 *Held* invalid. Claims 5, 8, 13, 14, 15, and 16 *Held* not infringed. *Mershon* v. *Sprague Specialties Co.*, 92 F.(2d) 313.

Adverse Decisions in Interference

In interferences involving the indicated claims of the following patents final decisions have been rendered that the respective patentees were not the first inventors with respect to the claims listed:

Pat. 1,798,840, H. J. Hemingway and W. A. Weidlich, Pigmented lacquer base, decided August 1, 1936, the claim.

Pat. 1,835,844, J. K. Butler, Electric refrigerator, decided October 13, 1937, claims 1, 2, 3, 4, and 5.

Pat. 1,925,584, H. C. Fisher, Production of pulps containing thermoplastic substances, decided October 19, 1937, claims 1 and 15.

Pat. 1,927,027, W. C. Foulds, Method of preventing the formation of scale in boilers and the like, decided December 7, 1937, claim 1.

Pat. 2,002,234, W. L. Morrison, Air cooling and circulating device and process, decided December 7, 1937, claims 6 and 7.

Pat. 2,002,235, W. L. Morrison, Air cooling and circulating device, decided December 7, 1937, claims 18 and 19.

Pat. 2,082,053, A. C. Freudenberg, Cotton picker, decided December 4, 1937, claims 1, 15, 16, 17, 18, and 19.

Trade-Mark Registrations Canceled

128,394. Preserved or prepared codfish. Great Eastern Fisheries Corporation, Rockland, Maine. Registered January 6, 1920. Canceled December 10, 1937.

273,016. Cod-liver-oil tablets. McCoy's Laboratories, Inc., New York, N. Y. Registered July 15, 1930. Canceled November 29, 1937.

326,405. Alcoholic liquors. Jacob S. Polefsky, doing business as Continental Pure Products Co., Jersey City, N. J. Registered July 23, 1935. Canceled November 12, 1937.

330,817. Medicinal preparation. Wm. A. Lange, doing business as Dormosed Laboratory, New York, N. Y. Registered December 17, 1935. Canceled November 29, 1937.

336,052. Alcoholic liquors. Jacob S. Polefsky, doing business as Continental Pure Products Co., Jersey City, N. J. Registered June 23, 1936. Canceled November 12, 1937.

337,602. Certain named medicinal preparations. Ford Hopkins Co., Chicago, Ill. Registered August 11, 1936. Canceled December 10, 1937.

342,205. Leather. Brightman Leather Co., Inc., Brooklyn, N. Y. Registered January 5, 1937. Canceled December 10, 1937.

350,366. Device for fastening pencils to office machines. Ketcham & McDougall, Inc., Upper Montclair, N. J. Registered September 28, 1937. Canceled November 12, 1937.

Disclaimers

1,685,966.—*Robert S. Stewart*, Chicago, Ill. ANNEALING POT. Patent dated October 2, 1928. Disclaimer filed November 29, 1937, by the assignee, *The American Brake Shoe and Foundry Company.*

Hereby disclaims from the scope of claim 1 each and every annealing pot which is not cast and therefore not integral and wherein the excess of metal at each corner of the pot is not confined to the inside of each such corner.

1,704,754.—*Harry N. Marvin*, Rye, N. Y. RADIO APPARATUS AND METHOD OF OPERATING THE SAME. Patent dated March 12, 1929. Disclaimer filed November 26, 1937, by the patentee.

Hereby enters this disclaimer to claims 23, 29, 30, 31, 32, and 33 of said patent.

1,764,312.—*Harold C. Jenks*, Wilkinsburg, Pa. CONTROL SYSTEM FOR ROLLING MILLS. Patent dated June 17, 1930. Disclaimer filed December 1, 1937, by the assignee, *Westinghouse Electric & Manufacturing Company.*

Hereby enters this disclaimer to claims 1, 3, 4, 5, and 6 of the patent specification.

1,953,844.—*Wilson S. Yerger* and *Lewis S. Somers*, Philadelphia, Pa. CAST TYPE. Patent dated April 3, 1934. Disclaimer filed November 29, 1937, by the assignee, *Imperial Type Metal Company.*

Hereby enters this disclaimer to claims 1, 2, 4, 5, and 7 in said patent.

2,042,670.—*Richard C. Leake*, Rochester, N. Y. CENTRALIZED TRAFFIC CONTROL SYSTEM. Patent dated June 2, 1936. Disclaimer filed November 30, 1937, by the assignee, *General Railway Signal Company.*

Hereby enters this disclaimer to claims 1, 2, and 8 of said Letters Patent.

2,045,900.—*Oscar H. Dicke*, Rochester, N. Y. INTERLOCKING SYSTEM FOR RAILROADS. Patent dated June 30, 1936. Disclaimer filed November 30, 1937, by the assignee, *General Railway Signal Company.*

Hereby enters this disclaimer to claims 1, 2, and 3 of said Letters Patent.

Interference Notice

U. S. PATENT OFFICE, *Washington, D. C., Dec. 3, 1937.*

Robert W. Edens and Omer E. Brubaker, their assigns or legal representatives, take notice:

Four interferences having been declared by this Office between a joint application for patent of Robert W. Edens and Omer E. Brubaker, of 349 Highland Avenue and 2892 Pershing Avenue, San Bernardino, California, respectively, and applications for patent filed by Edwin E. Daniels, 200 South Willard Street, San Jose, California, and Edison Harrington, 1128 Fugate Street, Houston, Texas, and ten other applications, and counsel for the parties Edens and Brubaker having been unable to secure satisfactory service upon said Edens and Brubaker, notice is hereby given that unless said Edens and Brubaker, their assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the interference will be proceeded with as in case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

Notice of Cancellation

U. S. PATENT OFFICE, *Washington, D. C., Dec. 1, 1937.*

Charles D. Fox, his assigns or legal representatives, take notice:

A cancellation proceeding has been instituted by this Office upon the application of Modern Merchandising Bureau, Inc., 36 West 44th Street, New York, N. Y., to effect the cancellation of trade-mark registration of M. Hirshfield, No. 241,179, dated April 17, 1928. The assignment records of this Office show a transfer of title to this registration to Charles D. Fox, New York, N. Y., who has been substituted for said M. Hirshfield to defend the registration concerned. The notice of such proceeding sent by registered mail to Charles D. Fox, at the said address, having been returned by the post office as undeliverable, notice is hereby given that unless Charles D. Fox, his assigns or legal representatives, shall enter an appearance therein within 30 days from the first publication of this order the cancellation will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

BULLETIN OF DECISIONS OF PATENT OFFICE ON TRADE-MARKS, LABELS, AND PRINTS

RENDERED DURING NOVEMBER, 1937

REPUBLIC STEEL CORPORATION *v.* CENTRAL IRON & STEEL COMPANY, Opposition No. 15,069.

In a decision rendered November 8, 1937 (159 Ms. Dec. 1,014), *Assistant Commissioner Frazer* held that Central Iron & Steel Company, of Harrisburg, Pa., is not entitled to register as a trade-mark for alloy steel a mark consisting of the term "Centralloy" in view of the prior use by the Republic Steel Corporation, of Youngstown, Ohio, of the terms "Central Alloy Division" and "Central Alloy District" in association with its own name on labels on its goods.

In the decision, after stating that the Republic Steel Corporation was successor to Central Alloy Steel Corporation and used the above referred to terms on its labels in order to perpetuate the good will of the latter corporation and, noting that the Examiner of Interferences dismissed the opposition on the ground that the opposer had shown no trade-mark use of the words "Central Alloy", the Assistant Commissioner said:

"I do not think that view finds support either in the statute or in the authorities. Section 6 of the Trade-Mark Act provides for opposition by 'any person who believes he would be damaged by the registration of a mark'; and it has frequently been held, both by the Court of Appeals of the District of Columbia and the Court of Customs and Patent Appeals, that this language does not necessarily contemplate the violation of an opposer's trade-mark rights as an element of damage."

He then, after stating that the expressions "Central Alloy Division" and "Central Alloy District" have come to identify as that of opposer the merchandise to which they are applied in advertising, said:

"While I agree with the Examiner of Interferences that such use by opposer of the words 'Central Alloy' has been in no sense a trade-mark use, I cannot escape the conviction that registration to a competitor of these words or their equivalent would result in confusion, and that opposer would probably suffer damage. Upon the record before me, the likelihood seems apparent that a large proportion of prospective purchasers, seeing the trade-mark 'Centralloy' applied to alloy steel products, would assume that such products originated with opposer."

RED STAR YEAST AND PRODUCTS COMPANY *v.* STAR BISCUITS OF AMERICA, INC., Opposition No. 15,331.

In a decision rendered November 8, 1937 (159 Ms. Dec. 1,013), *First Assistant Commissioner Macklin* held that Star Biscuits of America, Inc., of Lowell, Mass., is entitled to register, as a trade-mark for crackers or biscuits, a mark comprising a representation of a star shown in white, but not limited as to color, below which are the representations of ribbons bearing the words "Star Biscuits" and "of America, Inc.," notwithstanding the prior adoption of use by the Red Star Yeast and Products Company of Milwaukee, Wis., of the words "Red Star" and the representation of a star printed in red as a trade-mark for yeast.

In his decision, after noting that the Examiner of Interferences had found that there was a difference between the marks of the parties and considerable difference between the products upon which they are used, and these differences are sufficient to make it seem unlikely that confusion in trade would result, the First Assistant Commissioner said:

"Broadly considered, yeast and crackers and/or biscuits are in my opinion goods of the same descriptive properties. However, they are of markedly different character. The opposer's mark comprises the words 'Red Star' and a representation of a five-pointed star beneath these rather prominently printed words. The applicant's mark comprises a star shown and used as white, but not limited as to color, and above and below which are representations of ribbons bearing the words 'Star Biscuits' and 'of America, Inc.', respectively."

He then, after referring to the decision in *Vick Chemical Co. v. Central City Chemical Co.*, 22 C. C. P. A. 996, 75 Fed.(2d) 517, said:

"I agree with the Examiner of Trade-Mark Interferences that these differences here are cumulative and sufficient to make confusion in trade unlikely."

HENRY SCHNIEWIND, JR., AND IRVING TRUST COMPANY, AS TRUSTEES OF SUSQUEHANNA SILK MILLS, DEBTOR (SUSQUEHANNA SILK MILLS, ASSIGNEE, SUBSTITUTED.) *v.* ROYAL ROBES INC., Opposition No. 15,063.

In a decision rendered November 9, 1937 (159 Ms. Dec. 1,018), *First Assistant Commissioner Macklin* held that Royal Robes Inc., of New York, N. Y., is not entitled to register as a trade-mark for bathrobes, lounging robes, beach robes, lounging gowns, lounging pajamas, smoking jackets and negligees, a mark consisting of the words "Susquehanna Robes by Royal", in association with a pictorial representation of an Indian in a canoe and lines suggesting water in one corner and in another corner a bow and arrow.

The ground of the decision is that the word "Susquehanna" is geographical and that the mark, by reason of inclusion of this word, is confusingly similar to the mark "Suskana" which had been registered for various piece goods and articles of wearing apparel by the predecessors of the opposer.

In his decision, the *First Assistant Commissioner* said:

"The Examiner's holding as to the geographical nature of the word 'Susquehanna' and that it is the predominant word and part of the mark, the spoken word by which the mark would be known, is believed to be correct. I cannot agree with the contention that other features of the mark make it such a composite mark as will take it out of the clause of the statute prohibiting registration of geographical names."

He then, with reference to opposer's right to oppose on the alleged ownership of the three "Suskana" marks, and noting that the registrations of these marks had been renewed by the Susquehanna Silk Mills, as assignee, and that there was in the record a certified copy of an order of the United States District Court for the Southern District of New York directing transfer of property and otherwise providing for carrying out a plan of reorganization, said:

"It seems to show opposer's right to these marks and accordingly its right to be heard as opposer here. I am, therefore, unable to disregard opposer's apparent ownership of these registrations and the presumptions of use which follow from ownership. • • • However, it must be presumed that these trade-marks here are properly renewed, there being no showing to the contrary and on the other hand some showing of the propriety of opposer's present position, as well as the prima facie showing of the copies of the trade-marks themselves, and I find that the opposer at least has the presumption of likelihood of damage from the use of the word 'Susquehanna' for the goods stated."

He then further said:

"It follows, therefore, that the registration of applicant's mark should be refused as consisting primarily of a geographical word, which of itself is sufficient. Further, the concurrent use of the words 'Susquehanna' and 'Suskana' upon goods of the same descriptive properties, and particularly goods of the same character, would likely cause confusion, and for this reason also, the registration should be refused. It becomes unnecessary to pass upon the question of whether the name clause of section 5 also negatives the right of registration, as was held by the Examiner of Trade-Mark Interferences."

KELLY LIQUOR COMPANY *v.* NATIONAL BROKERAGE COMPANY, INC. (PHILIP BLUM & COMPANY, INC., ASSIGNEE, SUBSTITUTED), Trade-Mark Interference No. 2,744.

In a decision rendered November 9, 1937 (159 Ms. Dec. 1,016), *Assistant Commissioner Frazer* held that priority of adoption and use was properly awarded to Philip Blum & Company, Inc., as assignee of National Brokerage Company Inc., of Chicago, Ill., of the notation "Camp Nelson" as a trade-mark for whisky, since the Kelly Liquor Company, of Minneapolis, Minn., had established no actual use of the mark prior to the filing date of the application of the National Brokerage Company and had not established a transfer of the trade-mark rights from its alleged predecessor.

In his decision the Assistant Commissioner, after stating that the only evidence offered to establish a transfer of title was a paper executed by Patrick J. Kelly as president of Kelly Brothers Company and noting that Mr. Kelly is also president of the Kelly Liquor Company and the document recited that there had been a previous transfer to the latter company, said:

"I am clearly of the opinion that the instrument referred to affords no competent evidence in this proceeding that an assignment was made 'on or about September 1, 1934', or at any time prior to the date it bears. The rule here applicable is set forth in 22 Corpus Juris at page 859, as follows:

"'Whether or not a recital in a written instrument has any probative value depends largely upon whether or not the person against whom it is sought to be used is estopped to deny its truth, or has thereby made an admission of some kind; from which it results that while such recitals are competent evidence against parties to the instrument, or their privies, they are not competent as against strangers.'"

And then, noting that that rule had been approved by the Supreme Court and that Mr. Kelly, who was called as witness, had not testified about the assignment and that the Examiner of Interferences pointed out circumstances which he thought would indicate an intention to make the transfer, he said:

"It must be remembered, however, that as junior party Kelly Liquor Company had the burden of proof, and that any doubt created by its own record, or by the absence therefrom of material evidence within its control, must be resolved against it. In reaching the conclusion stated the Examiner appears to have disregarded this rule.

"As Kelly Liquor Company has failed to show an assignment from Kelly Brothers Company earlier than May 26, 1936, and did not begin to use the 'Camp Nelson' trade-mark until October, 1934, which was a year later than the filing date of National Brokerage Company, Inc., it follows that as between these parties the latter was the first to adopt and use the mark. Many other questions are discussed in the briefs, but as what has been said disposes of the case they need not be considered here."

TAMPAX SALES CORPORATION *v.* PAULA A. M. BREESE, Application for Cancellation No. 2,972.

In a decision rendered November 13, 1937 (159 Ms. Dec. 1,022), *First Assistant Commissioner Macklin* held that Paula A. M. Breese, of Woodbury, Long Island, N. Y., is not entitled to register, under the act of 1905, the term "Tampad" as a trade-mark for Absorbent Catamenial Tampons, and that the registration which she had obtained for that mark should be cancelled. The ground of the decision is that the mark is confusingly similar to the term "Tampax", registered by the predecessor in business of the Tampax Sales Corporation, of Denver, Colo., on an application filed prior to any date of use established by Mrs. Breese of the term "Tampad" as a trade-mark.

In his decision the First Assistant Commissioner held that the Examiner of Interferences properly refused to consider testimony taken in another opposition and offered as an exhibit by the Tampax Sales Corporation.

After noting that the Examiner of Interferences had held that the certificate of the trade-mark registration had not been properly introduced in evidence, the First Assistant Commissioner, after noting that a printed copy of the registration had been produced before the Examiner of Interferences, said:

"It seems clear to me that the Patent Office may take proper notice of such a registration to the extent that it is at least a prima facie showing of what it purports to be. The appellee-registrant had due notice in the application for cancellation of this registration and it does not seem proper to ignore this registration for the mere reason that the appellant here failed to formally introduce it as an exhibit, inasmuch as it has been at all times before the parties and the tribunals in this proceeding."

He then, after stating that the appellee, Mrs. Breese, must show trade-mark use to the extent of overcoming the presumption arising from the filing of the application for registration and subsequent registration of the word "Tampax", said:

"Doubtless the best proof of title would have been to produce the assignment and proper testimony pertaining thereto. However, I am persuaded that the applicant-appellee to prevail here must overcome the aforesaid presumption of the registration and presumed use of 'Tampax' for 'sanitary absorbent tampons' at least as early as February 5, 1932."

He then stated that the entire testimony was sufficient to establish that Tampax, Inc., was in existence late in 1931 and had begun trade-mark use of the term "Tampax" prior to February, 1932, and that the testimony of Mrs. Breese was insufficient to show a trade-mark use of the word "Tampad" prior to February 5, 1932, the date on

which the application for the registration of the term "Tampax" was filed, and then said:

"I, therefore, find that the prima facie presumption of the 'Tampax' trade-mark registration should stand and that it has not been overcome by satisfactory testimony of trade-mark use by the appellee Breese, that aside from placing the allegation in issue by the answer filed by the respondent Breese there is no attempt to contradict the statement of the witness Davis, for the appellant, that Tampax Sales Corporation is the successor to Tampax, Inc., registrant of the 'Tampax' trade-mark."

LEVER BROTHERS COMPANY v. TRADERS OIL MILL CO., Opposition No. 15,365.

In a decision rendered November 17, 1937 (159 Ms. Dec. 1,026), *First Assistant Commissioner Macklin* held that Traders Oil Mill Co., of Fort Worth, Tex., is not entitled to register the word "CoFlo" as a trade-mark for partially defatted cooked cottonseed flour in view of the prior adoption and use by Lever Brothers Company, of Cambridge, Mass., of the word "Covo" as a trade-mark for a vegetable shortening composed of cottonseed oil and other vegetable oils. After noting that the Examiner of Trade-Mark Interferences had found in substance that the goods of the parties are specifically different and there are certain differences between the marks so that confusion would not be likely, the First Assistant Commissioner said:

"It seems to me that the goods of the parties, while not identical, are certainly of the same descriptive properties within the meaning of the statute. There is in part at least a common origin, that is, from cotton-seed, and both are used in the making of baked goods. As to the similarity of the marks, the Examiner of Trade-Mark Interferences noted that 'CoFlo' is displayed within a panel and applicant points out that the mark is never used without the enlarged 'F' and the mark being drawn at a slight angle with the horizontal."

He then said:

"It seems clear, however, that the two marks are strikingly similar and sound very much alike, and it seems reasonable to me that there must be a large class of purchasers even of the fifty and one hundred poung packages of such goods who would not be discriminating and who were not necessarily educated English speaking people, and further it seems reasonable that the sale of such products in small packages is a natural development of such business."

And then, after stating that the word "Covo" is not descriptive of the goods and that it would not constitute a substantial distinction to change its spelling or appearance slightly while keeping the sound, said:

"These variations are open to the original user and owner. The nature of the goods and their use are clearly of the same descriptive properties and therefore there seems to be no difference either in the words or in the goods such as could be considered to be cumulative, as was held by the Examiner of Trade-Mark Interferences. 'Covo' is an arbitrary, coined word, and I believe the case distinguishes from such cases • • • (*Anaco Photoproducts, Inc.*, v. *Eastman Kodak Co.*, 19 Fed.(2d) 720, 57 App. D. C. 246; *Kraft-Phenix Cheese Corporation* v. *Von Allmen Preserving Co., Inc.*, 28 U. S. P. Q. 486, 464 O. G. 960; *Lever Bros. Co.* v. *Riodela Chemical Co.*, 41 Fed.(2d) 408, 17 C. C. P. A. 1,272; *Skelly Oil Co.* v. *Powerine Co.*, 24 C. C. P. A. 790, 86 Fed.(2d) 752.) It seems to me that in this case confusion would be inevitable."

EASTMAN KODAK COMPANY, EASTMAN KODAK COMPANY (NEW JERSEY) ASSIGNEE, SUBSTITUTED v. QUALTOP BEVERAGES, INC., Opposition No. 15,865.

In a decision rendered November 24, 1937 (159 Ms. Dec. 1,029), *First Assistant Commissioner Macklin* held that Qualtop Beverages, Inc., of Rochester, N. Y., is not entitled to register the term "Kodak City" as a trade-mark for nonalcoholic, noncereal, maltless beverages sold as soft drinks in view of the use by Eastman Kodak Company of Rochester, N. Y., of the term "Kodak" as a trade-mark for various organic chemicals used as ingredients in soft drinks.

In his decision, after noting that the Examiner of Interferences had found the record did not show that either party dealt in merchandise sold by the other and that he was aware of no trade-mark practice which would justify the assumption that the same traders handled the same classes of goods, the First Assistant Commissioner said:

"I think, however, that the opposer has made a fair showing under the confusion in trade clause, as well as the name clause of section 5 of the Trade-Mark Act. It is common knowledge that its kodak supplies are sold in many kinds of retail establishments. Everyone who has bought photographic equipment has seen that equipment displayed in drug stores, soda fountains, confectionery and drink stands and the like. It seems to me that the use of 'Kodak City' by the applicant upon a soft drink would inevitably raise the question whether the word 'Kodak' applied to such soft drinks was an authorized use as a part of the business of the Kodak Company."

Then, after referring to the argument for the applicant that there was no rational basis for holding the goods to be of the same descriptive property and no ground upon which confusion may be predicated, he said:

"I find, however, that the manufacture and sale of the numerous chemicals by the Eastman Kodak Company since 1920 and 1925, and actual use of these chemicals by it for purposes of soft drinks, do meet the requirement of their being goods of the same descriptive properties, and I find that the word 'Kodak' has accompanied the products of the Kodak Company on such goods."

He then said:

"Consideration of this case from the wide variety of practical standpoints, in view of the outstanding character of this well known, arbitrary mark, and of the decisions cited by the parties, and particularly attempts to apply the decisions cited by the applicant, leads me to the conclusion that this applicant should not be allowed to register the word 'Kodak', with or without the additional word 'City', and for the reasons above stated I find that the requirements of the statute are met in respect to confusion in trade and similarity of goods."

EX PARTE NATIONAL RESEARCH PRODUCTS COMPANY, Serial No. 371,036.

In a decision rendered November 26, 1937 (159 Ms. Dec. 1,033), *First Assistant Commissioner Macklin* held that the National Research Products Company, of Springfield, N. J., is not entitled to register, under the act of 1905, the term "Asmatone" as a trade-mark for asthma and hay fever capsules in view of the prior registration to another of the term "Asthma-Tol" as applied to an asthma medicine.

After noting applicant's argument that the term "Asthma" is descriptive of the goods here involved and that in determining whether applicant's mark is registrable one must look to the differences in the marks and referring to the decision in *Kraft-Phenix Cheese Corporation* v. *Von Allmen Preserving Co., Inc.*, 28 U. S. P. Q. 486, 464 O. G. 960, in which "Magic Mix" and "Miracle Whip" were held to be similar, he said:

"I think there is a definite distinction between this and cases such as that involving 'Magic Mix' and 'Miracle Whip' where the mark involved is not descriptive but is arbitrary and merely suggestive, in that in such cases as the one cited a greater difference is likely to be necessary to avoid confusion that where the earlier registrant has simply added something to the natural usual English descriptive word relating to his product.

• • • • • • •

"In the present case the similarity between the two marks results from the use of the word 'Asthma'. The applicant merely shortens the word and adds 'Tone'. The earlier registered mark adds 'Tol' to the word 'Asthma'. The resulting words 'Asmatone' and 'Asthma-Tol' seem so close that registration of 'Asmatone' is precluded by that portion of section 5 of the statute which says, '. . . or which so nearly resemble a registered or known trade-mark owned and in use by another and appropriated to merchandise of the same descriptive properties as to be likely to cause confusion or mistake in the mind of the public or to deceive purchasers shall not be registered.'"

EX PARTE COMPANIA RON DAIQUIRI, S. A., Serial No. 387,433.

In a decision rendered November 29, 1937 (159 Ms. Dec. 1,037), *Assistant Commissioner Frazer* held the Compania Ron Daiquiri, S. A., of Habana, Cuba, is not entitled to register, under the act of March, 1920, the term "Daiquiri" as a trade-mark for rum. The ground of the decision is that the mark is confusingly similar to certain registered marks consisting of the words "Daiquiri Bacardi" and "Bacardi Daiquiri". The ground of the decision is that the goods are the same and the marks are confusingly similar.

With reference to applicant's argument that the registrant has no exclusive right to the word "Daiquiri" because it is descriptive and has in effect been disclaimed, the Assistant Commissioner said:

"Assuming that to be true, the fact remains that it forms a part of the registered marks and must be so considered in determining the question of confusing similarity. *Joseph Tetley & Co.* v. *Bay State Fishing Co.*, 23 C. C. P. A. 969, 82 Fed.(2d) 299."

With reference to applicant's argument that there can be no refusal to register a mark under the act of 1920 merely because of a prior registration but it must be shown that the mark was actually used in trade, the Assistant Commissioner said:

"In this connection counsel submits a copy of a paper filed by the registrant in an opposition proceeding in which one of the registered marks was involved, and seeks to have the statements there made construed as an admission that no such use of the mark has occurred. I do not find it necessary to determine the meaning or effect of the paper referred to, because so long as the marks remain on the register it is my opinion that they stand as a bar to the registration, under either act, of confusingly similar marks for goods of the same descriptive properties as those to which they are appropriated. The construction of the statute for which counsel contends might often result in the very confusion which it was intended to prevent."

EX PARTE THE AMERICAN INSTITUTE OF REFRIGERATION, Serial No. 372,231.

In a decision rendered November 29, 1937 (159 Ms. Dec. 1,036), *Assistant Commissioner Frazer* held that The American Institute of Refrigeration, of Chicago, Ill., is not entitled to register, under the act of 1905, as a trade-mark for tags a mark consisting of the representation of a circular seal having printed thereon the words "Certified Cold Storage Vaults" and "American Institute of Refrigeration" where this mark was displayed on tags designed to be placed on an article which had been stored as a guarantee to the owner that the article was stored in a certified cold storage vault, the Assistant Commissioner said:

"Obviously the mark sought to be registered is descriptive of the cold storage vaults to which it refers, and would necessarily be so understood by the public. For that reason I am constrained to agree with the Examiner that it can have no trade-mark significance as applied to applicant's tags. The mark is a constituent part of the tag itself, and serves no other purpose."

THE ANACIN COMPANY v. THE WM. S. MERRELL COMPANY, Opposition No. 15,051.

In a decision rendered November 29, 1937 (159 Ms. Dec. 1,039), *Assistant Commissioner Frazer* held that Wm. S. Merrell Company, of Cincinnati, Ohio, is not entitled to register the word "Alycin" as a trade-mark for a preparation for the treatment of common colds, neuralgia, rheumatism, and the like, in view of the prior adoption and use by the Anacin Company, of Chicago, Ill., of the term "Anacin" as a trade-mark for a medicinal preparation for internal use for the treatment of headache, neuralgia, etc. In his decision, after discussing the testimony relating to use by the opposer, the Assistant Commissioner said:

"Opposer having thus shown its own use to have commenced at least a month earlier than any use established by applicant, and there being no serious dispute as to the similarity of the two marks, the only remaining question in issue between the parties is whether or not their goods are of the same descriptive properties within the meaning of the Trade-Mark Act."

Then, after noting applicant's argument based on the grounds that its preparation is an ethical remedy sold only on physicians' prescriptions while the goods of the opposer is a nonethical remedy, the Assistant Commissioner said:

"I am unable to agree with applicant's conclusion. As pointed out by the Examiner, applicant may change its trade practices at will; and while its product has not yet been marketed in a form to permit of self-administration, it is 'a matter of common knowledge that pharmaceutical preparations may at the commencement of their use in trade be restricted to prescription by physicians, but later may also be sold over the counter without such a prescription.' Moreover, while differences in methods of sale and in the classes of purchasers sought to be reached are doubtless of importance in determining the likelihood of confusion, I do not think these considerations alone are sufficient to warrant the conclusion that items so nearly identical in their essential characteristics as are those here involved do not in fact possess the same descriptive properties."

He then, after noting that the opposer had made of record two registrations of the word "Anacin" and had unsuccessfully tried to prove that they owned them, said:

"• • • One of these registrations, issued November 19, 1918, and covering the specific goods in which opposer deals, was held by the Examiner of Interferences to be a bar to the registration of applicant's mark 'regardless of whether or not the opposer's proofs support its claim of ownership thereof.' Complaint is made of this ruling, but I think it was clearly right. It is well established that in an opposition proceeding the Examiner of Interferences is charged with the duty of determining the registrability of an applicant's mark irrespective of the grounds of opposition, and that in doing so resort may be had to third party registrations of marks considered to be confusingly simulated. *California Canneries Co.* v. *Lush'us Products Co.*, 18 C. C. P. A. 1,480, 49 Fed.(2d) 1,044."

C. E. LANGFIELD v. JAMES S. BRADY, Opposition No. 15,615.

In a decision rendered November 29, 1937 (159 Ms. Dec. 1,034), *Assistant Commissioner Frazer* held that James S. Brady, of Kenmore, N. Y., is entitled to register the term "Solvoline", as a trade-mark for nonexplosive dry cleaning fluid notwithstanding the prior adoption, use and registration

by C. E. Langfield, of Northville, Mich., of the term "Solvite" as a trade-mark for a dry cleaning soap. In his decision the Assistant Commissioner said:

"Applicant's dry cleaning fluid and opposer's dry cleaning soap are unquestionably 'merchandise of the same descriptive properties', but they are nevertheless widely different in many of their essential characteristics. One is a liquid; the other a paste. The fluid is ready for use when purchased; the soap must first be dissolved in naphtha or gasoline. While it is perhaps possible that the two products could be used together, there is no evidence that they ever have been so used, nor is any reason suggested why they ever should be.

"As the goods of applicant and those of opposer are not the same, I think their marks are sufficiently dissimilar as to insure against any reasonable likelihood of confusion."

Then, after referring to the decision of the Court of Customs and Patent Appeals in *Vick Chemical Co.* v. *Thomas Kerfoot & Co.*, 23 C. C. P. A. 752, 80 Fed. (2d) 73, in which it was held that the term "Vapex" applied to an inhalant for the relief of head colds was not confusingly similar to the term "Vaporub" as applied to a rubifacient salve for the treatment of colds, he said:

"Manifestly there is as much difference between the words 'Solvite' and 'Solvoline' as there is between the words 'Vapex' and 'Vaporub', and as much difference between the two dry cleaning products of the instant case as between the two cold remedies with which the latter marks were used. It seems to me that the two cases are substantially parallel both as to marks and goods, and that the cited case lends ample support to the conclusion I have reached."

EX PARTE THE KILGORE MANUFACTURING COMPANY, Serial No. 349,015.

In a decision rendered November 30, 1937 (159 MS. Dec. 1,036), *Assistant Commissioner Frazer* held that The Kilgore Manufacturing Company, of Westerville, Ohio, is not entitled to register, under the act of 1920, the words "Six Shooter" as a trade-mark for toy pistols.

The ground of the decision is that the term could not function as a trade-mark for the goods specified.

In his decision the Assistant Commissioner said:

"I think registration was properly refused. While descriptive marks may be registered under the 1920 act, it does not follow that the mere name of a particular article is registrable as a trade-mark for use with that article; and it seems to me that when a toy is made in simulation of some common device, such as a firearm, the toy quite naturally becomes known to the public by the name of the simulated device, even though the toy may have no practical utility. In other words, I do not think the expression sought to be registered is any more capable of trade-mark significance than if it were 'toy six shooter.' A toy piano can rarely be played, nor will a toy automobile usually run, yet 'piano' and 'automobile' are certainly the names of such toys. So here 'six shooter' is the name of applicant's product, and would be so considered by purchasers."

RAZALON CORPORATION v. PIERRE AMOUROUX, INC., Opposition No. 15,938.

In a decision rendered November 30, 1937 (159 MS. Dec. 1,042), *Assistant Commissioner Frazer* held that Pierre Amouroux, Inc., of New York, N. Y., is not entitled to register the words "Rasoline Molinard" as a trade-mark for shaving cream in view of the prior adoption, use and registration by the Razalon Corporation, of New York, N. Y., of the term "Razalon" as a trade-mark for a beard softener.

In his decision, after noting that the Examiner of Interferences held the two marks as applied to the respective goods confusingly similar, the applicant's only contention was that the marks are not confusingly similar, the Assistant Commissioner said:

"Applicant's mark, as shown on the drawing and on the specimen labels, displays the word 'Rasoline' above the word 'Molinard' and in substantially larger type, with a considerable space separating the two words. This arrangement accentuates the first word, and renders the probability of confusion greater, perhaps, than it would be otherwise. Quite independently of that circumstance, however, I am convinced that the marks 'Razalon' and 'Rasoline Molinard' are too nearly alike to be used without confusion on goods so closely related as are those of the present parties."

TRADE-MARKS

OFFICIAL GAZETTE, DECEMBER 28, 1937

[VOL. 485. No. 4]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 1 of said act, a fee of ten dollars must accompany each notice of opposition.

CLASS 1

Raw or Partly Prepared Materials

Ser. No. 399,122. BACMO POSTMAN CORPORATION, New York, N. Y. Filed Oct. 30, 1937.

The word "Berbera" is disclaimed apart from the mark.

For Glove Leather.

Claims use since January, 1937.

CLASS 4

Abrasive, Detergent, and Polishing Materials

Ser. No. 389,648. MINNESOTA MINING & MANUFACTURING COMPANY, St. Paul, Minn. Filed Mar. 4, 1937.

ELEK-TRO-CUT

The word "Cut" is disclaimed apart from the mark.

For Abrasive Cloth, Abrasive Paper, Abrasive Belts, Abrasive Sleeves, and Abrasive Disks.

Claims use since August, 1933.

Ser. No. 394,071. WILKEY LABORATORIES, INC., Chicago, Ill. Filed June 14, 1937.

KA-BO

For Shoe Dressings, Shoe Polishes, Shoe Cleaners, Polishing Waxes for Shoes, and Shoe Creams.

Claims use since Feb. 10, 1914.

Ser. No. 394,926. FREDERICK J. WUESTHOFF, Berkeley, Calif. Filed July 6, 1937.

SCOUR PUSS

The word "Scour" is disclaimed apart from the mark.

For Scouring Pads Containing Soft Rubber and Steel Wool Vulcanized Together as a Unit.

Claims use since Jan. 3, 1937.

Ser. No. 396,793. HAROLD G. VALENTINE, doing business as H. G. Valentine Co., Randolph, Mass. Filed Aug. 26, 1937.

The drawing is lined for green and black.

For Compositions Which Are Cleaners for Automobiles, Metals, Glass, Leather, and Wood, Said Compositions Also Having Polishing Properties.

Claims use since May 1, 1936.

Ser. No. 397,350. WALGREEN CO., Chicago, Ill. Filed Sept. 11, 1937.

For Toilet Preparations—Namely, Shaving Cream, Soap, and the Like.

Claims use since Oct. 7, 1937.

Ser. No. 397,569. BLOOMINGDALE BROS., INC., New York, N. Y. Filed Sept. 20, 1937.

GLOPANE

For Window Cleaning Preparation.
Claims use since Aug. 6, 1937.

Ser. No. 397,977. J. A. M. LEWIS, doing business as Silverlite Products Company, Denver, Colo. Filed Sept. 30, 1937.

SILVERLITE

For Razor Hone.
Claims use since Jan. 1, 1932.

CLASS 5

Adhesives

Ser. No. 392,798. INTER-COASTAL PAINT CORP., East St. Louis, Ill. Filed May 15, 1937.

INCO

For Rubber Cement Used as an Adhesive.
Claims use since Feb. 2, 1937.

Ser. No. 398,761. A. B. DICK COMPANY, Chicago, Ill. Filed Oct. 21, 1937.

MIMEOGRAPH

For Cement for Mounting Stencils and Stencil Sheets.
Claims use since July 24, 1933.

Ser. No. 399,891. HEALEY, SEAVER COMPANY, Boston, Mass. Filed Nov. 18, 1937.

DU-AL

For Adhesives Having a Dextrine Base.
Claims use since Aug. 16, 1937.

CLASS 6

Chemicals, Medicines, and Pharmaceutical Preparations

Ser. No. 383,556. ROSE WEBER, Chicago, Ill. Filed Sept. 23, 1936.

Road to Radiance

For Cosmetics—Namely, Deodorants, Eye Washes, Dentifrices, Face Powder, Tinting Powder, Talcum Powder, Sachet Powder, Lipsticks, Mascara, Brilliantine, Eye Shadow, Bath Softener, Nail Polish, Liquid Cleansing Cream, Face Creams, Tissue Creams, Body Lotion, and Hand Lotion.
Claims use since June 20, 1934.

Ser. No. 385,348. MARTIN DE BOTELHO, New York, N. Y. Filed Nov. 10, 1936.

PRINCE GEORGE
OF RUSSIA

The words "Prince George of Russia" are disclaimed apart from the mark.
For Toilet Water and Perfume.
Claims use since Sept. 1, 1936.

Ser. No. 389,024. HEALTH RESEARCH FOUNDATION, Ann Arbor, Mich. Filed Feb. 17, 1937.

The words "Standard Vitamins" are disclaimed apart from the mark. The drawing is lined for red and black.
For Vitamin Tablet.
Claims use since May, 1933.

Ser. No. 392,625. IVY-DENE PRODUCTS COMPANY, Ithaca, N. Y. Filed May 11, 1937.

The drawing is lined for green and black.
For Preparation for the Strengthening of Manufactured Silk Goods.
Claims use since Apr. 20, 1937.

Ser. No. 393,217. HERCULES GLUE COMPANY, San Francisco, Calif. Filed May 25, 1937.

MULTI-FILM

The word "Film" is disclaimed except as shown.
For Insecticidal Compositions, More Particularly Spreaders for Insecticides Such as Astringent Lead Arsenate.
Claims use since Apr. 15, 1937.

Ser. No. 393,774. ANDREW MCNALLY, Wilmar, Calif. Filed June 7, 1937.

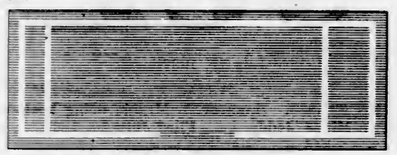
FYFFE'S

SOORA-ADMEE

The word "Fyffe's" is disclaimed apart from the mark.
For Liniment for Diabetic Rheumatism, Lumbago, Aches and Sprains, and Athlete's Foot.
Claims use since May, 1937.

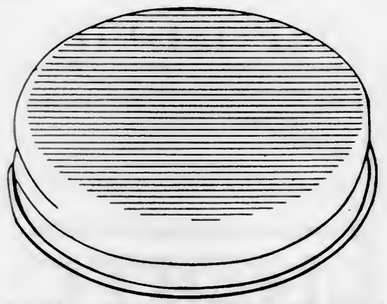
Ser. No. 395,135. LA COMPAGNIE PHARMACEUTIQUE DESBERGERS, Montreal, Quebec, Canada. Filed July 12, 1937.

ANOGEL



For Granular Preparation To Be Used as a Physiological and Mechanical Treatment of Chronic Constipation.
Claims use since February, 1936.

Ser. No. 395,276. CHESEBROUGH MANUFACTURING COMPANY, CONSOLIDATED, New York, N. Y. Filed July 16, 1937.



The mark consists of a blue disk or spot applied to one face of the container. No claim is made to the representation of a carton.
For Petroleum Jelly.
Claims use since 1907.

Ser. No. 395,277. CHESEBROUGH MANUFACTURING COMPANY, CONSOLIDATED, New York, N. Y. Filed July 16, 1937.

The mark consists of white lines disposed upon a blue field of rectangular form. No claim is made to the representation of a label.
For Petroleum Jelly.
Claims use since 1906.

Ser. No. 395,278. CHESEBROUGH MANUFACTURING COMPANY, CONSOLIDATED, New York, N. Y. Filed July 16, 1937.

The mark consists of a blue spot or disk applied centrally to the top of cover or cap of the container and having a white band surrounding the spot or disk. No claim is made to the representation of a cap.
For Petroleum Jelly and Preparation Thereof, and Pomade.
Claims use since 1902.

Ser. No. 395,279. CHESEBROUGH MANUFACTURING COMPANY, CONSOLIDATED, New York, N. Y. Filed July 16, 1937.

The mark consists of a blue disk applied centrally to the top of the container and a blue rectangular panel applied to the lower circumference of the container. No claim is made to the representation of a bottle.

For Petroleum Jelly.

Claims use since 1906.

Ser. No. 395,582. MARINELLO CORPORATION, New York, N. Y. Filed July 23, 1937.

SUZ

For Hair Shampoo.

Claims use since July 15, 1937.

Ser. No. 395,833. HARRIET A. MINOR, doing business as H. A. Minor, Jeddo, Pa. Filed July 30, 1937.

For Deodorizer Preparation for Refrigerators.

Claims use since July 20, 1937.

Ser. No. 396,774. GEORGE HAUGWITZ, Brooklyn, N. Y. Filed Aug. 26, 1937.

DEPOSULIN

For Liquid Pharmaceutical Preparation of Insulin and Hormone Extract Medically Used in the Treatment of Diabetes, Nervous Diseases, and in General in Every Case Where Insulin is Usable.

Claims use since Aug. 19, 1937.

Ser. No. 396,859. FRANK MIRRER, Brooklyn, N. Y. Filed Aug. 28, 1937.

FURITE

For Preparation for the Treatment of Athlete's Foot.

Claims use since June, 1932.

Ser. No. 397,172. THE BARRETT COMPANY, New York, N. Y. Filed Sept. 7, 1937. Under section 5b of the act of 1905 as amended in 1920.

Barrett

For Germicides, Fungicides, Insecticides, Disinfectants, Preservatives for Wood and Analogous Materials, Creosote Oil and Other Derivatives and Oil Distillates of Coal Tar, Hydrocarbon Solvent Oils, Oils for Use in Ore Flotation, Compositions Used in the Processing and Treatment of Rubber, Synthetic Tanning Extract; Organic Chemicals as Follows: Crude and Refined Cresylic Acid, Naphthalene, Cresol, Chlor-Cresol, Phenol, Xylenol, Chlor-Xylenol, Benzol, Toluol, Xylol, Naphtha, Crude and Refined Pyridine, Alpha Picoline, Quinoline, and Tar Acid Oils.

Claims use on germicides, fungicides, insecticides, disinfectants, preservatives, creosote oil, other oils, derivatives of tar and organic chemicals since about 1906; on compositions used in the processing and treatment of rubber since about 1920; and on synthetic tanning extract since about 1921.

Ser. No. 397,219. MASCHINEN- & APPARATE-BAUANSTALT HANS LANGEN, München Gladbach, Germany. Filed Sept. 8, 1937.

Conditionol

For Yarn Wetting Agents.

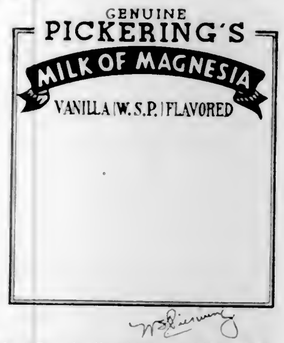
Claims use since July 14, 1937.

Ser. No. 397,327. COLE CHEMICAL COMPANY, Wilmington, Del., and St. Louis, Mo. Filed Sept. 11, 1937.

MYRTICRINE

For Pharmaceutical Preparation for the Treatment of Diabetes.

Claims use since Aug. 24, 1937.



Ser. No. 397,479. NATIONAL COSMETICS, INC., Chicago, Ill. Filed Sept. 16, 1937.

MODERN EYES

For Cosmetic Preparations Suitable for the Darkening of Eye Lashes and Eye Brows—Namely, Mascara.

Claims use since July 27, 1937.

Ser. No. 397,484. WILEY S. PICKERING, doing business as Druggist Laboratories, New Orleans, La. Filed Sept. 16, 1937.

The words "Genuine", "Milk of Magnesia", "Vanilla", and "Flavored" are disclaimed apart from the mark. The facsimile signature is that of the applicant.

For Milk of Magnesia.

Claims use since Aug. 1, 1937.

Ser. No. 397,782. VITAMINS PLUS INCORPORATED, New York, N. Y. Filed Sept. 24, 1937.

VITAMINS Plus

The word "Vitamins" is disclaimed apart from the mark.

For Capsules Containing Vitaminic Preparations.

Claims use since Aug. 20, 1937.

Ser. No. 397,915. G. D. SEARLE & CO., Chicago, Ill. Filed Sept. 28, 1937.

SODIUM PSYLLIATE

The word "Sodium" is disclaimed apart from the mark.

For Medicinal Preparation for Use in Producing Tissue Irritation, and Fibrous Tissue Proliferation.

Claims use since Mar. 3, 1936.

Ser. No. 398,018. MILTON RAY COMPANY, Minneapolis, Minn. Filed Oct. 1, 1937.

For Tooth Paste, Tooth Powders, Mouth Washes, Hair Tonics, Stomach Powders and Tablets, After Shaving Lotions, Toilet Water, Face Powders, Astringents, Wave Set, Face Creams, Rouge, Skin Ointments, Cold Cream, Lipstick, Hair Dressing, Pain Relieving Compounds, Halibut Liver Oil Capsules, Brewers' Yeast Tablets, Aspirin Tablets, Medicinal Mineral Oil, Cod Liver Oil, Cough Syrup, and Vitamin A B D Capsules.

Claims use since June 23, 1936.

Ser. No. 398,032. BAR-JE, INC., Chicago, Ill. Filed Oct. 2, 1937.

Bar-Té

For Cleansing Creams, Tissue Creams, Finishing Creams, and Hand Creams.

Claims use since Sept. 15, 1937.

Ser. No. 398,039. FRANKLIN SIMON & CO., INC., New York, N. Y. Filed Oct. 2, 1937.

TubTone

For Water Softener.

Claims use since July 9, 1937.

For Razors and Razor Blades.
Claims use since Oct. 31, 1936.

353,310. (CLASS 17. TOBACCO PRODUCTS.) THE AXTON-FISHER TOBACCO COMPANY, Louisville, Ky. Filed Dec. 4, 1936. Serial No. 386,299.

ROYCROFT

For Cigarettes.
Claims use since Nov. 4, 1936.

353,311. (CLASS 26. MEASURING AND SCIENTIFIC APPLIANCES.) HEARST METROTONE NEWS, INC., New York, N. Y. Filed Dec. 16, 1936. Serial No. 386,804.

NEWS of the DAY

For Motion Picture Films.
Claims use since Nov. 9, 1936.

353,312. (CLASS 39. CLOTHING.) CARAFIOL-SILVERMAN COMPANY, St. Louis, Mo. Filed Jan. 6, 1937. Serial No. 387,495.

Paula Brooks

For Women's Wearing Apparel—Namely, Street Dresses.
Claims use since Nov. 1, 1936.

353,313. (CLASS 6. CHEMICALS, MEDICINES, AND PHARMACEUTICAL PREPARATIONS.) DR. MADAUS & COMPANY, Radebeul, near Dresden, Germany. Filed Feb. 4, 1937. Serial No. 388,540.

„Madaus"

For Chemicals, Medicines, and Pharmaceutical Preparations—Viz., Alumina Colloidalis, Antimonium Crudum Colloidale, Antimonium Sulphuricum Aurantiacum Colloidale, Argentum Metallicum Colloidale, Aurum Metallicum Colloidale, Barium Carbonicum Colloidale, Bismutum Metallicum Colloidale, Bismutum Nitricum Colloidale, Calcarea Carbonica Colloidalis, Calcium Fluoratum Colloidale, Calcium Phosphoricum Colloidale, Carbo Animalis Colloidalis, Carbo Vegetabilis Colloidalis, Cuprum Arsenicosum Colloidale, Cuprum Metallicum Colloidale, Ferrum Metallicum Colloidale, Ferrum Phosphoricum Colloidale, Graphites Colloidalis, Magnesium Carbonicum Colloidale, Magnesium Phosphoricum Colloidale, Mercurius Dulcis Colloidalis, Mercurius Jodatus Flavus Colloidalis, Mercurius Solubilis Colloidalis, Mercurius Vivus Colloidalis, Platinum Metallicum Colloidale, Plumbum Metallicum Colloidale, Selenium Colloidale, Strontium Carbonicum Colloidale, Sulphur Colloidale, Zincum Metallicum Colloidale, Gold-Drops (Essentia Aurea), Honiglebertran (Cod-Liver-Oil and Honey), Herbal Tonicum, for Chloresis and as a Restorative for Convalescents, Sulphur Iodatum Immutabile; Ointment, for Eczema, Herpes, and Psoriasis, Bath Preparations for Eczema, Psoriasis, and the like; and Unguentum Ultrazinci.
Claims use since Apr. 28, 1919.

353,314. (CLASS 39. CLOTHING.) CARSON PIRIE SCOTT & COMPANY, Chicago, Ill. Filed Mar. 6, 1937. Serial No. 389,721.

SCOTTVILLE

For Men's and Boys' Outer Shirts.
Claims use since Oct. 29, 1936.

353,315. (CLASS 37. PAPER AND STATIONERY.) AMERICAN PAPER EXPORTS, INC., New York, N. Y. Filed Apr. 10, 1937. Serial No. 391,166.

RUBBERETTE

For Bond, Ledger, Document, and Index Paper.
Claims use since July, 1935.

353,316. (CLASS 44. DENTAL, MEDICAL, AND SURGICAL APPLIANCES.) INTERNATIONAL CELLUCOTTON PRODUCTS COMPANY, Chicago, Ill. Filed Aug. 6, 1937. Serial No. 396,081.

LADY MADISON

For Sanitary Napkins.
Claims use since July 3, 1933.

353,317. (CLASS 4. ABRASIVE, DETERGENT, AND POLISHING MATERIALS.) LEE E. BERRY, doing business as Shop & Laboratory Equipment Company, Chicago, Ill. Filed Aug. 9, 1937. Serial No. 396,176.

SURE-PULL

For Dressing for All Machine Belts.
Claims use since June 1, 1936.

353,318. (CLASS 39. CLOTHING.) DVORKIN & OKUN COMPANY, New York, N. Y. Filed Aug. 26, 1937. Serial No. 396,767.

PHILIP MORRIS CLOTHES

For Men's Clothing, More Particularly, Suits, Topcoats, Overcoats, and Trousers.
Claims use since June, 1935.

353,319. (CLASS 37. PAPER AND STATIONERY.) AUSTIN, NICHOLS & CO., INC., Brooklyn, N. Y. Filed Sept. 22, 1937. Serial No. 397,639.

Chelsea

For Toilet Tissue.
Claims use since Oct. 2, 1931.

353,320. (CLASS 39. CLOTHING.) THE FORSCH-BENJAMIN COMPANY, Cleveland, Ohio. Filed Oct. 6, 1937. Serial No. 398,228.

MISS MODE

For Women's and Misses' Cloaks and Suits.
Claims use since Jan. 1, 1934.

353,321. (CLASS 23. CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF.) MACCLATCHIE MANUFACTURING COMPANY OF CALIFORNIA, Compton, Calif. Filed Oct. 7, 1937. Serial No. 398,252.

Wear-Ever

For Pistons for Pumps.
Claims use since May 15, 1933.

353,322. (CLASS 39. CLOTHING.) A. SOLOMON, New Orleans, La. Filed Oct. 12, 1937. Serial No. 398,413.

SOUTH PARK

For Summer Clothing—Namely, Suits, Coats, Pants, and Vests for Men, Young Men, and Boys.
Claims use since January, 1935.

353,323. (CLASS 46. FOODS AND INGREDIENTS OF FOODS.) MAXIMILLIAN D. HOPPER, doing business as M. D. Hopper, Hanford, Calif. Filed Oct. 25, 1937. Serial No. 398,902.

LUCERNE

For Fresh Fruits, Particularly Fresh Grapes.
Claims use since October, 1922.

TRADE-MARK REGISTRATIONS RENEWED

119,675. LEAD-PENCILS. Registered December 11, 1917. JOSEPH DIXON CRUCIBLE COMPANY, Jersey City, N. J., a corporation of New Jersey. Renewed December 11, 1937.

119,676. LEAD-PENCILS. Registered December 11, 1917. JOSEPH DIXON CRUCIBLE COMPANY, Jersey City, N. J., a corporation of New Jersey. Renewed December 11, 1937.

119,677. LEAD PENCILS. Registered December 11, 1917. JOSEPH DIXON CRUCIBLE COMPANY, Jersey City, N. J., a corporation of New Jersey. Renewed December 11, 1937.

119,746. WATCHES. Registered December 11, 1917. MARSHALL FIELD & COMPANY, Chicago, Ill., a corporation of Illinois. Renewed December 11, 1937.

119,905. LEATHER SHOES. Registered December 18, 1917. MARSHALL FIELD & COMPANY, Chicago, Ill., a corporation of Illinois. Renewed December 18, 1937.

120,024. DRY GIN AND OLD TOM GIN. Registered January 1, 1918. THE GORDON'S DRY GIN COMPANY, LIMITED, New York, N. Y. Renewed January 1, 1938, to Charles Tanqueray & Co. Limited, London, England, a limited liability company of Great Britain, assignee.

120,069. WHISKY. Registered January 8, 1918. JAMES BUCHANAN & Co. LIMITED, London, England, and Glasgow and Mulben, Speyside, Scotland. Renewed January 8, 1938, to James Buchanan & Company Limited, London, England, a corporation of Great Britain.

120,159. PANCAKE, BUCKWHEAT, CORN, AND WHEAT FLOURS. Registered January 15, 1918. AUNT JEMIMA MILLS COMPANY, St. Joseph, Mo. Renewed January 15, 1938, to The Quaker Oats Company, Chicago, Ill., a corporation of New Jersey, assignee.

120,160. PANCAKE, BUCKWHEAT, CORN, AND WHEAT FLOURS. Registered January 15, 1918. AUNT JEMIMA MILLS COMPANY, St. Joseph, Mo. Renewed January 15, 1938, to The Quaker Oats Company, Chicago, Ill., a corporation of New Jersey, assignee.

120,162. COFFEE. Registered January 15, 1918. EDWARD BRONDI, doing business as Importers Mills Co., New York, N. Y. Renewed January 15, 1938.

120,584. PIPES, CIGAR AND CIGARETTE HOLDERS, TOBACCO-POUCHES, CIGARETTE-PAPER, AND PIPE-CASES. Registered February 19, 1918. KAUFMANN BROS. & BONDY, New York, N. Y. Renewed February 19, 1938, to Kaufmann Bros. & Bondy, Inc., West New York, N. J., a corporation of New Jersey, successor.

120,598. CERTAIN NAMED KNITTED, NETTED, AND TEXTILE FABRICS. Registered February 19, 1918. LIBERTY & CO. LIMITED, London, England, a corporation of Great Britain. Renewed February 19, 1938.

120,826. WHISKY. Registered March 12, 1918. JAMES BUCHANAN & Co. LIMITED, London, England, and Glasgow and Mulben, Scotland. Renewed March 12, 1938, to James Buchanan & Company Limited, London, England, a corporation of Great Britain.

120,843. WHEAT-FLOUR. Registered March 12, 1918. THE COLORADO MILLING & ELEVATOR CO., Denver, Colo., and Burley, Idaho, a corporation of Colorado. Renewed March 12, 1938.

120,955. SOAPS. Registered March 19, 1918. COLGATE & Co., Jersey City, N. J., and New York, N. Y. Renewed March 19, 1938, to Colgate-Palmolive-Peet Company, Jersey City, N. J., a corporation of Delaware, assignee.

121,180. BOOKCASES, FILING-CABINETS, FILING-CASES, AND OFFICE-CABINETS AS ARTICLES OF OFFICE FURNITURE. Registered April 16, 1918. THE GLOBE-WERNICKE COMPANY, Cincinnati, Ohio, a corporation of Ohio. Renewed April 16, 1938.

121,266. WHEAT-FLOUR. Registered April 23, 1918. THE COLORADO MILLING & ELEVATOR CO., Denver, Colo., and Burley, Idaho, a corporation of Colorado. Renewed April 23, 1938.

121,278. WOOD BEADING. Registered April 23, 1918. E. W. ELLIS LUMBER COMPANY, Grand Rapids, Wis. Renewed April 23, 1938, to Kinzel Lumber Company, Merrill, Wis., a corporation of Wisconsin, assignee by mesne assignments.

121,361. LEMONS. Registered April 23, 1918. TUSTIN LEMON ASSOCIATION, Tustin, Calif. Renewed April 23, 1938, to Central Lemon Association, Orange, Calif., a corporation of California, assignee.

121,394. ARTISTS' CRAYONS. Registered April 30, 1918. BINNEY & SMITH CO., New York, N. Y., a corporation of New Jersey. Renewed April 30, 1938.

121,400. DRIED FRUITS. Registered April 30, 1918. CALIFORNIA ASSOCIATED RAISIN CO. Renewed April 30, 1938, to Sun-Maid Raisin Growers of California, Fresno, Calif., an incorporated co-operative association of California, assignee.

121,612. A PREPARATION FOR THE TREATMENT OF CERTAIN NAMED DISEASES. Registered May 14, 1918. FORT WAYNE DRUG COMPANY, Fort Wayne, Ind., a corporation of Indiana. Renewed May 14, 1938.

121,829. WOVEN COTTON FABRICS IN THE PIECE. Registered May 28, 1918. GEORGE ALBERT STAFFORD. Renewed May 28, 1938, to G. A. Stafford & Company, Inc., New York, N. Y., a corporation of Virginia, assignee.

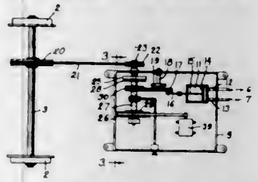
REISSUES



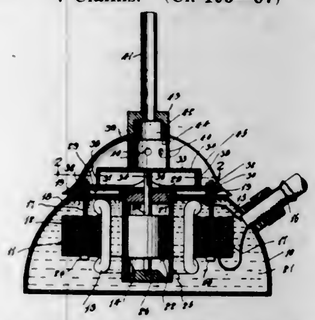
DECEMBER 28, 1937

20,603
REFRIGERATING SYSTEM AND CONTROL MECHANISM THEREFOR

Benjamin L. Gates, Spokane, Wash., assignor of one-half to H. Luella Beamish, Spokane, Wash.

Original No. 1,827,981 dated October 20, 1931, Serial No. 226,341, October 15, 1927. Application for reissue October 9, 1933, Serial No. 692,909

31 Claims. (Cl. 62—117)



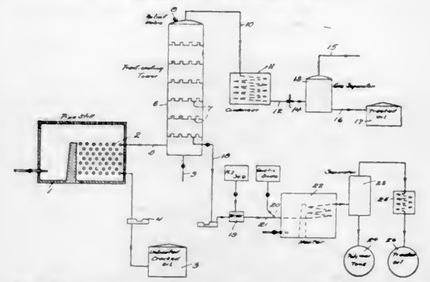
4. In a vehicle, the combination with a refrigerating compartment, of cooling mechanism therefor, an operative connection between a rotating shaft of said vehicle and said cooling mechanism, means for disengaging said connection, secondary driving means for said cooling means, means for disengaging said secondary driving means, and connections between both of said disengaging means permitting connection of only one at a time.

20,604
SUBMERSIBLE PUMP AND ELECTRIC MOTOR UNIT

James Fred Haldeman, Martinsville, Ind.

Original No. 2,004,866, dated June 11, 1935, Serial No. 746,919, October 4, 1934. Application for reissue February 18, 1937, Serial No. 126,528

7 Claims. (Cl. 103—87)



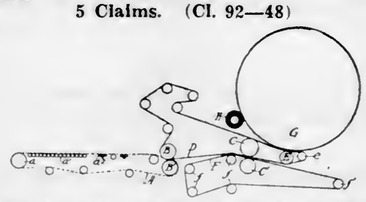
1. A device of the class described comprising a casing having a chamber, an impeller in said chamber, a discharge pipe leading from the casing, said discharge pipe having an inlet, said chamber having an outlet opening, a hood secured over said casing by said discharge pipe to confine the discharge from the chamber and cause it to pass into the inlet of the discharge pipe, a plate adjacent the bottom of the hood surrounded by the hood and having an opening constituting an inlet for the chamber, a base having an electric motor therein, the armature shaft of the motor extending above the base and through said plate opening and driving the impeller, bolts connecting the field core of the motor, said casing and plate together, and means spacing the plate and casing from the base and surrounding said bolts.

20,605
METHOD OF TREATING CRACKED PETROLEUM DISTILLATES

Rudolph C. Osterstrom, Kenilworth, and Cary R. Wagner, Chicago, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

Original No. 1,891,108, dated December 13, 1932, Serial No. 426,122, February 5, 1930. Application for reissue September 18, 1934, Serial No. 744,562

8 Claims. (Cl. 196—93)

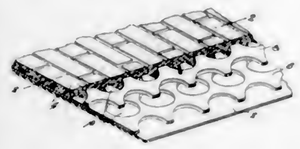


5. The method of removing gum-forming and color-imparting bodies from low boiling cracked oil vapors which consists in contacting said vapors in a fractionating zone with a plurality of bodies of liquid hydrocarbons at temperatures above the vaporizing temperature of gasoline but below cracking temperature and at high superatmospheric pressure for a period of time ranging from approximately 15 minutes to 3 hours, and condensing the degummed vapors.

20,606
PAPER MAKING MACHINE

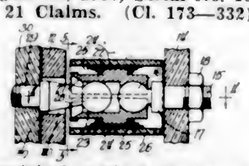
Charles R. Seaborne, Appleton, Wis., assignor, by mesne assignments, to American Lakes Paper Company, Waukegan, Ill., a corporation of Delaware

Original No. 1,517,018, dated November 25, 1924, Serial No. 676,705, November 24, 1923. Application for reissue June 25, 1936, Serial No. 88,268



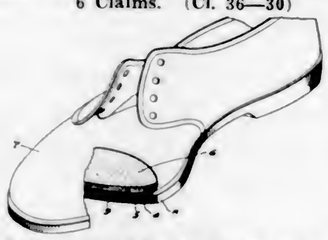
5 Claims. (Cl. 92—48)

1. In combination, a drying cylinder of a paper making machine, and a marking roll arranged to



be forced toward said cylinder so as to directly engage and compress a web of paper manufactured by said paper making machine between said drying cylinder and said marking roll to accomplish an ornamental marking thereof, said marking roll comprising: a rigid core, a continuous, single, one-piece outer sleeve-like layer of hard rubber, and means resiliently supporting said outer sleeve-like layer relatively to said core, said means including a cushioning layer of relatively soft rubber interposed between said core and said outer sleeve-like layer; the outer surface of said outer sleeve-like layer being finished concentric with respect to the axis of rotation of said marking roll, as by a grinding operation, said marking roll and drying cylinder being relatively crowned so as to maintain a substantially uniform nip pressure across a web of paper, portions of the material of said outer ground surface being removed, as by an engraving operation, so as to leave lands which constitute a design that it is desired to impart to a web of paper during a marking operation thereon, said lands being sufficiently rigid to effect a desired marking and being sufficiently resilient to avoid injuring a web of paper when used in direct contact therewith during a marking operation.

20,607
BUILDING MATERIAL
John Tomec, Trenton, N. J.
Original No. 2,075,373, dated March 30, 1937, Serial No. 34,510, August 3, 1935. Application for reissue June 25, 1937, Serial No. 150,342
11 Claims. (Cl. 154—45.9)



1. Building material embodying two sheets each formed with openings therein, the openings in one sheet having the edges thereof overlapping the edges of the openings in the other sheet and a plastic layer of wear receiving material applied to and covering the surface of one sheet only and extending through the openings in said sheet and into the openings in the other sheet.

20,608
ELECTRICAL CONTACT DEVICE
Charles H. Koehler, Oak Park, Ill.
Original No. 2,086,424, dated July 6, 1937, Serial No. 724,118, May 5, 1934. Application for reissue August 16, 1937, Serial No. 159,442
21 Claims. (Cl. 173—332)

1. An electrical contact device comprising a terminal stud having a ball contact tip, a plurality of contact shoes recessed to have ball and socket engagement about said tip and defining a cylindrical opening extending outwardly of said top, an enclosing housing supported about said shoes, spring means biased against said housing and said shoes, and a male contact plug engageable within the opening formed by said shoes, said spring means equalizing the pressure between each of said shoes and said contact tip and contact plug.

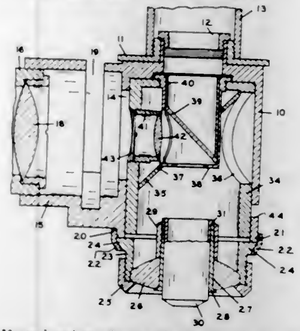
20,609
SHOE
Ernest W. Dunbar, Hudson, Mass., assignor to Cambridge Rubber Co., Cambridge, Mass., a corporation of Massachusetts
Original No. 2,075,432, dated March 30, 1937, Serial No. 735,759, July 18, 1934. Application for reissue November 2, 1937, Serial No. 172,410
6 Claims. (Cl. 36—30)

4. A shoe comprising an upper, an outsole, an insole including a highly porous body layer of sisal fibers loosely matted together but secured to each other at their intersections by an adhesive binder, and means securing said outsole and said insole together.

PLANT PATENTS

GRANTED DECEMBER 28, 1937

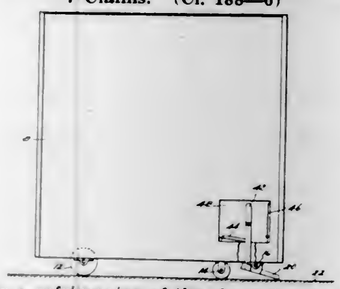
Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.



265
BEGONIA
Rocco Zeparo, Arlington, Mass.
Application October 31, 1935, Serial No. 47,707
Renewed July 23, 1937
1 Claim. (Cl. 47—59)

The begonia plant of parentage *semperflorens streigau* × sport of Winter Romance, substantially as herein shown and described, characterized in that it bears an unusually large flower of deep salmon color, blooms for six months, is resistant to plant disease and not subject to damping-off, and puts out, when cultivated in hothouses, new folliage and flowers in two months after cutting back.

PATENTS

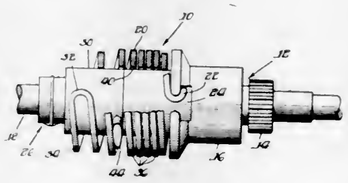


GRANTED DECEMBER 28, 1937

2,103,230
MICROSCOPE ILLUMINATOR
James R. Benford, Rochester, and Leon V. Foster, Irondequoit, N. Y., assignors to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York
Application June 30, 1937, Serial No. 151,200
3 Claims. (Cl. 88—40)

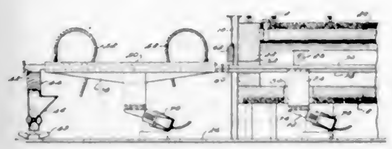
1. An illuminator for attachment to the body tube of a microscope, said illuminator comprising a casing having means for attaching it to said body tube, a second casing secured at the lower end of the first casing, a light condensing element having a central aperture secured in said second casing, an objective mounted in said aperture in alignment with said body tube, a housing rotatably mounted in said first casing above said second casing, an inclined annular reflector mounted in said housing in alignment with said condensing element, a semi-reflecting element mounted in said housing in alignment with said objective at an inclination opposite to that of said annular reflector, said casing having an opening in one side thereof to admit light to said housing and means for rotating said housing to present selectively said annular reflector or said semi-reflecting element to the opening in said casing.

2,103,231
TRANSPORTABLE ANCHORABLE REFRIGERATOR
Henry W. Blake, Kansas City, Mo., assignor to William F. Kirk, Kansas City, Mo.
Application May 8, 1936, Serial No. 78,726
7 Claims. (Cl. 188—6)



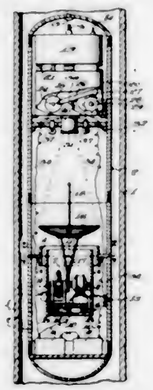
1. In a refrigerator of the character described, a case having a cavity formed in one side thereof; a plurality of rollers on the case for rendering the same mobile; anchoring elements movable to and from a position in engagement with the supporting surface; and operating mechanism for so moving the anchoring elements, said anchoring elements having yieldable means for urging the same against the said supporting surface when the operating mechanism has moved the said elements to the position in engagement with the said supporting surface, said anchoring elements being attached to the operating mechanism by means permitting limited movement of the elements independently of the said operating mechanism.

2,103,232
LEATHER AND PROCESS FOR THE MANUFACTURE THEREOF
Hugo Böhm, Munich, Germany
No Drawing. Application January 23, 1937, Serial No. 121,981. In Germany December 5, 1935
5 Claims. (Cl. 149—1)



1. In a process of producing smooth surface leather from stomachs or paunches of ruminants which includes tanning the leather, the operation of removing tufts and irregularities which comprises treating with slaked lime, stretching and drying the material without degreasing, and abrading to remove tufts and irregularities.

2,103,233
ENGINE STARTER
James A. Charter, Chicago, Ill., assignor to Charter Drive, Inc., Chicago, Ill., a corporation of Illinois
Application December 31, 1936, Serial No. 118,535
11 Claims. (Cl. 74—9)



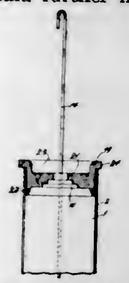
1. An engine starter of the type in which a pinion and a spring coupled therewith move together as a unit, said spring including a double coil of spring wire forming a series of convolutions, a portion of the convolutions at least being spaced to provide a helical way, means traversing said helical way toward one extremity of said coiled spring, providing an abutment surface adapted to be engaged for driving purposes, coupling means provided at the free extremity of each strand at the opposite end of said coiled spring for coupling with said pinion, and a drive shaft unit centrally of the spring, the convolutions being normally spaced therefrom, a portion at least of said convolutions being bent inwardly to contact said drive unit whereby to position said spring with respect to the drive unit.

2,103,234
FURNACE STRUCTURE
Julius A. Clauss, Detroit, and Donald E. McGuire, Wyandotte, Mich.
Application December 24, 1934, Serial No. 759,022
6 Claims. (Cl. 263—21)

1. In combination, a furnace, a closed section substantially gas tight retort projecting through said furnace and extending beyond opposite ends thereof in generally spaced relation with respect to the interior walls of said furnace, means for feeding material to said retort including a flexible connection therewith, means for discharging material from said retort including a flexible connection therewith, a plurality of electric vibrating units positioned exteriorly of said furnace in spaced relation to each other longitudinally of said retort, means projecting through a wall of said furnace connecting said units and said retort whereby to bodily vibrate said retort to effect a movement of material therethrough, and a common control means for all of said units whereby to cause them to vibrate in synchronism with each other.

2,103,235
INSTRUMENT FOR DETERMINING THE DEVIATION OF BORE HOLES
Joshua C. Conrad, Oklahoma City, Okla.
Application August 17, 1936, Serial No. 96,448
6 Claims. (Cl. 33—205.5)

1. An instrument for photographically indicating the deviation of bore holes from the vertical including means arranged to maintain a given orientation and carrying a calibrated element said element comprising a concave having a centrally disposed and upwardly extending pin, illuminating means, photographic means normally following the angle of said bore hole for recording on a moving film the angular positions of said pin with respect to said concave, whereby to determine the angular relationship between said bore hole and said first means.

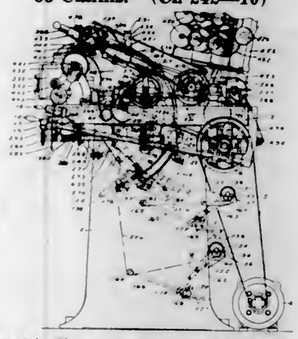


2,103,236
SUCKER ROD STABILIZER
Chester L. Coshow, Oklahoma City, Okla., assignor of thirty-five percent to Lucille A. Huguley and thirty-five percent to John E. Lucas, both of Oklahoma City, Okla.
Application January 6, 1937, Serial No. 119,284
1 Claim. (Cl. 255—27)

In a device of the class described, in combination with a sucker rod, a cylinder, a plug for closing the lower end of said cylinder having a downward extension with a box for connecting with a sucker rod, a stuffing box closure for the upper end of said cylinder having slots on its lower face, a gland member for said stuffing box having an upward extension provided with fishing rings, a piston rod for reciprocating through said stuffing box, a pin formed on the upper end of said piston rod for connecting with a sucker rod, a piston secured to the lower end of said piston rod for reciprocation within the said cylinder, lugs formed on the upper face of said piston for registering in said slots of said stuffing box for locking said piston rod and piston against turning with reference to said cylinder, said piston having longitudinal ports formed therein for the passage of fluid therethrough, ball checks for said ports, perforated plugs for said balls, one of said ports being larger than the other, having the ball check and perforated plug at the top to allow the fluid within said cylinder to flow upward through said larger port and the other and smaller of said ports having the ball check and perforated plug at the bottom of said cylinder to allow the fluid to flow downward through said smaller of said ports.

2,103,237
METHOD FOR MAKING SANCTUARY CANDLES
Danvers O. C. Deckert, St. Louis, Mo.
Application December 18, 1936, Serial No. 116,475
1 Claim. (Cl. 18—58)

The method of making a candle having a permanent casing comprising, flowing molten material into the casing, allowing said material to harden against the walls of the casing, leaving through shrinkage a central cavity at the top thereof, placing a mold piece within the top of the casing, flowing further molten material into the cavity and against the underside of said mold piece, allowing said further material to harden

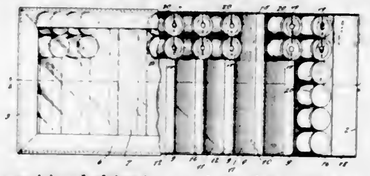


in contact with the underside of the mold piece to form a mound, and removing the mold piece.

2,103,238
SYNTHETIC RESIN MANUFACTURE
Herbert O. Albrecht, Ronald A. McGlone, and Stephen John Roskosky, Flint, Mich., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application July 13, 1934, Serial No. 735,049
11 Claims. (Cl. 260—8)

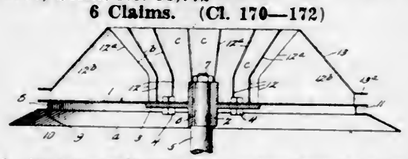
1. A process for making resins of low acid number which comprises heating to resinification a reaction mixture of phthalic anhydride and glycerol in the presence of a copper compound in solution in the reaction mixture, said compound containing not less than 0.002% copper based upon the weight of the reacting ingredients, and thereby producing a resin having an acid number at least 50% less than a resin similarly made in the absence of said copper compound.

2,103,239
WINDING MACHINE
James C. Anderson, deceased, late of Elmhurst, N. Y., by Annie G. Anderson, executrix, Elmhurst, N. Y., assignor, by mesne assignments, to Alcet Electro Products Corporation, New York, N. Y., a corporation of Delaware
Application April 7, 1926, Serial No. 100,319
Renewed July 29, 1936
33 Claims. (Cl. 242—10)



1. In a winding machine, a winding spindle, means for winding sheet material on said spindle, a plurality of independently revoluble holders for sheet material, selective means operable to place the material on any of said holders in operative position independently of unselected material of the other holders, and means to supply strand material to the sheet material being wound.

2,103,240
NONSPECIFIC SPERMATOXIC VACCINE AND PROCESS OF PRODUCING SAME
Morris J. Baskin, Denver, Colo.
No Drawing. Application July 6, 1935, Serial No. 30,162
12 Claims. (Cl. 167—78)



1. A spermatoxic vaccine containing mammalian spermatozoa rendered non-specific by heat.

2,103,241
DISPLAY DEVICE
John Bell, Yonkers, N. Y., assignor to The Spool Cotton Company, New York, N. Y., a corporation of New Jersey
Application January 22, 1935, Serial No. 2,888
1 Claim. (Cl. 206—44)

A combined shipping and display package comprising a box having a flat bottom and a removable cover parallel to each other when the cover is in place on the box, spools within the box and arranged in closely adjacent transverse rows, the longitudinal axes of said spools being parallel to each other and inclined to the perpendicular, a stepped support between said spools and bottom and comprising inclined seats engaging the bottoms of the spools and backs connecting the edges of adjacent seats, said seats and backs being disposed at right angles to each other and the lower edges of the seats and backs resting on said bottom of the box, the lowest and highest points of the spools lying respectively in parallel horizontal planes spaced apart a vertical distance substantially equal to that between the bottom and cover of the box, the spools in one row overlapping those in an adjacent row, the spools in each row being freely removable from the box in a direction parallel to their longitudinal axes without disturbing the spools in adjacent rows and each spool having its top end and part of its side visible when in the box, each end row being spaced a clear distance from the adjacent end of the box which is insufficient to accommodate another row of similarly arranged and inclined spools but which is sufficient to permit ready removal of the spools in said end row.

2,103,242
AIRCRAFT PROPELLER
William W. Bradford, Jr., Bel Air, Md., assignor to Howard R. Hyle, Catonsville, Md., Eldridge Hood Young, Baltimore, Md., and Stanley Turner Holmes, Harford County, Md.
Substitute for application Serial No. 556,909, August 13, 1931. This application August 31, 1936, Serial No. 98,772
6 Claims. (Cl. 170—172)

1. An air-craft propeller comprising a shaft, a disc secured centrally to the shaft, a circular

series of radially arranged members forming air channels on the forward side of the disc, said channels being open and relatively deep at their inner ends and converging to restricted outlets at the periphery of the disc, and a ring of sheet material connected to the rear side of the disc inwardly from the periphery of the disc and offset from the latter, said ring being concentric with the disc and projecting radially beyond the disc.

2,103,243

AIRCRAFT PROPELLER

William W. Bradford, Jr., Bel Air, Md., assignor to Howard R. Hyle, Catonsville, Md., Eldridge Hood Young, Baltimore, Md., and Stanley Turner Holmes, Harford County, Md.

Substitute for application Serial No. 605,741, April 16, 1932. This application September 21, 1936, Serial No. 101,833

17 Claims. (Cl. 170—172)

1. An air-craft propeller comprising a head adapted for connection to a propeller shaft and a plurality of wings spaced apart circumferentially of the head, each wing comprising an oblong base and top plates extending laterally from said head, the top plate being of less width than the base plate and extending over the forward part of the latter, and spaced partitions forming transverse air passageways between said plates, the discharge ends of said passageways being spaced from the base plate.

2,103,244

MATTRESS PROTECTOR

Frederick Y. Briscoe, Newton, Mass.

Application June 4, 1935, Serial No. 24,958

1 Claim. (Cl. 24—72.5)

A securing device comprising a bar having surface portions adapted to engage sheeting passing thereabout, a sleeve having a slit extending from end to end thereof and receiving the bar and a portion of the sheeting by inserting the bar endwise into one end of the sleeve with the sheeting extending outwardly of the sleeve by way of the slit, said bar having a diameter less than the diameter of said sleeve to provide a space between the sleeve and the bar filled by the sheeting passing about the bar to establish a frictional contact between the bar and the sleeve, and a loop secured to the bar and extending through the slit to lie partially outwardly of the sleeve.

2,103,245

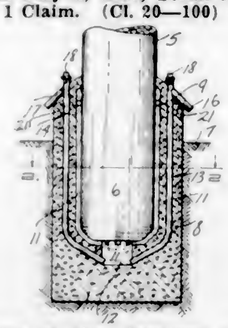
RUBBERIZED PRODUCT

Edward G. Budd, Philadelphia, Pa., assignor to Edward G. Budd Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Application December 21, 1933, Serial No. 703,407

6 Claims. (Cl. 117—53)

1. As a new article of manufacture, a rayon yarn for reinforcement in rubberized products, such as cord tires, heavy duty tires and the like, of from approximately 1000 to 4000 denier or more, comprised of a bundle of filaments of from approximately 1⅔ to approximately 2½ denier, the bundle being twisted into a single thread.



2,103,246

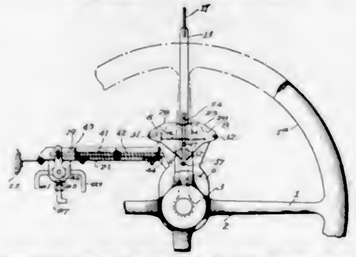
PROTECTIVE BASE FOR POLES

Henry P. Coustette, San Francisco, Calif.

Application July 2, 1936, Serial No. 88,628

1 Claim. (Cl. 20—100)

In a device of the character described, a molded base having a vertical bore extending thereinto, a sump communicating with said bore, pipes positioned in said molded base and having their lower extremities communicating with said sump and having their upper extremities exposed whereby moisture in said sump may be withdrawn therefrom.



2,103,247

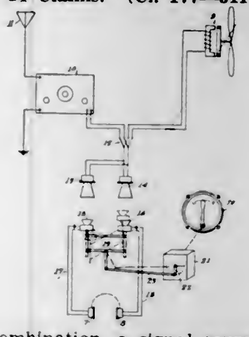
SIGNAL MEANS

Victor Cranford, San Fernando, Calif.

Application May 27, 1935, Serial No. 23,560

1 Claim. (Cl. 116—36)

In combination with a vehicle having a body portion and a portion movable relative to said body portion during a change in course of said vehicle, a signal indicator control device which comprises: lever means pivotally mounted for movement to positions to the right and left sides, respectively, of a central neutral position, said lever means being provided with operative association with a signal indicator to effect operation of said indicator to right-turn and left-turn indicating positions upon movement of said lever means to the respective right and left side positions; spring means biasing said lever means to said neutral position; a supporting structure mounted on said body portion and provided with two spaced detent means disposed respectively in positions corresponding to the aforesaid right and left side positions of said lever means; latch means carried by said lever means and adapted to engage said detent means to cause said lever means to persist in one of said right and left side positions upon manual movement thereof to said position; a release member pivotally mounted on said supporting structure adjacent each of said detent means and biased toward normal positions for engagement by said latch means upon movement of said lever means to the respective right and left side positions, said latch means being adapted to bear against the respective release members when moved into engagement with the respective detent means to move such release member about its pivot to a displaced position; an actuating member secured to said relatively movable vehicle portion and constrained to move through a fixed path during a change in course of said vehicle, each of said release members being provided with a portion positioned in said fixed path when in said displaced position and movable out of said fixed path about its respective pivot upon engagement thereof by said actuating member, the release member associated with the right-side detent means being adapted to draw away from said latch means upon engagement of said portion of said release member by said actuating member in one direction corresponding to a change in course of said vehicle to the right and to move to normal position and force said latch means from said detent means upon engagement of said portion by said actuating member in the other direction corresponding to a change of course of the vehicle to the left, and the release member associated with the left-side detent means being adapted to draw away from said latch means upon engagement of said portion by said actuating member in said other direction and to move to normal position and force said latch means from said detent means upon engagement of said portion by said actuating member in said one direction.



2,103,248

BINAURAL FLYING

Luis de Florez, New York, N. Y., assignor to National Aviation Research Corporation, New York, N. Y., a corporation of Delaware

Application March 7, 1935, Serial No. 10,195

14 Claims. (Cl. 177—311)

10. In combination, a signal source, speakers energized thereby, pickup devices movably related to said speakers, binaural receivers connected with said pickup devices and turn sensitive means for effecting the shifting of said pickup devices reversely toward and away from said speakers.

2,103,249

PRODUCTION OF REFRACTORIES

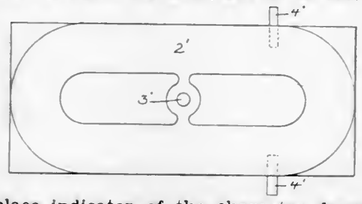
Howard P. Eells, Jr., Willoughby, Ohio, assignor to Basic Dolomite, Incorporated, Cleveland, Ohio, a corporation of Ohio

No Drawing. Application October 30, 1933, Serial No. 695,954

6 Claims. (Cl. 106—9)

1. A method of producing refractories, which comprises crushing a refractory base-material to desired size, applying to the particle-surfaces a water-resistant medium, and while the latter is tacky applying a comminuted flux ingredient without substantial agglomeration of the particles together.

2,103,250



PLACE INDICATOR

Robert M. Eichelsdoerfer, Governors Island, N. Y.

Application January 29, 1935, Serial No. 3,911

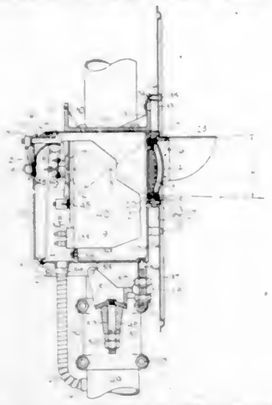
1 Claim. (Cl. 40—28)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

A place indicator of the character described comprising a base, a transparent holding sheet overlying the base and corresponding in miniature to the outline of the top of the table around which the guests are to be assembled, said holding sheet throughout its entire surface area presenting a continuously flat and uninterrupted surface to the underlying surface of the base whereby said holding sheet, throughout its surface area will have frictional contact with said base, fastening means securing said holding sheet to said base, said sheet when secured in position co-acting with the underlying surface of the base to form a single pocket coextensive with the edge of said base, and a series of markers, each marker being adapted to bear the name of a guest, said markers being seated within the pocket and shiftable therein to positions commensurate with the rank and social standing of the guests, the markers being frictionally secured to the adjacent surfaces of the transparent holding sheet and the base with their extremities extending beyond the edge of said sheet whereby said markers may be conveniently grasped for removal and for shifting within the pocket, and the name of the guest on the marker readily discerned through the transparent holding sheet in any position to which said marker may have been shifted.

2,103,251

LIGHT SIGNAL



Oscar S. Field, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.

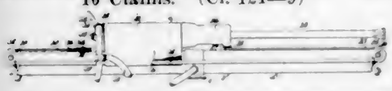
Original application August 10, 1926, Serial No. 128,437. Divided and this application September 8, 1931, Serial No. 561,802

7 Claims. (Cl. 177—329)

1. In a light signal, a housing adapted to carry

a lens in the front thereof, a lens in said housing, lugs in said housing having holes formed therein, a mechanism casing containing mechanism adapted to control rays of light passing to said lens, a source of light for said lens carried by said mechanism casing, dowel pins on said

mechanism casing adapted to fit the holes in said lugs, and locking means for said mechanism casing, comprising a bar having ears adapted to engage said housing and spring pressed studs adapted to hold the mechanism casing and source of light in accurate relationship to said lens.



2,103,252

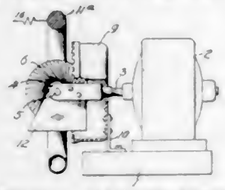
ROCK DRILL

Elmer G. Gartin, Claremont, N. H., assignor to Sullivan Machinery Company, a corporation of Massachusetts

Application March 6, 1934, Serial No. 714,317

10 Claims. (Cl. 121—9)

1. In a rock drill, a feeding mechanism comprising a pneumatic feeding device comprising a plurality of feed motor parts held in assembled relation by parallel longitudinally extending tie rods and embodying a power feeding element, and a drilling unit mounted on said feeding mechanism and having guide elements slidably engaging said tie rods, said tie rods constituting the sole support for the drilling unit whereby the latter is supported and guided wholly independently of said power feeding element.



2,103,253

SOLID WEAVE SCANNING DEVICE

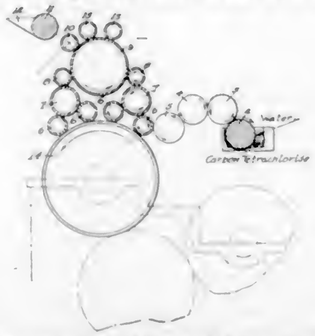
Delamere B. Gardner, Los Angeles, Calif.

Application October 2, 1936, Serial No. 103,688

6 Claims. (Cl. 178—7.3)

1. In combination, a mirror, means for rotating said mirror and simultaneously rotating its axis of rotation to produce a mirror screen on which a projected image may be viewed, means encompassing the mirror for illuminating said screen, and means blocking the flow of light to the screen from one side of said illuminating means.

2,103,254



DUAL DAMPENING AND INKING MECHANISM FOR PLANOGRAPHIC AND ANALOGOUS PRESSES

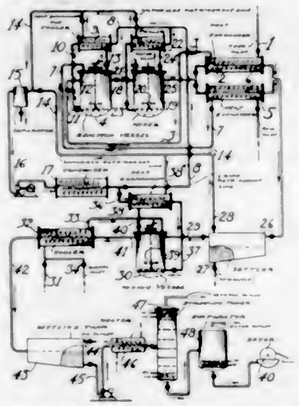
John G. Goedike, San Antonio, Tex.

Application February 1, 1937, Serial No. 123,458

8 Claims. (Cl. 101—148)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. The method of inking and dampening printing surfaces of planographic and analogous printing members, which consists in transmitting water from a source of supply to an inking mechanism, transmitting the water together with a film of ink to said printing member through said ink distributing system, whereby an ink repelling coating of water will be applied to the non-design portions of a printing surface and ink will be applied to the design portions of said surface.



2,103,255

IMPROVED PROCESS FOR PREPARATION OF SULPHURIC DERIVATIVES

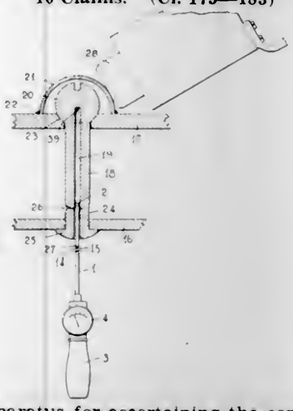
Edwin J. Gohr, Elizabeth, N. J., assignor to Standard Oil Development Company, a corporation of Delaware

Application November 9, 1934, Serial No. 752,283

12 Claims. (Cl. 260—99.12)

1. In the preparation of organic derivatives of sulphuric acid by treatment of an olefine with excess strong sulphuric acid at a low temperature

and the subsequent reduction in the strength of the excess sulphuric acid sufficient to prevent further action of said excess acid in said reaction mixture by means involving liberation of heat, an improved method of operation comprising conducting both of said steps in the presence of an added liquid refrigerant sufficient in quantity to remove the heat evolved in both the acid reaction and the acid strength reducing step which removes heat from the reaction mixture by vaporization.



2,103,256

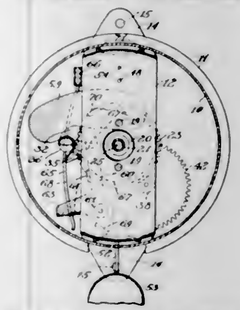
METHOD OF AND MEANS FOR TESTING STAYBOLTS

Grover R. Greenslade, Scott Township, Allegheny County, Pa., assignor to Pittsburgh Dry Stencil Company, a corporation of Pennsylvania

Application September 4, 1934, Serial No. 742,656

10 Claims. (Cl. 175—183)

1. Apparatus for ascertaining the condition of a telltale staybolt temporarily energized by substantially longitudinal alternating magnetic flux, the said apparatus including a testing implement provided with an attenuated portion movable within the telltale hole of the bolt for determining the condition of the bolt by magnetic exploration of the telltale hole thereof.



2,103,257

TIMING DEVICE

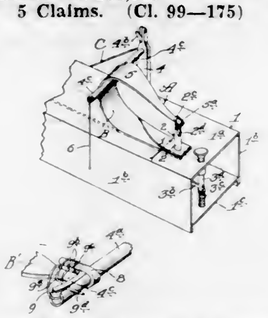
Herbert Hastings, Brighton, N. Y.

Application February 20, 1935, Serial No. 7,426

10 Claims. (Cl. 161—23)

1. In a timing device, the combination of a casing, timing mechanism within the casing, means for setting the timing mechanism for operation for a predetermined period, a movable element within the casing for striking the latter to sound a signal, said element having spaced operating and holding parts thereon, and spring means engaging said operating part for moving said element from a predetermined position to striking position and engaging said holding part to cushion said element when rebounding upon completion of each striking operation, said timing mechanism operating when being set to move said element to said predetermined position at which it will be held through engagement of the spring means with said operating part during operation of the timing mechanism, said timing mechanism when completing its period of operation effecting movement of said element from said predetermined position to free it for movement by the spring means to striking position.

4. In a timing device, the combination of a casing, a supporting bracket for the casing disposed therein and having rearwardly extending upper and lower arms within the casing, said lower arm having an opening therein, a supporting member extending between said arms and connected therewith, timing mechanism supported by the bracket within the casing including an actuating member, escapement mechanism disposed on said supporting member, means operatively connecting the actuating member with the escapement mechanism, a pendulum for controlling the operations of the escapement mechanism, said pendulum depending from the supporting member and extending through the opening in said lower arm, and means for setting the timing mechanism and for indicating the extent of its operation.



2,103,258

SAUSAGE CASING AND METHOD OF EFFECTING CLOSURE THEREOF

Henry A. Hensel, Milwaukee, Wis., assignor to The Visking Corporation, Chicago, Ill., a corporation of Virginia

Original application May 23, 1936, Serial No. 81,431. Divided and this application October 7, 1936, Serial No. 104,505

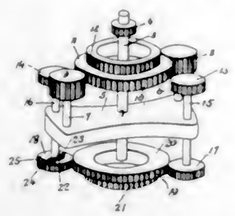
5 Claims. (Cl. 99—175)

2. A sausage casing having a portion thereof passed through the material of another portion thereof to form a knot, and a cord wrapped around said casing adjacent said knot and passed through said knot whereby tension on said cord tightens the grip of said cord on said casing.

2,103,259

EPICYCLIC GEAR TRAIN

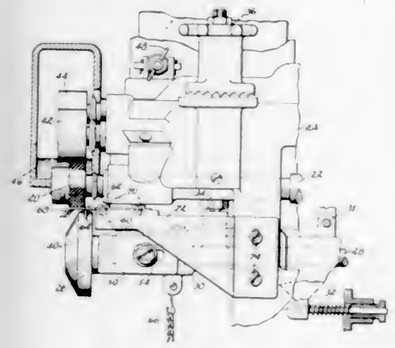
Henry C. Hitt, Bremerton, Wash.



Application January 15, 1936, Serial No. 59,229

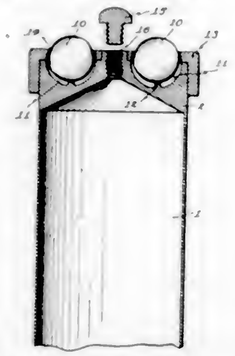
5 Claims. (Cl. 74—282)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



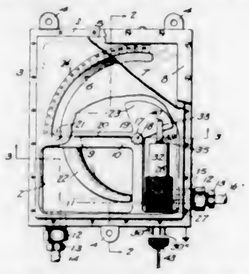
1. An epicyclic gear train, comprising an input shaft, an arm member fixed thereto to ro-

tate therewith having portions extending radially outwardly in opposite directions therefrom, a planet gear rotatably mounted on said member adjacent each end thereof, both said planet gears being on the same side of said member, a member rotatably mounted on said shaft having a gear for outside connections and a gear meshed with said planet gears, a gear on the one face of one end of said arm member having a shaft extending through said arm member, a gear rotatable on the other end of said gear shaft, a resilient element substantially in the form of an



annulus around the hub of the last mentioned gear having one end fixed to said last mentioned gear and the other end fixed to said gear shaft, said element being under stress tending to rotate in opposite directions the gear and the shaft on which it is mounted, a shaft extending through the other end of said arm member, a gear fixed on each end of the last mentioned shaft with one thereof meshed with a planet gear, and a member rotatable on the input shaft having a gear for outside connection and a gear meshed with one gear on each of the shafts through the ends of said arm member.

2,103,260
WELT-TREATING MACHINE
Charles E. Hood, Lynn, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application April 18, 1936, Serial No. 75,061
13 Claims. (Cl. 12—80)

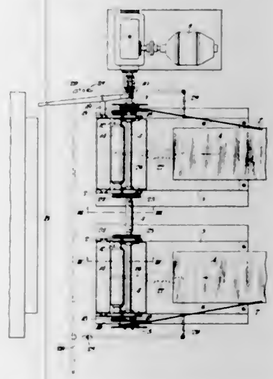


1. In a machine for operating on work having stitched-together parts such as a shoe upper and a welt stitched thereto prior to the lasting of the shoe, coacting rolls for engagement with opposite faces of one of the stitched-together parts thereby to feed the work progressively through the machine, and means associated with one of said rolls for engagement with the other part of said stitched-together work, said means having a work-engaging surface which forms an obtuse angle with the work-engaging portion of the peripheral face of the adjacent roll.

2,103,261
APPLICATOR
Stewart W. Hughes, Evanston, Ill.
Application September 16, 1935, Serial No. 40,760
8 Claims. (Cl. 128—65)

1. A toilet article comprising a container having a feed aperture at one end, a housing means surrounding said feed aperture, and massage rollers mounted on said housing means and surrounding said feed aperture whereby said rollers will rotate freely in any direction.

2,103,262
FLOWMETER
Hugh J. Knerr, Osborn, Ohio
Application January 15, 1935, Serial No. 1,905
2 Claims. (Cl. 73—210)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

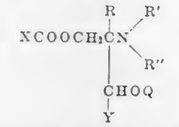


2. In a flowmeter, a housing having a receiving cavity and a discharge cavity, a dividing wall between said cavities having an orifice of predetermined flow characteristics, metering means comprising an arm having its base pivotally secured to said dividing wall and including an arcuate tapered pin depending from the free end thereof and a weight overhanging the pivoted end thereof to partially counterbalance said tapered pin and arm about their pivoted support, said metering means being controlled by the flow of fluid from said receiving cavity through said orifice, a cover plate for sealing said cavities and metering means, and means responsive to movement of said metering pin for indicating rate of fluid flow through said orifice.

2,103,263
DIAL FOR WATCHES AND OTHER INSTRUMENTS
Alvin Lodge, Lancaster, Pa., assignor to Hamilton Watch Company, Lancaster, Pa., a corporation of Pennsylvania
Application May 15, 1935, Serial No. 21,622
4 Claims. (Cl. 58—127)

4. As a new article of manufacture, a dial for watches comprising a metal dial plate having varying thickness in the different portions of its area suitable for dials and one surface of which provides the dial face, feet projecting from the opposite surface of the said plate and from the thinner portions thereof to be received in the usual openings in the pillar plate of a watch and being texturally homogeneous with the dial plate, the portions of the dial plate from which the feet project being solid in every direction around each foot and of greater diameter than said portions of the dial plate from which they project, and the dial face being smooth and free of indentations therefrom.

2,103,264
FEED DEVICE
Edwin T. Lorig, Gary, Ind., assignor to American Sheet and Tin Plate Company, a corporation of New Jersey
Application October 9, 1933, Serial No. 692,897
Renewed October 1, 1937
3 Claims. (Cl. 271—2.3)



1. A strip-feeding device comprising a rotatable roll, a pivoted frame movable toward and away from said roll, a rotatable roll carried by said pivoted frame, said second named roll being constructed and arranged for movement into adjacent parallelism with respect to said first named roll, a shaft rotatably mounted on said frame, a driving connection between said shaft and said first named roll, an independent driving connection between said shaft and said second named roll, and means for driving one of said rolls.

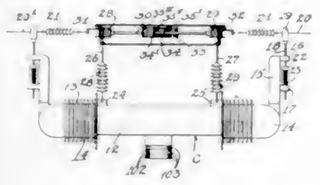
2,103,265
ACRYLIC ACID DERIVATIVES
William A. Lott, Newark, N. J., assignor to E. R. Squibb & Sons, New York, N. Y., a corporation of New York
No Drawing. Application September 12, 1933, Serial No. 689,158
13 Claims. (Cl. 260—103)

1. Compounds selected from the group having the general formulas Y,Z-amino-alkyl α-R′ β-R acrylate and Y,Z-amino-alkyl α-R′ β-R acrylamid wherein R represents one of the radicals alkyl, aryl, and halogen-, alkoxy-, alkylene-dioxy-, and dialkylamino-aryl, R′ represents one of the radicals alkyl and aryl, and Y and Z represent radicals of the class consisting of alkyls and aralkyls; and the inorganic salts thereof.

2,103,266
ACYLATED DIOLS
William A. Lott, Newark, N. J., assignor to E. R. Squibb & Sons, New York, N. Y., a corporation of New York
No Drawing. Application October 7, 1933, Serial No. 692,622
7 Claims. (Cl. 260—103)

1. Compounds of the group having the general formula

wherein X represents one of the radicals phenyl, alkoxy-phenyl, β-phenyl-vinyl, α-alkyl-β-phenyl-vinyl, α-alkyl β-dialkoxy-phenyl-vinyl, phenyl-amino, and alkoxy-phenyl-amino; R represents one of the class consisting of hydrogen and alkyl; R′ and R″ represent one of the possibilities (*a*) R′ is one of the class consisting of hydrogen, alkyl, and aralkyl and R″ is one of the class consisting of hydrogen, alkyl, and aralkyl, and (*b*) R′ and R″ jointly are alkylene; Q represents one of the class consisting of hydrogen and alkyl; Y represents one of the radicals benzene aryl and dialkoxy- and alkylenedioxy-benzene aryl.



2,103,267
ALLOY FOR VACUUM TUBE ELEMENTS
Ambrose J. Mandell, Westfield, N. J.; Edward Mandel, administrator of said Ambrose J. Mandell, deceased, assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware
No Drawing. Application November 20, 1926, Serial No. 149,801. Renewed September 3, 1936
21 Claims. (Cl. 250—27.5)

1. An electrically conductive core for a thermionically active cathode comprising an alloy of nickel and silicon.

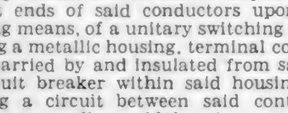
2,103,268
CIRCUIT BREAKER OPERATING MEANS
George A. Matthews, Detroit, Mich., assignor to The Detroit Edison Company, Detroit, Mich., a corporation of New York
Application October 22, 1934, Serial No. 749,401
10 Claims. (Cl. 175—375)

8. Operating means for a circuit breaker having a pair of contacts movable into and out of engagement to open and close an electrical cir-

cuit, means operative in one direction to close the contacts and in another direction to open the contacts under normal conditions in said circuit, a spring under compression during normal closing of the breaker, and means energizable to release said spring to open the contacts under abnormal conditions in said circuit, said first means being operative, when moved in a direction to normally open the contacts, to compress said spring after it has functioned to open the contacts under abnormal conditions.

10. In a power transmission system, the combination with an overhead transmission line including a pair of dead-ended conductors, supporting means, and insulators suspending the adjacent ends of said conductors upon said supporting means, of a unitary switching device comprising a metallic housing, terminal contact members carried by and insulated from said housing, a circuit breaker within said housing for completing a circuit between said contact means, means suspending said housing upon said supporting means, said suspending means including insulators at said housing and cables extending from said insulators to the supporting means, and means operable from the ground for actuating said cables to raise said housing to engage said contact members with said conductors and to lower said housing to separate said contact members from said conductors.

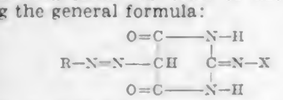
2,103,269



AZO COMPOUNDS AND PROCESS FOR DYEING THEREWITH

James G. McNally and Joseph B. Dickey, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application January 14, 1937, Serial No. 120,556



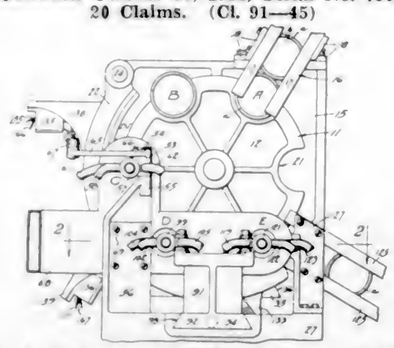
20 Claims. (Cl. 8—5)

3. An azo compound having the general formula:

wherein X represents hydrogen or an alkyl group and R represents an aromatic nucleus.

9. A process of coloring an organic derivative of cellulose which comprises applying thereto a dye selected from the class of azo compounds having the general formula:

wherein X represents hydrogen or an alkyl group and R represents a nuclear non-sulfonated aromatic nucleus.



2,103,270

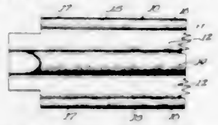
CAN SPRAYING MACHINE

John H. Murch, East Orange, N. J., assignor to American Can Company, New York, N. Y., a corporation of New Jersey

Application October 30, 1934, Serial No. 750,721

20 Claims. (Cl. 91—45)

1. A spraying machine for coating cans with a liquid coating material comprising in combination, means for carrying open-end cans intermittently and successively through a plurality of spraying stations, means for rotating individual cans while at said stations, an oscillating spraying device at one of said stations for coating the interior surface of the bottom of a said rotating can through its open end, means for changing the angle of said spraying device relative to the bottom of said can, a plurality of reciprocating spraying devices at the other of said stations for successively applying a plurality of coats of said coating material to the interior side wall of said cans, and means for moving said reciprocating spraying devices into and out of said cans through their open ends.



2,103,271

VENETIAN BLIND SLAT AND METHOD OF MAKING

Raymond C. Pratt, Chicago, Ill., assignor to H. B. Dodge and Company, Chicago, Ill., a corporation of Illinois

Original application July 21, 1932, Serial No. 623,802. Divided and this application May 10, 1934, Serial No. 724,935

14 Claims. (Cl. 156—17)

14. A metal slat for Venetian blinds having a flattened tubular cross-section with rounded lateral edges.

2,103,272

PROCESS FOR THE PRODUCTION OF β-METHYLCHOLINE ETHERS AND SALTS THEREOF

Georg Roeder, Rahway, N. J., assignor to Merck & Co. Inc., Rahway, N. J., a corporation of New Jersey

No Drawing. Application January 30, 1937, Serial No. 123,151

3 Claims. (Cl. 260—25)

1. A process for the production of salts of methylcholine ethers which comprises reacting an alkali metal salt of 1-dimethylamino-2-hydroxypropane with an alkylating agent to form the corresponding 1-dimethylamino-2-alkoxy propane, and then reacting upon this ether with an alkylating agent of the group consisting of alkyl halides and sulfate, to form the corresponding alkyl salt of dimethyl-amino-2-alkoxy-propane.

2,103,273

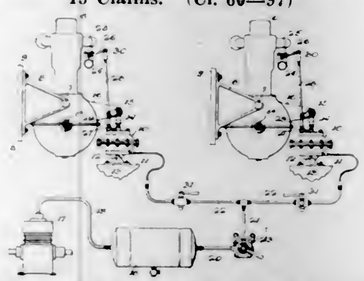
POLYHYDRIC ALCOHOL-POLYBASIC ALIPHATIC ACID RESIN

Israel Rosenblum, Jackson Heights, N. Y.

No Drawing. Application January 26, 1934, Serial No. 708,477

16 Claims. (Cl. 260—8)

1. The method of producing homogeneous, fusible, oil-soluble resins, which comprises reacting substantially simultaneously approximately 1 mol. of glycerol, ½ mol. of maleic acid, ½ to 1½ mols of a saturated monobasic aliphatic acid of one to five carbon atoms, and ½ to 1 mol. of the acids obtained by hydrolysis from a fatty oil or fat.



2,103,274

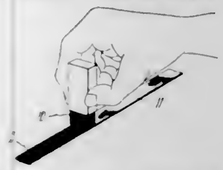
CONTROL MECHANISM

Roy S. Sanford, New York, N. Y., assignor to Bendix-Westinghouse Automotive Air Brake Company, Pittsburgh, Pa., a corporation of Delaware

Application December 29, 1936, Serial No. 118,173

15 Claims. (Cl. 60—97)

1. A control system for an engine comprising pivotal mounting means therefor, control means for said engine, power means for rotating the engine about said pivotal mounting means, control means for said power means, and means responsive to relative movement of said engine and mounting means to vary the action of said second named means.



2,103,275

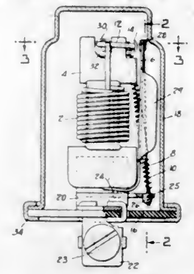
TYPEWRITER RIBBON AND INK COMPOSITION THEREFOR

George W. Schaefer, Quincy, Mass.

Application November 22, 1934, Serial No. 754,312

8 Claims. (Cl. 197—172)

6. A typewriter ribbon consisting of a thin, closely woven, highly flexible fabric base having one face thereof coated with a transferable writing medium made up largely of pigment particles and an oil lubricant therefor, said oil being present in such medium in small proportion relative to said pigment particles and in amount sufficient only to lubricate said particles and to provide an adherent coating penetrating into said ribbon less than the full thickness thereof, whereby a transfer or writing face is provided on only one face of said ribbon.



2,103,276

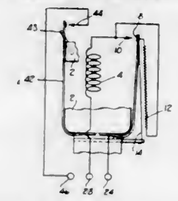
FLASHER DEVICE

Joseph Schmidinger, Long Island City, N. Y.

Application March 3, 1936, Serial No. 66,814

9 Claims. (Cl. 200—88)

3. A device of the class described, the combination comprising an electromagnet including a core and a coil, wound thereupon, an armature secured at one end to said core, a contact carried by said armature remote from the fixed end thereof, a pair of terminals one electrically connected to said core and the other to one end of said coil, a fixed contact electrically connected to the other end of said coil and positioned to be engaged by said armature carried contact, an expansible resistance wire electrically connected across said contacts, said wire having one end secured to the movable end of said armature, and insulated anchoring means for maintaining said wire under tension, whereby said wire, upon contraction, moves said armature out of contact closing position.



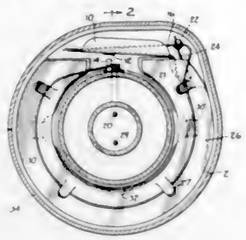
2,103,277

FLASHER DEVICE

Joseph Schmidinger, Long Island City, N. Y.

Application March 25, 1936, Serial No. 70,761

6 Claims. (Cl. 175—373)



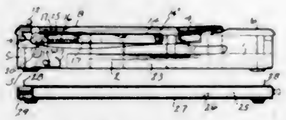
1. In a device of the character described, the combination comprising a core having two armatures each secured at one end thereto, one of said armatures being biased toward attracted position and the other being biased to retracted position, an expansible wire secured to said first mentioned armature and mechanically preventing, when cold, movement of the armature to attracted position, an energizing coil for said core, an electrical resistance connected in series with said coil and positioned to heat said wire by radiation, and

means including a pair of contacts for shunting said resistance when said first mentioned armature is in attracted position whereby, when a potential difference is applied across said coil and resistance, movement of said first mentioned armature to attracted position shunts said resistance and thereby increases the current through said coil sufficiently to move said second mentioned armature to attracted position.

2,103,278

COMBINED INCANDESCENT LAMP AND FLASHER DEVICE AND METHOD OF MANUFACTURE THEREOF

Joseph Schmidinger, New York, N. Y.
Application April 14, 1936, Serial No. 74,249
Renewed June 25, 1937
7 Claims. (Cl. 176—14)

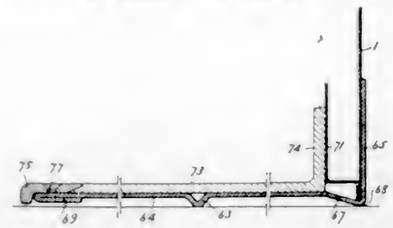


1. A combined incandescent lamp and flasher device comprising in combination a lamp, having a filament and a base, an annular container mounted on said base, a permanent magnet within the container, an armature having one end secured to said magnet, an expansible wire having one end secured to the movable end of said armature, a contact carried by said armature, a fixed contact electrically connected to one end of said filament and positioned to be engaged by said first mentioned contact when the armature is in attracted position, an expansible resistance wire having one end secured to the movable end of said armature and its other end electrically connected with said fixed contact, and insulated anchoring means for applying a tension to a portion of said wire whereby said wire when cold mechanically prevents movement of the armature to contact closing position.

2,103,279

PORTABLE REGISTER

John Q. Sherman, Dayton, Ohio
Application August 27, 1934, Serial No. 741,580
19 Claims. (Cl. 282—3)

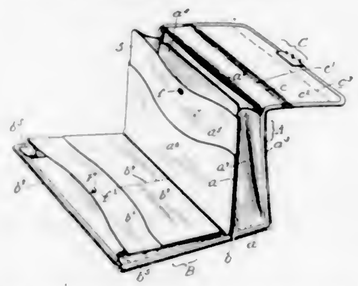


1. In a manifolding register for a packet of superposed record strips reversely folded at spaced intervals into zigzag formation and divisible on transverse weakening lines at spaced intervals into succeeding sections, a container for the packet, said container having a packet compartment therein and being of greater length than the packet compartment, a fixed partial cover for the container, the packet receiving compartment being located in a portion of the container where it is overhung by said fixed partial cover, a swinging cover portion for the container forming a writing tablet for withdrawn portions of the strips, there being an exit slot intermediate the swinging and fixed cover portions, and the writing tablet being longitudinally offset relative to the packet compartment, and means for anchoring transfer sheets interiorly of the container for extension through said slot and thence over the writing tablet in interleaved relation with the withdrawn portion of the strips.

2,103,280

TELEPHONE BOOTH

Percival H. Sherron, Jamaica, N. Y.
Application January 13, 1937, Serial No. 120,323
6 Claims. (Cl. 189—2)

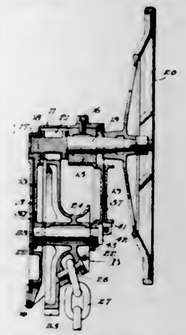


1. A telephone booth comprising a metal shell and a one-piece metal floor having a plurality of ribs formed intermediate its edges and extending beneath the adjacent floor level, a downwardly dished portion extending completely around its periphery except on one side, and a flange extending upwardly from the outer edge of said dished portion, said flange being secured to the lower edge of said metal shell to attach the floor thereto.

2,103,281

TRAVELING CASE

Leopold G. Stanley, Maplewood, N. J.
Application May 21, 1936, Serial No. 80,925
7 Claims. (Cl. 150—1.6)



1. A traveling case of the briefcase type, oblong in form, composed of leather or like material and generally flexible, the same having rear and front walls with top-opening receiving space between them, and collapsible end gussets and a cover flap constituting a flexible extension of the rear wall and adapted to fold over the front to close the case, with a fastening means therefor, and a handle on the exterior side of the flap; and characterized by the following features combined

therewith, namely that the bottom of the case is flat, non-collapsible and stiffened so that the case may stand steadily upright upon a support, and that connected with the main section of the case, having its rear and front walls upstanding, is a supplemental swingable front section having an interior receiving space or pockets, said swingable section being connected with the main section only by a hinge between the swingable section and the front edge of the stiff bottom wall of the case; whereby the swingable section may be closed up vertically against the main section and confined by the cover flap when fastened or may be released to drop flat while the main section remains upright, thus fully exposing both sections to access.

2,103,282

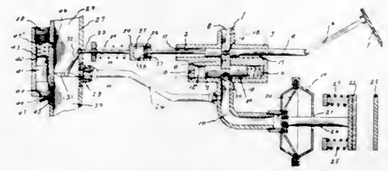
OPERATING DEVICE FOR HAND BRAKES AND THE LIKE

Frederick John Stolpe, Chicago, Ill., assignor, by mesne assignments, to Augustus F. Klasing
Application April 1, 1936, Serial No. 72,158
7 Claims. (Cl. 74—505)

1. An operating device for hand brakes and the like, the same comprising a casing to be mounted on a support, and a pulling mechanism including a shaft hanger supporting and carrying the operating parts thereof, said hanger being telescopically insertable in and removable from said casing, and means whereby said hanger is supported by said casing when operatively disposed therein.

2,103,283

CONCENTRATION OF PHOSPHATE-BEARING MINERALS



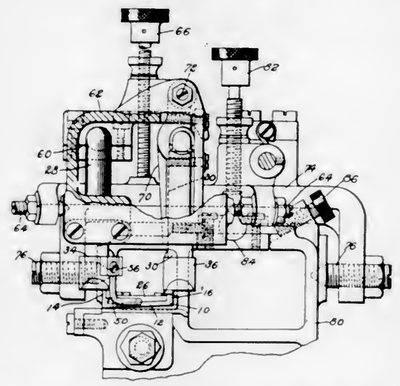
Francis X. Tartaron and James B. Duke, Mulberry, Fla., assignors to Phosphate Recovery Corporation, New York, N. Y., a corporation of Delaware
No Drawing. Application February 4, 1937, Serial No. 124,040
40 Claims. (Cl. 209—49)

1. The process of concentrating phosphate-bearing minerals which consists in agitating a pulp of the ore containing the phosphate-bearing mineral first with crude quinoline and thereafter with an activating agent causing the crude quinoline to have a preferential affinity for the silicious gangue, said activating agent being an inorganic salt capable of reacting acid in solution with water, separating from the pulp a material relatively rich in silicious gangue and relatively poor in phosphate values, and collecting the remaining material as the concentrate.

2,103,284

AUTOMATIC CONTROL OF CLUTCH AND THROTTLE ACTUATION OF AN AUTOMOTIVE VEHICLE

Ralph S. Whittington, Oak Park, Ill., assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application July 15, 1932, Serial No. 622,703
11 Claims. (Cl. 192—.01)



1. In a system of the class described, the combination with the intake system, the carburetor and a mechanism for controlling the acceleration of the motor, of a pressure responsive means for releasing the clutch, means providing a passage between said pressure responsive means and said intake system, means operative, when the aforementioned mechanism is released, to open said passage whereby vacuum from said intake system actuates said pressure responsive means to release the clutch, means operating upon the actuation of said aforementioned mechanism to reduce the vacuum acting on said pressure responsive means whereby the clutch is moved toward engaged position, and means responsive to pressure changes accompanying the operation of said system, and being operative at a predetermined drop in vacuum in said system, to admit more mixture to said intake system.

2,103,285

EDGE FINISHING MACHINE

Thomas G. Winnett, Whitman, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application December 31, 1936, Serial No. 118,615
6 Claims. (Cl. 69—1)

1. In a machine for treating the edges of leather, a U-shaped searing tool having legs connected by a crossbar, means for supporting said legs, and auxiliary means for supporting the crossbar against upward bending.

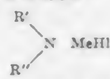
2,103,286

METHOD OF PRODUCING COMPOUNDS OF CYCLIC β-KETOCARBOXYLIC ACIDS

Karl Ziegler, Heidelberg, Germany, assignor to Schering-Kahlbaum A. G., Berlin, Germany, a corporation of Germany

No Drawing. Application June 4, 1934, Serial No. 728,855. In Germany June 13, 1933
8 Claims. (Cl. 260—124)

1. A method of producing compounds of cyclic β-keto carboxylic acids comprising acting on compounds of the general formula

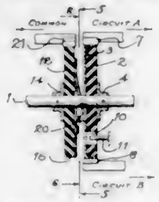


wherein n is an integer greater than three and wherein A represents a member of the class consisting of cyano group and a group of the general formula

and B represents the same or different groups of the general formula

wherein Y is a radical taken from the class consisting of O and NR and Z is a radical taken from the class consisting of OR and NR_2, R denoting a hydrocarbon radical, said groups being capable of transformation by saponification into the carbonyl group of the acyl radical with a condensing agent of the type

wherein R′ and R″ are radicals taken from the class consisting of alkyl, aralkyl, aryl and alicyclic, Hl is halogen or



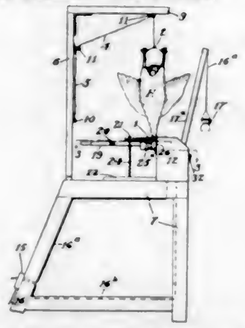
while Me is a metal of the group constituted by the alkali, alkaline earth and earth metals and m denotes the valency of this metal.

2,103,287

DOUBLE CIRCUIT ROTARY SWITCH

Clarence B. Howard, Oakland, Calif., assignor to E. H. Kueffer

Application April 14, 1937, Serial No. 136,710
4 Claims. (Cl. 200—8)



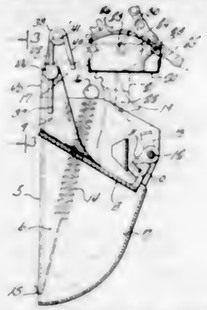
1. A rotary switch comprising a shaft to be rotated, a contact disc of insulating material free to rotate on said shaft, stop means for limiting the rotation of said disc to a limited arc, a pair of segmental contacts on the periphery of said disc and joined by a collector ring, a pair of circuit brushes bearing against said periphery and so spaced with relation to said segmental contacts that only one of said brushes will be in contact with said segmental contacts at each end of the arc of rotation of said disc, a collector brush bearing against said ring, said latter brush being rotatable by said shaft and thereby rotating said disc by friction.

2,103,288

METHOD AND APPARATUS FOR KILLING POULTRY

Wilber V. Hunt, North Acton, Mass.

Application December 19, 1935, Serial No. 55,243
31 Claims. (Cl. 17—11)



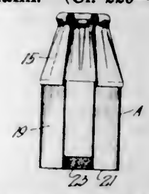
27. In apparatus for use in stunning or killing poultry by electricity, a support, means on said support to receive the head of a bird and an electric circuit, said circuit including a contact adapted to be attached to said bird and a contact adapted to be held against the head of said bird.

2,103,289

VENDING MACHINE

William L. Kissel, Hartford, Wis., assignor to Ira Milton Jones, Thiensville, Wis.

Application May 19, 1933, Serial No. 671,846
Renewed May 5, 1937
1 Claim. (Cl. 312—96)



In a vending machine, the combination of a discharge chute having a door, an article supporting tray positionable alongside the door with the ends of the tray and door substantially in line, and means to simultaneously open the door and tilt the tray, a guard to hold an article on the tray, said guard being movable to release the article for discharge and having a part adjacent one end of the tray, means disposed at the adjacent end of the door and operable upon said part of the guard to move the guard to its inoperative position, and means at the same end of the door operable concomitantly with the opening of the door for actuating said guard engaging means.

2,103,290

CONTAINER

Lydia B. Koch, New York, N. Y.

Application September 17, 1935, Serial No. 40,888
1 Claim. (Cl. 229—4.5)

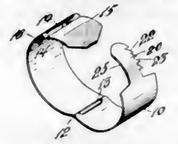
A container comprising a body having upper and lower sections, the lower section having a plurality of upright flat sides, and the upper section having a corresponding number of flat sides each of which tapers to a smaller dimension peripherally of the bottle next the top thereof, each of said flat sides being connected by rounded vertical corners.

2,103,291

WATERTIGHT DOOR

Albert L. Lambert and Francis M. Lambert, Narberth, Pa., assignors to Heintz Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania

Application August 22, 1935, Serial No. 37,269
33 Claims. (Cl. 114—117)



24. The combination with a door frame and a door fitting the frame and having an inwardly flexible sheet metal panel, of means, including members on the edge of the panel and on the door frame interengaging when the door is closed on the door frame, to anchor the edge of the panel against movement toward the center of the door when the panel is flexed inwardly, said panel being dished inwardly and the concavity extending from all points around its edge to a common center area of the panel, said panel shape tending to diminish strain on the said interengaging members and on the body of the panel consequential to outside pressure applied to the panel tending to flex the panel inwardly, a member supported adjacent said door frame and connected to said panel adjacent said center area and means for urging said member toward said panel when the door is closed.

2,103,292

SEAL

Harry Leach, Providence, R. I.

Application October 28, 1937, Serial No. 171,428
4 Claims. (Cl. 40—3)

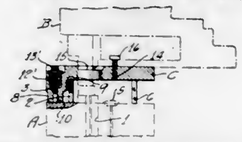
2. A seal comprising a strip of sheet material bent into substantially circular form, with the end portions of the strip overlapping, one end portion having an offset with a slot in said offset portion, the other end portion being of a narrowed width to extend over the outer surface of the band and through said slot, teeth along an edge of said narrowed portion, and a resilient latch at one end of said slot to engage said teeth and prevent withdrawal of said toothed portion from said slot.

2,103,293

CHINTZ

Arnold Leroy Lippert, Wilmington, Del., assignor to Joseph Bancroft & Sons Co., Wilmington, Del., a corporation of Delaware

No Drawing. Application April 13, 1937, Serial No. 136,525
4 Claims. (Cl. 91—70)



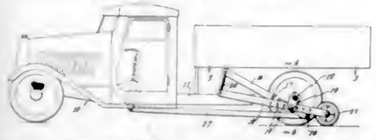
1. The process of making chintz which comprises impregnating the cloth with a water solution of urea formaldehyde and a coagulatable protein, the solution having a concentration of about 10% to about 30% of urea formaldehyde, and passing the treated cloth through a heated glazer to simultaneously set the resin and glaze the cloth.

2,103,294

CYLINDER REBORING-PLATE

Edward R. Michener, St. Louis, Mo., assignor to H & H Machine & Motor Parts Company, St. Louis, Mo., a corporation of Missouri

Application October 9, 1935, Serial No. 44,139
2 Claims. (Cl. 77—62)



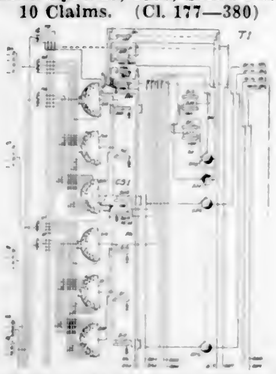
1. An automotive engine cylinder reboring fixture for use with an engine block having stud bolts upstanding from a plane-surfaced face thereof adapted to receive a cylinder head comprising, a metallic plate portion having an upper plane-surfaced face, legs on the lower side of the plate to engage the plane face of the cylinder block and having their ends terminating in a plane substantially parallel to the upper plane face of the plate, said legs being of sufficient length to position said plane face above the outer ends of the stud bolts and the plate being provided with openings to receive said stud bolts and being countersunk in its plane face around

certain of said stud bolts, and means received upon the stud bolts within the countersunk recesses to thus rigidly secure the fixture in place and leave the outer face thereof unobstructed and in a plane substantially parallel with and spaced from the plane face of the cylinder block to receive and support a boring tool.

2,103,295
ANTISKIDDING DEVICE FOR MOTOR VEHICLES

Joseph Mucha, Neenah, Wis.

Application February 27, 1937, Serial No. 128,122
1 Claim. (Cl. 188—5)

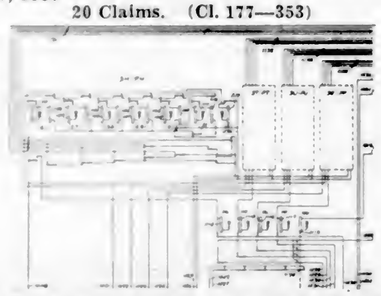


In a motor vehicle, a pin rigid with the body of the vehicle between the rear wheels, a lever pivotally mounted on said pin, a second lever adjacent thereto pivotally mounted on said pin, one of said levers having a longer projection rearward from said pin and having a wheel mounted in the end thereof, the shorter of said levers having a link pivotally mounted in the rearwardly projecting end thereof, a spring joining the forward ends of said levers, handle connected with said link and adapted to move said link in a substantially horizontal direction, movement of said link in one direction causing said wheel to be urged downward against the road, and movement in the opposite direction causing said wheel to be lifted above the road.

2,103,296
TRANSMITTING AND RECEIVING SYSTEM

Martin L. Nelson, Park Ridge, Harold C. Robinson, Chicago, and John I. Bellamy, Brookfield, Ill., assignors, by mesne assignments, to Associated Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware

Application April 19, 1930, Serial No. 445,746
10 Claims. (Cl. 177—380)

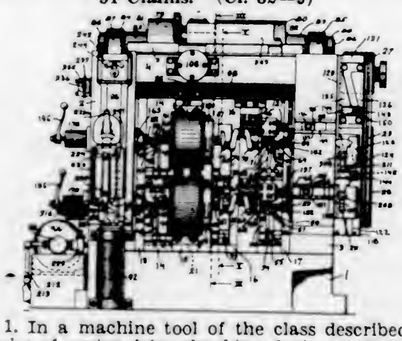


1. In a stock-quotation transmitter, a plurality of stock-code-digit registers, a plurality of price-digit registers, a plurality of outgoing conductors, a sender, means for operating said sender under the control of operated ones of the stock digit registers to send out a group of stock digits over said outgoing conductors, respectively, and for again operating said sender to send impulses over said outgoing conductors in accordance with the respective settings of operated ones of the price-digit registers, a plurality of price-range conductors controlled, respectively, by the price-digit registers, means for connecting the price-range conductors to said sender between the sending of the stock digits and the price digits, and means controlled over the price-range conductors for making the number of price digits transmitted equal the number of price-digit registers operated.

2,103,297
STOCK-QUOTATION SYSTEM

Martin L. Nelson, Park Ridge, Ill., Harold C. Robinson, Baltimore, Md., and John I. Bellamy, Brookfield, Ill., assignors, by mesne assignments, to Associated Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware

Original application April 19, 1930, Serial No. 445,746. Divided and this application March 26, 1931, Serial No. 525,476. Renewed May 17, 1937
20 Claims. (Cl. 177—353)

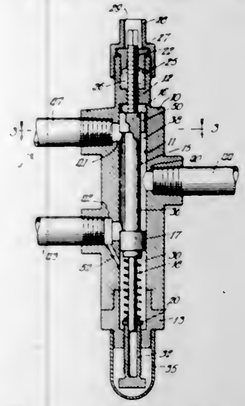


5. In a stock-quotation receiver wherein a stock is represented by a plurality of price-digit indicators, receiving apparatus for receiving a plurality of price digits during the same period of time, a group of price-range relays, means effective upon the starting of the receipt of a group of price digits and responsive to the operation of the receiving apparatus for operating a number of said price-range relays indicative of the number of price digits being received, and means controlled by said price-range relays for restoring the ones of the price-digit indicators which correspond to new price digits being received.

2,103,298
MULTIPLE SPINDLE CENTER DRIVE CRANKSHAFT LATHE

Henry C. Pierle, Cincinnati, Ohio, assignor to The R. K. Le Blond Machine Tool Company, Cincinnati, Ohio, a corporation of Delaware

Application October 5, 1936, Serial No. 104,037
31 Claims. (Cl. 82—9)

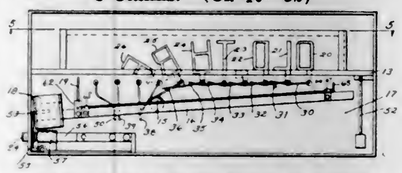


1. In a machine tool of the class described, a series of center drive chucking devices with their axes interspaced substantially parallel and arranged substantially in a plane, tool carriers arranged along said axes on each side of said chucking devices, series of tools on the respective carriers, also arranged substantially in said plane, and means whereby said tool carriers are moved in said plane substantially at right angles to the axes of said chucking devices.

2,103,299
MEANS FOR HANDLING LIQUIDS

Fred Ravnsbeck, Chicago, Ill., assignor to Ace Engineering Co., a corporation of Illinois

Application December 10, 1934, Serial No. 756,771
6 Claims. (Cl. 137—153)

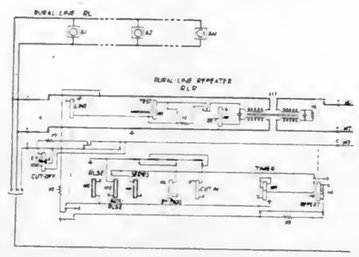


1. A valve of the type described comprising a casing having a bore therein, a piston member having two spaced piston heads rigidly connected to each other, said piston member being slidably journaled in said bore, said casing having an intake port communicating with said bore intermediate said heads and having a plurality of outlet ports communicating with said bore and controlled by said piston heads, respectively, adjustable means engageable with one of said piston heads for positively limiting displacement of said piston member in one direction, and yieldable means retarding displacement of said piston member in the other direction, the piston head adjacent to said limiting means having a port extending through it whereby that portion of the bore at one end of said piston head communicates with that portion of the bore at the other end of said piston head.

2,103,300
ANIMATED SIGN

Bruce Roberts, Hollywood, Calif., assignor to Frank McQuoid, Los Angeles, Calif.

Application June 25, 1937, Serial No. 150,238
8 Claims. (Cl. 40—52)



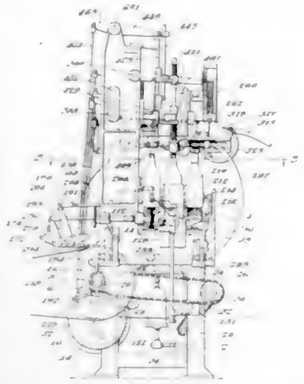
1. In an animated sign, a fixed frame, a plurality of movable characters, individually journaled to the frame so as to come into and out of display position, means of consecutively bringing the characters into display position, means of collectively retaining the characters in display position, and a means of simultaneously removing the characters from display position.

2,103,301
TELEPHONE SYSTEM

Norman H. Saunders, Chicago, Ill., assignor to Associated Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware

Application October 21, 1935, Serial No. 45,846
9 Claims. (Cl. 179—16)

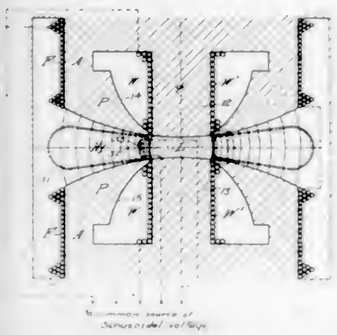
1. In an automatic telephone system, a subscriber line, calling terminals individual to said line, an impulse repeater inserted between said line and said calling terminals, automatic switching apparatus for extending connections from subscriber lines, switching means for connecting said automatic switching apparatus with the said line by way of the calling terminals thereof, called terminals individual to said line and connected thereto between the line and the repeater, said automatic switching apparatus being operative to extend connection to said line by way of said called terminals, a cut-off relay associated with the called terminals and means for operating it to disconnect the line from the said repeater when it is called, means for guarding the line from seizure by way of said called terminals when a call is originated thereover, and means for preventing the operation of the said cut-off relay when a call is originated over the line and the line is guarded from seizure through the called terminals thereof.



2,103,302
BAND APPLYING MACHINE

Ralph C. Strout, Wollaston, Mass., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

Application February 24, 1934, Serial No. 712,853
11 Claims. (Cl. 226—80)

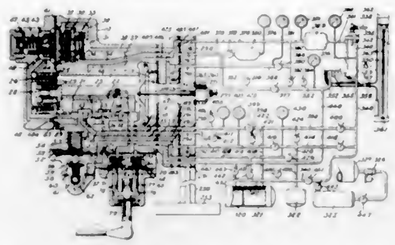


6. In a machine for applying a banding sleeve to a container, in combination, mechanism for feeding successive sleeves from a bulk supply thereof, mechanism for opening said sleeve, mechanism for delivering successive containers into a position below a sleeve thus opened including an incoming conveyor, a pusher member arranged to reciprocate transversely thereof for pushing successive containers into an intermediate position, separate means for transferring successive containers from such intermediate position into a position beneath said open sleeve, mechanism for moving the sleeve downwardly over the upper end of the container thus posi-

tioned to thereby apply the sleeve to the container, and mechanism for transferring the con-

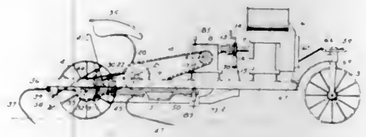
tainer from such sleeve applying position onto the outgoing conveyor.

2,103,303
DEVICE FOR PRODUCING ELECTRON RAYS OF HIGH ENERGY
Max Steenbeck, Berlin-Siemensstadt, Germany, assignor to Siemens-Schuckertwerke Aktiengesellschaft, Berlin-Siemensstadt, Germany, a corporation of Germany
Application March 4, 1936, Serial No. 67,184
In Germany March 6, 1935
10 Claims. (Cl. 250—27)



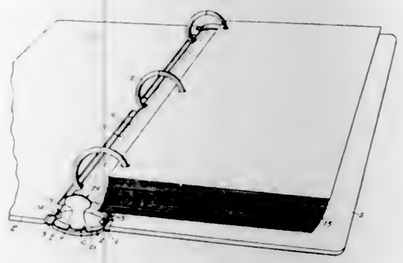
1. A device for generating electron rays of great energy by means of an electric eddy field produced by a magnet field varying with time, comprising a source of electrons, an evacuated vessel containing said source and constructed to provide a circular path for said electrons, means for producing a magnetic field varying with time for accelerating the electrons in a circular path and whose field axis coincides with the rotation axis of the electron stream, means for producing a guide field for the electron stream which varies similarly with time and which coaxially surrounds said acceleration field, said guide field-producing means being arranged so that the field intensity decreases outwardly with increasing radius of the electron path but at a rate not more than inversely proportional to the path radius increase, the means for producing said two fields being normally proportioned relatively to one another so that the guide field has always one-half the intensity of the accelerating field, and means for disturbing the relative intensities of said two fields when the electrons have attained the desired speed.

2,103,304
CHEESE PRODUCT
George Lincoln Teller and W. Kedzie Teller, Chicago, Ill., assignors to Henry H. Doering, Chicago, Ill.
No Drawing. Application April 22, 1935, Serial No. 17,656
20 Claims. (Cl. 99—117)



17. A method of plasticizing Cheddar cheese and the like which consists in comminuting cheese, adding a quantity in the amount ranging from 1 to 5 per cent of an alkaline caseinate and an edible urea compound to said comminuted cheese, and pasteurizing the combined cheese and urea to avoid detrimental separation between the cheese constituents.

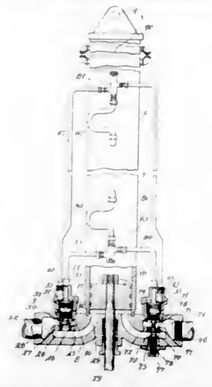
2,103,305
TEST RACK
Frank B. Thomas, Irwin, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application April 27, 1935, Serial No. 18,604
22 Claims. (Cl. 73—51)



20. In apparatus for testing a valve device of a type comprising a body having a mounting face having a plurality of ports therein having passages associated therewith and communicating with operating elements of the valve device, the testing apparatus comprising a bracket having a mounting face having a greater number of ports therein than are provided in the face of the body of the valve device, the ports in the bracket being arranged differently than the ports in the body of the valve device, the bracket having passages therein communicating with the ports therein and through which fluid under pressure may be supplied to and released from said ports, and a filling piece comprising a body having a mounting face adapted to be secured against the mounting face of the bracket, said face of the filling piece having a lesser number of ports therein than are provided in the mounting face of the bracket, the ports in the filling piece being adapted to be in communication with selected ports in the bracket when the filling piece is secured thereagainst, the filling piece also having a mounting face adapted to have the mounting face of a valve device to be tested secured thereagainst, said face of the filling piece having a plurality of ports therein communicating with the ports in the other face thereof and adapted to communicate with the ports in the mounting face of a valve device when the said valve device is secured thereagainst.

2,103,306
CULTIVATING AND WEEDING DEVICE
William E. Urschel, Valparaiso, Ind.
Application January 22, 1934, Serial No. 707,664
25 Claims. (Cl. 97—21)

1. A cultivator comprising transversely movable plows, means for advancing said plows along a row of plants to be cultivated, a pointer manually movable to point to a plant in the path of said plows, and mechanical means in cooperation with said pointer and controlled thereby to move said plows to avoid such plant.

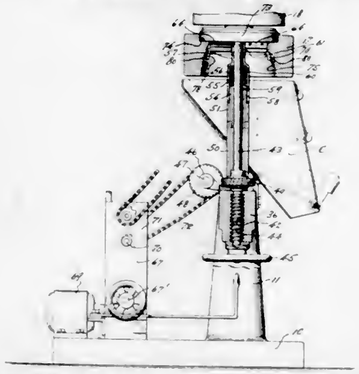


2,103,307
LOOSE-LEAF BINDER
Paul O. Unger, Elmhurst, Ill., assignor to Wilson-Jones Company, Chicago, Ill., a corporation of Massachusetts
Application June 26, 1933, Serial No. 677,534
11 Claims. (Cl. 129—24)

1. In a loose leaf binder, a ring metal including a plurality of sheet retaining rings anchored to a pair of toggle plates, a back member to which said ring metal is secured, and a trigger for operating said toggle plates to open said rings, said trigger being fulcrumed on said back member between the end of said ring metal and the end of the binder.

2,103,308
MOTOR FOR PUMPING MECHANISMS
Wade H. Wineman, Michigan City, Ind., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application October 9, 1934, Serial No. 747,538
29 Claims. (Cl. 121—126)

1. In a motor, in combination, a cylinder, a piston reciprocable therein, means for continuously venting one end of said cylinder, and means for controlling admission and exhaust with respect to the opposite end of said cylinder including an admission valve opened by the pressure prevailing in the working end of the cylinder just prior to admission and an end-seating exhaust valve moving on closure in the direction of flow of the discharging exhaust fluid and whose closing is controlled by motor back pressure, and means for moving said valves in the opposite directions by cylinder



pressure including a check valve moving with each of said valves and delaying throwing thereof.

2,103,309
DYE COMPOSITION FOR THE TREATMENT OF EXTERNAL BURNS IN HUMAN BEINGS
Robert H. Aldrich, Boston, Mass., and David A. Bryce, Bound Brook, N. J., assignors to Calco Chemical Company, Inc., Bound Brook, N. J., a corporation of Delaware
No Drawing. Application January 14, 1935, Serial No. 1,606
5 Claims. (Cl. 167—58)

1. A composition for the treatment of burns comprising crystal violet, neutral acriflavine and a material selected from the group consisting of brilliant green and basic fuchsine.

2,103,310
CONVERTIBLE HYDRAULIC PRESS FOR LONG AND SHORT PASTE PRODUCTS
Conrad Ambrette, Brooklyn, N. Y., assignor to Consolidated Macaroni Machinery Corporation, Brooklyn, N. Y., a corporation of New York
Application March 11, 1935, Serial No. 10,475
2 Claims. (Cl. 107—14)

1. In a press of the kind described, a bridge block pivotally connected with the press frame to swing in horizontal plane into or out of alignment with the operative press cylinder and the cooperating paste forming die thereof, means to

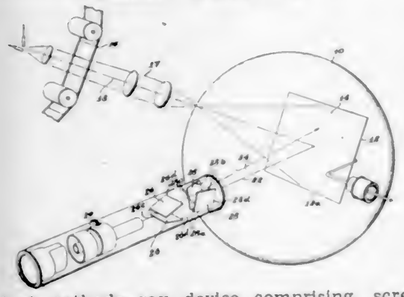
releasably lock said bridge block to the press frame and in operative relation to said press cylinder and die, a vertically movable spindle carried by said bridge block, a sleeve having a removable upper section rotatably mounted on said spindle, a hub-sleeve telescopically movable on said upper sleeve section, means to key said hub-sleeve to said upper sleeve section for rotation therewith, a cutter blade carried by said hub-sleeve, spring means between said upper sleeve section and said hub-sleeve for yieldably thrusting the latter upwardly to maintain said cutter blade in operative contact with said paste forming die, and connectable power transmission means for driving said sleeve structure to revolve said cutter blade.

2,103,311

DRIVE RING FOR FLOOR MAINTENANCE MACHINE BRUSHES

Kenneth C. Atkin, Toledo, Ohio, assignor to The American Floor Surfacing Machine Company, Toledo, Ohio, a corporation of Ohio

Application August 2, 1937, Serial No. 156,879
1 Claim. (Cl. 15—180)



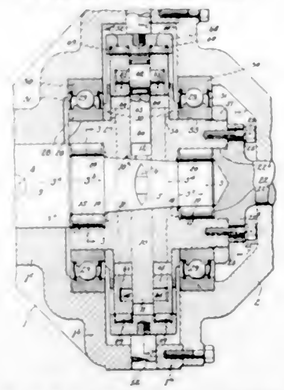
A drive ring of the class described comprising a plurality of stamped metal segments each having a substantially flat body portion adapted to have end to end abutment with the corresponding portion of adjoining segments and each at one end having a two-stepped portion with the first step in overlapping engagement with the adjacent end of the body portion of the next segment and with the second step spaced from said overlapped body portion to form a clutch finger, and means for firmly connecting said segments at their overlapping portions.

2,103,312

CATHODE RAY DEVICE

Maggio C. Banca, Magnolia, N. J., assignor to Radio Corporation of America, New York, N. Y., a corporation of Delaware

Application August 29, 1933, Serial No. 687,298
9 Claims. (Cl. 250—27.5)



1. A cathode ray device comprising, screen structure, means for scanning said structure comprising means for developing a scanning ray and directing the same at said structure, the axis of said ray-developing means being inclined at an acute angle to said structure, and means for deflecting said ray simultaneously in different directions at relatively high and relatively low frequencies respectively to cause the ray to scan said structure over a substantially rectangular area, said deflecting means including complementary non-parallel plates disposed on opposite sides of said axis for deflecting the ray at the relatively high frequency.

2,103,313

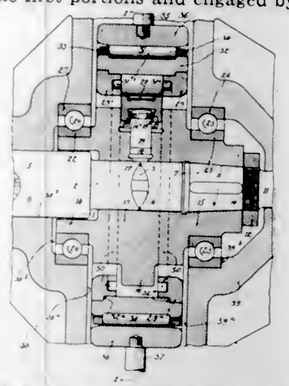
HYDRAULIC PUMP OR MOTOR

Elek K. Benedek, Bucyrus, Ohio

Application October 21, 1935, Serial No. 45,909
5 Claims. (Cl. 103—161)

1. In a rotary, radial piston, pump or motor, a cylinder barrel having a plurality of radial cylinders, a flange on the barrel in the zone of the cylinders and having radial guideways aligned with the cylinders respectively, pistons in the cylinders respectively, valve means for the cylinders, heads on the pistons operative in said guideways, thrust means carried by the piston heads and extending beyond the heads parallel to the axis of rotation of the barrel, a reactance means for actuating the pistons comprising a pair of rings closely alongside the faces of the barrel flange respectively, said rings having reactance grooves aligned with each other and opening toward the flange for receiving said thrust means for operatively connecting the pistons and reactance means, means rotatably supporting said rings in eccentric relation to the barrel, guide means carried by the barrel and having walls abutting the rings and constraining the rings from separation axially of the barrel while permitting free independent rotation thereof.

2,103,314



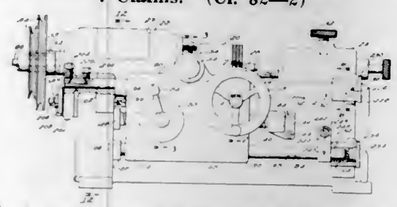
VARIABLE DELIVERY PUMP OR MOTOR

Elek K. Benedek, Bucyrus, Ohio

Application December 31, 1935, Serial No. 56,954
2 Claims. (Cl. 103—161)

2. In a rotary radial piston pump or motor, a rotatable barrel, a radial flange on the barrel, radial cylinders in the barrel in the zone of the flange, radial guideways in the flange respective to the cylinders, a valve pintle in valving cooperation with the cylinders, pistons in the cylinders respectively, a reactance surrounding the cylinders and pistons, and means operatively connecting the reactance to the pistons for actuation of the pistons upon relative rotation of the barrel and reactance, said means comprising heads for the pistons, respectively reciprocable in said radial guideways, each of said heads having a transverse arcuate groove extending transversely of the associated head and open toward

the reactance, cylindrical rolling elements rotatable in said grooves respectively and having their axes of rotation substantially parallel with the axis of rotation of the barrel, each element having a portion of its peripheral surface in direct rolling contact with said reactance at the open portion of the groove and a diametrically aligned opposite load transmitting peripheral surface portion, and having two adjacent secondary portions positioned circumferentially between the first portions and engaged by the por-



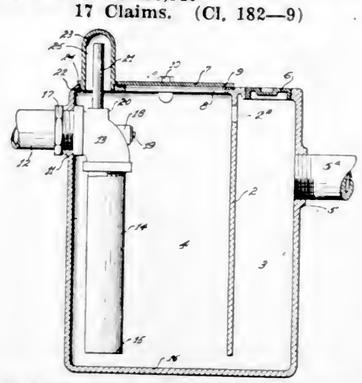
tions of the wall of the associated groove for actuating the associated piston during the suction stroke, an arcuate recess in the base of each groove and terminating intermediate the circumferential limits of the groove, and free antifriction rollers in each recess between said diametrically aligned opposite load transmitting peripheral surface portion of the rolling element and the bottom of the recess for effecting antifriction load transmission between the said rolling element and the associated piston head.

2,103,315

LATHE

Christian A. Birkebak, Detroit, Mich., assignor to Ex-Cell-O Corporation, a corporation of Michigan

Application June 20, 1935, Serial No. 27,506
7 Claims. (Cl. 82—2)



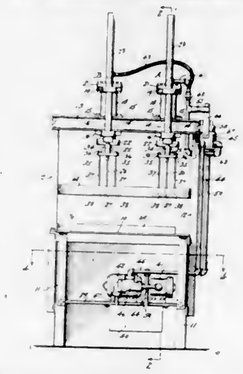
3. A machine tool comprising a base, rotary work stock supporting means, a tool holder having a tool adapted to engage the work, means including a shaft extending substantially parallel to the work axis for pivotally mounting the tool holder on the base, an eccentric shaft extending substantially parallel to the first mentioned shaft and operatively engaging the tool holder for moving it inwardly and outwardly with respect to the work axis, means for rotating the work, and means for oscillating the eccentric shaft through a limited angle less than that of a complete rotation and in timed relation to the work rotation, whereby such oscillation enables moving the tool accurate and small amounts to and from the axis of work rotation.

2,103,316

GREASE TRAP

Edward W. N. Boosey, Detroit, Mich.

Continuation of application Serial No. 711,311, February 15, 1934. This application July 21, 1934, Serial No. 736,340
17 Claims. (Cl. 182—9)



1. In a grease trap, a chambered body having an inlet conduit, an outlet conduit opening to the body of the trap below the normal liquid level therein, said outlet being positioned to determine the normal level of liquid below the top providing an air and gas space, a vent means for discharging gas and air from the said space to the outlet, and means associated with the vent for preventing greases and oils accumulated on the surface of the liquid from passing through the vent to the outlet, said vent means comprising a casing opening through the top of the body and providing an inlet for the vent.

2,103,317

CUTTING MACHINE FOR SPAGHETTI, MACARONI, ETC.

Nicholas J. Cavagnaro, Richmond Hill, N. Y., assignor to Consolidated Macaroni Machinery Corporation, Brooklyn, N. Y., a corporation of New York

Application February 16, 1935, Serial No. 6,825
3 Claims. (Cl. 107—21)

1. In a machine for the purposes described having a support for a tray containing the material to be cut and a frame including a transverse portion spaced above said support, a plurality of hydraulically actuated and selectively operable cutter means adjustably mounted on said trans-

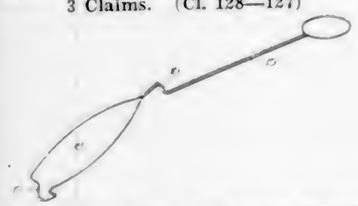
verse frame portion for spacing the same according to lengths of cut material desired to be obtained.

2,103,318

CULINARY UTENSIL OF FIBROUS STRUCTURE AND METHOD OF MAKING SAME

Albert L. Clapp, Danvers, Mass.

No Drawing. Application June 17, 1933, Serial No. 676,401
6 Claims. (Cl. 92—21)



1. A culinary utensil shaped and adapted to hold foodstuff during cooking and baking operations and of a relatively stiff and rigid molded structure comprising interfelted fibrous material of a thickness not exceeding about 0.030 inch, the pores of which contain swelled starch particles derived from raw starch modified to a swelled condition in situ in the pores, said starch being present in the amount of at least 10%, based on the dry weight of the fibrous material, and said amount of starch serving to stiffen said structure sufficiently to keep its molded shape when handled and to render said structure substantially greaseproof.

2,103,319

APPLICATOR FOR PESSARIES

Percy L. Clark, Jr., Chicago, Ill.

Application November 2, 1935, Serial No. 47,956
3 Claims. (Cl. 128—127)

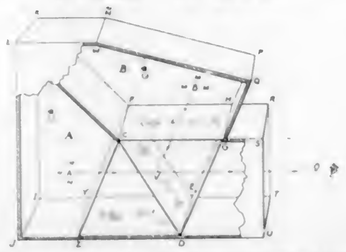
1. An applicator for diaphragms comprising a frame structure and a handle, said frame providing a pair of abutments spaced apart a distance greater than the diameter of the diphragm to be used therewith, the frame between the abutments being spread to provide an open space within which a sack formed as a part of said diaphragm may be accommodated.

2,103,320

ABRASIVE HOLDER

Edward V. Corff, Chicago, Ill.

Application September 6, 1935, Serial No. 39,429
1 Claim. (Cl. 51—187)



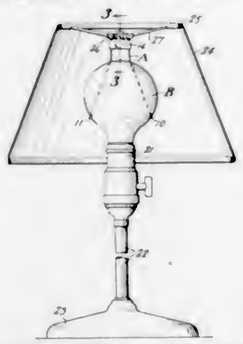
An article of the kind described comprising an elongated hollow body member having one end forming a handle and the other end providing a slightly tapered surface uniformly convergent away from the handle, said tapered end having a narrow longitudinal recess or open seam terminating in its smaller end, the side walls of the recessed portion being resilient and so spaced that opposite edge portions of an abrasive sheet may be inserted in the open end of the recess and the sheet drawn longitudinally over said tapered portion to a position wherein it is disposed about and closely fits said tapered surface with its inserted edge portions held in spring pressed engagement by the bounding edges of said recess.

2,103,321

APPARATUS FOR PRODUCING OPTICAL ILLUSIONS

Francisco Suárez de Deza and Ramón Benito Mangana Trabazo, Buenos Aires, Argentina

Application April 24, 1937, Serial No. 138,786
In Argentina February 23, 1937
3 Claims. (Cl. 88—75)



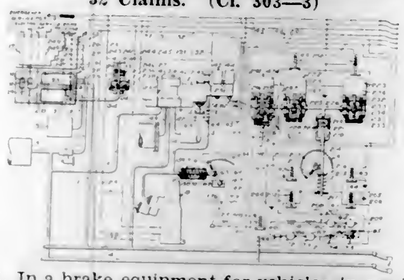
3. An apparatus for producing optical illusions, characterized in that it comprises, in combination, a transparent mirror interpolated between some objects and the observer; plates of transparent and diaphanous material arranged at symmetrical angles in respect to the plane of the transparent mirror, one of said plates being applied to all or part of the floor on which said objects are placed; and means for alternatively illuminating one face and the other of the transparent mirror.

2,103,322

LAMP SHADE ADAPTER

William N. de Sherbinin, Hastings on Hudson, N. Y.

Application February 15, 1934, Serial No. 711,319
6 Claims. (Cl. 240—138)



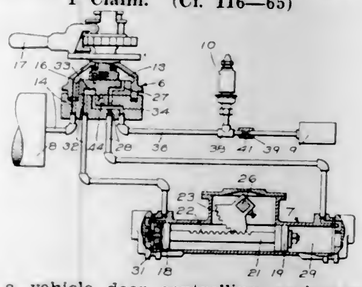
1. An adapter for securing a lamp shade to an electric light bulb comprising spaced resilient ring-like members for engaging opposite parts of an electric light bulb, and plates secured directly to each of said ring-like members, said plates having a portion for engaging the inner annulus of a bridge and ring type shade and another portion of smaller dimension than the first mentioned portion for engaging the washer of a washer type shade, whereby the shade may be securely mounted on the bulbs.

2,103,323

BRAKE SYSTEM FOR HIGH SPEED TRAINS

Sidney G. Down, Edgewood, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application June 18, 1935, Serial No. 27,171
32 Claims. (Cl. 303—3)



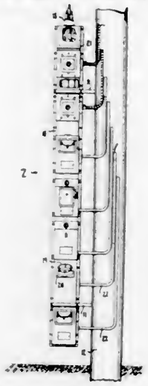
1. In a brake equipment for vehicles, in combination, fluid pressure braking means, an electric dynamic braking means, a brake control pipe, means comprising a brake valve device and a control valve device for controlling the supply of fluid under pressure to said brake control pipe to effect a pressure therein corresponding to a desired degree of braking, a retardation control device for limiting the application of said fluid pressure brake in accordance with the rate of retardation of the vehicle, means responsive to pressure in said control pipe for controlling the degree of application of said dynamic braking means, and means responsive to the pressure in said brake control pipe for controlling the setting of said retardation control device.

2,103,324

DOOR CLOSING WARNING SIGNAL

Sidney G. Down, Edgewood, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application August 10, 1935, Serial No. 35,600
1 Claim. (Cl. 116—65)



In a vehicle door controlling equipment, in combination, a door engine having a movable abutment operative by fluid under pressure supplied to one side to open a door and by the fluid under pressure supplied to the opposite side to close the door, a control valve device having a door-open position for supplying fluid under pressure to the door opening side of the movable abutment, and having a door-closed position for supplying fluid under pressure to the opposite side of said abutment and for venting fluid under pressure from said door opening side, a communication through which said control valve device is adapted to vent fluid under pressure from the door-opening side of said door engine to the atmosphere upon movement of said device to the door-closed position, said communication having a choke portion with a restricted flow area for producing a local back pressure in the communication upon fluid under pressure being supplied thereto, and fluid pressure responsive signal means connected to said communication intermediate said choke portion and the door engine.

2,103,325

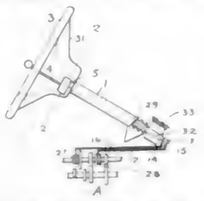
PANEL BOARD

William H. Frank and Joseph W. Harper, Detroit, Mich.

Application May 13, 1935, Serial No. 21,114
5 Claims. (Cl. 247—3)

1. A panelboard comprising a vertically disposed support, a vertically disposed elongated casing closely adjacent thereto and supported thereby, and a group of closely spaced branch circuit enclosed box-like units removably supported thereon and outside the casing, and disposed on opposite front and back walls thereof, with their long dimensions parallel to the run of the casing, the casing containing naked rigid bus bars insulatedly supported therein with their edges adjacent the front and back walls of the casing, the casing having openings in these front and back walls suitably positioned over the bus bars to provide access to the bus bars from front and back of the casing for contacts plugged onto the bus bars through the openings, the contacts projecting from the backs of the units and engaging flat sides of the bus bars, the contacts being parts of the associated group of branch circuit units, these having identical mounting and plug-in details of construction whereby they may interchangeably cooperate with standard arrangements of bus bars, openings, and unit mounting details of the casing, the associated group of branch circuit units having a variety of branch circuit control means of different types.

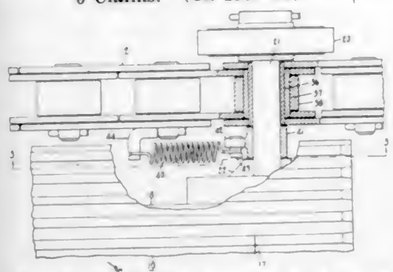
2,103,326



GEAR SHIFT MECHANISM FOR AUTOMOBILE TRANSMISSIONS

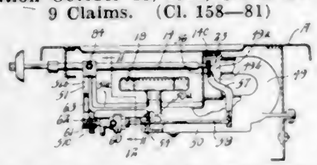
James L. Getaz, Maryville, Tenn.

Application September 16, 1935, Serial No. 40,697
16 Claims. (Cl. 74—473)



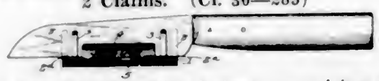
1. In an automobile, a set of gears, a lever for shifting said gears, a steering wheel, a hollow

shaft operated by said steering wheel, a support through said hollow shaft for said lever, a plurality of means connected to the gears, and adapted to be engaged by said lever to actuate the



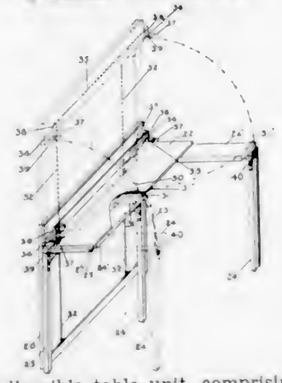
gears, said means extending through said hollow shaft, said lever being rotatable to either side of a vertical plane parallel to said hollow shaft for selective engagement of said lever with one of said means for shifting of said gears.

2,103,327
MOVING STAIRWAY
Arthur Edward Handy, Lynbrook, N. Y., assignor to Otis Elevator Company, New York, N. Y., a corporation of New Jersey
Application August 18, 1937, Serial No. 159,650
6 Claims. (Cl. 198—16)



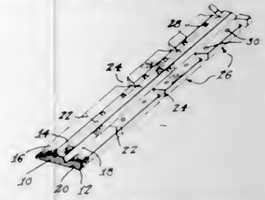
1. A moving stairway comprising; a series of steps; running gear chain for said steps; a wheel for each step; an axle for each wheel, said running gear chain being provided with an aperture for each axle through which the axle extends; and means for each step for yieldingly maintaining said axle for the wheel of that step against the wall of its aperture in said chain.

2,103,328
FUEL FEEDING SYSTEM WITH THERMOSTATIC AIR CONTROL
Hans C. Hanson and Walter Olsen, Albert Lea, Minn.
Application October 18, 1933, Serial No. 694,082
9 Claims. (Cl. 158—81)



2. A fuel feeding system for hydrocarbon burners having in combination a generator tube heated by the burner when in operation, a liquid fuel supply means for feeding said tube, a compressed air supply means for simultaneously feeding air with liquid fuel to said tube, means affording communication between said two supply means and said tube, a valve in said compressed air supply means controlling the passage of air therethrough, a supporting structure for said generator tube and said valve and subject to some expansion through heat from said burner when in operation, said supporting structure being connected to said generator tube in spaced relation from one end thereof, a member bearing against the said end of said generator tube and movable by said tube as the tube expands through heat and a rod formed of material having a higher coefficient of expansion than the material forming said supporting structure and extending between said member and said valve, said valve being normally open and said rod acting to close said valve as said generator tube is heated to a certain temperature and the expansion of said rod through heat acting to compensate to at least some degree for the expansion of said supporting structure as it is heated.

2,103,329
GUARD FOR PARING KNIVES
Julius H. Karlson, Chicago, Ill.
Application January 31, 1936, Serial No. 61,687
2 Claims. (Cl. 30—285)

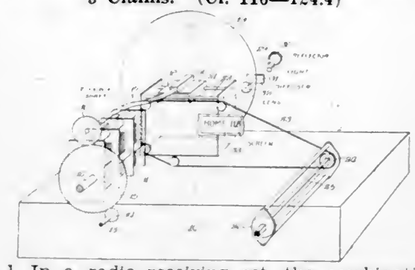


2. A guard for paring knives, comprising a flat metal gauge bar having integral with one edge thereof upstanding blade-embracing fingers deflected from said edge to opposite sides of a plane which causes them to hold a knife blade at a large obtuse angle to the plane of the gauge bar and to arrest the cutting edge of the blade at a throat-maintaining distance from the edge of said gauge bar from which said fingers project and in a plane laterally displaced therefrom; said gauge bar having a guard flange upstanding from the edge that carries the fingers and extending between the nearer fingers of the respective pairs in a plane substantially normal to the plane of said gauge bar; said gauge bar also having a stiffening flange upstanding from the margin thereof which is remote from its finger-carrying edge.

2,103,330
COLLAPSIBLE TABLE UNIT
Harry L. La Fetra, New York, N. Y.
Application June 5, 1937, Serial No. 146,529
4 Claims. (Cl. 311—80)

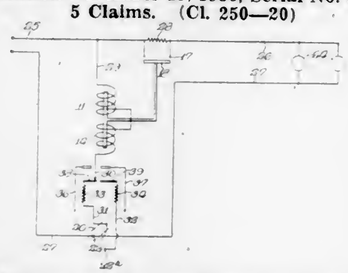
1. A collapsible table unit, comprising a sub-table top element and a pair of legs fixed thereto, a pair of swingable legs including respective portions hinged to the sub-table top element to swing thereunder when the table is not in use and to be swung outwardly to position the legs, a table top pivotally and slidably attached to the sub-table top element and adapted to be swung thereover for support thereon and upon the positioned swingable pair of legs and to be dropped in front of the outer edge of said sub-table top element in collapsing the table unit, and leveling means attached to the under side of the table top to rest upon the hinged portions of the swingable pair of legs when said top is brought thereover, together with means pivotally carried by the leveling means to lock the table top to said swingable pair of legs.

2,103,331
WELTING AND METHOD OF MAKING THE SAME
Edward F. Mathews, Weymouth, Mass.
Application January 23, 1936, Serial No. 60,405
10 Claims. (Cl. 36—78)



1. An article of manufacture comprising a welting strip having a rear face and a finished front face, the rear face being grooved longitudinally therealong within such face to permit flexing of the body portion along and in a direction to close the groove, the strip having predetermined and open thread-receiving perforations on opposite sides of the groove and said rear face being skived along one edge in a manner reducing the body in tapering thickness toward said edge.

2,103,332
POLE AND GUY CALCULATOR
Walter W. Mayfield, Jefferson City, Mo.
Application August 11, 1936, Serial No. 95,316
3 Claims. (Cl. 235—84)



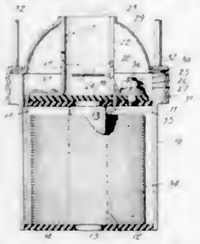
1. A calculating device comprising a base member provided near its edge with a scale, an intermediate member movable with respect to said base and having a set of graduations thereon, an ear on said intermediate member, a set of graduations on said ear adapted to cooperate with said first scale, a set of logarithmic graduations on said base member, a second set of logarithmic graduations on said base member disposed concentrically within said first set, an upper member movable with respect to said base and intermediate member there being windows in said upper member through which are visible the set of graduations on said base member, a logarithmic scale on said upper member cooperating with the first one of said graduations on said base, and a second logarithmic scale on said upper member cooperating with the graduations on said intermediate member through said windows.

2,103,333
MEANS FOR PROJECTING AND MAGNIFYING TUNING INDICIA
John L. McWeeny, Chicago, Ill.
Application November 12, 1936, Serial No. 110,461
3 Claims. (Cl. 116—124.4)

1. In a radio receiving set, the combination with a variable condenser, of a disc mounted for bodily movement transverse to the axis of rotation of the disc, a flexible shaft connecting the shaft of the disc to the rotating element of the condenser, said disc having a plurality of series of indicia arranged in circles of different radii, said indicia being radially disposed in light-contrast relation on said disc, a source of light positioned to project rays past said indicia, a lens placed to collect said transmitted rays, a screen on which said rays are projected to reproduce said indicia in enlarged form, and means for shifting said disc to present the indicia of different circles to said source of light.

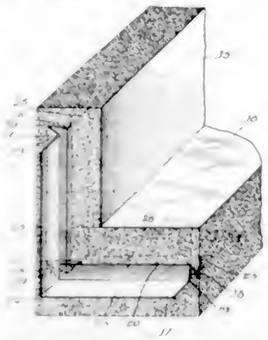
2,103,334
MEANS FOR DIMMING RADIO LIGHTS
John L. McWeeny, Chicago, Ill.
Application November 19, 1936, Serial No. 111,707
5 Claims. (Cl. 250—20)

1. In means of the class described, the combination of a light circuit having a switch, said circuit having resistance therein when the switch is open, and means for controlling said switch including a magnet having a movable part, a circuit for energizing said magnet to move said part and close said switch and short circuit said resistance, means for closing said last named circuit, said last named circuit including resistance for generating heat, and a thermostat positioned to be affected by said heat and



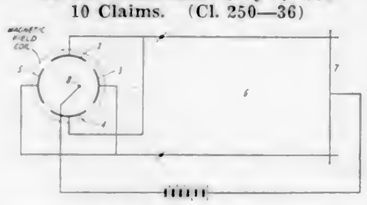
acting to break said last named circuit after the expiration of a predetermined time, whereby to de-energize said magnet and open said switch and thereby to place said resistance in circuit with said light.

2,103,335
X-RAY TUBE
Harry F. Mesick, Jr. and Malvern J. Gross, Chicago, Ill., assignors to General Electric X-Ray Corporation, Chicago, Ill., a corporation of New York
Application May 28, 1932, Serial No. 614,124
24 Claims. (Cl. 250—34)



1. The combination with an X-ray tube, of a demountable casing comprising an inner continuous, imperforate sleeve of insulating material transparent to X-light, a centrally disposed housing member of X-ray absorbing material about said transparent insulating sleeve, and end housing sleeves of insulating X-ray absorbing material engaging said centrally disposed member, there being a window for a beam of X-light in said centrally disposed housing member.

2,103,336
PORTABLE LIGHT
Stefan Novoveszky, St. Louis, Mo.
Application January 24, 1936, Serial No. 60,558
2 Claims. (Cl. 240—8.18)

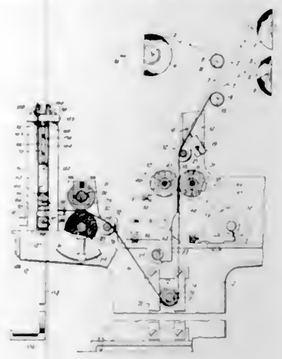


1. A light comprising a hollow casing open at both ends, a spool therein including a magnetically permeable core and end members, said members being of insulating material and having centrally disposed holes and said core having reduced portions extending into said holes to effect assembly of the spool, one end member serving as a closure for one end of the casing, an insulating member connected to said other spool end member in superposed relation, a bulb socket directly supported by the insulating member, a contact blade connected to said insulating member by a terminal and extended into said socket through an opening therein in non-engaging relation, said terminal, a coil between said end members and surrounding said core having one end connected to the socket and the other end to said terminal, a reflector disposed about said socket and maintained in removable relation thereto by a ring screw threadedly engaging said casing whereby said light elements may be readily completely dismantled for repair, and power leads, one connected to said terminal and one to said socket, whereby current passed through a light bulb in the socket contacting the blade passes through the coil to energize the core so that it will adhere to permeable objects to support the light.

2,103,337
EXPANSION JOINT
John Foster Oury, Chicago, Ill.
Application March 17, 1937, Serial No. 131,281
5 Claims. (Cl. 72—106)

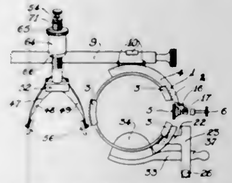
1. An expansion joint for concrete structures comprising a unitary sheet of metal having its end portions folded at an angle to each other and into channel portions in one section, the channel section projecting inwardly and the other portion having the channel portion extending outwardly.

2,103,338
ULTRAHIGH FREQUENCY OSCILLATOR
Klaas Posthumus and Pierre Janne Henri Alphonse Nordlohne, Eindhoven, Netherlands, assignors to N. V. Philips' Gloeilampenfabrieken, Eindhoven, Netherlands
Application June 15, 1935, Serial No. 26,760
In the Netherlands July 7, 1934
10 Claims. (Cl. 250—36)



1. An oscillation generator comprising an electron discharge device having within an evacuated container a cathode and a plurality of anodes surrounding said cathode, means for suitably energizing said cathode and anodes and for applying a magnetic field to the electrons emanating from said cathode to produce oscillations, said cathode being located unsymmetrically with respect to said anodes.

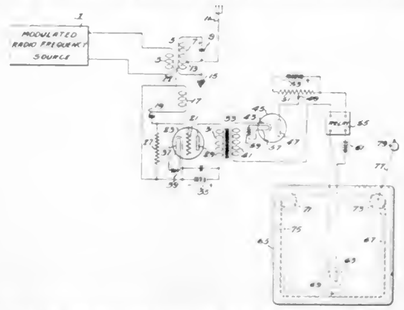
2,103,339
PACKAGE FORMING MACHINE
Leroy L. Salfisberg, South Orange, N. J., assignor to Wrap-Ade Machine Company, Inc., Newark, N. J., a corporation of Delaware
Application August 21, 1936, Serial No. 97,104
18 Claims. (Cl. 93—18)



1. A package forming machine comprising, means for feeding plural layers of ribbon packaging material, roller means for crimping said layers upon both sides to close the edges thereof for forming a continuous tube-like packaging structure, a motor for continuously driving said roller means, intermittent means for forming

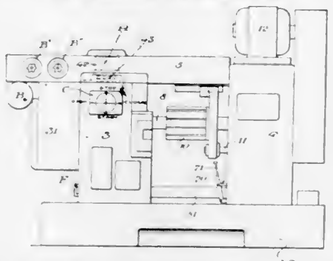
said tube-like structure into envelopes, said intermittent means comprising crimping and severing means for intermittently transversely

crimping and severing said tube-like structure in predetermined lengths, and feeding means for feeding said tube-like structure from said roller means to said intermittent means.



2,103,340
OPTICAL TRIAL FRAME
Nathan Schneck, Manitowoc, Wis.
Application May 7, 1936, Serial No. 78,312
9 Claims. (Cl. 88—20)

1. In an optical trial frame, the combination with a cross-bar and eye-ring assemblies suspended from said cross-bar, of a forwardly extending arm supported at one end thereof by said cross-bar on a horizontal pivot, a collar rigid with the other end of said arm, an internally threaded thimble journaled in and locked against endwise movement relatively to said collar, a screw extending through and having threaded engagement with said thimble, means for locking said screw against turning, a nose-grip attached to said screw, and means for rotating said thimble.

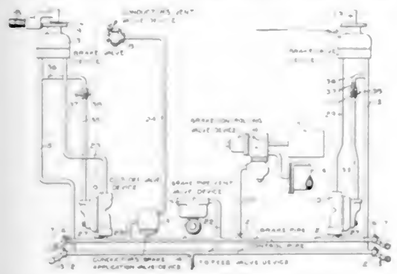


2,103,341
MODULATION METERING DEVICE
Harold J. Schrader, Haddon Heights, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application January 28, 1936, Serial No. 61,150
6 Claims. (Cl. 179—171)

1. In a modulation metering device, a circuit including a rectifier, relay, and illumination means, means for impressing modulated carrier current on said circuit, means for biasing said rectifier to prevent rectification of currents below a predetermined level, currents exceeding said bias corresponding to overmodulation, a source of power, means connecting said source to said illumination means and to said relay whereby the operation of the relay applies power to said illumination means during intervals when said modulation exceeds said predetermined level,

and light sensitive means for recording said illumination.

2,103,342
ELECTRIC CHUCKING MACHINE
Charlie W. Simpson, Cleveland, Ohio, assignor to The National Acme Company, Cleveland, Ohio, a corporation of Ohio
Application September 16, 1936, Serial No. 101,051
62 Claims. (Cl. 29—38)



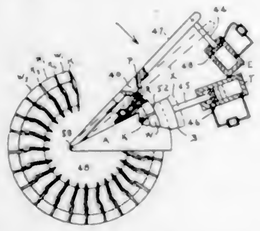
1. In a chucking machine having an indexible rotary spindle carrier provided with rotary chuck carrying spindles, a unit within each spindle for operating its chuck, shiftable means for engaging each chuck unit as it is indexed into position, an electrical motor rotating said shiftable means, an electric motor for axially shifting it, and means whereby the operation of said motors in sequence is electrically controlled.

2,103,343
FLUID PRESSURE BRAKE
Carlton D. Stewart, Swissvale, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application September 16, 1936, Serial No. 100,997
9 Claims. (Cl. 303—14)

1. In a fluid pressure brake equipment, in combination, a brake pipe, a reduction in the pressure of which brake pipe is adapted to cause the equipment to operate to effect an application of the brakes a plurality of brake controlling valve devices for controlling an application of the brakes, connections from said brake pipe to said devices, some of said connections being of minimum length, others, which lead from relatively large volumes, being of minimum length and being restricted at a point close to the brake pipe and others of greater length and unnecessary in certain braking operations being adapted to be cut off from the brake pipe, all of which combined minimizes the amount and rate of back-flow of

fluid from said devices to the brake pipe upon a reduction in brake pipe pressure and thereby minimizes the detrimental effect back-flow of

fluid may have on the transmission of the reduction in brake pipe pressure throughout a plurality of operatively connected brake equipments.



2,103,344

PROCESS OF MAKING LININGS FOR JORDAN ENGINE SHELLS

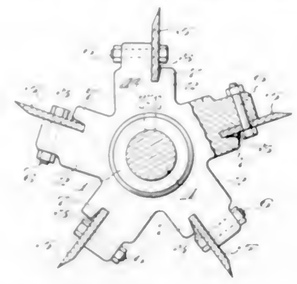
Harold D. Stuck, Lawrence, and Philip A. De Nault, North Andover, Mass., assignors to John W. Bolton & Sons, Inc., Lawrence, Mass., a corporation of Massachusetts

Refiled for application Serial No. 728,780, June 2, 1934. This application February 25, 1937, Serial No. 127,700

4 Claims. (Cl. 92—27)

1. The process of making a section of a preassembled built up lining for a Jordan engine shell which consists of assembling a group of the elements and of holding them in position while predetermined pressure is applied to them in a direction at substantially right angles to the length, of holding the pressed together parts in place and of adding other groups, of applying similar pressure to such groups successively, and of holding such groups together with the preceding group or groups until a larger section of the filling is built up.

2,103,345



SPIDER CONSTRUCTION FOR STALK CUTTERS

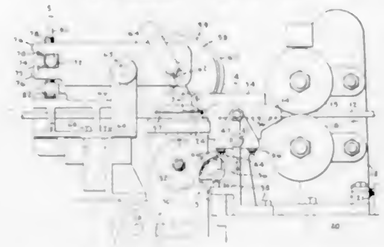
Lloyd J. Taylor, Wichita Falls, Tex.

Application October 1, 1936, Serial No. 103,539

1 Claim. (Cl. 146—121)

As a new article of manufacture, the combination in a spider casting for rotary stalk cutters comprising a tapered hub portion receivable on a shaft, a series of radial arms, each being bifurcated to define two projecting portions of unequal length, the space between said portions affording a recess to receive a cutter blade and having one wall as an abutting face for said blade and whose plane intersects the rotating axis of said hub, the adjacent wall of said recess being inclined

relative to said abutting wall and means for securing said blade in said recess.



2,103,346

TUBE WELDING

James L. Anderson, Closter, N. J., assignor to Air Reduction Company, Incorporated, New York, N. Y., a corporation of New York

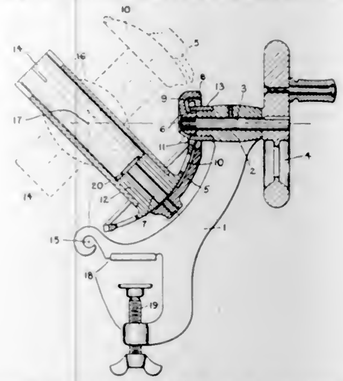
Application April 17, 1936, Serial No. 75,030

13 Claims. (Cl. 78—87)

1. In a machine for welding the longitudinal seams of two tubes traveling in adjacent and generally parallel courses, the combination of torches disposed to apply high-temperature flames to the seam regions at juxtaposed portions of the courses, and a set of rolls laterally holding both tubes adjacent the welding regions, said set of rolls comprising two adjacent rolls constructed and arranged to contact with the outer sides of the respective tubes, and roll means in axially angular relation to said two rolls and extending into the narrow spacing between the tubes and into contact with the inner sides of the tubes adjacent the welding regions to hold the tubes against said adjacent rolls.

2,103,347

WINDING MACHINE



Robert J. Bartholomew, Germantown, Pa.

Application July 10, 1936, Serial No. 90,030

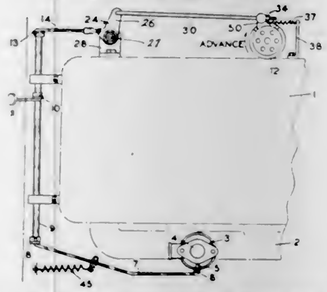
5 Claims. (Cl. 242—2)

1. A ball winder comprising a support having clamp jaws thereon, one of said jaws having a fastening bolt and the other a guide aperture, a bearing on the support, a shaft in the bearing, an arm secured to the shaft, a journal on said arm, a gear on said journal, a bobbin affixed to said gear, a gear fixed non-rotatably to the bearing, the arm having one end shaped to form a hood for the fixed gear and the adjacent end of the shaft and bearing, and the rest of the arm lying

between a portion of the support and the first-named gear, the arm having an aperture adjacent

the hood to enable the gears to be in constant engagement with each other.

2,103,348



IGNITION TIMER CONTROLLING DEVICE

Leonard D. Boyce, Maplewood, Mo.

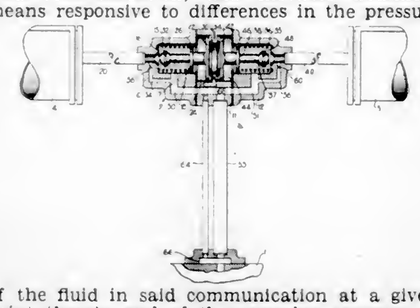
Application August 13, 1934, Serial No. 739,559

Renewed July 12, 1937

1 Claim. (Cl. 123—98)

In an internal combustion engine, having a device for supplying fuel mixture thereto, a valve for controlling the supply of said mixture, means including a distributor for supplying a spark to said engine, said distributor having adjusting means whereby the timing of the spark may be advanced or retarded, a manually operable device for controlling said valve, connections between said manually operable device and said distributor adjusting means, said connections being constructed and arranged to move the distributor adjusting means to a spark retarding position when the valve is in fully open position and when the valve is in fully closed position and to a spark advancing position when the valve is in partially open position.

2,103,349



CHECK VALVE DEVICE

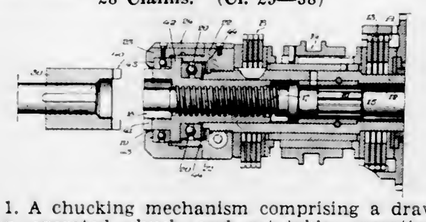
Willard I. Conant, Decatur, Ill., and Clyde C. Farmer, Pittsburgh, Pa., assignors to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application February 29, 1936, Serial No. 66,406

26 Claims. (Cl. 303—84)

1. In a fluid pressure brake equipment, in combination, a brake cylinder, a communication through which fluid pressure may be supplied to the brake cylinder, valve means controlling the flow of fluid to the brake cylinder through said communication, and movable abutment means responsive to differences in the pressure

of the fluid in said communication at a given point therein and of the opposing pressure of fluid at a point therein spaced a substantial distance from said given point for operating said valve means.



2,103,350

DRAWBAR MECHANISM FOR ELECTRIC CHUCKING MACHINES

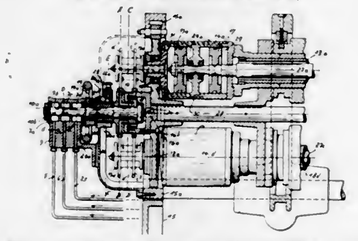
Alfred E. Drissner, Cleveland, Ohio, assignor to The National Acme Company, Cleveland, Ohio, a corporation of Ohio

Application October 9, 1936, Serial No. 104,771

28 Claims. (Cl. 29—38)

1. A chucking mechanism comprising a draw bar operated chuck and rotatable operating means therefor, and means for urging the entire draw bar in its chuck locking direction after the rotatable operating means has performed its work of closing the chuck.

2,103,351



METALWORKING MACHINE

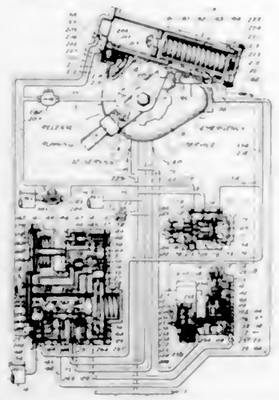
Rudolf Eckardt, Leipzig, Germany, assignor to The National Acme Company, Cleveland, Ohio, a corporation of Ohio

Application September 13, 1935, Serial No. 40,403

In Germany September 17, 1934

28 Claims. (Cl. 29—38)

1. In a metal working machine, the combination of a rotary spindle carrier, a plurality of rotary work spindles carried thereby, a chuck for each work spindle, pressure fluid operated means



for operating the said chucks, a single centrally arranged control device for the said pressure fluid operated means which control device comprises two discs rotatable relatively to each other and being provided with ducts for the pressure fluid and independently indexible means co-operating with said single control device and pressure fluid operating means for controlling the operation of the chucks in any operative position of the spindles, said single control device being in direct communication with a single fluid pressure supply source for opening and closing the chucks and also maintaining them closed.

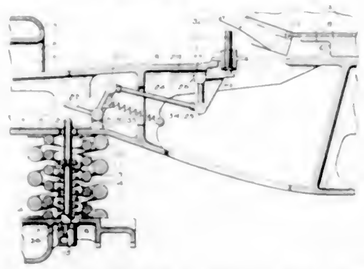
2,103,352

AUTOMATIC TRAIN CONTROL DEVICE

Clyde C. Farmer, Pittsburgh, and Ellis E. Hewitt, Edgewood, Pa., assignors to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application June 26, 1935, Serial No. 28,390
38 Claims. (Cl. 303—18)

1. In a train control brake equipment, in combination, a brake pipe, a brake valve device having a normal position for supplying fluid under pressure to said brake pipe, a lap position for cutting off the supply of fluid under pressure to said brake pipe and an application position for venting fluid under pressure from said brake pipe, a handle operable manually to move said brake valve device out of said normal position to either said lap or application position, a movable abutment, a lug associated with said abutment and operative by said abutment to effect movement of said handle and thereby said brake valve device out of said normal position to lap position only, and means operative upon a change in signal indication to effect operation of said abutment, the movement of said brake valve device by said handle being independent of said abutment.



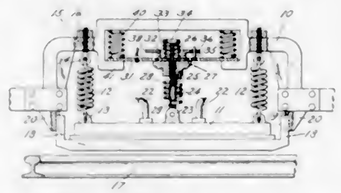
2,103,353

LOAD BRAKE MECHANISM

Clyde C. Farmer, Pittsburgh, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application September 3, 1936, Serial No. 99,211
4 Claims. (Cl. 188—195)

1. In a vehicle, in combination, a vehicle body, a supporting truck for said body comprising a side frame and a member associated with said side frame and movable vertically relative thereto according to the load carried by said body, an empty and load brake control element having an empty position and a load position and operatively carried by said vehicle body, a strut carried by said side frame, and a control mechanism carried by said member and movable vertically therewith and adapted to cooperate with



said strut and element to control the positioning of said element according to the load carried by said body, said control mechanism being normally out of operative engagement with said strut and being movable into operative engagement therewith by said element.

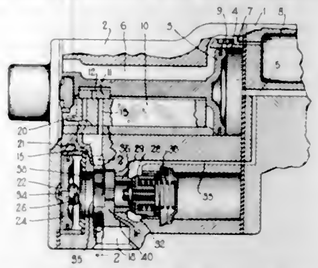
2,103,354

MAGNETIC BRAKE SHOE

Clyde C. Farmer, Pittsburgh, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application September 30, 1936, Serial No. 103,293
15 Claims. (Cl. 188—165)

1. In a magnetic track brake system, in combination, a magnetic track brake device, means for yieldingly suspending said track brake device from a vehicle truck frame, and means for automatically maintaining said track brake device suspended in its normal or release position a substantially constant distance above a track rail regardless of wear which may take place on the track brake device due to repeated engagement with the track rail.



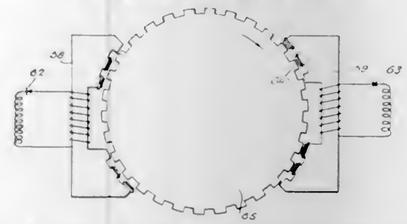
2,103,355

INSECT EXCLUDER

Clyde C. Farmer, Pittsburgh, Pa., assignor to The Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application April 23, 1937, Serial No. 138,570
17 Claims. (Cl. 303—1)

1. In a vehicle fluid pressure brake equipment, in combination, a brake controlling valve device comprising a body having a vent chamber having a wall having a relatively large vent opening therein, said body also having a discharge passage therein opening to said vent chamber, said valve device incorporating means for releasing fluid under pressure through said discharge passage, and protecting means comprising a foraminous member secured in an opening in the wall of said vent chamber and substantially separating the portion of said vent chamber open to



the vent opening from the portion of the vent chamber open to the discharge passage.

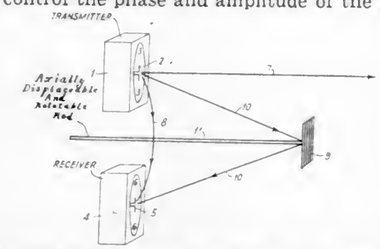
2,103,356

ELECTRIC MOTOR

Robert H. Fisher, New York, N. Y., assignor to Whiting Holding Company, Minneapolis, Minn., a corporation of Minnesota

Application December 5, 1935, Serial No. 52,986
2 Claims. (Cl. 172—275)

1. A motor comprising, a plurality of toothed stators each having its own individual electromagnetic exciting coil thereon, each stator being separate from and independent of the other, a toothed rotor, the respective stators being situated adjacent respectively different portions of said rotor for co-action therewith in a mutually independent manner, said coils being adapted for one thereof being normally connected to a source of electrical energy of pulsating magnitude, and lag rings of respectively different electrical conductivities encircling respective successive teeth of one of said stators whereby the magnetic fluxes in said encircled teeth will lag behind the flux in the unencircled teeth in phase-time relation and the degrees of lag in the respective encircled teeth will be respectively different.



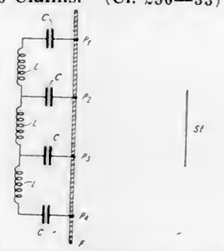
2,103,357

ULTRASHORT WAVE SYSTEM

Ernst Gerhard, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application July 18, 1936, Serial No. 91,260
In Germany August 19, 1935
2 Claims. (Cl. 250—9)

1. In an ultra short wave system, a transmitter employing a directive antenna and a reflector in the rear thereof, an adjacent receiver also having a directive antenna and a reflector, means for overcoming the effects of stray radiation from said transmitter entering said receiver, said means comprising a polarized plane reflector located in such manner as to receive a portion of the waves radiated by said transmitter and to reflect same back to said receiving antenna, said plane reflector being adjustable to control the phase and amplitude of the waves



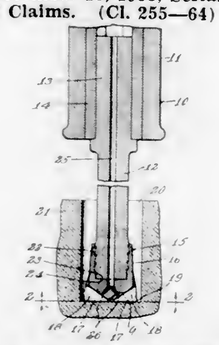
reflected by it, whereby said reflected waves can be received by said receiver in phase opposition and in amount equal to said stray radiation.

2,103,358

METHOD OF ELIMINATING RERADIATION

Albrecht Gothe, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application March 13, 1935, Serial No. 10,787
In Germany March 26, 1934
6 Claims. (Cl. 250—33)



1. The method of eliminating reradiation from an electrical conducting surface which is excited by a radio frequency radiator, which comprises short circuiting points on said surface facing said radiator which present between said points substantial radio frequency voltage differences at the frequency of the operating wave of said radiator.

2,103,359

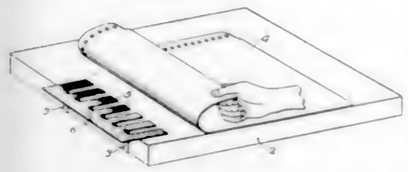
ROCK DRILL

Frank F. Graham, Cardiff, Md., assignor to Peyton du Pont, Incorporated, a corporation of Delaware

Application December 13, 1933, Serial No. 702,107
7 Claims. (Cl. 255—64)

5. A drill of the rotary-percussive type including a rod having a fluid passage extending

therethrough, a bit at one end of said rod, said bit comprising a body portion having a plurality of integral cutting edges, the inner ends of the cutting edges terminating short of the longitudinal axis of the drill to provide a central recess in the bit, said recess constituting an intercommunication for the spaces between the cutting edges and an aperture in the bit connected with the passage of said rod, said aperture terminating between the cutting edges of the bit and in spaced relation to the longitudinal axis of the drill.



2,103,360

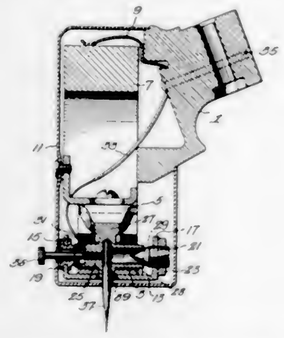
METHOD OF MAKING EQUALIZER SHEETS

Erwin C. Greenway, Chicago, Ill., assignor to Wilson-Jones Company, Chicago, Ill., a corporation of Massachusetts

Application September 25, 1936, Serial No. 102,513

3 Claims. (Cl. 93—1)

1. In a method of making equalizer sheets, the steps of positioning a comb like member adjacent one end of a sheet with the projecting strips of said comb like member projecting into the area of said sheet, adhering said projecting strips to said sheet, and trimming off the butt portion of said comb like member.



2,103,361

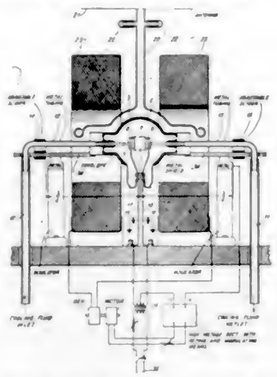
SIGNAL TRANSLATING APPARATUS

Emile C. Guedon, Audubon, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application November 12, 1936, Serial No. 110,436

6 Claims. (Cl. 179—100.41)

1. In an electric signal translating device, the combination of an armature including a pivot shaft hollowed out at its ends and having a socket therein for the reception of a needle, and a pair of tapered bearing members extending into said hollowed ends for pivotally supporting said armature, one of said members being itself hollow for the reception of a needle screw for securing a needle in said socket.



2,103,362

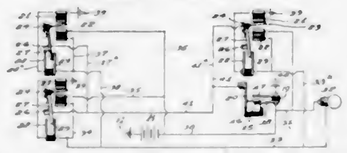
ULTRAHIGH FREQUENCY MAGNETRON OSCILLATOR

Clarence W. Hansell, Port Jefferson, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Application June 13, 1933, Serial No. 675,531

16 Claims. (Cl. 250—36)

1. An oscillation generator comprising an electron discharge device having a cylindrically shaped electron emitting element, a source of heating energy for said element and leads extending from said source to said element, an electron collecting element at the center of the electron emitting element and positioned along the axis thereof, and means for tuning said leads and the effective length of said electron collecting member.



2,103,363

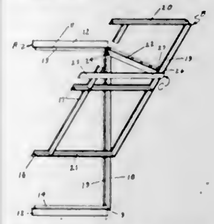
INDICATOR FOR MULTIPLE LOCK SETS

Lorrin L. Hansen, Rapid City, S. Dak.

Original application June 21, 1934, Serial No. 731,767. Divided and this application January 18, 1936, Serial No. 59,783

2 Claims. (Cl. 177—311)

1. In an electrically controlled locking system, a main key controlled lock and a plurality of electromagnetically controlled auxiliary locks, said main lock and said auxiliary locks each having a movable locking member having a locking position and an unlocking position, a movable contact mounted for movement with said locking member, a locking contact mounted to be engaged by said movable contact at the locking position of said member, an unlocking contact mounted to be engaged by said movable contact in the unlocking position of said member, means including said contacts of said main lock for locking and unlocking said auxiliary locks, an electric signal, circuits for said signal, and means for completing said circuits including the movable and locking contacts of said main lock, and the movable and unlocking contacts of said auxiliary locks to indicate the failure of any one of said auxiliary locking members to move to locking position.



2,103,364

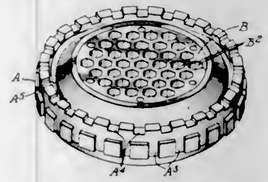
WINDOW

Casper F. Hanson, Albert Lea, Minn., assignor to Olson Manufacturing Company, Albert Lea, Minn., a corporation of Minnesota

Application April 6, 1936, Serial No. 72,867

7 Claims. (Cl. 189—69)

7. The combination with a window frame, of a sash mounted in the frame for vertical adjustment therein simultaneously with tilting movement on a horizontal axis, and means attached to the frame and influenced by the weight of the sash to adjustably grip the sides thereof at selected points above the tilting axis to support the sash in vertically adjusted positions, said means comprising a pair of arms each being pivoted at one end to the frame and having its other end provided with a recess engaged by a side bar of the sash.



2,103,365

GAS BURNER

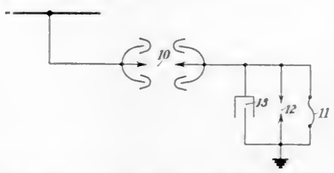
Fred Hess, Tredyffryn Township, Chester County, Pa., assignor to The Selas Company, Philadelphia, Pa., a corporation of Pennsylvania

Application March 1, 1934, Serial No. 713,432

7 Claims. (Cl. 158—116)

1. A plate-like gas burner wall member of ceramic material formed with a multiplicity of side by side burner channels of small cross section extending through it and separated from one another throughout their lengths by walls, each separating wall being relatively thin in respect to the cross-sectional area of an adjacent channel, whereby there is prevented the attainment of temperatures within said channels high enough for the ignition therein of a combustible gas mixture flowing through said channels in such volume that its combustion in its discharge from said channels will heat to incandescence the face of the burner at which the gas is discharged from said channels.

2,103,366



ARCING GAP

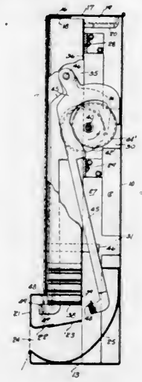
Ralph Higgins, Akron, Ohio, assignor to The Ohio Brass Company, Mansfield, Ohio, a corporation of New Jersey

Application July 27, 1935, Serial No. 33,533

6 Claims. (Cl. 175—30)

1. In a surge arrester the combination with an arcing gap, of a circuit interrupter adapted, when open, to provide an open break in the circuit in which it is connected, said interrupter being electrically connected between one terminal of said gap and ground, and a condenser in parallel with said circuit interrupter between said terminal and ground for supplying charging current to said arcing gap when said circuit interrupter is open, the capacitance of said condenser being insufficient to produce effective reduction in the crest of a surge voltage causing discharge across said gap, but the resistance of the path through said circuit interrupter being low enough to divert the major portion of the surge current from said condenser and to provide a substantially direct ground for said current.

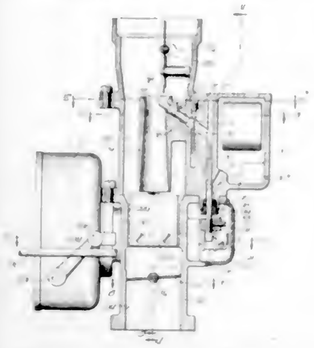
3. The combination with an arcing gap, of a circuit interrupter in series with said gap between one terminal of said gap and ground, a condenser in parallel with said circuit interrupter, and an auxiliary gap in parallel with said circuit interrupter and said condenser.



2,103,367

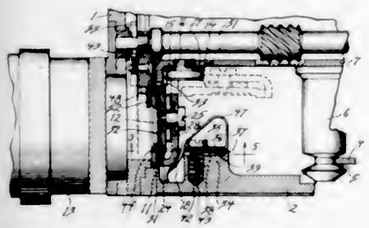
DISPENSING MACHINE

Fairfield William Hoban, New York, N. Y., assignor to Stewart & McGuire, Inc., New York, N. Y., a corporation of New York



Application May 31, 1935, Serial No. 24,402

13 Claims. (Cl. 312—69)

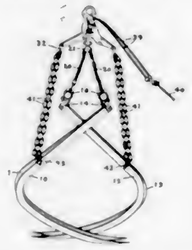


1. A dispensing device having a plurality of storage magazines arranged side by side, a reciprocatory element movable underneath each magazine for removing the lowermost article from the corresponding magazine, actuating means for positively shifting each reciprocatory element in each direction, said means extending upwardly alongside the corresponding magazines, and a transversely extending unitary step by step operator for all of said actuating means and movable only when all the reciprocatory elements are free to move, the operator being disposed above the bottoms of the magazines and connected to the actuating means so that at each step only one reciprocatory element engages an article to remove it.

2,103,368
FUEL CONTROL MECHANISM
Addison C. Hoof, Hinsdale, Ill.
Application September 6, 1935, Serial No. 39,375
18 Claims. (Cl. 261—51)

1. Downdraft fuel control means of the class described adapted to be inserted in the inlet conduit of an internal combustion engine, comprising a carburetor body having a conduit therethrough a governor housing secured thereto, a butterfly valve in said conduit, a governor valve, a liquid fuel supply, a liquid fuel nozzle in said conduit above both of said valves, a fuel valve, an air supply, a manual control for said butterfly valve, an automatic control for said governor valve and means interconnecting said butterfly valve, governor valve and liquid fuel valve for controlling the quality and quantity of fuel mixture flowing to said engine.

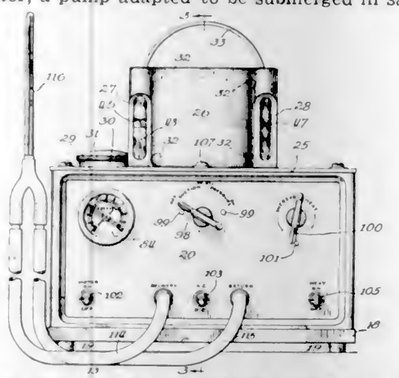
2,103,369
STRIP FEED MECHANISM
Albert S. Howell, Chicago, Ill., assignor to The Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Application October 22, 1934, Serial No. 749,334
15 Claims. (Cl. 88—17)



1. In a strip feed guide the combination of opposing strip face guide members, a pivotal mounting for one of said guide members and comprising flattened bearing means and spring means cooperating with said bearing means to yieldably urge this guide member into an intermediate position of its pivotal movement and adapted to permit movement thereof in either direction from said intermediate position, and releasable means for positioning said pivotally mounted guide member in film retaining relation with the other guide member.

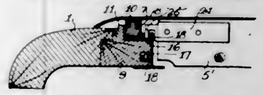
6. In a strip feed mechanism the combination with an intermittent strip feed guide comprising a relatively stationary strip face guide member and an opposing movable face guide member, of a carrier mounted for movement facewise of said stationary guide member, means resiliently carrying said movable guide member on said carrier for limited facewise movement with respect thereto, releasable means for positioning said carrier member with said movable guide member in guiding relation with said stationary guide member, a take up device for taking up a strip from said guide, and opposing strip locking members between which the strip passes between the guide and said take up device to cause a relatively sharp bend in the strip consequent to tension exerted on the strip by said take up device, one of said locking members being arranged on said carrier beyond one end of said movable guide member for movement to and away from the other locking member with movement of said carrier to open and close said guide.

10. In a photographic camera the combination with a casing provided with an access opening and a door for closing said opening, of a film feed exposure guide within said casing and comprising opposing film face guide members and opposing film edge guide members, and mounting means carrying one of said face guide members and one of said edge guide members for movement into and out of film guiding position comprising a mounting carrying said movable edge guide member on said door.



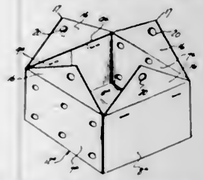
2,103,370
HAY FORK
Albert C. Johnson, Fairfield, Iowa, assignor to The Louden Machinery Company, Fairfield, Iowa, a corporation of Iowa
Application February 19, 1936, Serial No. 64,718
11 Claims. (Cl. 294—109)

1. A hay fork comprising a head, a plurality of individually supported pairs of tines, the tines of each pair being hinged with respect to each other, and constrained to move about a definite axis, means connecting the hinged ends of the tines to the head, said means being releasably secured to the head, and means connecting the tines intermediate their length to the head to support the tines when the first mentioned means are released from the head.



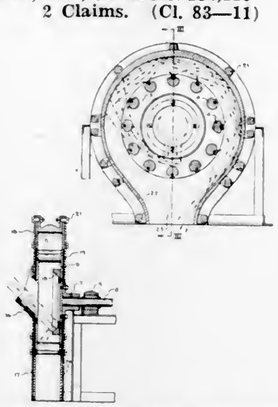
2,103,371
THERAPEUTIC DEVICE
Arthur C. Kleckner, Racine, Wis.
Application April 21, 1934, Serial No. 721,684
6 Claims. (Cl. 128—401)

1. A therapeutic device of the type described, comprising a tank for liquid to be circulated, means for heating said liquid, and a unitary structure including a flange whereby it is removably mounted on said tank and partly extending thereinto, said unitary structure comprising a motor, a pump adapted to be submerged in said



liquid, and conduit means above said flange for supplying heated liquid from and to said pump.

2,103,372
SLIDING HOOD
Hermann Lange, Erlenbach, Switzerland
Application November 26, 1935, Serial No. 51,656
2 Claims. (Cl. 296—137)

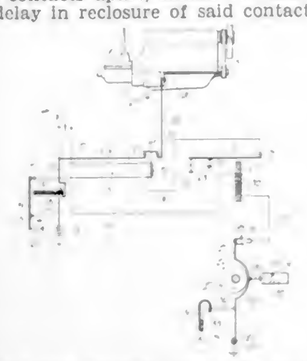


1. A sliding hood, comprising in combination hoops, longitudinal bars one on each side of said hoops and each having a guide channel on its inner side, U-section guides on the upper side of each of said bars, endless pull link chains mounted on each of said bars and extending parallel to said guides, the upper part of each chain being exposed on its upper side and situated at the same height as the adjacent guide and guided between this guide and the middle of the end face of said hoops, and the lower part of each chain being accommodated in a guide channel in its bar, inverted T-section irons arranged one on the inner side of each of said bars, the upright arms of said irons forming the outer wall of said guide channels and extending above the upper chain part and the inwardly projecting horizontal arm T-section forming a supporting guide for said hoops, and anchor pieces at the ends of one of the end hoops loosely engaging from above in the upper part of said chains at any desired link.

2,103,373
BOX
Martin J. McClure, El Paso, Ill.
Application March 30, 1935, Serial No. 13,856
1 Claim. (Cl. 229—33)

In a device of the kind described, a box made up from a blank of cardboard impregnated against moisture and including a bottom, sides turned upward from the bottom, ends turned upward from the bottom, fastening flaps turned in from the said sides and disposed within the ends, staples securing the ends and fastening flaps together, and the said sides having ventilating apertures near their upper and lower margins, and triangular handle and cover flaps extended at their bases from the upper margins of the sides and ends and meeting precisely at the center so as to completely close the box, the said flaps having their apertures near their free ends.

2,103,374
APPARATUS FOR ELIMINATING SOFT STONE FROM GRAVEL
Victor Mikan, Durand, Mich.
Original application December 27, 1933, Serial No. 704,159. Divided and this application March 20, 1937, Serial No. 132,116
2 Claims. (Cl. 83—11)



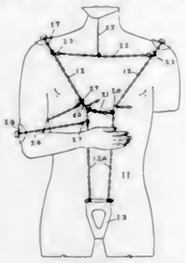
1. In apparatus for the elimination of soft stone in gravel, the combination of a rotor mounted for rotation in a vertical plane, said rotor having a hollow interior defined by an annular row of circumferentially spaced impact bars with openings defined therebetween for discharge of material directed into the interior of the rotor, disc-like plates spaced by said bars, a deflecting ring concentrically supported on one of said plates having a continuous surface angularly disposed to the axis of rotation of said rotor, means for directing gravel through the plate opposite the plate supporting said deflected ring through an unobstructed course, into engagement with said angular surface of said deflecting ring whereby the soft stone and gravel is directed from said deflecting ring to said impact bars, the direction of flow of gravel against said deflecting ring being substantially normal to said angular surface.

2,103,375
AUTOMATIC STARTING SYSTEM
Marion W. Morris, Logansport, Ind., assignor, by mesne assignments, to Eclipse Machine Company, Elmira Heights, N. Y., a corporation of New York
Application June 29, 1935, Serial No. 29,024
8 Claims. (Cl. 290—38)

1. In a starting system for internal combustion engines, a control circuit for said system including a normally closed set of contacts, means including mechanical means operated in

response to operation of said engine for holding said contacts apart, means for introducing a time delay in reclosure of said contacts after

said engine has stopped operating, and means for maintaining said time delay constant during temperature variations.



2,103,376

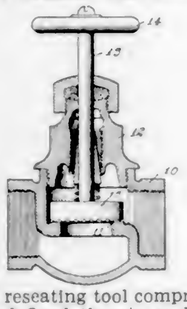
APPLIANCE FOR PREPARING BODIES FOR BURIAL

Homer R. Murray, Fairfield, Iowa

Application May 18, 1936, Serial No. 80,320

6 Claims. (Cl. 27—1)

1. An appliance for preparing bodies for burial comprising flexible members adapted to engage the shoulders of a body and a crotch-engaging member to which the flexible members are fastened under tension, whereby the shoulders may be drawn down and held in position during embalming.



2,103,377

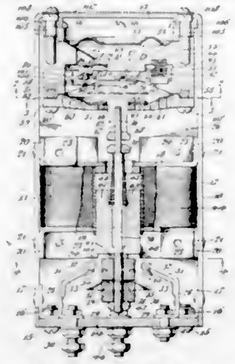
VALVE RESEATING TOOL

Raymond P. Norton, Algona, Iowa

Application November 27, 1936, Serial No. 113,042

2 Claims. (Cl. 29—103)

1. A valve reseating tool comprising a stem and a cutter head fixed thereto and adapted to rotate about the axis of said stem, one portion of the working surface of the cutter head having formed thereon a series of cutting blades, the cutting edge of the blade of said series which is in advance of the other blades during the normal rotation of the cutter being shorter than the remaining blades of the series relative to a plane at right angles to the axis of rotation of the tool, an oppositely disposed portion of the working surface of the cutter head having formed thereon a series of cutter blades having their cutting edges in substantially the same plane as that of the longer blades of the first mentioned series.



2,103,378

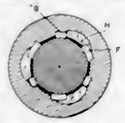
TIME DELAY APPARATUS

Victor L. Oestnaes, Westfield, and Carl Arthur Swanstrom, Irvington, N. J., assignors to American Gasaccumulator Company, a corporation of New Jersey

Application August 24, 1933, Serial No. 686,592

20 Claims. (Cl. 200—97)

1. In a time limit control device, the combination of a solenoid, a core movable therein, a transmission rod movable with said core and having a lost motion connection therewith, and delay means for said transmission rod comprising a compression chamber having a diaphragm wall connected to said transmission rod, an expansion chamber associated with said compression chamber, a throttling valve between said chambers, an equalizing valve between said chambers, means for closing said equalizing valve, and means for opening said equalizing valve upon a predetermined spacial movement of said transmission rod.



2,103,379

METHOD OF FORMING A ROTARY TOOL

Carl J. Oxford, Detroit, Mich., assignor to National Twist Drill & Tool Company, Detroit, Mich., a corporation of Michigan

Application September 14, 1936, Serial No. 100,775

3 Claims. (Cl. 29—156)

1. The method of forming a tool socket comprising the forming of said socket with a cylindrical bore, forming in the inner wall of said socket a series of longitudinally extending grooves and a second series of grooves of lesser

width intermediate and parallel to said first series leaving ribs therebetween, and cutting away portions of alternate ribs a predetermined distance from the end of the socket to form transverse grooves therein connecting the wide and narrow grooves, the remaining ribs constituting limiting shoulders at the end of each transverse groove accurately and uniformly positioned with respect to the corresponding wide grooves.

2,103,380

TORPEDO LAUNCHING GEAR

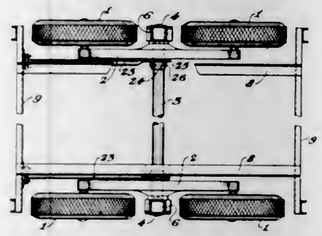
Hubert Scott-Paine, Hythe, England

Application August 31, 1936, Serial No. 98,650

In Great Britain June 20, 1935

7 Claims. (Cl. 114—18)

1. A marine weapon comprising a light variable speed craft having a torpedo runway thereon relative to which a torpedo may move longitudinally of the craft and of its own length from a normal position to a launching position, a torpedo supported for free relative movement along the runway from the normal to the launching position, a latch for restraining the torpedo against relative movement along the runway, and common means for simultaneously releasing the latch and changing the speed of the craft whereby the inertia of the torpedo is utilized to move it from the normal to the launching position.



2,103,381

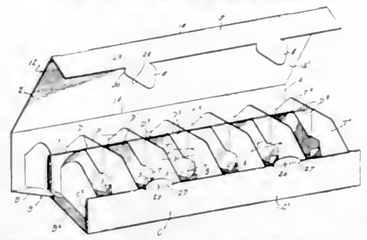
VEHICLE RUNNING GEAR

Edward H. Perkins and Hubert E. Mills, Midland, Mich., assignors, by mesne assignments, to Whitehead & Kales Company, River Rouge, Mich., a corporation of Michigan

Application May 17, 1935, Serial No. 21,940

2 Claims. (Cl. 280—124)

1. A road vehicle having a body, a transversely extending axle beneath said body, rocker-beams on said axle adjacent opposite ends thereof, ground-engaging wheels upon the outer sides of said rocker-beams and connected thereto at opposite ends thereof, body supporting means at opposite ends of said axle upon the outer sides of said rocker-beams substantially in longitudinal alignment with said wheels, radius rods upon the inner sides of said rocker-beams and terminally connected to said body and axle, and guide brackets projecting downwardly from said body at each side thereof, each bracket having a slotted portion receiving the axle and an upright portion for sliding engagement with the contiguous radius rod.



2,103,382

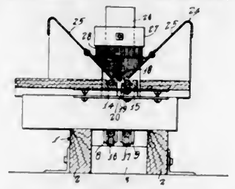
EGG CARTON

Noel A. Petter, Los Angeles, Calif.

Application December 11, 1935, Serial No. 53,889

11 Claims. (Cl. 229—29)

1. An egg carton having side walls, a bottom connected with said side walls and comprising two inclined panels with a longitudinal elevated ridge connecting the same, transverse partition walls hingedly connected to the inner faces of the side walls to swing in a horizontal plane, a longitudinal partition wall hingedly connected with the transverse partition walls, so that the longitudinal partition wall may swing longitudinally, said ridge having a plurality of openings spaced along the same, and the lower edge of said longitudinal partition wall having means for projecting below the bottom and engaging into said bottom openings in said swinging movement, maintaining the ridge in its elevated position and holding the transverse partition walls in a fixed position.



2,103,383

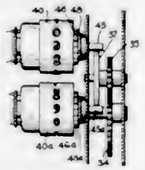
CHERRY SPLITTER

Clyde D. Russell, Oakland, Calif., assignor to California Packing Corporation, San Francisco, Calif., a corporation of New York

Application December 3, 1934, Serial No. 755,676

2 Claims. (Cl. 146—73)

1. In a machine for halving cherries, the combination of a hopper with converging side walls disposed apart to form a gap at their lower edges, a conveyer supported independently of said side walls and onto which the cherries descend down said walls, the conveyer including inverted V-shaped belts mounted in spaced relation to provide in conjunction with said converging side walls, a V-trough with downwardly converging faces, spaced apart grooved pulleys over which the belts are trained, means for relatively adjusting the spaced pulleys to vary the transverse dimension of the groove between the belts, a plurality of yielding curtains located within the trough substantially filling the cross section of the trough at its bottom and extending down to a point near the conveyer for engaging and holding back the cherries except a line of cherries within the V trough and supported directly by the belts in single file relation, a rotary splitting blade positioned over the conveyer with its periphery projecting into the trough, the converging side walls of the hopper and the conveyer extending continuously up to the cutter, and

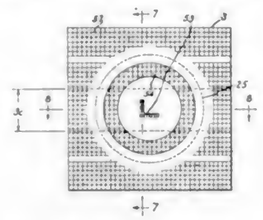


means for driving the rotary splitting blade to split the fruit as the same is conveyed by the conveyer past the rotary blade in single file relation.

2,103,384
NONBLURRABLE MIRROR
Manuel Somohano, Mexico, D. F., Mexico
Application January 21, 1935, Serial No. 2,823
In Mexico February 6, 1934
1 Claim. (Cl. 88—73)

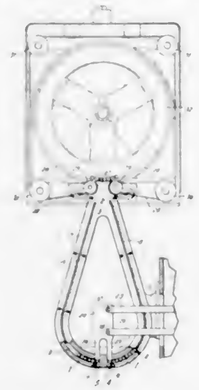
A non-blurrable bath room mirror comprising a housing of relatively little depth with relation to its length and height, one of the large walls of the housing being a transparent plate; in the interior of said housing and adjacent to the wall opposite to the transparent plate, a mirror with its reflecting surface facing inwardly so as to reflect light through the transparent plate of the opposite side; and a row of electric lamps along at least one of the interior sides of the housing, to heat the transparent plate that covers the housing, and to produce the light to be reflected by the mirror.

2,103,385
PACKAGE FABRICATION
Leroy L. Salfisberg, South Orange, N. J., assignor to Ivers-Lee Company, Newark, N. J., a corporation of Delaware
Original application November 22, 1934, Serial No. 754,311. Divided and this application May 4, 1935, Serial No. 19,762
4 Claims. (Cl. 41—21)



1. The method of providing indicia characters on regenerated cellulose material comprising a base having a fusible coating which comprises, applying heat to a predetermined area of said material corresponding to an indicia configuration to fuse and oxidize said coating to change its refractive index.

4. The method of providing indicia characters on regenerated cellulose material which comprises applying heat and pressure simultaneously on both sides of said material in the same predetermined area corresponding to an indicia configuration, said heat being continued to a degree sufficient to oxidize said cellulose material to alter the refractive index thereof.

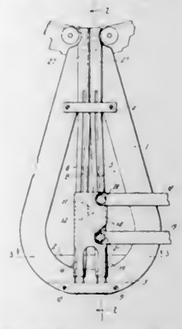


2,103,386
COLOR PACKAGING
Leroy L. Salfisberg, South Orange, N. J., assignor to Ivers-Lee Company, Newark, N. J., a corporation of Delaware
Application May 24, 1935, Serial No. 23,330
3 Claims. (Cl. 206—46)

1. A package structure comprising, a commodity-containing envelope composed of two walls of material sealed together in a sealing area, one of said walls being composed of heat sealable packaging material, and an indicia insert interposed between said commodity and said wall of

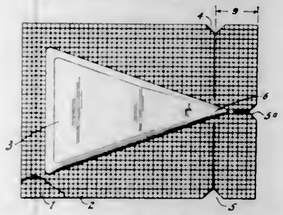
material and heat sealed thereto in an area within the boundary of said first mentioned sealing area, said insert being held by said wall by said heat seal.

2,103,387
ARTICLE FEEDING CONSTRUCTION
Leroy L. Salfisberg, South Orange, N. J., assignor to Ivers-Lee Company, Newark, N. J., a corporation of Delaware
Application October 5, 1935, Serial No. 43,705
8 Claims. (Cl. 226—2)



1. Article feeding means comprising, a feeding structure having a plurality of spaced channels each for storing articles in file formation to feed towards each other to a limited position, a chamber arrangement into which said channels feed, and into which said articles move, said chamber arrangement including chutes leading respectively from said channels for accommodating the articles from different channels in definite spatial relationship with respect to each other, and commonly actuated means for releasing said articles in said spaced relationship from said individual chutes, said last mentioned means being operable in the space between said channels.

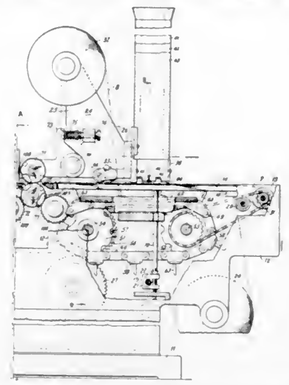
2,103,388
PACKAGING FEEDING SYSTEM
Leroy L. Salfisberg, South Orange, N. J., assignor to Ivers-Lee Company, Newark, N. J., a corporation of Delaware
Application October 5, 1935, Serial No. 43,706
2 Claims. (Cl. 226—2)



1. Article feeding means comprising, a mounting structure, a plurality of tubes carried by said

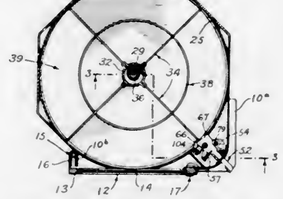
mounting structure and having an elliptical cross-section, chamber means carried by said structure and comprising channels to which said tubes open, trap means for normally closing said channels, and plunger means rectilinearly movable through said channels for removing articles from said chamber means through said channels while actuating said trap means, said tubes and said

chamber means being constructed so as to roll articles of ovoid formation into said channels along their minor axes, and said tubes being loosely carried by said mounting structure, and an arrangement included in said plunger means for agitating said tubes by its rectilinear motion so as to effect the alignment of articles within said tube.



2,103,389
CONTAINER FOR FLUIDS
Leroy L. Salfisberg, South Orange, N. J., assignor to Ivers Lee Company. Newark, N. J., a corporation of Delaware
Application August 21, 1936, Serial No. 97,105
10 Claims. (Cl. 221—60)

1. A fluid container comprising, opposed layers of packaging material bonded together to form a fluid containing receptacle having an orifice maintained in closed condition by said layers of material, said layers of material including a flap structure adapted to be torn off to open said orifice for permitting the discharge of the fluid contents of said receptacle.

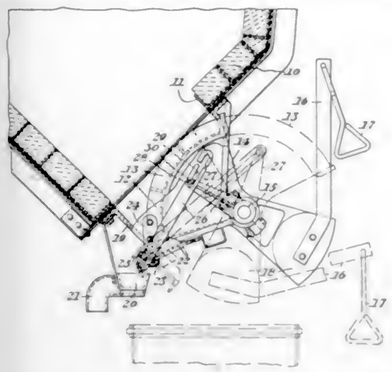


2,103,390
PACKAGING MACHINE
Leroy L. Salfisberg, South Orange, N. J., assignor to Ivers-Lee Company, Newark, N. J., a corporation of Delaware
Application August 21, 1936, Serial No. 97,106
11 Claims. (Cl. 93—2)

1. Packaging apparatus comprising, package forming equipment, means for feeding packaging material to said package forming equipment in a substantially horizontal plane, commodity storage means disposed above said plane, and means beneath said material and acting therethrough for disengaging articles from said storage means to cause the same to be deposited upon said ma-

terial for feeding to said package forming equipment.

2,103,391
VENDING APPARATUS OR THE LIKE
Gilbert J. Scofield, Loudonville, N. Y.
Application December 8, 1933, Serial No. 701,411
10 Claims. (Cl. 312—94)

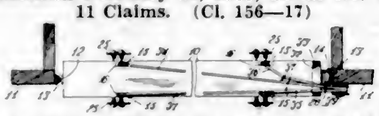


10. An apparatus of the general nature of that herein described, in combination, an enclosure, a plurality of shelves horizontally disposed in said enclosure and fixedly secured thereto, a plurality of partition members disposed between each adjacent pair of shelves, each adjacent pair of partition members forming a compartment, said shelves having registering openings formed therein, and means for moving said partitions over said shelves to sweep articles disposed thereon into said openings.

2,103,392
DEFLECTOR MEANS FOR HOPPER SPOUTS
Edgar A. Thumlert, Marion, Ohio, assignor to The Fairfield Engineering Company, Marion, Ohio, a corporation of Ohio
Application June 23, 1936, Serial No. 86,788
4 Claims. (Cl. 110—165)

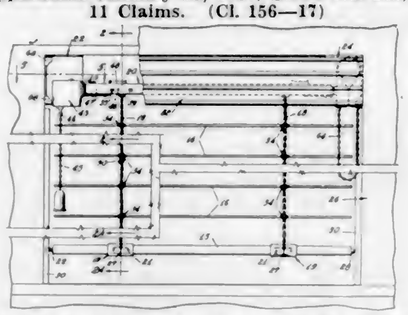
1. In combination with an ash hopper spout having a gate pivoted therebelow, said gate blocking the spout when closed, said spout being adapted to discharge granular material by gravity when the gate is open, a shelf pivoted below the bottom of the spout, a crank movable with said gate, a link pivotally connected to the crank and shelf whereby to tilt said shelf in one direction when the gate is opened and in the opposite direction when it is closed, the tilting axis of the shelf being so located that the shelf tends by its own weight to tilt in said first-mentioned direction, and said

shelf being positioned under the spout and closely adjacent thereto so that material discharged



therefrom tends to tilt the shelf in said first-mentioned direction.

2,103,393
GARMENT CUTTER PLOTTING INSTRUMENT
Emma W. Van Ame, Detroit, Mich.
Application May 18, 1936, Serial No. 80,324
1 Claim. (Cl. 33—11)

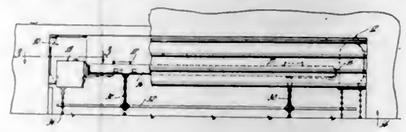


A measuring instrument having constituent branches in substantially right-angular relation to one another, each branch being provided with standard linear scale portions along but spaced from its outer edge, the other edge of each branch being curvedly contoured, and means carried by each of said branches for supporting between its edge and the scale portion carried thereby, beside and in operative propinquity to both the edge and the scale portion, any one of a plurality of detachable supplementary linear scales, said supporting means including attaching elements secured to the curved portion of each branch and bridging the first-mentioned linear scale portions and bearing against the space between the edge and said first-mentioned linear scale portions, thereby rendering either its markings or those upon the adjacent graduated edge of the branch available to one who is using the measuring instrument for the selective plotting of guiding markings on a subjacent surface.

2,103,394
VENETIAN BLIND
William Wade, Chicago, Ill., assignor to National Lock Co., Rockford, Ill., a corporation of Delaware
Application February 21, 1935, Serial No. 7,528
11 Claims. (Cl. 156—17)

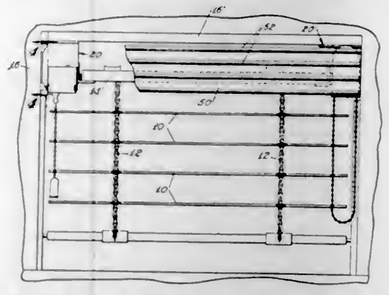
1. In a blind of the character described provided with supporting chains, a slat holding clip of resilient sheet metal bent into substantially U-shape and adapted to frictionally slip onto a longitudinal edge of a slat, one side of the U-shape clip being slit toward the base and said partially severed portion bent outwardly to provide an integral hook shaped spring tongue, and a contractible loop member adapted to engage the tongue and to effect holding relation with a link of said supporting chain.

2,103,395
VENETIAN BLIND
William Wade, Chicago, and Edwin North, Rockford, Ill., assignors to National Lock Company, Rockford, Ill., a corporation of Delaware
Application January 28, 1937, Serial No. 122,793
11 Claims. (Cl. 156—17)



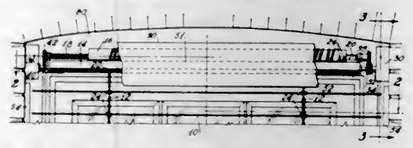
1. Blind supporting means including a main support, a plurality of blind slats suspended by flexible elements from said main support; and a pair of end supports attachable to a window casing, and one of the same having mounting pin means extended therefrom and receivable in an opening in an end of said main support, said main support having an end opposite to said last mentioned end and provided with a pivoted member having pin and slot engagement with the remaining end support of said pair whereby said main support may be readily slipped into and out of mounted position relative to said end supports.

2,103,396
VENETIAN BLIND
William Wade, Chicago, and Edwin North, Rockford, Ill., assignors to National Lock Company, Rockford, Ill., a corporation of Delaware
Application January 28, 1937, Serial No. 122,794
12 Claims. (Cl. 156—17)



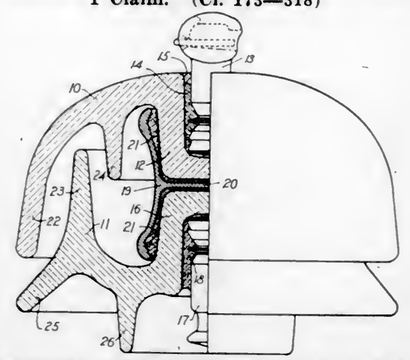
1. In a Venetian blind, a carriage supported axially between opposite end brackets attached to a window casing or the like, one of said brackets having pin means extended in an axial direction toward said carriage and receivable in the axial end of the same, the other said bracket having a member with axially elongated slots

therein, the corresponding end of said carriage having a pivoted member with lug means re-



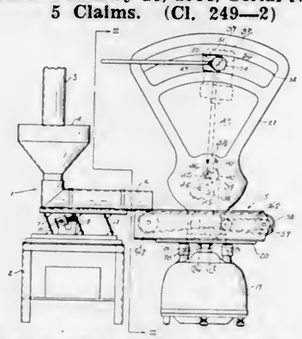
ceivable in said last-mentioned slots, and said carriage being movable axially between said brackets.

2,103,397
BLIND HOUSING STRUCTURE
William Wade, Chicago, and Edwin North, Rockford, Ill., assignors to National Lock Company, Rockford, Ill., a corporation of Delaware
Application January 28, 1937, Serial No. 122,799
6 Claims. (Cl. 156—17)



1. A blind housing structure consisting of a pair of brackets having integrally formed extensions for engagement with a valance plate, and an elongated valance plate having formations along its longitudinal edges and adapted to snap into supporting engagement with said bracket extensions whereby said plate may be supported between and by said brackets.

2,103,398
OUTSIDE VENETIAN BLIND
William Wade, Chicago, and Edwin North, Rockford, Ill., assignors to National Lock Company, Rockford, Ill., a corporation of Delaware
Application January 28, 1937, Serial No. 122,801
7 Claims. (Cl. 156—17)



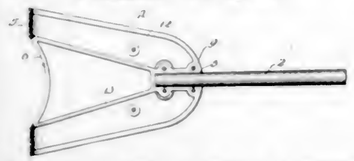
1. Blind supporting and operating mechanism for installation on the outside of a window structure, said mechanism including a carriage, means for pivotally supporting the carriage across the outside of a window structure, a plurality of slats suspended from said carriage by flexible elements and mechanism on said carriage for moving said slats and including a driven member, together with control means drivingly connected with said driven member and extended through the window structure to the inner wall surface adjoining said window, and manually operable means on said control member and operable to drive the same.

2,103,399
INSULATOR
Robert H. Walker, Barberton, Ohio, assignor to The Ohio Brass Company, Mansfield, Ohio, a corporation of New Jersey
Application April 24, 1935, Serial No. 17,981
1 Claim. (Cl. 173—318)

An insulator unit comprising a pair of dielectric members each having a boss thereon, a sleeve connecting said bosses to secure said dielectric members together, a radially extending flange on each of said dielectric members, skirts on said flanges directed inwardly toward each other and enclosing the space about said sleeve and forming a labyrinthine passage connecting said space with the surrounding atmosphere, said bosses having outwardly opening recesses therein, said recesses being closed at their inner ends by the material of said bosses, and attachment pins secured in said recesses for connecting said insulator unit to other units in a string, the inwardly directed position of the skirts providing clearance for close coupling of said units in the string so as to secure a minimum string length, while at the same time the skirts enclose the sleeves of the various units in the string producing a string having a minimum exposure of its fittings.

2,103,400
WEIGHING DEVICE
Mark A. Weckerly, Toledo, Ohio, assignor to Toledo Scale Manufacturing Company, Toledo, Ohio, a corporation of New Jersey
Application February 16, 1934, Serial No. 711,498
5 Claims. (Cl. 249—2)

1. In a device of the class described, in combination, weighing mechanism, means for supplying material in a smooth stream to said weighing mechanism, a belt conveyor for conveying such material from said weighing mechanism, a



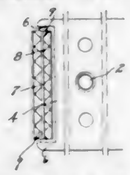
synchronous motor for moving said belt conveyor at a uniform linear footage per minute, and means controlled by said weighing mechanism and controlling said supplying means to maintain the load on said weighing mechanism at substantially constant weight, said belt conveyor and synchronous motor being supported on said weighing mechanism.

2,103,401

ANIMAL POKING IMPLEMENT

Archie S. Bailey, Albert Lea, Minn., assignor of one-half to John P. Donahue, Twin Lakes, Minn.

Application April 15, 1937, Serial No. 137,033
3 Claims. (Cl. 119—1)



1. An animal poke comprising a guiding end formed of a doubled rubber sheet, a handle centrally secured between the free ends of said sheet, and anchoring and stiffening means for said double sheet in the handle supporting portion, bringing about relative resiliency in the outer doubled edge of said sheet.

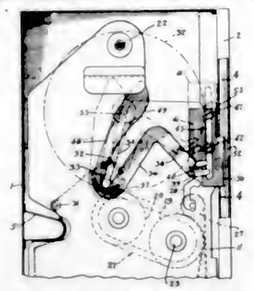
2,103,402

SAFETY RAZOR

Pendleton Beckley, Paris, France

Application October 29, 1936, Serial No. 108,206
In France August 26, 1936
2 Claims. (Cl. 30—83)

1. An attachment for a lateral edge of one of the blade-holding members of a safety razor, consisting of a lattice-work cylindrical member rotatably supported in parallel relation to such lateral edge of the holder and to the adjacent cutting edge of the razor blade, adapted to slightly compress the skin surface relatively to the normal protuberance of the individual hairs of the beard therebeyond in advance of the action of the blade thereupon, thereby enabling the severance of the same to be effected at points on each substantially in the plane of the skin surface.



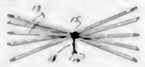
2,103,403

TOWEL DISPENSING APPARATUS

Rudolph G. Birr, Lombard, Ill., assignor to Steiner Sales Company, Salt Lake City, Utah, a corporation of Utah

Original application April 8, 1935, Serial No. 15,271. Divided and this application November 1, 1935, Serial No. 47,855
8 Claims. (Cl. 312—38)

5. An apparatus for dispensing toweling material including, a roll, journaling means for the roll capable of motion in a direction perpendicular to the roll axis, said roll and its journaling means being responsive to a change in the amount of toweling material by movement in the direction aforesaid, indicating means, and means



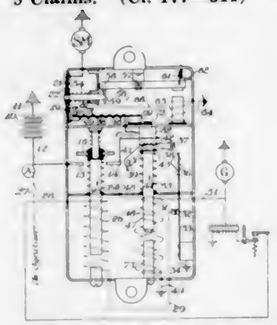
controlled by the journaling means to cause said indicating means to move in response to change in the amount of toweling.

2,103,404

ORNAMENTAL STRUCTURE

Charles C. Bolyard, Los Angeles, Calif., assignor to Paper Supply Company, Los Angeles, Calif., a corporation of California

Application July 20, 1936, Serial No. 91,559
5 Claims. (Cl. 41—10)



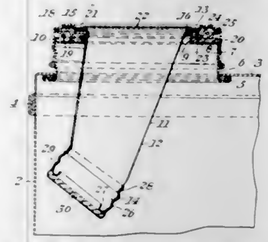
2. A process of making ornamental decorations consisting in disposing a plurality of elongated tubular translucent straws longitudinally side by side providing a bundle, placing an elongated flexible element about the bundle between the ends of the straws, twisting the ends of said element together for forming a loop encircling the bundle, and further twisting the ends of said element for compressing the straws adjacent said loop for causing the ends of said straws to be disposed radially with respect to said loop.

2,103,405

AUTOMATIC STARTING MECHANISM FOR INTERNAL COMBUSTION ENGINES

Frank T. Christian, Elmira, N. Y., assignor to Eclipse Machine Company, Elmira, N. Y., a corporation of New York

Application April 29, 1931, Serial No. 533,649
5 Claims. (Cl. 177—311)



1. Automatic starting mechanism for internal combustion engines including a starting motor and means for automatically energizing said starting motor if the engine stalls and for deenergizing said motor when the engine starts, and auxiliary means for deenergizing said motor and maintaining the same deenergized in case the motor fails to start the engine in a predetermined time, said energizing and deenergizing means comprising elements rendered effective by the operation of said auxiliary deenergizing means to produce a signal to the operator in case of such failure to start.

2,103,406

CONTAINER AND SPOUT CONSTRUCTION

Guy O. Conner, Wheeling, W. Va., assignor to Wheeling Steel Corporation, Wheeling, W. Va., a corporation of Delaware

Application October 1, 1935, Serial No. 43,070
6 Claims. (Cl. 221—24)

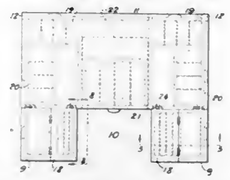
1. In combination, a container having a discharge opening and having a gasket connected therewith adjacent the discharge opening and a reversible spout having a flange having reentrant sealing portions adapted to engage the gasket in sealing relationship in either position of the spout.

2,103,407

STEEL HOUSE CONSTRUCTION AND THE LIKE

William T. Dean, Gary, Ind.

Application May 11, 1933, Serial No. 670,444
Renewed May 5, 1937
7 Claims. (Cl. 189—34)



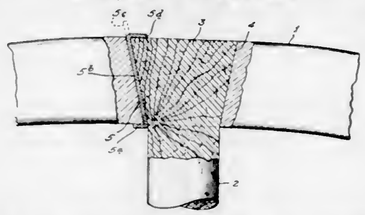
7. In a building construction of the type described, the combination of a plurality of inner and outer sheet metal panels having side edges, the respective inner and outer panels being disposed adjacent each other and the outer panels being spaced from the inner panels, integral return bend portions formed on the side edges of each of the said panels, said return bend portions of adjacent panels being adjacent to each other, and sheet metal studs, each telescopically engaging adjacent and opposed pairs of return bend portions, connecting adjacent and opposed pairs of inner and outer panels, and spacing the inner panels from the outer panels, at least one side of said studs having a lining of insulating material for insulating the inner panels from the outer panels.

2,103,408

CLASSROOM COMMITTEE TABLE

Mildred I. Eddy, Omaha, Nebr.

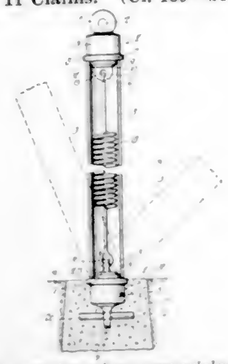
Application November 12, 1936, Serial No. 110,432
2 Claims. (Cl. 45—6)



1. A classroom committee table comprising a pair of upright casings rectangular in plan and elevation disposed with their sides relatively parallel and spaced apart to provide a recess therebetween, each casing having a plurality of vertical compartments varying in length opening on its top and said recess, a pair of swingable lids for covering said compartments, a table-member rectangular in plan extending from the ends of the casings, the top surfaces of the table-member and casings being disposed in a single plane, one side of said table member extending along a side of one of said casings, across said recess and along the corresponding side of the other casing, means to secure said side to said casings for support thereof, and legs for supporting the opposite side of said table.

2,103,409

TOOL CONSTRUCTION



Major R. Ford, Mill Port, N. Y.

Application August 18, 1936, Serial No. 96,561
1 Claim. (Cl. 306—33)

In a tool having a handle with an outwardly flaring, tool-engaging end section and a tool having a complementary socket to receive the flared end of the handle, a tool-retaining element for retaining the tool in position on the handle comprising a single flat piece of sheet metal of relatively narrow and substantially uniform width consisting of a flanged section extending outwardly over the edge of the socket in the tool at the restricted end of the socket and engaging the inner face of the tool, a longitudinal section extending along the wall of the socket and between the wall of the socket and the flared end section of the handle, and a flanged end section extending inwardly over and engaging the outer end of the handle and terminating thereon, whereby the direct wedging contact between the socket and flared end of the tool handle is substantially continuous.

2,103,410
POST CONSTRUCTION
John Frei, Jr., Chicago, Ill.
Application March 20, 1936, Serial No. 69,876
11 Claims. (Cl. 189—23)

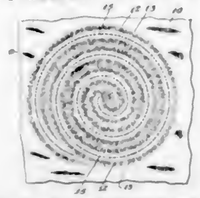
1. A post construction comprising a standard, caps closing the ends of said standard and including means restraining movement of said caps inwardly into said standard, studs on said caps cooperating with said standard to restrain lateral movement of said caps with respect thereto, ears on said studs, and means connected between said ears and securing said caps to said standard.

2,103,411
MILK PRODUCTS AND STABILIZER THEREFOR
Alexander Frieden, New Rochelle, and Sanford Joseph Werbin, Woodhaven, N. Y., assignors to Stein, Hall & Company, Inc., New York, N. Y., a corporation of New York
No Drawing. Application September 30, 1936, Serial No. 103,354
14 Claims. (Cl. 99—25)

1. A milk product stabilized by the presence of a relatively small quantity of a mixture of colloidal stabilizer and a salt of an earth alkali metal.

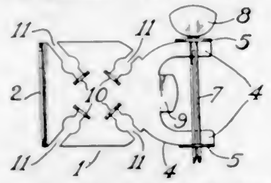
2,103,412
FINGER RING
Frederick J. Gaertner, Maplewood, N. J.
Application October 1, 1936, Serial No. 103,477
7 Claims. (Cl. 63—15)

1. A finger ring comprising a hollow setting having a top, and side walls connected together at each end thereof by a transverse strap, and a split ring shank having its ends secured to said straps, respectively.



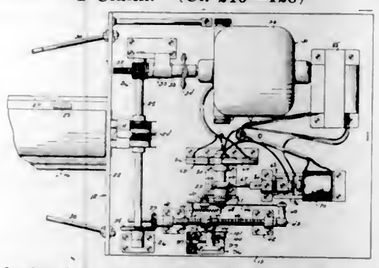
2,103,413
METHOD OF MAKING FINGER RINGS
Frederick J. Gaertner, Maplewood, N. J.
Original application October 1, 1936, Serial No. 103,477. Divided and this application April 1, 1937, Serial No. 134,248
4 Claims. (Cl. 29—160.6)

1. The method of making a setting consisting in making a sheet metal blank, forming an opening in said blank within the edges of the blank, securing a piece of metal to each of opposite edges of said blank in angular relation to the general plane of the blank, bending said blank across said opening to bring the edges of said pieces into abutting relation to each other and opposite said opening and with the portions of the blank be-



tween said pieces and said opening in spaced relation to each other, and securing together said abutting edges of said pieces, whereby said pieces complementally form a top for the setting and the other portions of the blank form side walls the edges of which along said opening form the bottom of the setting.

2,103,414
METHOD OF MAKING AN APPLIQUÉD ARTICLE
Morris J. Garshman, Brooklyn, N. Y.
Application July 8, 1937, Serial No. 152,525
3 Claims. (Cl. 2—278)

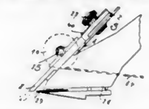


1. A method for producing appliquéd articles, comprising cutting on a bias, strips of material having crossing warp and woof threads, shirring the strips to provide an undulating effect thereto, while attaching the strips side by side to a fabric background substantially along the center line of said strips, and acting on the free edges of the strips to separate the threads at such free edges, thereby to impart a fluffy fringed appearance to the strips against the background.

2,103,415
PASTE DISPENSING DEVICE
Harold Greenwood, Ozone Park, N. Y.
Application March 19, 1937, Serial No. 131,939
2 Claims. (Cl. 221—60)

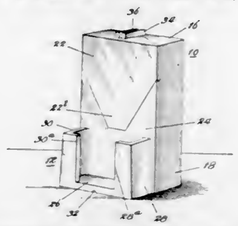
1. A dispenser for toothpaste, and the like, comprising a metal plate having one end turned up substantially at right angles thereto and provided with perforations for the reception of retaining means, and having at its other end a pair of arms extending outwardly in a substantially horizontal direction, a lip turned up on each of said arms at right angles thereto, aligned perforations in said lips, a slidingly removable spindle disposed in said perforations, said spindle having a forked shank and an enlarged head, and a tongue struck out of said metal plate at a point behind said arms in such a manner as to extend downwardly and forwardly.

2,103,416
RAILROAD CROSSING SIGNAL
Oscar T. Gregory, Mobile, Ala., assignor to The Auto Flagger Corporation, Atlanta, Ga.
Application May 19, 1936, Serial No. 80,641
1 Claim. (Cl. 246—128)



A device for operating a railroad crossing signal comprising a supporting means, a shaft carried by said means for rotation in opposite directions to move a signal into signaling and non-signaling positions, a reversible electric motor carried by the supporting means and connected to said shaft, a feed shaft driven by said first shaft, a sliding shaft carried by said supporting means, spaced collars secured to the sliding shaft, a feed nut meshing with the feed shaft and slidable on the sliding shaft between the collars, a reversing switch carried by the supporting means, a train controlled electric circuit connected to the reversing switch and to the electric motor, a main control switch connected to the circuit and including a hingedly mounted and weighted movable contact and slidable spaced contacts and having the contacts thereof connected in the circuit, a trip mechanism actuated by the movement of the sliding shaft to operate the reversing switch and the movable contacts for the main switch, and an electromagnet connected in the electric circuit for the actuation of the weighted movable contact of the main switch.

2,103,417
PENCIL
Friedrich Wilhelm Haack, Berlin, Germany
Application July 25, 1934, Serial No. 736,944
1 Claim. (Cl. 120—19)

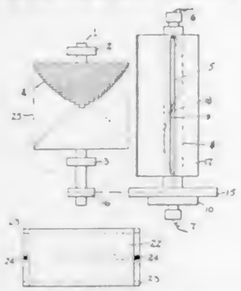


In a mechanical pencil, a tubular casing, a lead holder movable for alternate projection and retraction of the lead carried thereby, said casing being formed to provide an open ended slot extending longitudinally thereof, operating means on the exterior of the casing having a member projecting through said slot and engaging said lead holder to move the same as the operating means is moved, the slotted end of said casing being reduced to form a shoulder, a ring seated on said reduced end, an inwardly extending portion on said ring, said portion fitting in said slot to prevent accidental compression of the same, and a cap fitted on said reduced end and maintaining said ring against said shoulder.

2,103,418
DEVICE FOR REGULATING CUTTING HEIGHT
Karl Hagebeuker, Solingen, Germany
Application January 19, 1934, Serial No. 707,344
1 Claim. (Cl. 30—202)

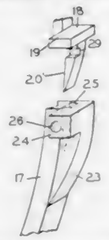
A device attachable to a hair cutting machine for regulating the cutting height, comprising a ground plate attachable to the cutting head of the machine, a recessed comb plate guided on said ground plate, a rack-like attachment on the ground plate extending through the recess in said comb plate, a shaft disposed above the recess on the comb plate, a pinion arranged on said shaft and engaging said rack-like attachment, a pulley firmly disposed on said shaft, a traction member on said pulley for actuating the device, and a spring arranged on said shaft for returning said comb plate to a position of rest.

2,103,419
DISPLAY BOX
John L. Hawkinson, Hartford, Conn., assignor to The Arrow-Hart & Hegeman Electric Company, Hartford, Conn., a corporation of Connecticut
Application September 5, 1935, Serial No. 39,329
3 Claims. (Cl. 206—44)



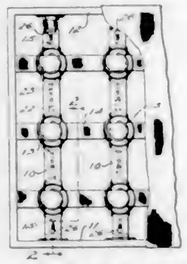
1. A container having base and cover parts, a portion of one wall of said container being carried by the base part, the remaining portion of said wall being carried by said cover part, said portions being formed to cooperate in one position to enclose an article of merchandise and to cooperate in a reversed position to form a device for displaying said article of merchandise, and means on said base part forming a receptacle for said article in both enclosing and display positions, said receptacle having a base wall which forms the bottom wall of the container when in enclosing position, and means forming channels in the top and bottom walls of said container for the reception of a tie cord.

2,103,420
METHOD OF AND APPARATUS FOR PRODUCING TELEVISION PICTURES
Louis W. Kolozsy, Astoria, N. Y., assignor to Television and Electric Corporation of America, New York, N. Y., a corporation of Delaware
Application March 28, 1934, Serial No. 717,841
9 Claims. (Cl. 178—7.6)



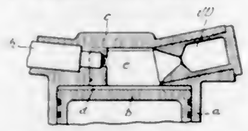
1. In an apparatus for producing television pictures, the combination of a variable light source,

and a plurality of movable reflecting surfaces adapted to project the light rays from said source



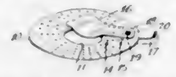
into a series of parallel and coextensive paths, and a transparent cylinder surrounding said reflecting surfaces.

2,103,421
OPHTHALMIC MOUNTING
Joseph W. Aspenleiter, Rochester, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York
Application March 27, 1936, Serial No. 71,198
2 Claims. (Cl. 88—47)



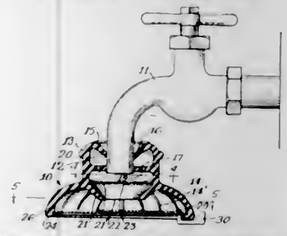
1. An ophthalmic mounting comprising a split lens rim having adjacent ends, a lug carried by each end, cooperating positioning members on said lugs, anchoring means in said members, said members being located so that the anchoring means are in communication, and an integral mass of fusible material molded to and connecting the anchoring means whereby the lugs will be held together.

2,103,422
FURNITURE
Harry E. Aulsbrook, Detroit, Mich.
Application January 24, 1935, Serial No. 3,281
5 Claims. (Cl. 5—263)



1. The combination with a metal strap extending between the sides of a frame of an element to be upholstered, double conical springs disposed thereon, tie elements positioned on the opposite side of the straps than that having the springs disposed thereon having branches which span the strap and engage the lower turn of each spring, and means integral with each of said tie elements engaging cooperating means of another tie element.

2,103,423
AIR CHAMBER DIESEL ENGINE
Franz Lang, Munich, Germany, assignor, by mesne assignments, to Lanova Corporation, New York, N. Y., a corporation of Delaware
Application May 6, 1935, Serial No. 20,030
In Germany May 17, 1934
3 Claims. (Cl. 123—32)



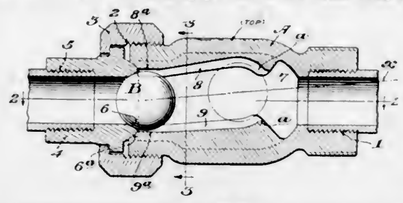
2. In an air storage chamber injection engine, a cylinder and a piston operating therein, a combustion chamber overlying and opening downward into said cylinder, said chamber comprising in plan two approximately circular lobes and a constriction therebetween defining a substantially V-shaped splitting element projecting inward from one side of said constriction, an air storage chamber opening into said combustion chamber at the opposite side of said constriction through a restricted orifice and a funnel-like passage leading thereto and flaring inward of said combustion chamber, said orifice and passage being aligned with said splitting element, and an injection nozzle extending through said splitting element disposed to inject a stream of fuel downward and inward of said combustion chamber and into said passage against the wall thereof at a point adjacent and to one side of said orifice, said passage and said orifice having a common axis inclined with respect to the direction of the injected fuel stream, whereby the fluid stream ejected from said air storage chamber through said orifice and said passage is directed against the vertex of said splitting element at a point below the tip of said nozzle.

2,103,424
FAUCET ATTACHMENT SPRAY PLATE AND PROCESS FOR MAKING THE SAME
Carl E. Lehman, Chicago, Ill.
Application December 18, 1936, Serial No. 116,630
2 Claims. (Cl. 29—157)

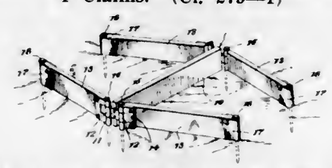
2. The process of making a spray plate comprising the step of stamping a blank simultaneously with a central stream opening, a plurality of spray openings, a stop member integrally extending to one side thereof, a handle pivoting aperture, and the further step of inserting a handle member through said handle pivoting aperture and peaning over the end of the handle through an opening in a door valve member to secure the door valve member in movable relation to the spray plate to abut against the stop member in one direction of movement.

2,103,425
FAUCET ATTACHMENT
Carl E. Lehman, Chicago, Ill.
Application December 18, 1936, Serial No. 116,631
6 Claims. (Cl. 210—84)

1. A faucet attachment comprising an all-rubber casing, said casing comprising a cylindrical portion, a flared skirt portion integrally joined to said cylindrical portion at one end thereof, an internal angularly extending apertured flange at the other end of said cylindrical portion, a funnel-shaped internally extending apertured flange integrally joined to said casing internally thereof, the diameter of the aperture in said last-mentioned funnel shaped flange being less than the diameter of said cylindrical portion, and another flange internally extending in said cylindrical portion between said first mentioned angular flange and said second-mentioned funnel-shaped flange, said additional flange extending in a direction normal to the axis of the cylinder and being centrally apertured to extend over the faucet.



2,103,426
GRILLING AND TOASTING DEVICE
Marcel Le Masson, Paris, France
Application April 26, 1935, Serial No. 18,458
In France April 27, 1934
1 Claim. (Cl. 53—5)



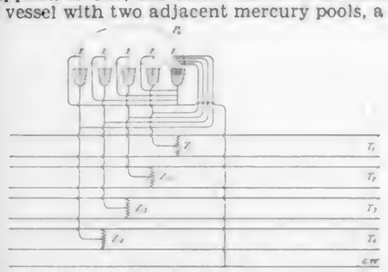
A toasting and grilling device of the character described, comprising a shallow pan of thin sheet metal constituting a screen having supporting legs and having upturned walls formed with guiding flanges on the edges thereof and a grid member rotatably mounted on said pan and slidably insertable into and out of said guiding flanges, said grid member being adjustably mounted and adapted to be located at different distances from said screen.

2,103,427
COMBINED PIPE UNION AND BALL CHECK VALVE
Fred R. Long, Catawissa, Pa.
Application September 18, 1935, Serial No. 41,146
1 Claim. (Cl. 251—121)

A check valve comprising a valve body having a horizontally disposed valve chamber, means providing a valve seat at one end of said chamber, a ball valve within said chamber for cooperation with said valve seat, and opposite pairs of ribs offset from the inner face of the valve chamber to provide runways for said ball, said ribs terminating short of the end of the valve chamber opposite the valve seat in inwardly directed enlargements to limit movement of the ball away from said seat, and the portions of said ribs adjacent to said valve seat being disposed parallel to the axis of said seat so that when the ball is disposed on said latter portions it is freely rollable into and from engagement with the valve seat, and the remaining portions of said ribs being inclined relative to said first mentioned portions so that whenever the ball is disposed on said inclined portions it tends to roll onto said first mentioned portions.

2,103,428
GAME APPARATUS
Cecil C. Lutes, Bellingham, Wash.
Application July 16, 1936, Serial No. 91,014
4 Claims. (Cl. 273—1)

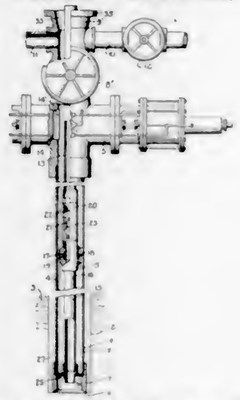
1. As a new article of manufacture, a goal comprising a straight back section, a pair of side sections, hinge means carried by the extreme ends of said back section for hingedly connecting the side sections being adapted to be selectively swung toward and away from each other and normally lying in an operative position to converge toward their outer ends and providing a restricted entrance opening for the goal, independent anchoring means engaging the hinge means at each end of the back section and the inner ends of the side sections for firmly anchoring the back section and the inner ends of the side sections upon the ground, and independent anchoring means engaging the outer end of each side section for holding the ends of the side sections in selected spaced relation.



2,103,429
METHOD FOR DEHYDRATING PINE OIL
Robert W. Martin, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application January 18, 1935, Serial No. 2,401
9 Claims. (Cl. 260—167)

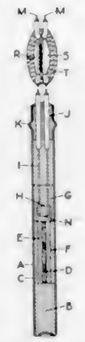
1. The method for the dehydration of a terpene alcohol contained in pine oil, which comprises subjecting water and pine oil containing terpene alcohol to a temperature above the normal boiling point of water and under a pressure such that the pine oil and water will remain in liquid phase at the temperature used.

2,103,430
ELECTRICAL PROTECTIVE SYSTEM
Keith L. Maurer, Rockville Centre, N. Y., and Leland K. Swart, Mountain Lakes, N. J., assignors to American Telephone and Telegraph Company, a corporation of New York
Application August 1, 1936, Serial No. 93,910
4 Claims. (Cl. 175—294)



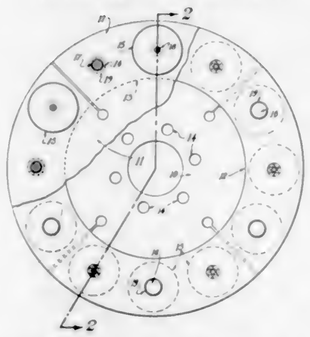
1. In a protective circuit for an electrical system including two substantially parallel conduc-

tors and including means for short-circuiting the two conductors together when excessive voltage is applied to one, the combination of an insulating vessel with two adjacent mercury pools, a low



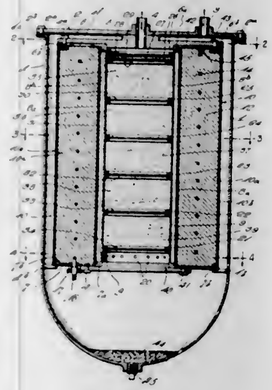
resistance connection from each conductor to one of the pools, an igniter electrode for each pool, and a connection from the igniter electrode of one pool to the conductor connected to the other pool.

2,103,431
MEANS FOR CONTROLLING WELLS
Robert A. Mueller, Houston, Tex.
Application October 26, 1931, Serial No. 571,099
Renewed September 19, 1936
7 Claims. (Cl. 166—15)



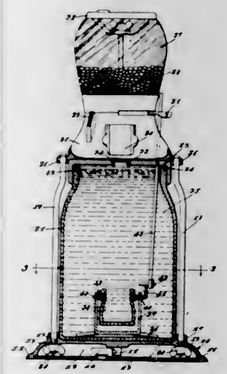
1. In an apparatus for bringing in a well in formation having high pressure with a single string of tubing and without removing said string from the well, a casing having a casing head at the surface of the well, a strainer positioned at the lower end of said casing, a tubing including a lower string and an upper string detachably connected with said lower string, the bottom end of said lower string and the bottom end of said strainer being provided with cooperating means to enable said lower string to seal in engagement with said strainer during outside washing of the well, said upper string of tubing serving to elevate said lower string of tubing from washing position to flowing position, a blowout preventer adjacent the casing head comprising elements movable into engagement with said tubing for control between the outside of said tubing and the inside of said casing during the washing and elevating operations, and movable out of engagement with said tubing to pass tubing collars and the like past said blowout preventer, and means at said casing head to control flow through said tubing when said lower string is elevated to flowing position and said upper string is detached therefrom.

2,103,432
ELECTRICAL FIRING DEVICE
Henry E. Nash, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
Application August 27, 1935, Serial No. 38,070
7 Claims. (Cl. 102—10)



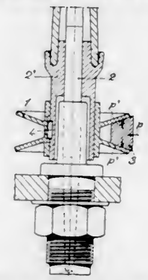
1. An electric delay firing device for firing explosives including a bridgewire, lead wires connected to the bridgewire and adapted for connection into an electric circuit, said lead wires having uninsulated portions along a portion of the length of said lead wires, and a shunt having an electrical resistance in excess of that of the bridgewire and sufficiently low so that on fusing of the bridgewire by an electric current the formation of an arc will be prevented by passage of the current through the shunt.

2,103,433
FRICTION CLUTCH
Noel Banner Newton, Acton, London, England
Application October 16, 1935, Serial No. 45,297
In Great Britain October 24, 1934
15 Claims. (Cl. 192—107)



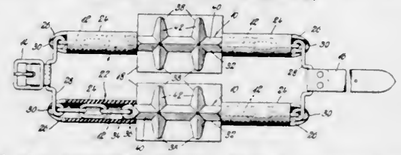
1. An improved clutch plate comprising a pair of plates arranged back-to-back, friction linings secured to the outer faces of said plates, a plurality of non-flat (sprung) spring members adapted to be flattened under pressure arranged between the plates behind said friction surfaces but always separated therefrom by the plates, a rivet securing each spring member to one of the plates, each plate being formed for axial flexibility in the region of the friction surfaces and formed at its centre for rigid connection to a common flange.

2,103,434
OIL FILTER
Robert H. Pennebaker, Baton Rouge, La.
Application September 6, 1935, Serial No. 39,487
15 Claims. (Cl. 210—134)



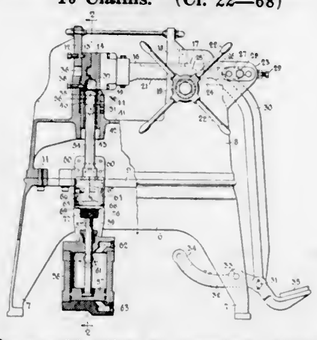
1. A filter unit including a mass of packed asbestos, and an electrical heating winding embedded in said packed asbestos and terminating in electrical terminals at opposite ends of said filter unit.

2,103,435
GAME
Melvin Pool, Oklahoma City, Okla., assignor to A. Newton Burns, Oklahoma City, Okla.
Application October 15, 1936, Serial No. 105,808
3 Claims. (Cl. 273—95)



1. A machine for use with a coin controlled vending mechanism comprising a base, a liquid filled container fitting said base, a head covering the container and releasably tied with the base and disposed between the vending mechanism and the container, said head having an opening for the passage of a coin therethrough, and a coin receiving tiltable trap confined within the container beneath the opening in said head for the deposit of a coin admitted to said container from the coin controlled mechanism.

2,103,436
WHARVE FOR SPINDLES FOR SPINNING, TWISTING, WINDING, AND SIMILAR MACHINES
Carlo Schleifer, Novara, Italy
Application June 23, 1936, Serial No. 86,835
In Italy July 4, 1935
4 Claims. (Cl. 118—47)



1. In a spinning device, parallel spindles, a wharve on each of said spindles, means mounting the wharves on the spindles to move longitudinally thereof but to revolve therewith, and a flexible belt in contact with said wharves and adapted to drive them.

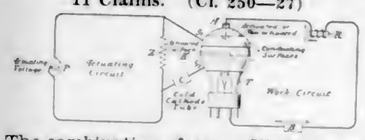
2,103,437
ANTISKID DEVICE
Max F. Schulz, Northbrook, Ill.
Application November 13, 1935, Serial No. 49,562
3 Claims. (Cl. 152—14)

1. An anti-skid device for attachment to a vehicle tire, comprising a lug unit, means for attaching the lug unit to the tire, and resilient means positioned between the lug unit and the tire and having integral extensions housing said means.

2,103,438
PRESSURE CASTING APPARATUS
Raymond J. Schultz, Madison, Wis., assignor to Madison-Kipp Corporation, Madison, Wis., a corporation of Wisconsin
Application April 1, 1936, Serial No. 72,161
10 Claims. (Cl. 22—68)

4. The combination in pressure casting apparatus of a bottom-gated, separable die compris-

ing a plurality of die parts adapted for substantially horizontal, relative movement between die open and die closed positions, the closed die having a casting cavity and a split pressure chamber formed by the die parts, said pressure chamber communicating with the die cavity and opening onto the bottom of the die; a tubular, upright well positioned beneath the closed die with its upper open end in alinement with the pressure chamber in the die but slightly spaced from the bottom of the die to permit freely said relative movement of the die parts; and a plunger in the well adapted for movement therethrough and into the pressure chamber to transfer metal from the well into said chamber and thence into the die cavity, said pressure chamber permitting free passage of the metal whereby leakage of metal between the closed die and the well is prevented.



2,103,439

GAS-FILLED TUBE

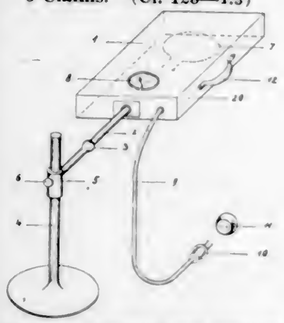
Leland Kasson Swart, Mountain Lakes, N. J., assignor to American Telephone and Telegraph Company, a corporation of New York

Application April 9, 1935, Serial No. 15,482

11 Claims. (Cl. 250—27)

1. The combination of a gas-filled tube enclosing two solid unheated substantially equal metallic electrodes spaced from each other, an electrode mounted external of the envelope of the tube, and means including a second electrode mounted external to the envelope of the tube for applying a potential between the first-mentioned external electrode and the second-mentioned external electrode so as to produce gaseous ionization between the internal electrodes of the tube, the circuit of the internal electrodes being uncontrolled by the external electrodes after gaseous ionization has been initiated.

2,103,440



ELECTROTHERAPEUTIC APPARATUS

Eugen Weissenberg, Vienna, Austria

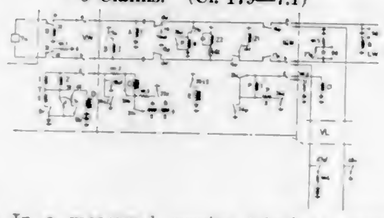
Application April 4, 1934, Serial No. 719,009

In Austria July 15, 1932

5 Claims. (Cl. 128—1.3)

1. A short-wave electro-therapeutic apparatus comprising a closed casing, a low power oscillator wholly enclosed in said casing and including a primary oscillatory circuit forming a treatment electrode, said casing consisting, at least at the point adjacent said oscillatory circuit, of a material of high electromagnetic wave permeability, said casing with the oscillator therein being easily transportable and applicable to the part of the patients body to be treated.

2,103,441



MEASURED SERVICE TELEPHONE SYSTEM

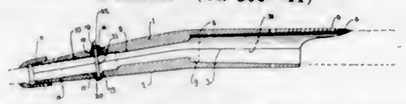
Kurt Wollack, Berlin, Germany, assignor to Siemens & Halske Aktiengesellschaft, Wernerwerk Siemensstadt, near Berlin, Germany

Application September 26, 1935, Serial No. 42,239

In Germany October 2, 1934

9 Claims. (Cl. 179—7.1)

4. In a measured service telephone system, means including automatic switches for setting up connections from a calling line to called lines, a meter for the calling line, a meter control relay, a glow lamp, means for operating said relay in series with said glow lamp to charge for one connection, and means for operating said relay over a circuit excluding said lamp to charge for another connection.



2,103,442

HANDLE AND SHANK THEREFOR

Joseph A. Bartosz, Salem, Oreg., assignor of one-half to A. C. Burk, Salem, Oreg.

Application February 25, 1935, Serial No. 8,077

1 Claim. (Cl. 306—41)

In a device of the class described, the combination of a pair of complementary shank forming members, so made that when they are secured together a handle receiving socket is disposed at one end and a tapering tang receiving socket is disposed at the opposite end into which the tang of a pitch fork may be inserted, a ferrule removably secured to the small end of the shank forming members for locking the shank forming members together, the longitudinal center line of the shank at the handle receiving end lying in a different plane than that of the longitudinal center line of the oppositely disposed end of the handle receiving end, said shank members having tapered slots therethrough adjacent the fork and in alignment with each other, tapered washers disposed in the tapered slots and a bolt disposed through the tapered washers and the tang of the fork to secure the same together.

2,103,443

METHOD FOR THE SOFTENING OF DOUGH

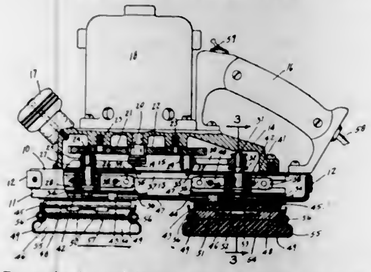
Arnold K. Balls and Walter S. Hale, Washington, D. C., dedicated to the free use of the People of the United States

No Drawing. Application September 26, 1935, Serial No. 42,248

2 Claims. (Cl. 99—90)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A method for the softening of dough which comprises incorporating with any of the ingredients used for the preparation of dough glutathione.



2,103,444

ABRADING, POLISHING, AND BUFFING DEVICE

William H. Bauch, Shelbyville, Ind.

Application June 23, 1937, Serial No. 149,881

6 Claims. (Cl. 51—170)

1. In a device of the class described, a box-like frame structure having openings in its upper and lower faces, a reciprocable member therein having parts projecting through said openings, power means connected to an upper projecting part for reciprocating said member, a working element secured to at least one lower projecting part and reciprocable thereby, and rollable anti-friction bearing members interposed between said reciprocating member and the upper wall of said frame structure.

2,103,445

REFINING OF ROSIN ESTERS

Joseph N. Borglin, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

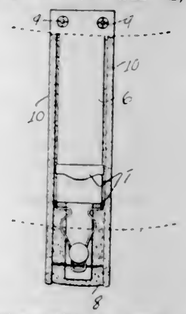
No Drawing. Application November 2, 1931, Serial No. 572,731

Renewed September 22, 1934

15 Claims. (Cl. 260—99.40)

1. The method of refining a rosin ester by the removal of color bodies therefrom which includes treating a solution of the ester with a substance capable of effecting separation of color bodies of the ester from the solution selected from the group consisting of furfural and furfuryl alcohol, and separating refined rosin ester from separated color bodies.

2,103,446



CUSHIONED STOCKING SUPPORTER GUARD

Eugene G. Boyle, San Francisco, Calif.

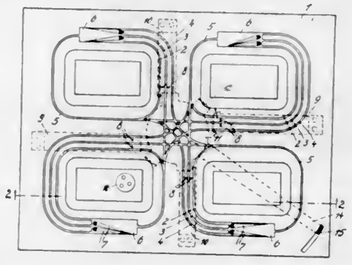
Application July 22, 1935, Serial No. 32,617

Renewed May 19, 1937

6 Claims. (Cl. 241—1)

1. In combination with a girdle or the like, having a hose supporter attached thereto, of cushioning means having elongated marginal ridges interposed between the supporter and the leg of the wearer of said girdle adapted to prevent contact of said hose supporter with the flesh of the wearer.

2,103,447



TOY

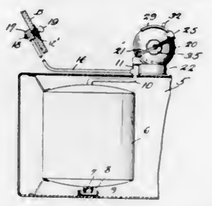
Ludwig Carl, Nuremberg, Germany, assignor to Ernst Horn, Nuremberg, Germany

Application March 11, 1937, Serial No. 130,405

In Germany November 28, 1936

14 Claims. (Cl. 46—210)

1. A toy comprising a base-plate having marked thereon the simulation of a pair of crossing streets, representations of city blocks having buildings, lawns or the like outlining said streets, guide-grooves and stopping-devices in said streets, said stopping devices being adapted to stop a toy-vehicle travelling on one of said streets at the crossing thereof, said guide-grooves partly crossing each other and partly merging one into the other to permit a variety of modes of travel of a toy-vehicle.



2,103,448

GASOLINE TANK FOR MOTOR VEHICLES

Charles Oliver Castledine, Windom, Minn.

Application January 29, 1937, Serial No. 123,043

7 Claims. (Cl. 158—46.5)

1. The combination with a main gasoline tank, a reserve tank therein having an air vent, a check valve for the vent, and a liquid trap at the bottom of the reserve tank and opening into both tanks, of means for directing gasoline into the two tanks and for sealing the tanks, said means including a spherical casing having alined outer and inner openings, a spherical member fitted snugly in the casing and having a diametrical opening therein, said member being rotatable to move its opening into or out of register with the openings in the casing and having means to open the vent when the member is in open position, and means for locking the rotatable member against movement when in closed position.

2,103,449

PROCESS OF PRODUCING BRANDY

Chambers L. Crutchfield, Wailuku, and John P. Foster, Paia, Territory of Hawaii, assignors to Maui Pineapple Company, Ltd., Paia, Territory of Hawaii, a corporation of Territory of Hawaii

No Drawing. Application March 25, 1936, Serial No. 70,886
5 Claims. (Cl. 99—37)

3. In the process of preparing distilled products from pineapple juice, the steps which comprise heating the juice at a temperature of about 140° F. to 212° F. until the albumins therein are coagulated, fermenting the juice at a temperature of about 85° F., distilling the fermented juice, and condensing a distillate at a temperature of about minus 16° F. to plus 4° F.

2,103,450

TUBE TESTING DEVICE

Walton De Verter, Chicago, Ill., assignor of one-third to Samuel L. Brenner, Chicago, Ill.

Application October 5, 1936, Serial No. 103,974
12 Claims. (Cl. 250—27)

1. The method of testing a radio tube comprising using said tube as a rectifier to cause a normally constant load on an electrically associated high frequency oscillator whereby any fluctuations in the load caused by internal defects in the tube will modulate the oscillator current, and transmitting said modulated current to an indicator.

2,103,451

FISH BOBBER

James Durham, Warsaw, Ind.

Application February 1, 1936, Serial No. 61,923
1 Claim. (Cl. 43—49)

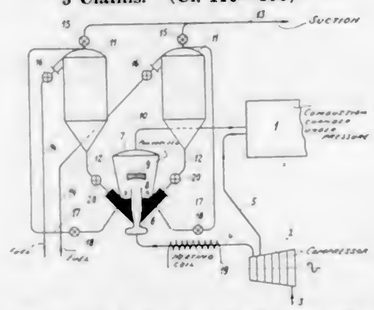
Means for attaching a fishing line to the stem of a bob comprising a one piece sheet metal element having a portion thereof of substantially cylindrical form and having stem gripping fingers in spaced relation on the length of the cylinder and arms extending outwardly from said portion, said arms having their free ends inturned towards the substantially cylindrical portion and converging into contact with each other whereby a line will be held between the arms, said fingers being adapted to be pressed into the material of the stem to cause a part of the stem between the fingers to constitute a stop to prevent longitudinal movement of the element on the stem and maintain the element in fixed relation on the stem.

2,103,452

TREATMENT OF TEXTILE MATERIALS

George Holland Ellis and Ernest William Kirk, Spondon, near Derby, England, assignors to Celanese Corporation of America, a corporation of Delaware

No Drawing. Application October 6, 1933, Serial No. 692,432. In Great Britain October 19, 1932
2 Claims. (Cl. 28—1)



1. Process for the treatment of cellulose acetate textile materials exhibiting glaze marks, which comprises subjecting said materials to the action of a hot aqueous bath comprising paratoluene sulphonamide and terminating the treatment when the glaze marks are substantially removed and before the remaining parts of the fabric are materially delustred.

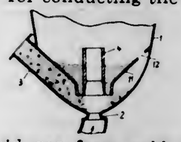
2,103,453

METHOD OF BURNING PULVERIZED FUEL

Benjamin Graemiger, Zollikon, Switzerland, assignor to Hephaest A.-G. für motorische Krafterzeugung, Zurich, Switzerland, a corporation of Switzerland

Application June 22, 1934, Serial No. 731,822
In Switzerland June 28, 1933
5 Claims. (Cl. 110—106)

1. The method which includes compressing a gas, delivering a part of said gas to a combustion zone, maintaining in said combustion zone a pressure substantially above that of the atmosphere, further compressing the remainder of said gas to a higher pressure, expanding said last mentioned gas to form a jet at a pressure above that of said combustion zone, delivering a fuel to said jet, pulverizing said fuel by impingement, and conducting said expanded gas from said jet and the pulverized fuel to said combustion zone.



2,103,454

IMPACT-CRUSHER FOR COMMINUTING HARD MATERIALS

Benjamin Graemiger, Zollikon, and Werner Ludin, Winterthur, Switzerland, assignors to Hephaest A.-G. für motorische Krafterzeugung, Zurich, Switzerland, a corporation of Switzerland

Application September 13, 1934, Serial No. 743,880
In Germany September 18, 1933
9 Claims. (Cl. 83—46)

1. A comminuting device comprising a casing adapted to receive a bed of raw material to be comminuted, a feed inlet for said raw material, a nozzle for forcing a stream of gas at high velocity into said casing and in contact with said raw material to entrain the particles of said material, means in said casing for separating the finer from the coarser and heavier entrained particles, an outlet for conducting the finer material

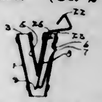
entrained in said gas from said casing, and a passage extending from a section slightly above the bed of raw material to a section adjacent to the outlet of said nozzle for conducting at least a portion of said separated coarser particles separate from said raw material and to a point adjacent to the outlet of said nozzle.

2,103,455

ABRASIVE MITT

Herman Greenwald, Brooklyn, N. Y., assignor to Herman Greenwald and Emanuel Koenig, New York, N. Y., doing business as Hygrade Novelty Co.

Application June 19, 1936, Serial No. 86,097
5 Claims. (Cl. 15—227)



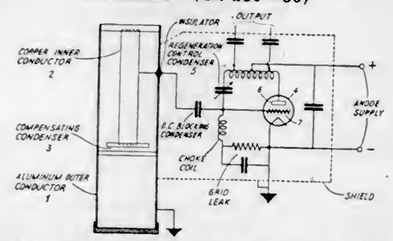
2. An abrasive mitt of the class described, comprising a back section and a front section, a thumb opening in a side edge thereof and a wrist portion at the lower end and a finger portion at the upper end, said front and back sections being bound together at their marginal edges, a wrist opening at said wrist portion, a pocket on said mitt across the front section and attached to said marginal edges, said pocket being open at the said finger portion and its opposite end, whereby a flexible abrasive strip may be placed within said pocket and partly drawn through the opening at the finger portion and over the upper part of the back section, and attaching means at the finger end of the back section for holding said abrasive strip in place.

2,103,456

NECKTIE

Harvey C. Hall, Toronto, Ontario, Canada

Application December 28, 1936, Serial No. 117,766
In Canada February 10, 1936
7 Claims. (Cl. 2—150)



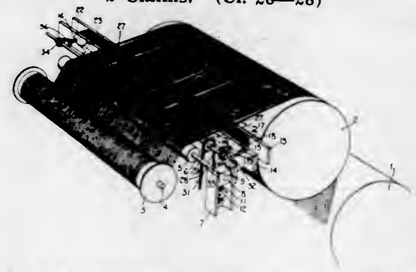
1. A necktie having a hollow member enclosed within the "knot", being open at the top, a neckband having one end extending through and sliding in the hollow member in the knot, and a member secured to the other end of the neckband for insertion into said hollow member adapted to be engaged thereby to be locked therein and having a portion to engage and hold the slidable end of the neckband.

2,103,457

FREQUENCY CONTROL LINE AND CIRCUIT

Clarence W. Hansell, Port Jefferson, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

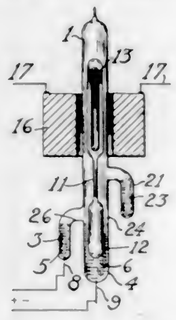
Application June 21, 1935, Serial No. 27,679
8 Claims. (Cl. 250—36)



1. A tuned circuit comprising inner and outer conductors connected together at one of their adjacent ends and having different temperature coefficients of linear expansion, a condenser within said outer conductor comprising a plate attached to said outer conductor and a plate attached to said inner conductor, said plates being spaced apart and movable relative to each other, whereby changes in the resonant frequency of said tuned circuit, due to a change in temperature and lengths of said conductors, are substantially compensated for by a variation in capacity of said condenser.

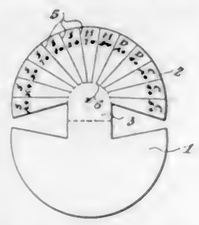
2,103,458

WARPING ARTIFICIAL YARNS



Clifford Hargreaves and Roland Booth, Drummondville, Quebec, Canada, assignors to Celanese Corporation of America, a corporation of Delaware

Application December 13, 1935, Serial No. 54,168
2 Claims. (Cl. 28—28)

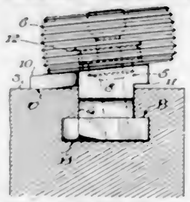


1. In a slashing device, the combination with means for drying a sheet of warp threads and a take-up warp beam, of means positioned between the drying means and the take-up warp beam for disassociating any adherent threads in the sheet of warp threads, said disassociating means comprising a plurality of oppositely moving bands adapted to travel transversely of the sheet of warp threads and members on the bands adapted to contact with the sheet of warp threads for separating any adherent threads therein.

2,103,459
MERCOID SWITCH
John McArthur Harris, Jr., Baton Rouge, La., assignor to Standard Oil Development Company, a corporation of Delaware
Application September 14, 1935, Serial No. 40,575
1 Claim. (Cl. 200—112)

An electric switch of the liquid flow type comprising a sealed tubular envelope having depending wells communicating with each other through the envelope, a column of mercury in each well, an electrode in each well in contact with the mercury, a plunger comprising a magnetic member enclosed in non-porous material and mounted for longitudinal movement in the mercury of one of the wells, a solenoid for effecting movement of the plunger whereby in one position the plunger is lowered displacing a portion of the mercury in the last-mentioned well to cause overflow of the mercury into the other well and establish an electric circuit through the columns of mercury between the electrodes, and a reservoir containing mercury communicating with the envelope whereby the quantity of mercury in the wells can be varied to either cause the plunger to close the circuit by moving it into the well or by withdrawing it from the well.

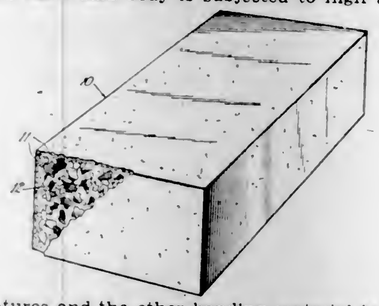
2,103,460
DEVICE FOR PLAYING CARDS
Richard C. Hart, Brighton, N. Y.
Application September 21, 1936, Serial No. 101,736
2 Claims. (Cl. 273—148)



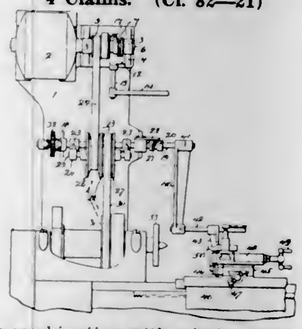
2. A device for playing cards comprising a circular base, a series of slips attached at one end radially to said base and being separated from the adjacent slips by radial slits, each of said slips bearing characters representing the value of a playing card, and all of the slips on one device bearing characters representing the values of the playing cards for one hand in a particular game.

2,103,461
VULCANIZATION OF RUBBER OR OTHER MATERIALS
Alfred Louis Hock, Alfred Kirkham, and Howard Spence, Manchester, England, assignors to Peter Spence & Sons, Limited, Manchester, England.
No Drawing. Application January 6, 1934, Serial No. 705,564. In Great Britain January 12, 1933
6 Claims. (Cl. 106—23)

1. The step in the process in the manufacture of vulcanized rubber which comprises introducing in to the composition finely divided silica intimately associated with a small portion of an alkali taken from the group consisting of soda and potash, the combined silica and alkali being of an adsorptive capacity of less than 25% as measured by the amount of diphenyl guanidine absorbed by one gram of the siliceous product from 50 cc. of a 0.2% solution of diphenyl guanidine in benzene at 50° C.



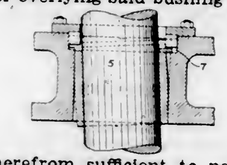
2,103,462
CHASER SUPPORTING BLOCK
William James Hogg, Cleveland, Ohio, assignor to The National Acme Company, Cleveland, Ohio, a corporation of Ohio
Application July 24, 1936, Serial No. 92,355
14 Claims. (Cl. 10—103)



1. A radially shiftable chaser carrying block for the reception of a circular chaser on the front face thereof and having a plurality of lateral projections at opposite sides of the block forming a pair of oppositely located radial guide-ways rearwardly of the front thereof, one of the projections at the front of the block extending beyond the other projections to form a wing extension engaging the chaser to its outer periphery and also the front face of the die body to give increased support to the circular chaser and increased bearing on the front face of the die body, said bearing being substantially greater transversely of the direction of its extension.

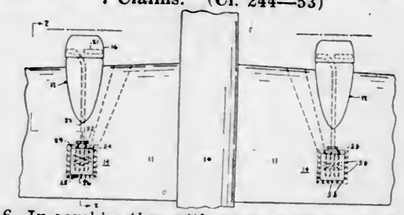
2,103,463
HIGH TEMPERATURE INSULATING COMPOSITION
Otis L. Jones, Joliet, Ill., assignor, by direct and mesne assignments, of one-half to The Illinois Clay Products Company, Joliet, Ill., a corporation of Illinois, and one-half to F. E. Schundler & Company, Inc., Joliet, Ill., a corporation of Illinois
Continuation of application Serial No. 694,061, October 18, 1933. This application April 9, 1934, Serial No. 719,728
6 Claims. (Cl. 106—10)

1. A high temperature insulating material of the character described comprising in combination a substantially thick body of efficient insulating material comprising granules of exfoliated vermiculite bonded together by a heat destructible liquid binder, said binder migrating to the surface of the body on drying to form a relatively thin reinforcing shell for the body, and a ceramic bonding material mixed with the granules of vermiculite and adapted to develop a ceramic bond when said body is subjected to high temperatures and the other bonding material is destroyed.



2,103,464
DRIVE FOR LATHES AND OTHER MACHINES
Oscar I. Judelshon, Park Ridge, N. J.
Application August 24, 1935, Serial No. 37,713
4 Claims. (Cl. 82—21)

1. The combination with a lathe having a shaft and a movable slide rest, a driving member operated from a source of power, a driven member on the shaft of the lathe, a plurality of expansible pulleys, an endless belt travelling around the driving member and one of said pulleys, an endless belt travelling around the other of said expansible pulleys and around the driven member, an oscillating shaft adapted to shift the positions of said expansible pulleys and to thereby effect the expansion and contraction of said pulleys, a lever arm on said oscillating shaft, a rod connected with said lever arm, and a lever arm connected with said rod and with said slide rest whereby the movement of the slide rest will effect the operation of said oscillating shaft for the purpose of automatically varying the speed ratio between the driving and driven members according to the movements of the slide rest.



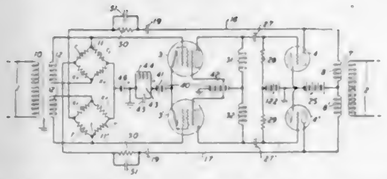
2,103,465
BEARING
Phillip A. Kinzie, Denver, Colo., assignor to Universal Hydraulic Corporation, Denver, Colo., a corporation of Colorado
Application August 3, 1934, Serial No. 738,205
1 Claim. (Cl. 308—72)

The combination comprising a shaft; a body having a cylindrical bore encircling said shaft; a bearing bushing in which the shaft is slidably and rotatably mounted and which serves also as a bearing for the bore of said body; the surface of the bushing adjacent said bore being generated by a curved element of relatively small but varying curvature; a lip member having a localized portion of increased thickness integral with the upper end of said bushing; a shoulder formed by a larger bored portion in said body and underlying said lip member in supporting relation; a cap member overlying said bushing and spaced a

distance therefrom sufficient to permit rocking movement of the lip member in response to deflection of the corresponding end of the shaft without permitting axial displacement of the said bushing; and means for preventing rotation of said bushing with respect to the encircling body.

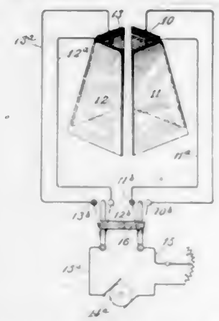
2,103,466
AIRCRAFT CONSTRUCTION
Herman G. Klemm, Baltimore, and Berthoud C. Boulton, Towson, Md., assignors to The Glenn L. Martin Company, Baltimore, Md.
Application December 29, 1936, Serial No. 118,072
7 Claims. (Cl. 244—53)

6. In combination with an aircraft, a receptacle having a perforate side and imperforate other sides, said perforate side being composed of a surface portion of said aircraft, a muffler in said receptacle, a compartment sealed, spaced from, and partially enclosing said receptacle, said compartment having a perforate wall and imperforate other walls, said perforate wall of said compartment forming a part of the surface of said aircraft which lies between said perforate side of said receptacle and the adjacent surfaces of said aircraft, and means to circulate a cooling medium through said chamber.



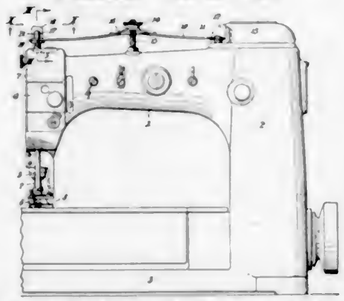
2,103,467
GAME APPARATUS
Robert H. Konikoff, Astoria, N. Y., assignor to Schranz & Bieber Co. Inc., New York, N. Y., a corporation of New Jersey
Application July 8, 1937, Serial No. 152,576
9 Claims. (Cl. 273—1)

1. Apparatus for playing a game in which play-



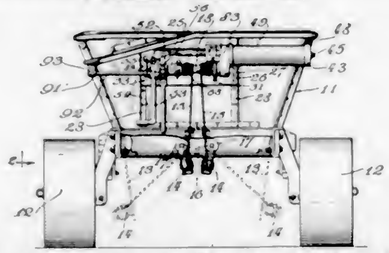
ing elements are piled one upon another until the pile upsets, comprising a rack to provide support for the pile, and a tee to support said rack, the rack and tee having under and upper surfaces respectively formed with reference to each other to provide an unstable, teetering support for the rack on the tee and permit the rack to upset when the pile is built up off balance.

2,103,468
WAVE TRANSLATING SYSTEM
John G. Kreer, Jr., Bloomfield, N. J., assignor to Bell Telephone Laboratories Incorporated, New York, N. Y., a corporation of New York
Application April 1, 1936, Serial No. 71,997
9 Claims. (Cl. 179—171)



1. An amplifier with a feedback loop comprising a push-pull stage having a mid-branch circuit and connections that introduce a phase reversal in transmission around the loop when the transmission is in the push-pull mode through the push-pull stage but not when the transmission is in the parallel mode through the push-pull stage, and means comprising a feedback impedance in said mid-branch circuit producing negative feedback around a portion of the amplifier stages in said loop for transmission whose passage through said push-pull stage is in the parallel mode but not for transmission whose passage through said push-pull stage is in the push-pull mode.

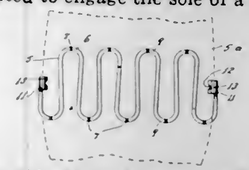
2,103,469
APPARATUS FOR BAKING DOUGH PRODUCTS AND THE LIKE
John Kremer, Southport, Conn.
Application December 7, 1935, Serial No. 53,409
18 Claims. (Cl. 219—19)



1. An apparatus of the character described comprising a receptacle adapted to receive a dough mass, a plurality of sets of oppositely disposed electric contact elements interposed between said dough mass and the walls of said receptacle, a source of current supply, and means for successively supplying current severally to said sets of contact elements.

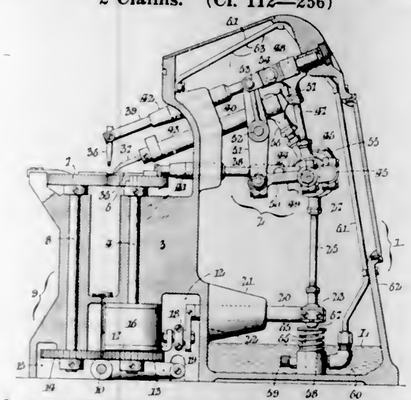
2,103,470
PRESSER MECHANISM FOR SEWING MACHINES
Frank A. Kucera, Chicago, Ill., assignor to Union Special Machine Company, Chicago, Ill., a corporation of Illinois
Application January 30, 1936, Serial No. 61,469
2 Claims. (Cl. 112—235)

1. Presser mechanism for sewing machines and the like including a presser bar with a rounded end; a guide confining the bar to axial movement; a stirrup-like member engaged over and supported, with capacity for universal pivotal movement, on the rounded end of the presser bar; and a leaf spring exerting endwise pressure upon the bar, said spring having its end bifurcated to straddle the stirrup member and bear upon a flange around the bottom of the latter.



2,103,471
SPRING WIND-UP FOR WAGONS
Joseph Kuchar, Chicago, Ill., assignor to Athey Truss Wheel Co., Chicago, Ill., a corporation of Illinois
Application February 15, 1933, Serial No. 656,819
7 Claims. (Cl. 298—35)

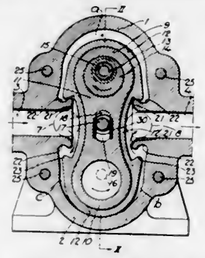
1. A spring windup for wagons adapted to operate wagon doors, comprising a drum adapted to receive flexible members, bearings for said drum, a pinion on said drum, a gear in mesh with said pinion, a bearing for said gear, a base on which said bearings are mounted, said base being mounted on the wagon wall, a helical spring, one end of which is secured to said gear, an end member operatively secured to said spring, means rigidly securing said end member to said wall, and releasable means adapted to hold said drum against rotation in both directions.



2,103,472
SHOE CLEAT
John Lascari, Unionville, Conn.
Application July 2, 1937, Serial No. 151,686
10 Claims. (Cl. 36—62)

1. A cleat of the character described comprising a sinuously formed intermediate portion having at the top surface thereof, a series of sharp teeth adapted to engage the sole of a shoe and at

the bottom side thereof, a series of wide teeth for engaging a surface and means for securing said cleat to said shoe.

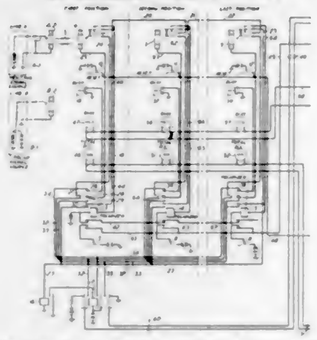


2,103,473
LUBRICATING SYSTEM FOR SEWING MACHINES
Harold J. Le Vesconte, Western Springs, and Albert M. Schweda, Chicago, Ill., assignors to Union Special Machine Company, Chicago, Ill. a corporation of Illinois
Application November 16, 1935, Serial No. 50,088
2 Claims. (Cl. 112—256)

1. A lubricating system for a cup feed sewing machine having an upright housing, a pair of feed cups supported at an elevation, a needle and a looper above the feed cups respectively operated by members protruding through oil tight bearings in the front wall of the housing for actuation by mechanism completely enclosed within said housing, means for driving the feed cups from below, and a connection for the drive means also extending through an oil tight bearing in the front wall of the housing for actuation by the actuating mechanism, said system including an oil sump in the base of the housing below the level of the feed cup driving connection aforesaid, and reciprocatory pump means motivated solely by contact with the feed cup driving connection within the housing to elevate oil from the sump for spray distribution upon the parts of the actuating mechanism as well as upon those portions of the needle and looper operating members and the feed cup driving connection within the housing.

2,103,474
REVERSIBLE PLANETARY PISTON PUMP
Gustav Rudolf Lindberg, Overum, Sweden
Application December 19, 1936, Serial No. 116,669
In Denmark February 11, 1936
7 Claims. (Cl. 103—131)

1. In a reversible planetary piston pump, a casing comprising two cylinders arranged side by side and having openings in their adjacent sides communicating with one another, inlet and outlet openings communicating with said cylinder openings at opposite sides, an impeller in said casing, said impeller comprising two rotary pistons, arranged one in each cylinder, and a rigid connecting member between said pistons constituting a partition between the inlet and outlet openings, a single eccentric drive operatively engaging the piston of one of the cylinders and imparting a rotary oscillation to said piston, and guiding means for said connecting member for

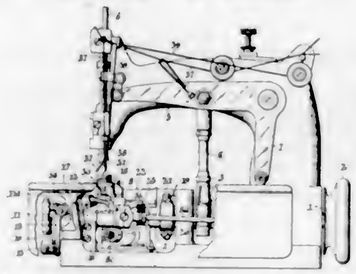


causing the piston in the other cylinder to move synchronously with the piston in the first cylinder, said guiding means consisting of a shaft extending through a slot of the connecting member and being movably mounted in slots of the walls of the pump casing, the slot of the connecting member and the slots in the walls of the pump casing having a larger extension in the plane through the piston axes then said movable shaft, the latter receiving simultaneously a rolling motion relatively to its own axis and a longitudinal movement relatively to the slots in the walls of the pump casing.

2,103,475
APPARATUS FOR TAKING FLUID SAMPLES
Ben E. Lindsly, Washington, D. C.
Application May 28, 1935, Serial No. 23,903
11 Claims. (Cl. 166—19)

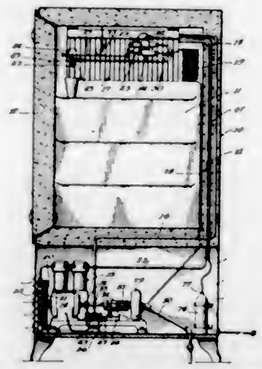
1. Apparatus for taking samples of fluid from a well including a collection chamber having inlet and outlet ports, a trap valve for preventing back flow from said chamber through the port, a stop valve controlling outlet of fluid from the chamber through the outlet port, means for closing the stop valve, and means for retarding closing movement of the stop valve.

2,103,476
TELEGRAPH TEST BOARD CIRCUIT
Charles W. Lucek, Forest Hills, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application June 6, 1936, Serial No. 83,830
10 Claims. (Cl. 178—69)



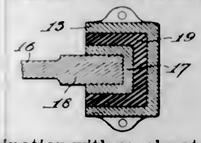
1. In an exchange for switching connections between electrical circuits, a switchboard comprising a plurality of sections, a plurality of transmission circuits terminating at a plurality of sections of said switchboard, a test circuit common to a plurality of sections of said switchboard, manually operated means at each of said sections, a chain circuit comprising two chain paths normally open and controlled by any one of said manually operated means, a relay responsive to the operation of each of said manually operated means, a second relay responsive to the operation of any one of said manually operated means, a link circuit at each of said sections for interconnecting any one of said transmission circuits and any one of said manually operated means whereby said chain circuit operates to include certain sections of said chain path, a third relay responsive to the operation of the second mentioned relay to connect said one of said transmission circuits to said test circuit.

2,103,477
ANCHOR FOR SHIPS OR THE LIKE
David Frederick Lucking, Felixstowe, England
Application January 4, 1935, Serial No. 448
In Great Britain January 5, 1934
2 Claims. (Cl. 114—207)



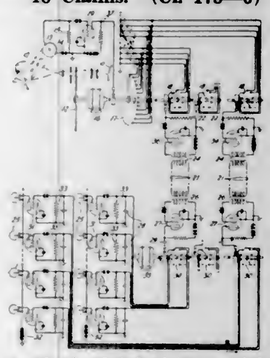
1. An anchor comprising a shank, a main fluke rigidly projecting therefrom, two auxiliary and mutually similar flukes carried rigidly by the shank and projecting at right angles to the main fluke, the main fluke being dissimilar from said other flukes, said flukes having palms and said main fluke having its palm inclined to the axis of the shank acutely, said auxiliary flukes having their palms both inclined away from said axis and on opposite sides from the palm of the main fluke, and means carried by the shank for permitting attachment to a line, said anchor having its center of gravity displaced from the axis of the shank and toward the main fluke.

2,103,478
SEWING MACHINE
Frederick Lutz, Stuttgart, Germany, assignor to Union Special Maschinenfabrik, G. m. b. H., Stuttgart, Germany
Application June 25, 1935, Serial No. 28,314
18 Claims. (Cl. 112—162)



1. A sewing machine comprising a reciprocating needle; a non-thread-carrying looper to draw loops from the needle thread at one side of the fabric being seamed; and a latch looper to draw loops from the needle thread at the other side of the fabric, and, after drawing such loops, to take the loops from the first mentioned looper.

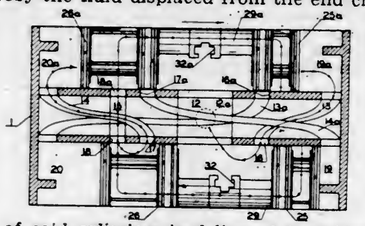
2,103,479
HOUSEHOLD CARBONATOR
William Magee, Park Ridge, Ill., assignor, by mesne assignments, of ten percent to Donald Guilliams, Evanston, Ill.
Application November 17, 1932, Serial No. 643,038
14 Claims. (Cl. 62—92)



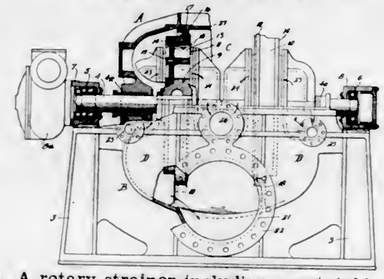
1. In combination, a household refrigerator having a power unit, a switch adapted to control said power unit, and a carbonator mounted in said refrigerator, said carbonator comprising valves adapted to admit water and carbon dioxide gas thereto, a pump adapted to supply water under substantial pressure, a clutch adapted operatively to connect said pump to said motor, a spigot for discharging carbonated water, and means for actuating simultaneously said valves, clutch and said switch.

2,103,480
GIB FOR ELEVATOR GUIDE SHOES
Howard F. Mason, Los Angeles, Calif.
Application June 10, 1936, Serial No. 84,517
2 Claims. (Cl. 308—3)

1. The combination with an elevator guide shoe, of a gib removably positioned in said shoe, said gib being formed in a single piece from iron wood, and channel shape in cross-section and a one piece channel-shape cushion arranged between said gib and said shoe.



2,103,481
SIGNALING SYSTEM AND METHOD
Robert C. Mathes, Wyoming, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application July 24, 1928, Serial No. 295,057
18 Claims. (Cl. 178—6)

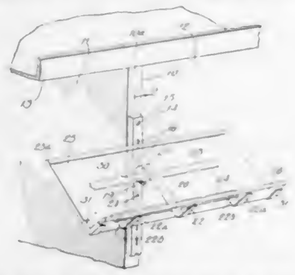


1. The method of television which comprises scanning a plurality of elemental areas of a field of view one at a time in succession to obtain a single electrical image current and utilizing energy derived from said current to control a plurality of transmission lines simultaneously.

2,103,482
LIQUID MEASURING DEVICE
Lyon McCandless, Beaver Falls, Pa.
Application August 20, 1935, Serial No. 37,027
8 Claims. (Cl. 73—242)

1. In a liquid measuring device a plurality of measuring cylinders having their axes in parallel relation and having axially spaced ports with communicating flow passages, hollow pistons operatively disposed in said cylinders having axially spaced heads dividing each of said cylinders into end compartments, a central compartment and intermediate compartments, the latter being communicative through the hollow pistons, a common inlet passage in radial alignment with one of each of the intermediate compartments of said pair of cylinders whereby the inlet pressure may be directed from said intermediate chambers through the flow passages to the end chambers of said cylinders to actuate the pistons for reciprocatory movement, the flow passages from said end chambers communicating with the central compartments of the cylinders, and said cylinders having a common outlet communicating with said central compartments whereby the fluid displaced from the end chambers of said cylinders is delivered to said common outlet and means connecting said pistons for correlating their movements.

2,103,483
ROTARY STRAINER
Daniel Raymond McNeal, Abington, Pa., assignor to Andale Company, Philadelphia, Pa., a corporation of Pennsylvania
Application November 30, 1935, Serial No. 52,288
5 Claims. (Cl. 210—196)

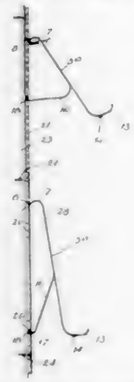


1. A rotary strainer including a rotatable axis mechanism, a pair of spaced strainer disks mounted on the axis mechanism, and a casing surrounding the strainer disks and cooperating therewith to form inlet and outlet chambers in the casing, one disposed intermediate the disks and serving as a flow chamber common to both disks and the other being divided with portions thereof disposed at the outer sides of both disks, a major part of the disk area at both sides of both disks being exposed to the adjacent chambers, inlet and outlet connections for introducing fluid to be strained into and for withdrawing the same from the inlet and outlet chambers, whereby to provide for flow of materials to be strained through the disks generally axially thereof but in opposite axial directions, a mechanism for cleaning the strainer disks, including cleaning boxes positioned at opposite sides of both disks, the boxes for each disk being circumferentially located in substantially the same position whereby to provide for flow of a cleaning medium from the box at one side of the disk through the disk to the box at the opposite side of the disk, and connections for a cleaning fluid associated with said boxes to provide for flow of cleaning fluid through the disks in a direction opposite to the flow therethrough of the fluid being strained.

2,103,484
ANGULAR DISPLAY SHELF
Pierre H. Meyer, New York, N. Y.
Application January 23, 1936, Serial No. 60,392
1 Claim. (Cl. 248—243)

A shelf supporting bracket comprising a unitary metal strip having a vertical arm joined at the upper end thereof through a large radius arc

to an outwardly and downwardly extending arm, said vertical arm having dual means for anchoring the bracket to a vertical apertured support, said means comprising a setoff on the lower portion of said arm to engage one of said apertures and an adjustable clamping means on the upper



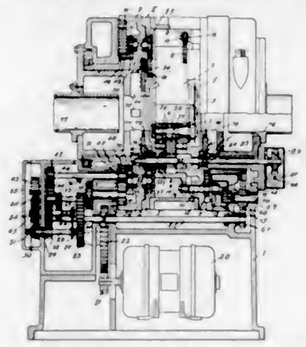
portion of said arm and near said arced portion adapted to engage another of said apertures, and said outwardly extending arm having a perpendicular extension at the lower end thereof to provide for the support of perpendicularly disposed back and front shelf members.

2,103,485

VARIABLE INCLINATION SUPPORTING BRACKET

Pierre H. Meyer, Mount Vernon, N. Y.

Application August 5, 1936, Serial No. 94,351
1 Claim. (Cl. 248—300)



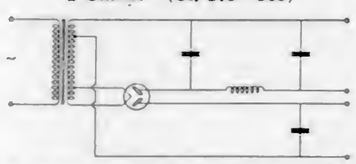
A device for supporting articles in an inclined position, said device comprising an elongated plate member, the lower end portion of which is provided with an outwardly extending curved article supporting flange and a pliable brace part normally disposed in alinement with said plate member and freely flexible into different angular positions with respect to the rear surface of said plate member and retained in the flexed position by the pliable characteristics of said member in controlling the angularity of support of said plate member with respect to a predetermined surface, said plate member having at the upper end thereof a rearwardly curved portion having a central upwardly curved tongue for engaging with an apertured support and downwardly curved tongues on either side thereof for engaging with the surface of said support, said device further having at the extremity of said brace part a central and downwardly curved tongue for engaging any one of several other apertures in said support, and upwardly curved tongues on either side of said last named tongue for engaging the surface of said support.

2,103,486

ROTARY TOOL MACHINE

Edwin R. Motch, Jr., Cleveland, and Johan Gustaf Moohl, South Euclid, Ohio, assignors to The Motch and Merryweather Machinery Company, Cleveland, Ohio, a corporation of Ohio

Application August 24, 1935, Serial No. 37,730
18 Claims. (Cl. 29—67)



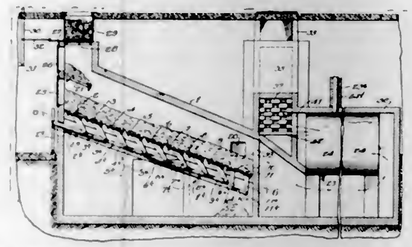
1. In a machine of the character described, the combination of work holding means, a series of rotary tools disposed exteriorly of the workpiece held in said work holding means, driving means for rotating said tools about their own axes and bodily around said work holding means, means for moving said tools inwardly with respect to the workpiece, and means for limiting the force applied to such inward movement of said tools.

2,103,487

RECTIFYING AND FILTERING SYSTEM

Paul Müller, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application October 24, 1933, Serial No. 694,964
In Germany October 18, 1932
1 Claim. (Cl. 175—363)



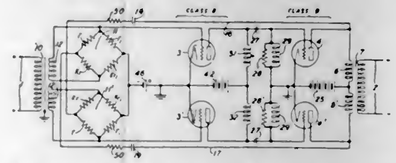
In a power supply device for amplifiers and the like, a source of alternating current, a power transformer having a primary winding and a secondary winding, a rectifier tube provided with a cathode and two anodes, an envelope for enclosing the cathode and two anodes, a connection between the cathode of the tube and one end of the secondary winding of the transformer, a load circuit, a connection between one of the anodes of the rectifier tube and the other end of the transformer secondary said connection including the load circuit, an auxiliary load circuit and a connection between the other anode of the rectifier tube and a point of the transformer secondary intermediate the two ends thereof whereby said two loads are supplied with independently rectified different voltage current.

2,103,488

APPARATUS FOR TREATING GARBAGE

Niels Ohlsen, Chicago, Ill.

Application April 5, 1926, Serial No. 99,721
Renewed September 10, 1936
4 Claims. (Cl. 110—15)



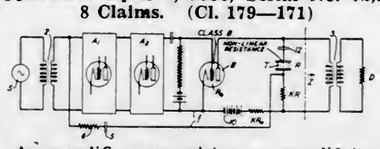
2. An apparatus for treating garbage comprising a burning chamber, the chamber being provided with an opening at the front through which garbage is inserted therein, a support in said chamber for said garbage inclined from the front downwardly toward the rear of the chamber, said support divided into a series of sections crosswise thereof, each crosswise section being separately movable, with means for moving each crosswise section so that the garbage thereon is bodily moved to the next section away from the opening, the last movable section constituting the burning section for the garbage, the garbage being dried and burned upon this inclined support by the heat supplied exclusively by the garbage to be disposed of.

2,103,439

AMPLIFIER CIRCUIT

Eugene Peterson, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application April 1, 1936, Serial No. 72,145
2 Claims. (Cl. 179—171)



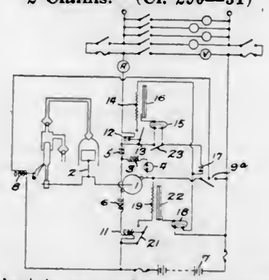
1. In combination, an amplifier having cascaded stages, each of said stages comprising space discharge devices in push-pull relation operated in accordance with so-called class B operation, in which the steady control-grid potential of each of the devices is such that the space current of the device is interrupted for the order of half the period of the waves to be amplified, said class B operation of said cascaded stages producing an objectionable gasping effect consisting of increase of gain of said amplifier with increase of load, and means for improving operation of the amplifier comprising connections for feeding back to the first of said cascaded stages a portion of the output waves of the amplifier in gain-reducing phase and in amount sufficient to suppress said gasping effect below the value without feedback.

2,103,490

WAVE TRANSLATING CIRCUITS

Eugene Peterson, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

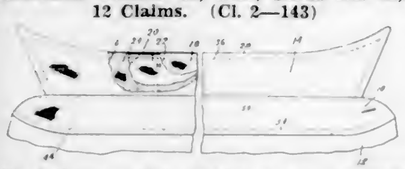
Application April 1, 1936, Serial No. 72,146
8 Claims. (Cl. 179—171)



2. An amplifier comprising an amplifying element whose output impedance varies with variation of the magnitude of the waves to be amplified by said amplifying element, a feedback path for producing negative feedback in the amplifier for reducing modulation in the amplifier, an outgoing circuit for the amplifier, and an amplifier output bridge having said feedback path and said outgoing circuit in its diagonals, respectively, and having the output impedance of said amplifying element in a ratio arm of the bridge, and an impedance device having a non-linear voltage-current characteristic in another ratio arm of the bridge for balancing the variable output impedance of said amplifying element and rendering the bridge diagonals conjugate.

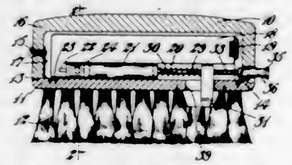
2,103,491

MEANS FOR CONTROLLING AUTOMATIC DIESEL ELECTRIC GENERATORS



Archie Read, Newcastle-on-Tyne, England

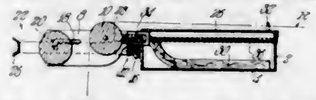
Application May 19, 1936, Serial No. 80,615
In Great Britain October 1, 1935
2 Claims. (Cl. 290—31)



1. An electric generator system, comprising a dynamo, a Diesel engine coupled thereto, a battery adapted to supply current to the dynamo so that it will act as a motor, and to be charged by the dynamo when the latter is generating, a consumption circuit adapted to be alternatively supplied with current by the battery and by the dynamo, the said dynamo having an armature provided with three independent field windings, one being the conventional shunt winding but capable of producing more than normal field strength, and the other two being designed to work together to produce balancing effects enabling the dynamo to give a potential on the armature that does not vary with load and allows a definite trickle charge to the battery when the dynamo is generating, a contactor starting switch, a coil for electromagnetic operation of the contactor switch and adapted to be connected across the consumption circuit, a hand set but thermally responsive switch in the circuit of such coil, a normally open heating circuit for said switch, and an emergency coil in series with the aforesaid third winding adapted to close the heating circuit in order to open the circuit of the contactor switch coil.

2,103,492
COLLAR
Harvey D. Roberson, Leominster, Mass., assignor to Wachusett Shirt Company, Leominster, Mass., a corporation of Massachusetts
Application October 21, 1935, Serial No. 45,897
12 Claims. (Cl. 2—143)

12. A fused collar having a top comprising front and rear face plies and at least one interposed stiffener ply, and a neck-band comprising front and rear face plies and at least one interposed stiffener ply, each stiffener ply having a coating of fusible stiffening material on one face only which bonds it to the confronting face ply and throughout the confronting faces and said top stiffener ply being excluded from the fold line of said top.

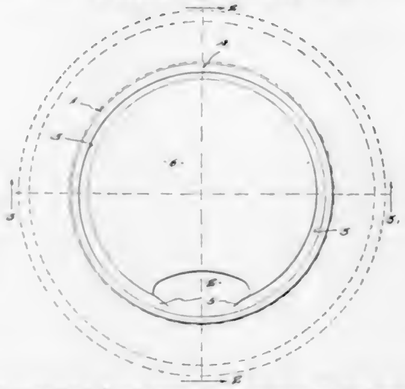


2,103,493
DISPENSING DEVICE
Charles Perkins Robertson, Upper Clapton, London, England
Application May 14, 1934, Serial No. 725,602
In Great Britain May 17, 1933
2 Claims. (Cl. 221—94)

1. In a device of the character described, a cylinder having an inlet at one end, a piston rod slidable through the other end of said cylinder, a piston at the other end of the piston rod, said piston rod having a longitudinally extending slot leading from its outer end, a push button formed with a longitudinally extending pocket slidably and rotatably receiving the outer end portion of said piston rod, and a pin extending diametrically of said push button through the pocket thereof and disposed to enter the slot when the push button is in one position to permit sliding movement of the push button independent of the piston rod, the pin being adapted to be disposed transversely of the slot when the push button is turned to an adjusted position and bear against the outer end of the piston rod in crossed relation to the slot to cause the piston rod to be shifted longitudinally into the cylinder and discharge contents of the cylinder when pressure is applied to the push button.

2,103,494
INKING DEVICE
Arthur Romano and Alboino Botta, Springfield, Mass.
Application September 19, 1936, Serial No. 101,602
4 Claims. (Cl. 91—62.5)

1. A device for applying ink or the like to a typewriter ribbon or the like comprising in combination, a casing in the form of a receptacle having spaced arms extending forwardly therefrom each provided with a longitudinally-extending slot and a communicating transverse slot at the outer end thereof, an inner roll journalled in said arms for rotation therebetween, an inking pad disposed in said casing having a part for contacting with said inner roll, a roll-release member having a pair of side arms disposed adjacent the first-named arms, an outer roll between the arms of the said release member having trunnions rotatable therein and disposed in and movable relative to said slots, and spring means associated with said casing and said arms of the release member urging the latter inwardly to-

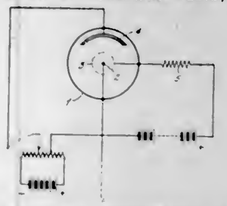


wards the casing, all adapted and arranged whereby the release member may be moved against the action of the spring means from an inner position where the rolls are in engagement to an outer position by sliding the trunnions of the outer roll along the longitudinal slots of the spaced arms and into the transverse slots thereof so that the release member is held against inward movement with the rolls in separated relation against the action of the spring means.

2,103,495
PROCESS FOR THE PRODUCTION OF VALUABLE SUBSTANCES
Hans Ruckdeschel, Kulmbach, Germany, assignor to the firm Ireks Aktiengesellschaft, Kulmbach, Germany, a joint-stock company of Germany
No Drawing. Application May 29, 1935, Serial No. 24,057. In Germany May 8, 1934
9 Claims. (Cl. 99—27)

2. The herein described process of making a syrup for flavoring, coloring and seasoning purposes, which process comprises the step of reacting a substance selected from the class consisting of trioses, pentoses and substituted pentoses, with a substance containing albumen decomposition products and selected from the class consisting of yeast, liquefied yeast, malt, malt mash, malt wort, malt extract, malt germs and malt germ extract.

2,103,496
PLANKED FOOD SERVER
Albert F. Saunders, Syracuse, N. Y., assignor to T. N. Benedict Manufacturing Company, East Syracuse, N. Y., a corporation of New York
Application November 21, 1935, Serial No. 50,884
1 Claim. (Cl. 65—15)

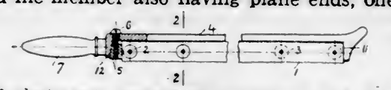


A planked food server comprising a flat wood body of substantially equal thickness throughout

its extent and having a circumferential groove in the margin of its upper face increasing in opposite directions in depth from one point to the diametrically opposite point of the body, the body being formed with a well at said diametrically opposite point into which the groove drains, the area of the upper face of the body within the circle of the groove being smooth and inclining in all directions towards the well.

2,103,497
ARTIFICIAL TEXTILE MATERIAL AND METHOD OF PREPARING THE SAME
George Schneider, Montclair, N. J., assignor to Celanese Corporation of America, a corporation of Delaware
No Drawing. Original application May 4, 1934, Serial No. 723,844. Divided and this application June 10, 1936, Serial No. 84,479
18 Claims. (Cl. 28—1)

1. Process of improving the properties of filaments or yarns containing organic derivatives of cellulose comprising applying thereto a finish containing a fatty material selected from the group consisting of higher fatty acids and their glycerides and an alkyl ester of a para hydroxy benzoic acid.

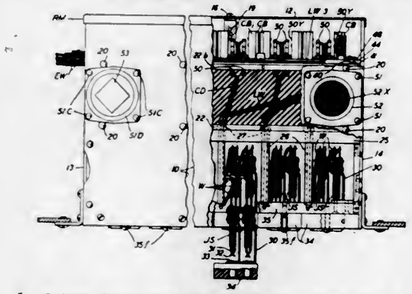


2,103,498
PHOTOCELL
Fritz Schröter, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application March 8, 1933, Serial No. 660,008
In Germany March 11, 1932
7 Claims. (Cl. 250—41.5)

1. In a system for amplifying photoelectric currents, an electron tube comprising a heated electron emitting electrode, a grid electrode, and a photo-sensitized retarding electrode, a resistor and a source of potential for maintaining the grid electrode positive with respect to the heated emitter, and means for maintaining the photosensitive retarding electrode at a predetermined negative voltage relative to the heated emitter so that upon illumination of the photosensitized electrode magnified voltage variations are produced across the said resistor element.

2,103,499
FILE AND RASP
Simon Seifried and Ferdinand Ries, Munich, Germany
Application July 11, 1935, Serial No. 30,824
In Germany July 13, 1934
3 Claims. (Cl. 29—79)

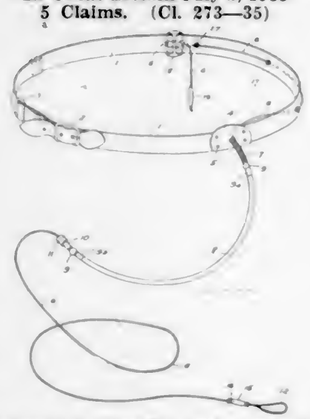
1. In a file, a plurality of individual longitudinal file elements each having a file surface, means rigidly holding said file elements in position parallel to one another for forming a unified, selfcontained, individual file member composed of said elements, for forming a file surface composed of the file surfaces of said individual elements, and for maintaining a predetermined clearance between the file surfaces of said individual elements, and a holder provided with a handle for holding said file member, said holder having a plane abutment at each end, said file member also having plane ends, one of



said abutments contacting one plane end of said file member, and a key contacting the other of said abutments and the other plane end of said member for forcing the first mentioned end of said member to its abutment and for securing said member to said holder and permitting easy removal of said member from said holder.

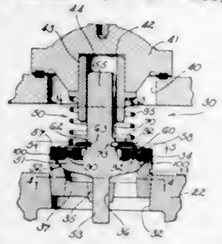
2,103,500
ALLOY
Enrique G. Touceda, Albany, N. Y., assignor to Consolidated Car-Heating Company, Inc., Albany, N. Y., a corporation of New York
No Drawing. Original application January 8, 1936, Serial No. 58,163. Divided and this application January 14, 1937, Serial No. 120,549
1 Claim. (Cl. 75—134)

A workable alloy having high resistance to lactic acid in solutions of the order of 12% at temperatures of the order of 180° to 190° F., and containing as essential alloying ingredients chromium, nickel, cobalt and molybdenum; the chromium content being from 20% to 33%, the nickel being from 20% to under 50%, the molybdenum being from 1% to under 7%, and the balance being substantially all cobalt and within the limits of 20% to 50%.



2,103,501
TERMINAL BOX DEVICE
Fred D. Waldron, Queens Village, N. Y., and Anthony J. Wier, Elizabeth, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application September 16, 1936, Serial No. 101,054
5 Claims. (Cl. 179—91)

1. A test terminal box device comprising a casing, partitions in said casing forming a plurality of adjacently disposed compartments, a plurality of terminals carried by one of said partitions and extending on opposite sides thereof into two of said compartments, a plurality of insulating bars supported by the end walls of said casing in adjusted spaced relation to each other, a plurality of switching devices having each a supporting block mounted in coordinate rows on said bars and connected to adjacent ends of said terminals, in one of the outer disposed compartments, a sleeve secured to one of the walls of



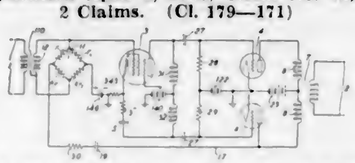
said casing through which the line wires enter the middle compartment for connection with the other ends of said terminals, and other electrical apparatus mounted on the other of said partitions in the other outer disposed compartment and having terminals connecting with the first-mentioned terminals in the said middle compartment.

2,103,502
GOLF HARNESS
John William Leo Webster, Liverpool, England
Application June 22, 1936, Serial No. 86,563
In Great Britain July 2, 1935
5 Claims. (Cl. 273—35)

1. A personal harness for use in controlling and directing the swing of a golf club, comprising, a hip girdle having means for adjusting its girth and securing it tightly around the hips of the golfer, a rein or cord connected at one end to the girdle at the left hip of the golfer when the girdle is secured in position, means for adjusting the effective length of the rein and for detachably connecting its outer end to the neck of the golf club, whereby if the rein be kept taut the club head is constrained to swing in a circle about the golfer's left hip.

2,103,503
SLUSH PUMP VALVE
Clarence White, Walnut Park, Calif., assignor to Oil Well Manufacturing Corporation, Los Angeles, Calif., a corporation of California
Application July 14, 1934, Serial No. 735,229
2 Claims. (Cl. 251—144)

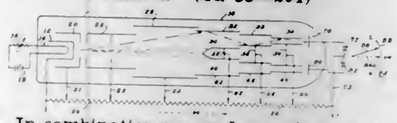
1. In a valve structure, the combination of: a valve body adapted to engage a seat and including a pin portion; a flexible disc carried by said body and having a seating face on each side thereof, said disc being reversible to dispose either of said seating faces for engagement with said seat when said valve body is seated to form a seal therearound; walls forming an annular groove in opposite faces of said disc; an annular rib formed on said body and extending into one of said grooves for centralizing said disc on said body; a pressure plate on said pin for retaining said disc; a shoulder formed on said pin adjacent said plate; and a clip engaging said shoulder for retaining said plate, said clip comprising a pair of relatively spaced fingers integrally joined by a resilient portion, each of said fingers having an inwardly extending arcuate segment spaced from said resilient portion and adapted to fit said pin and the inner sides of the free ends of said fingers being tapered outwardly and beveled upwardly so that the space between said fingers is narrowest adjacent said segments, said beveled portions engaging said shoulder on said pin to increasingly press said plate against said disc when said clip is forced laterally between said shoulder and said plate, said resilient portion allowing said fingers to spread to allow said arcuate segments to snap around said pin in grasping relation, and said tapered portions being adapted to guide said clip into engaging position.



2,103,504
PURIFICATION OF CRUDE WAXY HYDROCARBONS
James M. Whiteley, Roselle, and Hans G. Vesterdal, Elizabeth, N. J., assignors to Standard Oil Development Company, a corporation of Delaware
No Drawing. Application February 26, 1932, Serial No. 595,426
13 Claims. (Cl. 196—20)

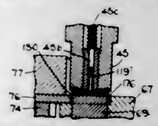
1. The method of purifying crude waxy hydrocarbons which comprises dissolving the crude material in a liquefied normally gaseous hydrocarbon, removing any material remaining undissolved, then chilling the solution whereby wax is caused to precipitate, and recovering the wax so precipitated.

2,103,505
PRODUCTION OF POLYMERS OF KETENE AND PREPARATION OF ESTERS THEREOF
Peter J. Wiezevich and Anthony H. Gleason, Elizabeth, N. J., assignors to Standard Oil Development Company, a corporation of Delaware
No Drawing. Application April 17, 1934, Serial No. 720,946
7 Claims. (Cl. 260—101)



1. Method of preparing esters comprising reacting aliphatic poly-hydroxy alcohols with the products obtained by the polymerization of ketene in presence of an acid esterification catalyst.

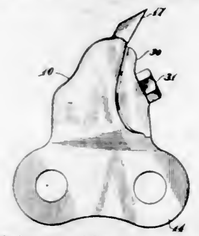
2,103,506
WAVE TRANSLATING SYSTEM
Clyde S. Yeutter, Leonia, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application April 1, 1936, Serial No. 72,148
2 Claims. (Cl. 179—171)



1. A wave translating system comprising two wave amplifying stages, of which one stage is a push-pull stage and the other is a driver stage therefor having but one amplifying element and having means cooperating with the output circuit of said amplifying element to form therewith a balanced output circuit of the stage including a mid-branch that contains a portion of the impedance of the input circuit of said amplifying element, and means producing negative feedback of waves from the output of said push-pull stage to the input of said amplifying element.

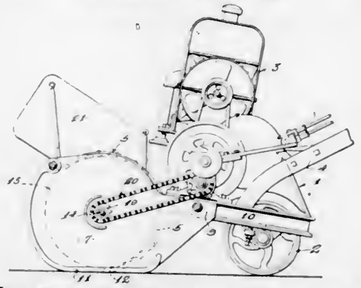
2,103,507
DIRECTION INDICATOR
Vladimir K. Zworykin, Philadelphia, Pa., assignor to Radio Corporation of America, a corporation of Delaware
Application March 31, 1936, Serial No. 71,982
3 Claims. (Cl. 33—204)

1. In combination means for producing a beam of electrons, a pair of parallel conduits so positioned that the electrons constituting the beam are divided between the two conduits in substantially equal numbers when the beam is undeflected, a terminal electrode adjacent the end of each conduit remote from the point of electron entry, and means connecting said respective terminal electrodes in opposition to produce a balanced indication of any difference in the number of electrons impinging against the respective electrodes.



2,103,508
MACHINE FOR CAPPING TACK HEADS
Nils H. Anderson, Shelton, Conn., assignor to The Shelton Tack Co., Shelton, Conn., a corporation of Connecticut
Application June 12, 1936, Serial No. 84,792
8 Claims. (Cl. 10—158)

1. An improved tack capping machine comprising, a magazine for holding a plurality of tacks, a magazine for holding a plurality of caps, means for agitating the tacks and the caps and feeding said tacks and caps successively out of their respective magazines, a chute for receiving the tacks as fed from the tack magazine, a chute for receiving the caps as fed from the cap magazine, and means located at the exit ends of said respective chutes for arranging the caps each with the head of a tack deposited therein.

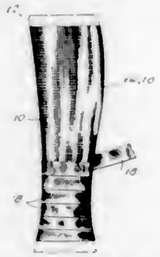


2,103,509
MINING MACHINE
Charles L. Bowman, Bowdil, Ohio, assignor to The Bowdil Company, Canton, Ohio, a corporation of Ohio
Application May 24, 1935, Serial No. 23,211
3 Claims. (Cl. 262—33)

3. A holder for a double-ended cutting tooth having opposed and offset angular sides and taper end to provide reversible cutting points, comprising, in combination, a body member having a recess for holding the bit in operative position with one cutting point exposed for operation and with the other cutting point seated into the bottom of the recess, the recess being large at its opening to receive the body of the tooth and being tapered at its bottom to receive the tapered end of the tooth and to provide an abutment for inward movement of the tooth, the tapered surface at the bottom of the recess encompassing all sides of the tooth, the recess having angular and opposed diverging offset surfaces integrally joined together

to form offset inner sides to engage opposed and offset angular sides of the tooth, said recess being open at its top and forward side and having deep lateral sides for engaging substantially the full depth of the sides of the tooth, and a separate clamping means having a portion engaging the exposed surface of the tooth at the forward open side of the recess for holding the tooth in the recess.

2,103,510
MOTOR SNOW PLOW
Charles S. Brown, Syracuse, N. Y.
Application May 19, 1936, Serial No. 80,599
2 Claims. (Cl. 37—43)



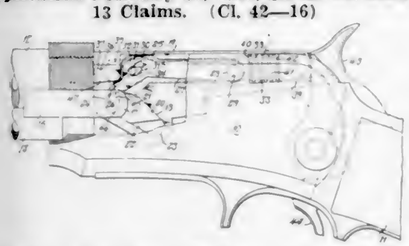
2. In a snow plow or sweeper, the combination with a suitable carriage and motor means thereon, of a cylindrical casing extending across the front of the carriage and being open at its front side, the casing having an outlet in the upper side at one end, a shaft mounted in the casing and having a head rotatable therewith in the discharge end of the casing close to the end wall of the casing, and a spiral vane, the edge of which runs substantially close to the surface over the carriage is being moved, the spiral vane terminating in a blade extending in a general direction lengthwise of the shaft and meeting said head, and motion transmitting means between the motor means and the shaft for rotating the latter.

2,103,511
ARTIFICIAL BODY MEMBER AND METHOD OF MAKING THE SAME
Rudolph K. Brown, Morristown, N. J.
Application April 22, 1936, Serial No. 75,676
7 Claims. (Cl. 3—2)

1. The method of making an artificial body member which comprises shaping wire mesh to

the form required, wrapping the shaped wire mesh with gauze, dipping such assembly in a water-proofing material, and repeating such wrapping and dipping steps alternately until the member is built up to the required thickness and strength.

2. As an article of manufacture, an artificial body member comprising a reenforcing body of wire mesh, a plurality of wrappings of gauze about said body, layers of water-proofing material interposed between the respective adjacent wrappings, and a coating of water-proofing material over the outside wrapping.



2,103,512

BOLT ACTION FIREARM

Frank F. Burton, Mount Carmel, Conn., assignor to Winchester Repeating Arms Company, New Haven, Conn., a corporation of Maryland

Application February 25, 1933, Serial No. 658,562

13 Claims. (Cl. 42—16)

1. In a bolt-action firearm, the combination with a retractable breech-bolt; of a reciprocating firing-pin carried by the said breech-bolt and having a laterally-offsetting operating-projection; a manually-reciprocatable action-slide having lost-motion connection to the said breech-bolt for operating the same; and a latch-member acting to releasably check the rearward movement of the said action-slide with respect to the said breech-bolt and provided with a cam-surface engaged by the laterally-offsetting operating-projection of the said firing-pin for being positively and concurrently moved into its unlatching position by the said firing-pin during the firing movement thereof.

2,103,513

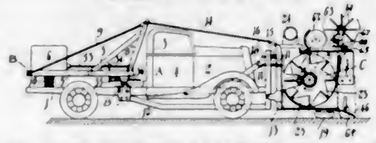
MEANS FOR COOKING FOODS

Huntly M. Campbell, Detroit, Mich.

Application April 15, 1936, Serial No. 74,420

2 Claims. (Cl. 219—20)

2. Means for cooking foods comprising an oven, a heating unit for heating the interior of the oven, a primary circuit for operating the heating unit, a heat sensitive device adapted for insertion in the food being cooked, a secondary circuit, a transformer between the two circuits, the heat sensitive device being detachably connected in the secondary circuit for manual movement within the oven, said connection allowing movement of the food in relation to the electric heating element about the interior of the oven with the heat sensitive device therein, the arrangement being such that the heat sensitive device will close the secondary circuit when the interior of the food being cooked reaches a predetermined temperature and means operated by closing of the secondary circuit to open the primary circuit.



2,103,514

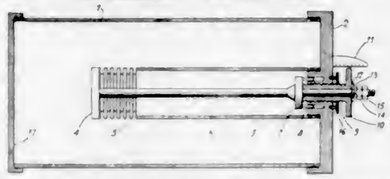
SNOW PLOW

Robert E. Cole, Highland Creek, Ontario, Canada

Application August 31, 1936, Serial No. 98,687

7 Claims. (Cl. 37—43)

1. In snow removing apparatus, the combination of a truck chassis; a platform pivoted at one end on said chassis; a motor on said platform; a snow plow frame pivoted on the front end of said chassis independently of said platform; and connections between said snow plow frame and platform to cause said snow plow frame and platform to rock simultaneously.



2,103,515

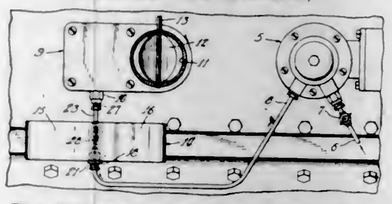
LOW POWER FACTOR LINE RESONATOR

James W. Conklin and Ludwig A. Battermann, Rocky Point, N. Y., assignors to Radio Corporation of America, a corporation of Delaware

Application August 31, 1935, Serial No. 38,695

15 Claims. (Cl. 178—44)

1. A line resonator comprising inner and outer conductors mechanically fixed in position with respect to one another at one of their adjacent ends, an element which is adjustable in length with respect to the free end of said inner conductor coupled thereto, a rod of low temperature coefficient secured to said element and extending substantially the length of and within said inner conductor for maintaining the effective overall length of said inner conductor and element constant with respect to said outer conductor despite temperature fluctuations, and means external of said conductors and mechanically linked to said rod for adjusting the effective length of said inner conductor including said element.



2,103,516

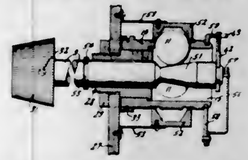
AUXILIARY FUEL SUPPLY FOR AUTOMOBILE ENGINES

Charles J. Dempsey, Chicago, Ill.

Application December 30, 1935, Serial No. 56,836

4 Claims. (Cl. 158—46.5)

1. In a fuel supply system for automobiles and the like, the combination with the carburetor, and a fuel pump for supplying fuel to said carburetor of a fuel container interposed between fuel pump and the carburetor, a supply conduit from the fuel pump through the container to the carburetor, said conduit having an opening in the side thereof within the container whereby to supply a portion of the fuel passing through it to the container and to impart the fluid pressure in the container to the fuel passing through said conduit to the carburetor, said container being pivoted on said conduit whereby it may be inverted with respect to the conduit.



2,103,517

DRIVE MECHANISM

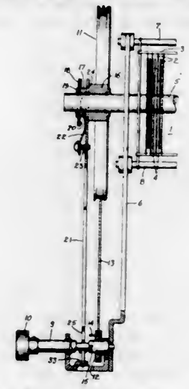
Donald R. De Tar, Stratford, Conn., assignor to General Electric Company, a corporation of New York

Application August 2, 1935, Serial No. 34,423

18 Claims. (Cl. 74—10)

1. In combination, an adjustable element, a control member coupled to drive said element thereby to adjust said element, an operating member, means for coupling said control and operating members in reduced drive relation while said operating member is rotated over a predetermined range in excess of one complete revolution, and means for automatically coupling said members in direct drive relation when said operating member is rotated in either direction to the limits of said range.

2,103,518



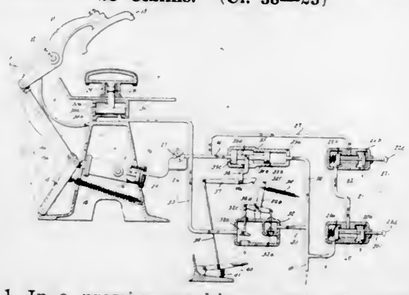
DRIVE MECHANISM

Donald R. De Tar, Stratford, Conn., assignor to General Electric Company, a corporation of New York

Application May 20, 1936, Serial No. 80,732

11 Claims. (Cl. 74—10)

1. In combination, a drive shaft, a driven shaft, said shafts having different axes, an arm connected to the driven shaft and extending therefrom toward said drive shaft, means to oscillate the end of said arm nearest the drive shaft about the axis of the driven shaft in response to rotation of the drive shaft through a predetermined range thereby to rotate said driven shaft, and additional means to drive the driven shaft independently of said arm in response to rotation of the drive shaft after said predetermined range is exceeded.



2,103,519

PRESSING MACHINE CONTROL

James M. Dewey, Cincinnati, Ohio, assignor to The American Laundry Machinery Company, Norwood, Ohio, a corporation of Ohio

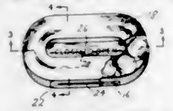
Application October 1, 1935, Serial No. 43,066

23 Claims. (Cl. 38—25)

1. In a pressing machine, a pair of coacting relatively movable pressing members, power means for causing relative approach movement between said members in two steps, a first step into preliminary closed position and a second step into final closed position, control members for said power means, one control member for causing each step of the operation thereof, a power device for actuating said second step control member, and means for operating said power device by operation of said first step control member successively in power supply and power cut-off directions.

2,103,520

DISPENSER FOR TABLETS OR THE LIKE



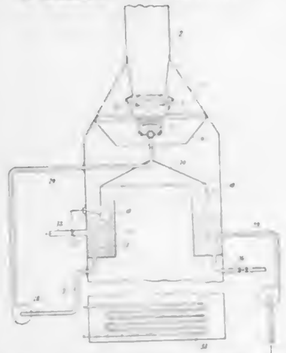
John H. Donnelly, Elmhurst, N. Y., assignor of one-half to Samuel E. Witt, New York, N. Y.

Application April 20, 1934, Serial No. 721,453

4 Claims. (Cl. 206—42)

1. A dispenser for tablets or the like comprising a bottom member, a cover member therefor arranged for movement relative to the bottom member, one of said members being provided with an opening, and the other of said members being arranged to completely close said dispenser against exit of a tablet and provided with means

whereby, when the members are moved relatively to each other, the dispenser is opened and a single tablet is exposed and ejected through the opening, and spring means for closing the container

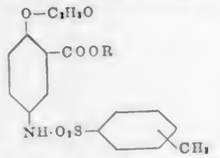


after a tablet ejecting operation, said members being arranged to confine the tablets to a single layer, and said ejection through said opening taking place in the direction of extent of said layer.

2,103,521
EVAPORATOR

Edgar Lionel Luly, London, England, assignor to The Babcock & Wilcox Company, Newark, N. J., a corporation of New Jersey

Application October 30, 1936, Serial No. 108,341
In Great Britain September 3, 1935
6 Claims. (Cl. 159—31)



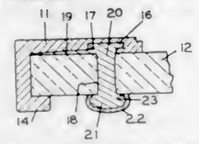
5. An evaporator having a cylindrical casing constructed to contain a pool of vaporizable liquid in the lower part thereof and having a vapor outlet in the upper part thereof, a gas and liquid separator in said casing opening to said outlet, a sprayer head below said separator arranged to downwardly discharge a conical liquid spray in said casing, a distributor cone symmetrically arranged relative to and below said sprayer head and having its lower end spaced from the sides of said casing for the passage therebetween of ascending vapor, and a separate annular collection chamber arranged to receive and collect liquid dropping from said distributor cone.

2,103,522
THERAPEUTIC COMPOSITION

Joseph Ebert, Westmont, N. J., assignor to The Farastan Company, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Application December 3, 1936, Serial No. 113,985
6 Claims. (Cl. 260—104)

1. Compounds of the formula

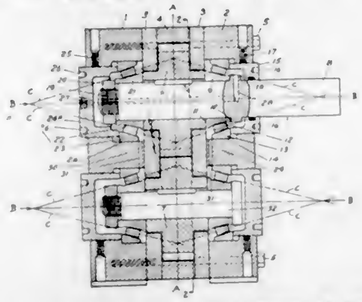


in which the relative position of the SO_2 group and the CH_3 group is one of the three positions, namely, ortho, meta and para positions, and in which R is a member of the group consisting of hydrogen and methyl.

2,103,523
OPHTHALMIC MOUNTING AND METHOD OF ATTACHING SAME

Gerhard A. Ellestad, Rochester, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York

Application November 5, 1936, Serial No. 109,360
4 Claims. (Cl. 88—47)



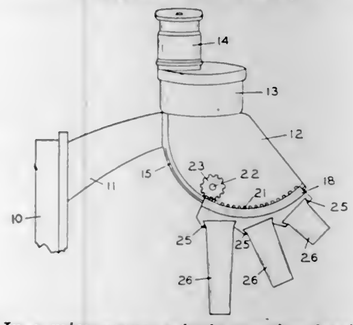
1. An ophthalmic mounting comprising a strap positioned on one face of a lens having an opening, anchoring means on said strap opposite and in communication with said opening, and a mass of fusible material filling said opening and having an integral portion secured to said anchoring means, said material also having an enlarged head portion contacting the other face of said lens, and a hollow shell substantially covering and anchored to said head portion, said shell being structurally independent of said mounting.

4. A method of attaching to a lens having an opening, an ophthalmic mounting having a strap provided with a recess which comprises placing the mounting on the lens with the recess in communication with the opening, placing a plug of fusible material in the opening with one end of the plug resting in the recess, placing on the other end of the plug a hollow shell having a diameter greater than that of said opening and applying sufficient heat to melt said plug so that the material of the plug will substantially fill the recess, opening and shell and then cooling the assemblage.

2,103,524
GEAR PUMP

Walter Ernst, Mount Gilead, Ohio, assignor, by mesne assignments, to The Hydraulic Press Corporation, Inc., Wilmington, Del., a corporation of Delaware

Application January 3, 1935, Serial No. 262
1 Claim. (Cl. 103—126)



In combination in a gear pump, a pair of spaced shafts, pumping gears mounted on said shafts, at least one of said shafts having an annular shoulder located inwardly of the end of the shaft and a threaded portion upon said end with a nut engaging said thread, tapered roller bearings mounted on said shaft on opposite sides of said gear, the inner races of said bearings being arranged between said gear and shoulder and nut, respectively, and in abutment therewith, said bearings, and their inner races together with the gear being assembled or disassembled as an entirety from the said end of the shaft beyond said shoulder and all of said parts being clamped to the shaft by said nut when it is in engagement with the threaded end of the shaft, a casing for said pump adapted to slidably support the outer races of said bearings, and adjustable collars in said casing adapted to engage said bearings for adjustably moving the bearings and the shaft with its gear axially of said shaft to simultaneously adjust the intervals between said gear and said casing and also to reduce the diametral clearances of said tapered roller bearings.

2,103,525
MICROSCOPE

George B. Gallasch, Rochester, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York

Application June 27, 1935, Serial No. 28,682
7 Claims. (Cl. 88—39)

1. In a microscope, a body member having an arcuately curved lower wall, a groove in each side of said member substantially parallel to said wall, a multiple objective carrier, a recess in said carrier for receiving the lower end of said member, a tongue on each side of said recess for engaging the adjacent groove on said member to slidably secure said carrier to said member, teeth on said carrier, a gear rotatably mounted on said member for engaging the teeth on said carrier, and means for rotating said gear.

2,103,526
HAIR CURLER

Jacob Goodman, Brooklyn, N. Y., assignor to Delamere Company, Inc., a corporation of Delaware

Application October 4, 1935, Serial No. 43,497
3 Claims. (Cl. 132—44)

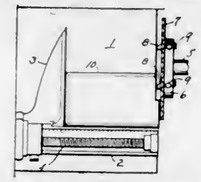
1. In a hair curler of the character described, the combination of a flexible tubular hair winding member upon which the hair may be wound, a pliable wire hair clamping member disposed within and projecting outward from the tubular member and adapted to be bent lengthwise against the tubular member to clamp the ends of the hair thereon prior to winding and to retain its bent form, and a locking member comprising two pliable wire arms, one extending outwardly from each end of the tubular member and adapted to be bent towards each other across the hair wound on the tubular member to fasten the curler in place in the hair.

2,103,527
PARTING WAX

Charles V. Goodyear, Waterloo, Iowa

No Drawing. Application December 17, 1936, Serial No. 116,381
1 Claim. (Cl. 22—190)

A method of preparing a parting wax, consisting in combining the following ingredients and mixing them together in successive stages, for approximately one gallon of the preparation, as follows:



First; mix one pound of melted rosin with two quarts of gasoline, and keep in a closed container.

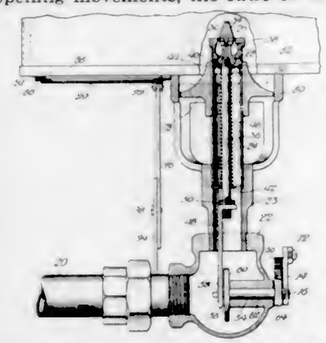
Second; melt one pint of paraffin wax, and mix with one pint of gasoline, one pint of light cylinder oil, two-thirds of a gallon of kerosene, one-half fluid ounce of castor oil, then add to this mixture one half pint of the first preparation.

2,103,528
TOOL SETTING GAUGE

Lee C. Hammond, Kalamazoo, Mich., assignor to Hammond Machinery Builders, Inc., Kalamazoo, Mich., a corporation of Michigan

Application March 23, 1937, Serial No. 132,588
6 Claims. (Cl. 29—69)

1. A tool setting gauge for printers' sawing and trimming machines of the type having a work table on which is mounted a work gauge provided with a work finger, said tool setting gauge comprising a rectangular block having downwardly opening recesses therein, one face of said block being stepped for coaction with the trimming tools and saw teeth, respectively, of the machine, said block being adapted to be disposed on the work table in the angle between the work gauge and finger with said stepped face adjacent the tools to be set.



2,103,529
AUTOMATIC CONTROL FOR BURNERS

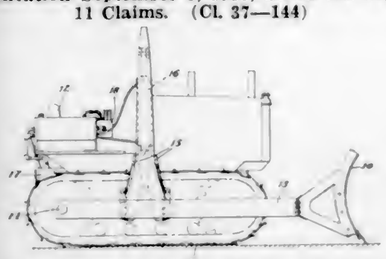
William G. Hartwig, Chicago, Ill., assignor to Railway Utility Co., Chicago, Ill., a corporation of Illinois

Application April 9, 1934, Serial No. 719,627
2 Claims. (Cl. 158—119)

2. In a burner, a controllable fuel valve, a primary air passage having a valve movable with said fuel valve and controlling the volume ratio of air mixed with fuel delivered thereto, a secondary air passage adapted to deliver air for promoting combustion of the fuel mixture, a secondary air valve controlling the volume ratio of secondary air supplied to the burner, and a valve-moving means having connections through which it moves all of said valves through a range of movements that positions all of said valves in substantially closed position or in a plurality

of open and successively more open positions, and means whereby the connection through which said valve-moving means opens the secondary air valve imparts to said secondary air valve opening movements, the ratio of which to

the opening movements of the fuel valve are progressively amplified, so that the volume ratio of secondary air supply to the fuel supply is materially greater as the volume of fuel supply increases.



2,103,530

SYSTEM OF EQUALIZING THE LIFTING SPEED OF DIFFERENTLY LOADED HYDRAULIC JACKS

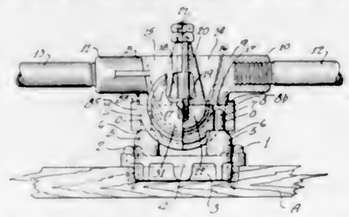
Carle D. Henry, South Portland, Maine, assignor to Maine Steel, Inc., South Portland, Maine, a corporation of Maine

Application September 5, 1935, Serial No. 39,274

11 Claims. (Cl. 37—144)

11. In material handling equipment, the combination with a propulsion vehicle and a material moving element propelled thereby, of a pair of separate lifting members mounted on the propulsion vehicle and operatively connected with the material moving element, a prime mover for said lifting members, a single source of power for driving said prime mover, and control means dominant upon said prime mover for causing a single jack to operate at maximum lifting speed or for causing both jacks to operate at equalized lifting speed on occasions when both jacks are differently loaded at the same time.

2,103,531



POURING JIG

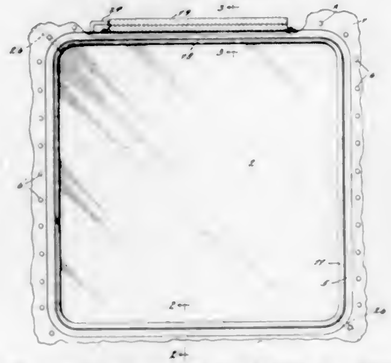
Michael Holhut and Walter G. Vollmer, St. Louis, Mo., assignors to H & H Machine & Motor Parts Co., St. Louis, Mo., a corporation of Missouri

Application September 16, 1936, Serial No. 101,006

3 Claims. (Cl. 22—123)

3. A pouring jig adapted for cooperation with an automotive-bearing support structure to provide a mold for forming a substantially hemi-cylindrical mold-cavity, comprising a substantially hemi-cylindrical former having a flat upper face, a pouring cup pivotally mounted on said upper face and having a lower flat face receivable flatwise upon and in the plane of, the open side of the bearing support structure to position the substantially hemi-cylindrical former in spaced relation therefrom, and means to close the ends

of the bearing structure, said pouring-cup having a plurality of apertures formed through the bottom thereof and arranged in a substantially straight line, contiguous to straight edges of the mold-cavity, and of diametrical extent substantially equal to the transverse dimension of said mold-cavity for cooperation with said edges of the mold-cavity to shear off the poured bearing metal upon rotary movement of the pouring cup.



2,103,532

MOUNTING FOR DOUBLE PANELS

Fenley Hunter, Flushing, N. Y., assignor to Hunter Sash Company, Incorporated, Flushing, N. Y., a corporation of New York

Application March 19, 1936, Serial No. 69,640

7 Claims. (Cl. 20—56.5)

1. In combination, a frame having an opening therein, a bracket surrounding said opening and rigidly secured to said frame and comprising a rib extending inwardly towards the center of the opening and defining the edge thereof, two shelves on said rib and extending in opposite directions therefrom, two flanges on said bracket and disposed on opposite sides of said rib and extending inwardly towards the center of the opening and having their inner edges spaced from the edges of said shelves to form throats, two spaced panels, each larger than the opening defined by said rib and overlapping said rib on opposite sides thereof, and two strips of resilient compressible material holding said panels against movement away from said rib, each of said strips having a portion thereof extending through one of said throats and into engagement with the outer side

of one of said shelves and each strip also being compressed between the panel and flange associated therewith.

2,103,533

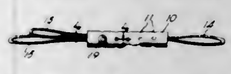
HAIR CURLER

William Huppert, New York, N. Y., assignor to Delamere Company, Inc., a corporation of Delaware

Application May 23, 1936, Serial No. 81,371

4 Claims. (Cl. 132—41)

1. A hair curler comprising a tubular body and a wire clasp swingably secured to the body, said clasp having spaced apart side portions interconnected at one end and terminating at their opposite ends in preformed curved portions that are directed toward each other and extend into the tubular body to prevent accidental detachment of the clasp and to permit of swinging it relatively to the body through an arc having a radius of predetermined length.



2,103,534

HAIR CURLER

William Huppert, New York, N. Y., assignor to Delamere Company, Inc., a corporation of Delaware

Application May 26, 1936, Serial No. 81,802

8 Claims. (Cl. 132—44)

1. In a hair curler, a flexible tube, a flexible wire member consisting of a single length of wire bent to form a unitary structure comprising three flexible loops which are bound together by a metal clasp having an extended portion formed with an eye, said wire member being disposed in the bore of the tube and being fastened to the tube, adjacent one end thereof, by means of a fastener passing through the wall of the tube and the eye of the clasp, one of the flexible wire loops extending lengthwise over the tube, the other two flexible wire loops extending outwardly from the ends of the tube, one from each end.

2,103,535

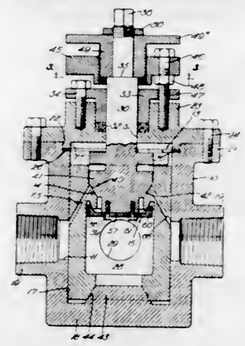
HAIR CURLER

William Huppert, New York, N. Y., assignor to Delamere Company, Inc., a corporation of Delaware

Application May 28, 1936, Serial No. 82,197

8 Claims. (Cl. 132—41)

8. In a hair curler, a tubular body, a clamping member hinged to the body, and means pressing against the clamping member at a point in advance of a line extending perpendicularly from the clamping member through the hinging point to hold the clamping member in raised position and at a point to the rear of said line to urge said clamping member into closed position.



2,103,536

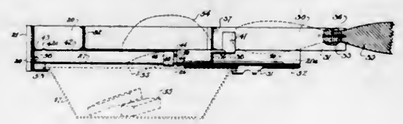
STOPCOCK

Melvin C. Inge, Brea, Calif.

Application September 4, 1936, Serial No. 99,331

8 Claims. (Cl. 251—101)

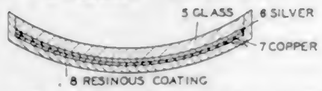
1. A stop cock including, a body having a fluid passage and an opening intersecting the passage, an expansible plug turnable in the opening to control the passage, means for expanding the plug to seal with the wall of the opening, means for equalizing the internal and external pressures on the plug, and a single means for expanding the plug and controlling the last mentioned means.



2,103,537

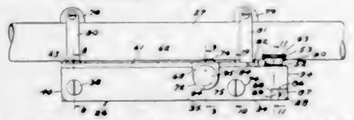
VEGETABLE SLICER

Thomas A. Killman and Robert T. Killman, Nashville, Tenn.



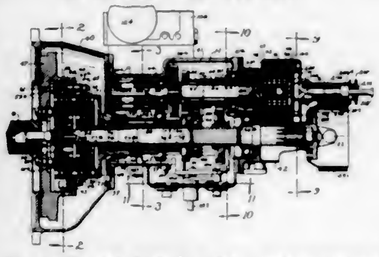
Application December 13, 1935, Serial No. 54,164

3 Claims. (Cl. 146—168)



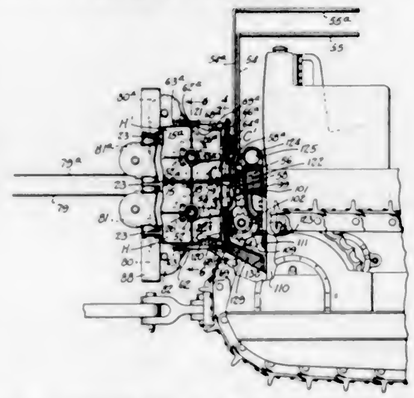
1. In a vegetable slicer, a stationary frame having a horizontal vegetable supporting floor, a main cutting blade carried by said stationary frame and lying in a plane parallel to and above said floor, a plurality of spaced vertical blades extending downwardly from the main cutting blade, a movable frame slidable within said stationary frame, composite vegetable pusher means carried by said movable frame and comprising an upper flat pusher strip mounted transversely of said movable frame and positioned entirely above the main cutting blade in a plane perpendicular to the plane of said blade and parallel to its cutting edge, and a second lower strip mounted transversely of said movable frame and lying in a plane parallel to and below the main cutting blade and spaced vertically from the upper flat pusher strip, said second lower strip being formed with slots, the ends of the metal between the slots being bent into a vertical plane, said plane being the plane that includes the upper flat pusher strip, whereby, at the end of a cutting stroke the main cutting blade passes into the space between the upper and lower strips and the vertical blades pass into the slots formed in the lower strip, and the bent down portions between the slots force the cut portions of the vegetable entirely clear of the blades.

2,103,538
REFLECTOR
Frank P. Kolb, Rochester, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York
Application November 22, 1934, Serial No. 754,317
2 Claims. (Cl. 88—105)



1. A reflector comprising a glass body, a reflective layer of silver on said body, a layer of copper on said silver and a protective coating, said coating being composed principally of glycerol phthalate and containing a metallic pigment.

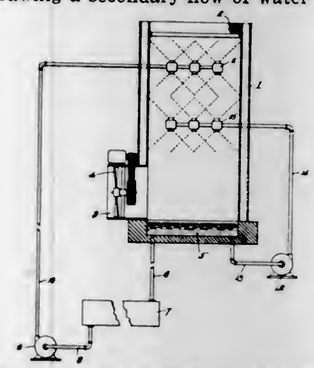
2,103,539
TELESCOPE SIGHT MOUNTING
Frederick A. Kuhn, Meriden, Conn., assignor to The Lyman Gun Sight Corporation, Middlefield, Conn., a corporation of Connecticut
Application November 27, 1935, Serial No. 51,805
7 Claims. (Cl. 33—50)



1. A mounting for telescope sight for rifles and the like comprising, a plate adapted to be secured on a part of a rifle, a base mounted on said plate for pivotal movement in a normally vertical plane, means for supporting a telescope sight on said base, and means for producing vertical movement of the base including, a screw mounted for rotation in said base and fixed against movement therein in the direction of the screw axis, and a cylindrical nut in which said screw is threaded, said plate having a cylindrical opening in which the nut is received, the axis of the opening being at right angles to the direction of movement of the base.

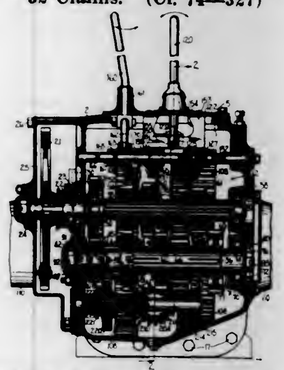
2,103,540
CHANGE SPEED TRANSMISSION
William T. Livermore, Westfield, N. J.
Application March 12, 1934, Serial No. 715,065
27 Claims. (Cl. 74—472)

2. In a change speed power transmission for automobiles including means for effecting a plurality of forward speeds and a reverse drive, a prime mover, a driving shaft and means for transmitting power from said prime mover to said driving shaft comprising a countershaft, a sleeve rotatably carried by said countershaft, a pair of continuously intermeshing gears connecting said sleeve and driving shaft for forward driving, a pair of continuously meshed gear trains of different gear ratios, one connecting said prime mover and sleeve and the other said prime mover and countershaft and means for rendering either of said gear trains effective to transmit power to said driving shaft through said sleeve and said pair of continuously intermeshing gears.



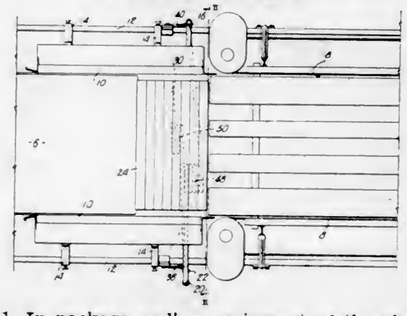
2,103,541
WINCH
John J. Low, Los Angeles, Calif., assignor to Kay-Brunner Steel Products, Inc., a corporation of Delaware
Application December 18, 1935, Serial No. 55,036
9 Claims. (Cl. 254—185)

9. In combination; a winch drum; a brake actuating lever; a spring connected to said lever for urging the latter in one direction wherein a brake is adapted to be applied to the drum; a member operable to move the lever in the opposite direction wherein the brake is adapted to release the drum; a driving means for rotating the winch drum in one direction; a clutch for operatively connecting the driving means to the winch drum; a clutch operating arm; and a connector between said arm and member for actuating the latter by movement of the arm, said arm being pivoted to occupy a neutral position in which the clutch is disengaged and the brake applied, a second position in which the clutch is engaged and the brake free to be released, and a third position in which the clutch is disengaged and the brake released, said connector comprising at least two elements, and means for connecting said elements to allow movement of one element with respect to the other before the arm actuates the member so as to delay movement of the member by the arm, sufficiently to permit complete engagement or disengagement of the clutch before releasing or applying the brake.



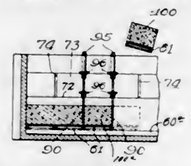
2,103,542
PROCESS FOR COOLING LIQUIDS
Leon T. Mart, Johnson County, Kans., assignor to The Marley Company, Kansas City, Mo. a corporation of Missouri
Application August 12, 1935, Serial No. 35,836
1 Claim. (Cl. 62—177)

The method of cooling water for and applying same to an industrial use, consisting in delivering hot water from a heat exchange system to a cooling tower, discharging said water into the cooling tower adjacent the upper end thereof, collecting the water in a collecting basin, returning a predetermined volume flow from the collecting basin to the heat exchange system, and finally, when the temperature of the water in the collecting basin exceeds a desired maximum, withdrawing a secondary flow of water from the



collecting basin without effecting a change in the return volume flow to the heat exchange system, and returning such secondary water flow to the cooling tower at a point below the hot water discharge for recooling such secondary water flow to effect a lowering of the overall temperature of the water in the collecting basin.

2,103,543
TRANSMISSION
Elmer McCormick and Wayne H. Worthington, Waterloo, Iowa, assignors to John Deere Tractor Company, Waterloo, Iowa, a corporation of Iowa
Application September 29, 1934, Serial No. 746,036
32 Claims. (Cl. 74—327)

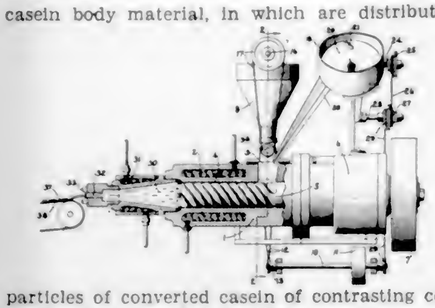


1. A selective speed transmission comprising a casing, a motor driven member journaled for rotation in said casing, a splined shaft rotatably mounted in said casing, means for coupling said splined shaft to said member whereby said splined shaft may be driven from said motor driven member at either of two speeds, a main driven gear journaled in said casing for rotation about an axis therein, gear means journaled for rotation about the same axis as a portion of said two-speed coupling means and operatively connected with said main driven gear, and a driving pinion slidably mounted on said splined shaft and optionally slidable into engagement with either said gear means or said main driven gear.

2,103,544
REFRIGERATED SEALING EQUIPMENT
Walter N. McWade, Overland Park, Kans., assignor of one-half to Merlin A. Sticelber, Kansas City, Mo.
Application February 12, 1937, Serial No. 125,420
5 Claims. (Cl. 62—1)

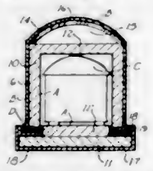
1. In package sealing equipment of the character described having a bottom cooling member provided with conduits for a refrigerant, and a pair of spaced-apart side cooling members above the bottom cooling member, adjustable toward and from each other and each provided with conduits for a refrigerant, the combination of a tube, having coils formed therein, joining said side cooling members; connections at the points of juncture between the tube and said side cooling members establishing communication between said conduits and said tube; and a bracket assembled with each side cooling member respectively holding the said tube at points thereof between the coils formed therein and the said connections for the purpose specified.

2,103,545
APPARATUS FOR MAKING CHEESE
Raymond Miollis, Barron, Wis.
Application May 11, 1935, Serial No. 21,007
11 Claims. (Cl. 31—46)



1. Apparatus for making natural cheese which comprises a molding vat adapted to receive a batch of curds, a plurality of removable platforms of equal size, spaced above the bottom of said vat, and means for cutting the batch in said vat along vertical lines coincident with the margins of said platforms, to form blocks of cheese of substantially equal size and shape so that they may be removed from the vat while supported separately on said platforms.

2,103,546
METHOD OF PRODUCING VARICOLORED CASEIN
George Morrell, Muskegon, Mich., assignor to George Morrell Corporation, Muskegon Heights, Mich., a corporation of Michigan
Application June 10, 1935, Serial No. 25,950
7 Claims. (Cl. 18—48.8)

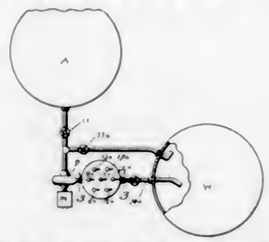


1. The method of producing varicolored casein which consists of subjecting unconverted rennet

casein body material, in which are distributed

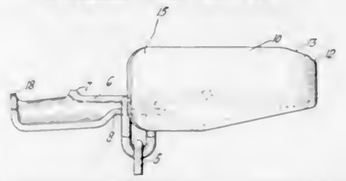
particles of converted casein of contrasting color, to pressure and elongation.

2,103,547
BURIAL VAULT
Roy H. Morris, Brownwood, Tex.
Application May 27, 1935, Serial No. 23,647
1 Claim. (Cl. 27—35)



A burial vault comprising a case consisting of two cooperating sections, one section constituting a wooden base, inside and outside coatings of waterproof preservative material on said wooden base section, an airtight sheet metal covering encasing said wooden base section, and a coating of waterproof preservative material on the exterior surface of said sheet metal casing for the base section, and the second section constituting a wooden cover having similar inside and outside coatings of waterproof preservative material and an airtight sheet metal casing therefor having an exterior coating of waterproof preservative material the same as that on the sheet metal casing for the base section, and a seal between the meeting edges of the two cooperating sections consisting of the same coating as that on the metallic casings of the two sections whereby the case is entirely sealed by the homogeneous coating of waterproof material.

2,103,548
ELECTRIC CONNECTER
John A. Obermaier, Chicago, Ill.
Application October 1, 1934, Serial No. 746,379
Renewed November 5, 1937
3 Claims. (Cl. 173—361)

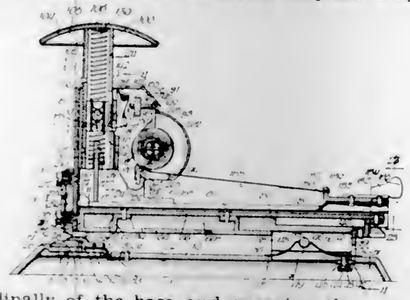


3. An electrical connecter comprising a disc of insulation, a block of metal having at one end a riveting stem extending through an opening in the disc and riveted over to secure the block to the disc, the opposite end of the block having a portion shaped to constitute one terminal of a plug and socket connecter, said block of metal having a wire receiving groove formed therein and extending in a direction parallel to the riveting stem, the disc of insulation having a wire receiving opening in alignment with the groove, and a wire extending through the opening and secured to the block at the groove therein.

2,103,549
APPARATUS FOR MAKING EMULSIONS OF BITUMINOUS MATERIALS
Matthew Griffin O'Neil, Dallas, Tex., assignor to Donald O'Neil, Dallas, Tex.
Application June 10, 1936, Serial No. 84,489
1 Claim. (Cl. 259—95)

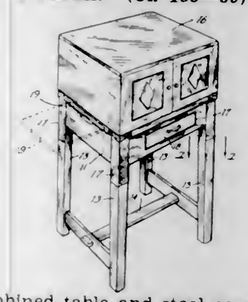
In apparatus for emulsification, a liquid tank, means for establishing a closed circulating stream of liquid from and to said tank, said means including a pump and emulsifier unit comprising a receptacle, a partition wall dividing said receptacle into high and low pressure compartments, a plurality of perforated pipes mounted in said partition wall extending into said high pressure compartment and opening at one end into said low pressure compartment, means for closing the other end of said pipes and for regulating the flow of liquid through said perforations in the pipes, said means comprising sleeve valves mounted on said pipes, said sleeve valves being imperforate and having an elongated slot in one side thereof, said perforations in said pipes extending only part way around the pipes, a connection from said pump to said high pressure compartment and a connection from said low pressure compartment back to said liquid tank.

2,103,550
TIRE LUG
Frederick A. Olmstead, Cleveland Heights, Ohio, assignor to The Chain Products Company, Cleveland, Ohio, a corporation of Ohio
Application July 1, 1935, Serial No. 29,275
3 Claims. (Cl. 152—14)



3. A traction lug for tires, comprising a plate, and an upstanding flange formed upon said plate, said flange being substantially V-shaped, the apex of which is rounded and reduced in depth to relieve the impact on the ground, the extremities of the flanges being extended laterally beyond the plate to form projecting wings.

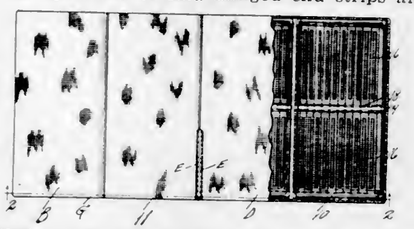
2,103,551
STAPLING DEVICE
William G. Pankonin, Chicago, Ill.
Application October 18, 1934, Serial No. 748,803
33 Claims. (Cl. 1—3)



1. In a stapling machine, a base, a fixed anvil in said base, a second anvil pivoted transversely

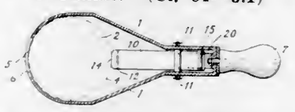
of said base for movement into and out of operative position, and a spring disposed longi-

tudinally of the base and engaging the second anvil to maintain it in and out of operative position.



2,103,552
COMBINED CABINET, TABLE, AND SEAT
Alexander Radyx, Denver, Colo.
Application November 23, 1936, Serial No. 112,237
4 Claims. (Cl. 155—39)

2. A combined table and stool consisting of a table top; four square legs extending downwardly from said top, the upper portion of each of said legs being cut away on a diagonal extending from corner to corner thereof; a stool member having a top; legs extending downwardly from the stool top, said latter legs being triangular in cross section so that they will occupy the space formed by said diagonal cut away portions; an open bottomed cabinet forming the seat portion of said stool member, the legs of said stool member having a length equal to the length of the cut away portions in the table legs, the diagonal faces of the legs of said stool member engaging the complementary diagonal faces of the legs of said table top when said stool member is placed on the table top to form a table of greater height.



2,103,553
SELF-COOLING BED AND COUCH CUSHION
Joseph H. Reynolds, Cisco, Tex.
Application September 15, 1934, Serial No. 744,103
1 Claim. (Cl. 155—182)

In a bed or couch cushion of the character described and comprising a pocketed casing of flexible sheet material, a cushioning and cooling unit insertable interchangeably in the respective pockets of the casing, comprising, a rectangular body frame of relatively stout wire, said frame having at opposite ends a strip of sheet metal folded longitudinally therearound with its marginal portions brought together to provide a flange, said flange being provided with a series of apertures throughout the length thereof, a bridle strip of flexible sheet metal extending across said frame from side to side thereof and medially between said flanged end strips and having apertures at its opposite marginal portions and respectively alined with the apertures of said flanged end strips, helical springs secured at their outer ends in the apertures of said flanged end strips and

at their inner ends in the apertures of said medial bridle strip, said springs being each of the same diameter and the diameter being relatively greater than the diameter of the constituent wire of the body frame and also greater than the thickness of the bridle strip, the axes of the frame wire, bridle strip and each of the springs being in substantially the same plane, and a wick element in each of said springs.

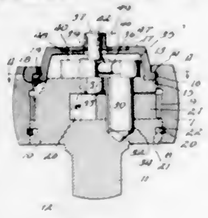
2,103,554
JAR OPENER
Cecil S. Robinson, Ithaca, N. Y.
Application June 24, 1936, Serial No. 86,952
3 Claims. (Cl. 81—3.1)

1. In a jar opener, the combination of a supporting means, a retaining band rigidly attached to said supporting means, a pivoted blade adapted to cooperate with said band in a toggle action so as to drive the edge of said blade with a powerful force toward said band, stop means for maintaining the blade substantially in the general direction of the retaining band, so that said band may also serve as a guard, and spring means for holding the blade when free in a position beyond the dead center of its toggle action, to permit the initial engagement of the blade under a jar cover.

2,103,555
DUST GUARD AND SEAL ASSEMBLY
Lawrence A. Rowe, Oak Park, Ill., assignor to MacLean-Fogg Lock Nut Company, Chicago, Ill., a corporation of Illinois
Application January 13, 1936, Serial No. 58,825
7 Claims. (Cl. 286—6)

1. In a dust guard assembly, the combination of a dust guard comprising a pair of relatively thin sheets having an enlarged aperture for passing a railway car journal, said sheets having a sealing member of flexible material secured between them, said sealing member being formed with a centrally located aperture bordered by a cylindrical flange engaging a cylindrical portion of a railway car journal, a shiftable housing comprising a pair of metallic sheet metal plates having enlarged apertures, the apertures being smaller than the outer area of said dust guard whereby the dust guard may shift between said metallic sheets to adapt itself to the position of

the railway car journal, a gasket of yieldable material engaging the inner wall of a dust guard well and having a metallic backing slidably engaging one of said sheets, and means for urging



said assembly toward one side of the dust guard well to place a compression upon said yieldable gasket and to effect a water-tight seal between the railway car journal and the dust guard well.

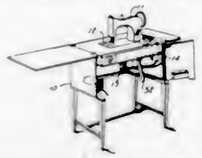
2,103,556

RATCHET WRENCH

Theodore O. Rueb, Chicago, Ill., assignor to The Sherman-Klove Company, Chicago, Ill., a corporation of Delaware

Application March 13, 1936, Serial No. 68,653
4 Claims. (Cl. 81—63)

2. In a ratchet wrench, a head having means for engagement with a nut or the like and having a transverse opening therein, a pin extending through said opening, a double ended pawl mounted on said pin, a handle having a cylinder engaging with said head and having internal teeth which are engaged by the pawl, a head on said pin having a crescent shaped recess therein, a block pivotally mounted on the first named head and having a longitudinal bore, a spring pressed plunger mounted in said bore and engaging with the recess in the head of the pin and serving to turn the pin and pawl, stops for said block, a cap mounted in the cylinder and enclosing the block and coacting parts, a disc engaging with an annular recess in said cap, and a thumb piece on the disc engaging with the pivot for said block for turning the same.



2,103,557

KNEE CONTROL FOR SEWING MACHINES

Neil T. Sawdey, Shaker Heights, and Nathaniel E. Colegrove, Lakewood, Ohio, assignors to White Sewing Machine Corporation, Cleveland, Ohio, a corporation of Delaware

Application July 25, 1935, Serial No. 33,106
11 Claims. (Cl. 74—515)

1. A device for operating the control mechanism of an electrically powered sewing machine comprising a fixed member, a pair of hinge brackets pivotally mounted on said member and spaced longitudinally thereof, a movable member hinged

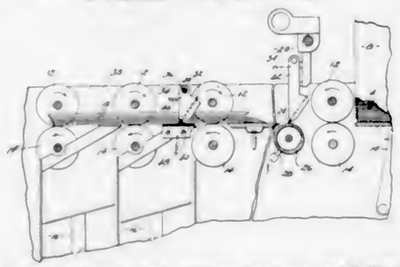
edly connected to said brackets and adapted to have an operative connection to said control mechanism, and a depending knee actuated element operatively connected with said movable member.

2,103,558

PHOSPHATES OF AMINO ACID ESTERS AND METHOD OF PRODUCING SAME

Walter Schoeller, Berlin-Westend, and Erich Borgwardt, Berlin-Hermsdorf, Germany, assignors to Schering-Kahlbaum A. G., Berlin, Germany, a corporation of Germany

No Drawing. Application August 29, 1934, Serial No. 742,000. In Germany September 6, 1933
18 Claims. (Cl. 260—106)



1. Addition products of aliphatic esters of amino acids and phosphoric acid.

2,103,559

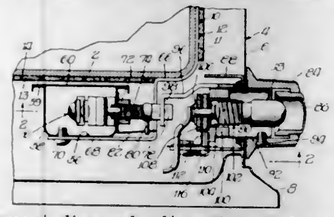
SELECTOR FOR SORTING MACHINES

William C. Silver, Kansas City, Mo.

Application June 20, 1936, Serial No. 86,393
8 Claims. (Cl. 209—110)

1. In a sorting machine having card feeding devices for successively carrying cards into the machine, a plurality of card-receiving pockets, and distributing passages leading to the pockets, the combination of electrical means having spaced-apart brushes for simultaneously, individually analyzing a plurality of the cards, and means operated by said analyzing means to open the receiving end of one of the distributing passages for one of the cards being analyzed, the relative natures of the plurality of cards being analyzed determining the pocket receiving one of said cards, said distributing passages having their receiving ends between said spaced-apart brushes.

2,103,560



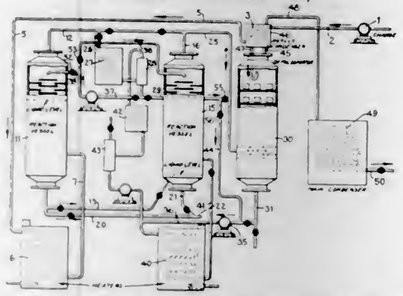
ELECTRIC COOKING UTENSIL

Alva T. Smith and Herbert J. Moon, Milwaukee, Wis., assignors to National Enameling & Stamping Company, Milwaukee, Wis., a corporation of New Jersey

Application May 4, 1935, Serial No. 19,796
26 Claims. (Cl. 219—20)

1. In an electric cooking device having a receptacle provided with a bottom and a side wall,

the combination of a low heating circuit including heating elements, one of said elements being disposed adjacent the bottom and another of said elements being disposed adjacent the side walls of said receptacle, said elements being connected in series, a high heating circuit including a heat-



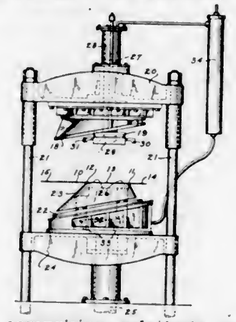
ing element disposed adjacent one of said walls and electrically connected in parallel with one of the elements of said low heating circuit, and a thermostat for disconnecting the heating element of the high heating circuit when a desired temperature is reached.

2,103,561

METHOD OF CONVERTING HYDROCARBON OIL

Harris A. Smith, Port Arthur, Tex., assignor to The Texas Company, New York, N. Y., a corporation of Delaware

Application August 23, 1932, Serial No. 630,016
4 Claims. (Cl. 196—49)



1. The process of producing gasoline from relatively heavy hydrocarbon oil which comprises heating said heavy oil to a cracking temperature under superatmospheric pressure, to cause mild cracking thereof in the liquid phase, separating the resulting cracked products into vapors and a liquid residue, introducing said vapors into a partial condensing zone wherein the heavier fractions thereof are condensed, introducing a portion of the condensate so formed into an upper point in a separate reaction zone, introducing said liquid residue into said reaction zone, introducing hot cracked vapors into said reaction zone to maintain the temperature thereof at a cracking value, removing cracked vapors from said reaction zone and introducing them into a dephlegmating zone wherein separation thereof into a clean condensate and a vapor fraction of desired boiling characteristics takes place, introducing another portion of said condensate first mentioned into said dephlegmating zone, removing uncondensed vapors from said partial condensing zone, condensing the removed vapors and heating the condensate so formed, in mixture with said clean condensate and a portion of said condensate first mentioned, to a vapor phase cracking temperature, to form said hot cracked vapors, and withdrawing unvaporized residue from said reaction zone at such a rate as to prevent the accumulation of large amounts of liquid therein.

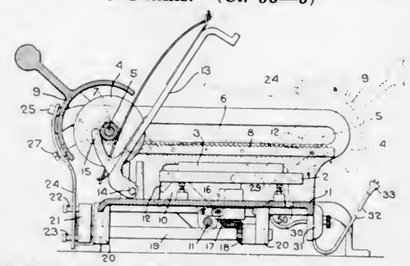
2,103,562

WHEELBARROW MANUFACTURE

Irving R. Smith, Milwaukee, Wis., assignor to Sterling Wheelbarrow Company, West Allis, Wis., a corporation of Wisconsin

Application May 11, 1934, Serial No. 725,045
6 Claims. (Cl. 153—21)

1. A press comprising, relatively movable dies cooperable to produce a marginal flange on a blank, a form carried by one of said dies and cooperable with the blank, a plunger carried by the other of said dies and cooperable with the blank in opposition to said form to cause bending of portions of the blank about said form, and resilient means for permitting movement of said form and plunger relative to the supporting dies to produce said marginal flange.

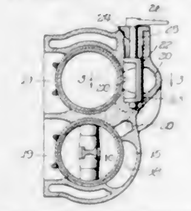


4. The method of forming a wheelbarrow body from a blank having a perforated bottom and slits extending away from the bottom to form segregated side and end projections, which comprises, utilizing the bottom perforations to initially position the blank, subsequently bending the side projections out of the plane of the bottom, thereafter likewise bending the end projections and simultaneously folding the opposite edge portions thereof over the adjacent edge portions of the previously bent side projections, and finally reversely bending the outer edges of all of the side and end projections into a common plane to provide a continuous marginal flange having double thickness at the overlapping edge portions.

2,103,563

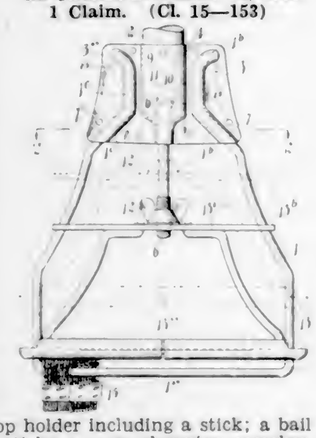
MACHINE FOR SLITTING AND BROILING MEAT

Joseph P. Spang, Quincy, Mass.



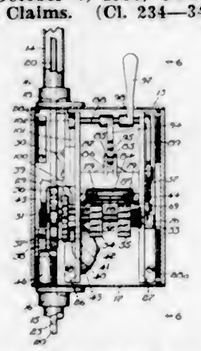
Application April 27, 1937, Serial No. 139,169
3 Claims. (Cl. 53—5)

2. A machine of the class described comprising a meat-supporting plate in the form of a turn-



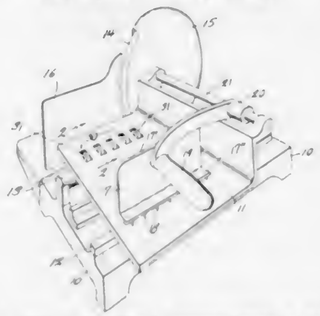
table, means for cutting slits in a slice of meat supported by said turntable, which slits extend from one edge of the slice of meat entirely across the slice to the opposite edge, means for heating the turntable sufficiently to subject the meat thereon to a cooking operation, and means for rotating the turntable.

2,103,564
INTERNAL COMBUSTION ENGINE
Philip A. Tanner, Waukegan, Ill., assignor to Johnson Motor Company, Waukegan, Ill., a corporation of Delaware
Application December 19, 1934, Serial No. 758,176
9 Claims. (Cl. 123—73)



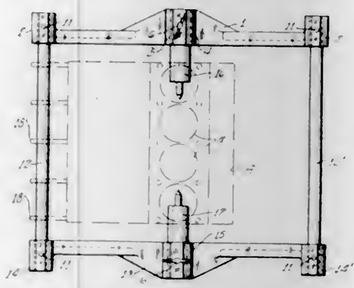
3. In a two-cycle, two cylinder, alternate firing, internal combustion engine of the crank case compression fuel type having means dividing the crank case and separate compression chambers for each cylinder, a passage from each compression chamber to the outer end of the cylinder, opposite inlet and exhaust passages in the walls of the cylinder, the passages being controlled by the pistons movable therein, of a transfer bypass between the passages having a port in the wall of one of the cylinders for admitting gas under compression from the passage of the other cylinder in advance of and after the normal fuel admission port for the cylinder to correspondingly increase the charging thereof.

2,103,565
MOP HOLDER
Hugh B. Tarbox, Toronto, Ontario, Canada
Application December 4, 1936, Serial No. 114,094
In Canada December 14, 1935
1 Claim. (Cl. 15—153)



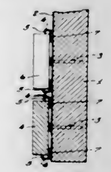
A mop holder including a stick; a ball secured to the stick; a mop clamping member slidable on the ball; a stud secured to the stick, said stud being threaded adjacent its outer end and having a diametrically reduced portion between said threaded portion and the stick; and a nut adapted to be screwed on the threaded end portion of the stud and to slide freely on the reduced portion of the stud between said threaded end portion and the stick, said stud being so positioned relative to the slidable clamping member that the nut may engage said clamping member to advance it to clamp a mop between the said clamping member and the ball.

2,103,566
LIQUID RECORDING MECHANISM
James P. Taylor, Los Angeles, Calif.
Application October 7, 1933, Serial No. 692,638
2 Claims. (Cl. 234—34)



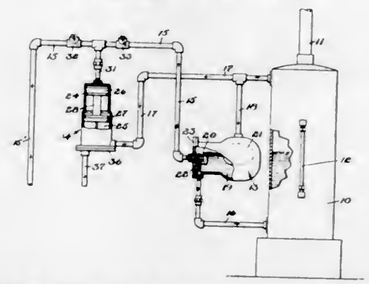
1. In a liquid dispensing and recording apparatus embodying a liquid reservoir having a float therein with operating connections from the float to a type wheel for setting the wheel in accordance with the variations in liquid level within said reservoir, and in which means are provided for producing an impression from the type wheel; the combination, of means responsive to the actuation of said means for releasably locking the type wheel, said operating connections being responsive to a refilling of the reservoir for acting upon the type wheel to release the same and move it into initial position.

2,103,567
SLICING MACHINE
Wilhelmus Adrianus van Berkel, Clarens, Switzerland, assignor to U. S. Slicing Machine Company, La Porte, Ind., a corporation of Indiana
Application November 5, 1934, Serial No. 751,595
In Great Britain November 9, 1933
11 Claims. (Cl. 146—102)



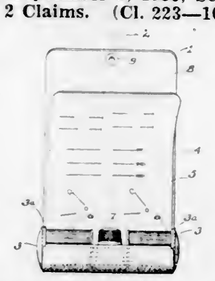
1. A slicing machine comprising a substance support, a rotating knife, a gauge plate, means arranged at spaced intervals in said support for lifting the substance from the support, means for operating the lifting means, and spring means for holding said lifting means depressed within the substance support during the slicing operation of the knife.

2,103,568
MOTOR-BLOCK STAND
Walter G. Vollmer, St. Louis, Mo., assignor to H & H Machine & Motor Parts Co., St. Louis, Mo., a corporation of Missouri
Application August 21, 1936, Serial No. 97,199
3 Claims. (Cl. 77—63)



1. A stand for supporting an engine block structure and positioning the structure for cylinder boring operations, comprising a pair of supporting frames spaced apart a distance greater than the length of the engine structure, opposed arbors carried by the frames engaging the main bearings of an engine structure therebetween for oscillatory movement, said frames having portions definitely locating the block with respect to the work supporting table of a boring machine, and means on said frames definitely limiting oscillatory movement of the engine structure to dispose the cylinder openings in definitely located relation to the work supporting table.

2,103,569
BRICK SUPPORT
David A. Wallace and Eugene Wallace, Detroit, Mich.; said Eugene Wallace assignor to said David A. Wallace
Application March 20, 1936, Serial No. 69,904
11 Claims. (Cl. 72—19)



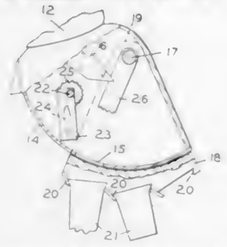
1. A device adapted for supporting bricks comprising a metal blank of strip form, said strip being severed and having the severed portions bent from the plane of the strip and extending substantially normal to the plane of the strip, the extremities of the severed portions being bent inwardly whereby the edges thereof provide retainers for the reception of facing elements, said severed portions and retainers being resiliently flexible, and said retainers being spaced apart a normal distance less than the width of the bricks they are adapted to receive.

2,103,570
AUTOMATIC LIQUID REGULATING SYSTEM
Michael Edward Walters and John Arthur Wolfe, Huntington Park, Calif.
Application December 20, 1935, Serial No. 55,460
8 Claims. (Cl. 122—451)

6. A fluid boosting device embodying, a pair of differential cylinders, a pair of differential pistons connected for simultaneous movement within said respective cylinders, means forming a passage in the high pressure cylinder through which fluid to be pumped is passed into and out of the device, means forming a permanently opened restricted inlet into the low pressure cylinder through which fluid is admitted for operating the device, said inlet being sufficiently small to permit continuous communication between the low pressure cylinder and the operating fluid during the exhaustion of fluid from said low pressure cylinder without appreciably retarding the exhausting operation, and a valve controlled exhaust passage leading from the low pressure cylinder whose cross sectional area is substantially greater than that of the restricted inlet.

2,103,571
SEWING KIT
Frederick W. Watson, New York, N. Y., assignor to Security Products Corporation, New York, N. Y., a corporation of New York
Application September 1, 1936, Serial No. 98,862
2 Claims. (Cl. 223—106)

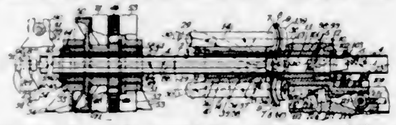
1. A sewing kit having the combination of a sheet of material, an entirely separate sheet of material for pinning articles thereto, both of said sheets being elongated and secured to each other so as to form a transversely disposed tube, an elongated receptacle adapted to enter longitudinally into said tube, a portion of said tube being inserted into said receptacle to constitute a lining therefor, the balance of said tube covering the exterior of said receptacle, both of said sheets projecting from said receptacle as free leaves and being adapted to wrap together in concomitance and in a manner freely shiftable relatively to each other around said receptacle, said second



sheet serving to close up the receptacle and said first sheet enwrapping said second sheet and entire kit, and said first sheet having fastening means to maintain it in enwrapped state.

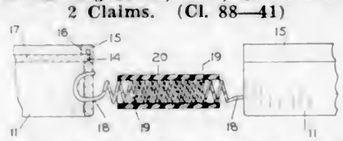
2,103,572
FILTER
Donald H. Wells, Glen Ellyn, Ill.
Application July 22, 1936, Serial No. 91,925
13 Claims. (Cl. 210—204)

4. A fluid-penetrable filter comprising a relatively thin porous body of fibers, the said fibers being uniformly impregnated over the entire filtering area thereof with a polymerized resin having irreversible thermoplastic characteristics similar to that of a phenol-formaldehyde resin, the pores of the body being substantially unobstructed.



2,103,573
MICROSCOPE
Ralph E. Wilkinson, Irondequoit, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York
Application August 20, 1935, Serial No. 37,004
8 Claims. (Cl. 88—39)

1. In a microscope a hollow body member having a light path therethrough, a multiple objective carrier movably mounted on said member, a lens mount, means for movably mounting said lens mount within said member and means on said carrier cooperating with the first named means for moving said mount into and out of said light path.

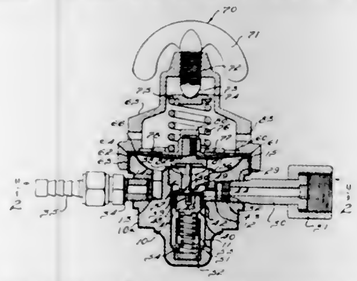


2,103,574
POSITIVELY CONTROLLED TUBE BORE MANDREL FOR TUBE FORMING MACHINES
John B. Wintercorn, Chicago, Ill.
Application June 12, 1934, Serial No. 730,232
17 Claims. (Cl. 80—13)

1. In a tube forming machine of the described class, means for forming the outside surface of the tube arranged to compose a working pass, mandrel means for forming the bore of the said tube in the said pass, means for relatively feeding the blank from which the said tube is formed through the said pass during the tube forming operation, means coaxially adjacent to the said pass adapted to tightly coaxially contact with the said outside surface of the said tube adjacent to the said pass and positively guide same coaxially with the said pass, means coaxially connected to the said mandrel means adapted to tightly coaxially contact with the said bore of the said tube adjacent to the said pass and positively guide same coaxially with the said mandrel means within the said pass, and means coaxially connected to the said mandrel means and the said bore guiding means and tightly coaxially contacting with the said outside surface guiding means adjacent to the said pass for positively locating and holding the said mandrel means and said bore guiding means coaxial to each other and respectively coaxial within the said pass and to the said outside surface guiding means at the start of the said tube forming operation, the said locating and holding means adapted to be longitudinaly coaxially moved relatively to said outside surface guiding means and relatively away from said pass as the forward end portion of the said tube is formed to thereby cause the

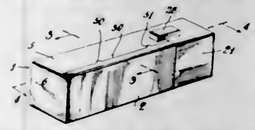
said outside surface and the said bore of the said forward end portion of the said tube to be formed coaxial to each other, and the part of the said forward end portion of the said tube progressively formed and adjacent to the said pass adapted in the same manner as the said locating and holding means thereafter for positively locating and holding the said mandrel means and the said bore guiding means coaxial to each other and respectively coaxial within the said pass and to the said outside surface guiding means as the remaining portion of the said tube is formed to thereby cause the said outside surface and the said bore of the said remaining portion of the said tube to be formed coaxial to each other.

2,103,575
GOGGLES
Bartholomew A. Diggins, Rochester, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York
Application August 21, 1936, Serial No. 97,237
2 Claims. (Cl. 88—41)



1. In a pair of goggles, a tube, two helixes screwed together within the tube and engaging the inner wall of said tube, each helix having one end extending out of said tube, and two eye cups secured one on each of said ends.

2,103,576
PRESSURE REGULATOR
Charles H. Dockson, Detroit, Mich.
Application January 9, 1935, Serial No. 960
8 Claims. (Cl. 50—23)

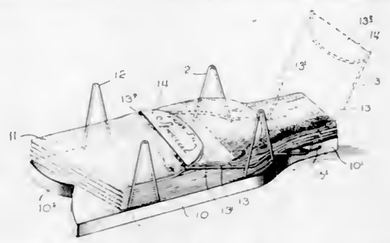


1. A pressure regulator to be used with pressures up to approximately 2000 pounds per square inch comprising a die-cast body portion provided with an inlet port communicating with a central high-pressure well integral with said body portion and a low-pressure chamber communicating with said well, said low-pressure chamber having an outlet port therein, said well and chamber having a lining of fine grained metal substantially impervious to fluid seepage under pressures up to approximately 2000 pounds per square inch, a pressure reducing valve within said low-pressure chamber and comprising a rigid valve nozzle, a

valve seat having a recessed face portion, a readily flexible washer secured centrally of said recessed face portion, clamping means secured to said valve seat and adapted to clamp the circumferential edge of said washer and maintain said washer in intimate contact with said valve seat, a resilient member acting on said valve seat and tending to hold said flexible washer in intimate contact with said nozzle, and pressure regulating means comprising a flexible diaphragm extending over said low-pressure chamber, a spring

disposed above said diaphragm and bearing thereon, a valve operating member depending from said diaphragm and adapted to contact a stem on said valve and unseat said valve seat from said nozzle, and adjustable means for compressing said spring, thereby to control the pressures on said diaphragm for regulating the pressures directly exerted on the gas in said low-pressure chamber and for operating said valve to control the flow of gas from said well to said low-pressure chamber.

2,103,577
COSMETIC DEVICE
Joseph Keith O'Moore Farrell, New York, N. Y.
Application July 7, 1936, Serial No. 89,388
Renewed August 31, 1937
12 Claims. (Cl. 132—79)

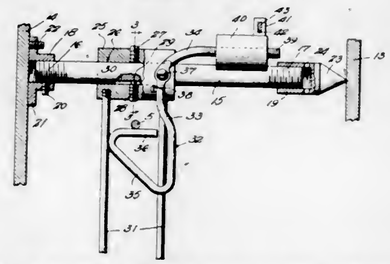


1. A lipstick device including a casing having an open end and adapted to telescopingly receive a lipstick, a separable cap adapted to carry a lipstick and to close the end of said casing, a mirror, means mounting said mirror for sliding movement into and out of said casing, and means actuated by the separating movement of said cap for urging said mirror out of said casing in a direction transversely to the movement of the cap.

2,103,578
DISPLAY HOLDER
Harry Stacy Ford, Cleburne, Tex.
Application February 9, 1937, Serial No. 124,912
2 Claims. (Cl. 211—49)

1. In a display holder for ties, socks, or similar articles, in combination, a base member having a surface for supporting a stack of articles, a bail formed of a single, continuous generally U-shaped wire or rod, the open end of the U being pivoted to said base about an axis substantially parallel to and below said surface, the free end of said bail having a reentrant bight, the said bight lying in a plane at an angle to the plane

of said U, a flat plate secured to and filling said bight, said bight and plate being adapted to



contact with and lie flat upon the uppermost article of a stack resting on said base.

2,103,579
ELASTIC BAND
Emil Glück, Burkhardtsdorf, Germany
Application May 13, 1936, Serial No. 79,587
In Germany May 8, 1934
1 Claim. (Cl. 154—42)

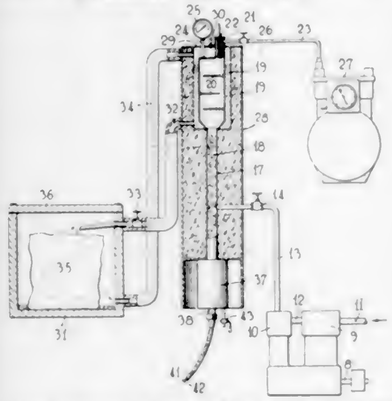
An elastic supporting band of the kind described, comprising a vulcanized rubber strip having the ends thereof overlapped and needle punctured and united by a layer of non-vulcanized needle punctured rubber, the composite having the characteristics of having been pierced after overlapping the ends of the strip.

2,103,580
FLUSH TANK ATTACHMENT
Eddie J. Goodman and Jennings W. Bibee, Lynchburg, Va.
Application March 8, 1937, Serial No. 129,752
7 Claims. (Cl. 4—41)

1. An accessory for a flushing device which includes a flush tank, a float valve, a ball valve for the outlet of the tank and an actuating arm for the valve ball; said accessory comprising latching means for releasably holding the float valve closed, and means for moving the latching means out of engagement with the float valve adapted to be connected with and actuated by the actuating arm of the ball valve.

2,103,581
VINYL RESINS
Daniel M. Gray, Wheeling, W. Va., assignor to Hazel-Atlas Glass Company, Wheeling, W. Va., a corporation of West Virginia
No Drawing. Application April 25, 1934, Serial No. 722,400
9 Claims. (Cl. 106—22)

1. A polymerized vinyl resin composition resulting from the polymerization of a vinyl compound and containing a basic organic inhibitor



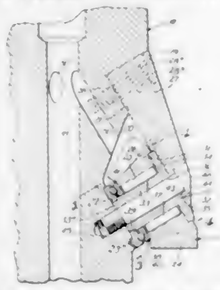
of discoloration of the vinyl resin on heating in the presence of iron, iron compounds or ferrous surfaces, said inhibitor being of the class consisting of urea, methyl urea, triethanolamine, dipropanolamine, urea oxalate, dibenzylamine, triamylamine, diethylthiourea, thiourea, and benzylamine.

2,103,582

METHOD AND APPARATUS FOR TESTING HYDROCARBON GASES

Lon S. Gregory, Tulsa, Okla., assignor to The Refinery Supply Company, Tulsa, Okla.

Application May 16, 1935, Serial No. 21,862
12 Claims. (Cl. 62—91.5)



7. The method of separating gases comprising introducing such gases into a rectification zone, forming a reflux condensate at the top portion of said zone by circulating a liquid refrigerating agent in association therewith, causing said agent during said circulation to flow in a restricted stream downwardly in liquid condition and to contact with a solid refrigerant having the characteristic of passing directly into a dry gaseous state, and utilizing pressure generated by said contact to elevate a stream consisting of a mixture of the gaseous refrigerant and said liquid refrigerating agent to maintain said circulation.

2,103,583

WELL REAMER

John H. Howard, Huntington Park, and Alfred C. Catland, Alhambra, Calif.; said Catland assignor to Globe Oil Tools Company, Los Nietos, Calif., a corporation of California

Application June 15, 1936, Serial No. 85,212
9 Claims. (Cl. 255—73)

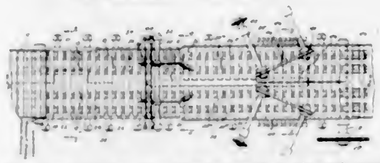
1. A well reamer including, a body having a recess, a cap secured to the body and extending downwardly across the outer side of the recess, opposing depressions in the wall of the recess and inner side of the cap, a cutter assembly comprising a bearing having a flange at one end, a cutter rotatable on the bearing, and a washer forcibly pressed on the other end of the bearing to be rigid therewith whereby the assembly may be handled as a unit, the flange and washer being adapted to cooperate with the depressions, and a pin carried by the body and cap and extending through the bearing to support the assembly.

2,103,584

COWTAIL GARTER

Michael Jamba, Stamford, N. Y.

Application March 12, 1936, Serial No. 68,550
1 Claim. (Cl. 119—105)



As a new article of manufacture, an elastic strip, hooks on the respective opposite ends of said strip, a pair of slide frames on the strip through which opposite end portions of the strip are doubled back to form loops, and keeper loops confined on the strip through the medium of said slides, and said hooks being engageable with said keeper loops as and for the purpose specified.

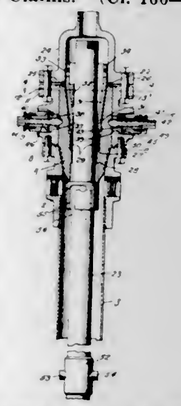
2,103,585

METHOD AND APPARATUS FOR SHAPING BODIES

Herman K. Kimble and Harry Richter, Vineland, N. J., assignors to Kimble Glass Company, Vineland, N. J., a corporation of Illinois

Application February 21, 1935, Serial No. 7,530
17 Claims. (Cl. 49—7)

5. In a machine for shaping the closed end of a hollow glass body, means for continuously moving the hollow glass body along a predetermined path, means for heating the closed end of the glass body, a forming tool providing a shaping surface adapted for tangential contact with the end of the body, said shaping tool being elongated in the direction of travel of the glass body, and fluid discharge means extending for a substantial distance in the direction of travel of the glass body and arranged to blow



the end of the body into engagement with the said shaping surface during the uninterrupted movement of the body longitudinally of the shaping surface.

2,103,586

TUBING HEAD

George B. Kitchel, Houston, and Edmund J. Roach, Beaumont, Tex., assignors to Beaumont Iron Works Company, Beaumont, Tex., a corporation of Texas

Application January 24, 1936, Serial No. 60,682
5 Claims. (Cl. 166—14)

1. A tubing head having the lower end secured to a casing and having an upwardly and outwardly flaring seat, a tubular hanger slidable in said head and having its lower end flared to fit said seat, means at the lower end of the hanger for detachably supporting an inner string of tubing in the hanger, and means in the upper part of the hanger for locking the said inner string in any desired position in the hanger.

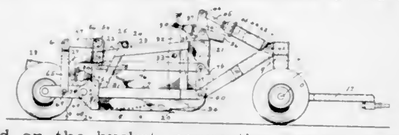
2,103,587

ORNAMENTATION OF TEXTILE FABRICS

Louis Amédée Lantz, Alexander Lang Morrison, and William Stuart Miller, Manchester, England, assignors to The Calico Printers' Association Limited, Manchester, England, a British company

No Drawing. Application January 23, 1936, Serial No. 60,522. In Great Britain February 21, 1935
4 Claims. (Cl. 8—5)

1. A process for producing pattern effects on textile fabrics which comprises applying to the fabric composed of natural or regenerated cellulose unreacted components of a synthetic resin of the amido-formaldehyde group and treating the fabric in selected areas with a reagent which inhibits the formation of said resin, heating the fabric to form the resin on the fabric in those portions thereof not treated with the inhibiting agent and then washing out of the selected areas the unreacted resin components and inhibiting agent.



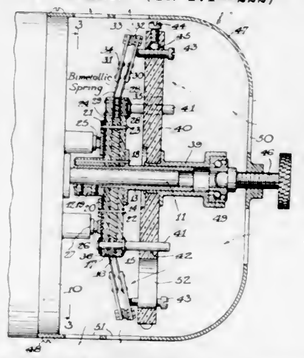
2,103,588

SCRAPER

Charles Le Bleu, Los Angeles, Calif.

Application May 15, 1936, Serial No. 79,909
20 Claims. (Cl. 37—124)

1. A machine of the character described comprising a bucket, wheels mounted on the rear end of the bucket for swinging movement in a vertical plane, a pony truck disposed forwardly of the bucket adapted for connection to a draft device, a frame mounted at its front end on the pony truck and swingably mounted at its rear



end on the bucket, connecting means operably associating the frame and the swingably mounted wheels at the rear end of the bucket, and means for swinging the frame to move the bucket vertically without tilting it.

2,103,589

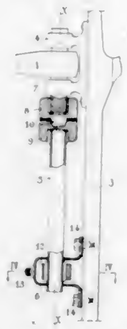
MOTOR SPEED REGULATOR

Royal Lee and Lawrence E. Egedal, Milwaukee, Wis., assignors to Lee Engineering Research Corporation, Milwaukee, Wis., a corporation of Wisconsin

Application May 20, 1935, Serial No. 22,429
16 Claims. (Cl. 171—222)

16. In a centrifugal switch, the combination of a rotatable means including a pair of coaxial rotatable members drivingly connected and relatively axially movable, a pair of circuit-closer contacts carried by said rotatable means, said rotatable means having a spring arm with a major component of flexural movement in a direction substantially parallel to the axis of rotation of said rotatable means, one of said contacts being carried by said spring arm at a distance from the axis of rotation and displaceable by centrifugal action with respect to the other contact, the contact on said spring arm having a major component of movement parallel to the axis of rotation, means for conducting electric current to said contacts, and means for varying the relative axial movement of said rotatable members to adjust the speed-setting of the circuit-closer.

2,103,590



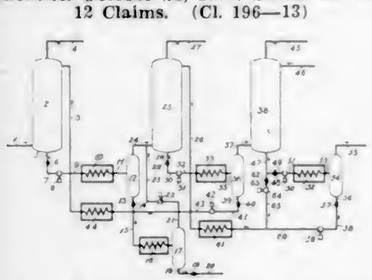
RESILIENT SUSPENSION DEVICE FOR MOTOR CARS OR OTHER VEHICLES

André René Lefevre, Paris, France, assignor to Société Anonyme Andre Citroen, Paris, France

Application August 15, 1934, Serial No. 740,014
In France August 26, 1933
4 Claims. (Cl. 267—57)

1. In a suspension for motor cars or other vehicles, the combination of a rod capable of resiliently working under a torsional stress, two supports secured on the said vehicle and in which the

ends of said rod are rotatively mounted, a lever rigid with one end of said rod and adapted to carry a wheel at its free end, abutments rigid with the other end of said rod, a pair of abut-



ments secured to the chassis of the vehicle and arranged for cooperating with the abutments of said rods, and adjusting means for some of these abutments.

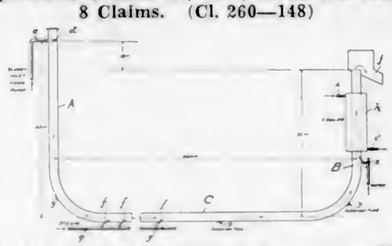
2,103,591

PROCESS FOR PRODUCTION OF LUBRICATING OIL

David R. Merrill, Long Beach, and Philip Subkow, Los Angeles, Calif., assignors to Union Oil Company of California, Los Angeles, Calif., a corporation of California

Application October 24, 1932, Serial No. 639,341
12 Claims. (Cl. 196—13)

1. A process for the production of lubricating oil from a hydrocarbon oil mixture which comprises extracting said mixture with a solvent, separating a raffinate and an extract dissolved in said solvent, cooling said solution of extract dissolved in said solvent to separate a paraffinic fraction from said solvent solution of extract, removing said paraffinic fraction from the remaining solvent solution of extract, continuously passing said cooled paraffinic fraction to a later extraction stage and extracting said fraction passed to said later extraction stage into a second raffinate and extract with a solvent.



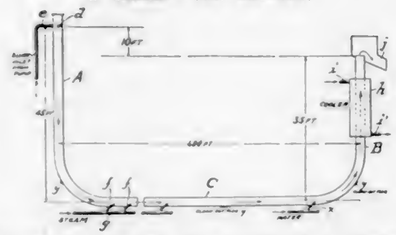
12. A process for the separation of paraffinic and non-paraffinic fractions from an oil containing the same which comprises commingling said oil in an extraction stage with a selective solvent, forming a raffinate phase comprising relatively paraffinic oil fractions and an extract phase comprising selective solvent and relatively non-paraffinic fractions, separating said phases, removing a paraffinic oil fraction from the extract phase, returning the selective solvent containing the remaining dissolved fractions to an earlier extraction stage, and extracting oil passing to said earlier extraction stage with the selective solvent containing the remaining dissolved fractions.

2,103,592

METHOD FOR STABILIZING NITROCELLULOSE

Mahlon G. Milliken, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

Application October 27, 1934, Serial No. 750,258
8 Claims. (Cl. 260—148)



1. A method of stabilizing nitrocellulose fibers which comprises subjecting nitrocellulose fibers admixed with water to an increasing and then decreasing hydrostatic pressure, which is above atmospheric pressure, and to a controlled heating, by means of open steam, for a time sufficient to stabilize the nitrocellulose and remove residual dilute acid therefrom and to a temperature above the boiling point of water when at atmospheric pressure but below the temperature at which water will boil under the superimposed hydrostatic pressure.

2,103,593

APPARATUS FOR STABILIZING NITROCELLULOSE

Mahlon G. Milliken, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

Application February 27, 1935, Serial No. 8,479
Renewed June 17, 1937
1 Claim. (Cl. 23—266)

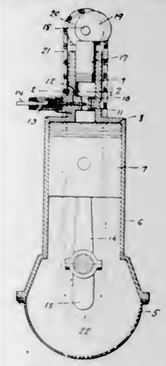
Apparatus for the treatment of a slurry of fibrous material suspended in a liquid comprising a substantially circular conduit of relatively large cross-section having a substantially horizontal section of great relative length and two relatively short substantially vertical sections of unequal length extending upwardly from the ends of said horizontal section and being connected thereto by arcuate sections having a large radius of curvature, a conduit of relatively small cross-section connected to the longer of said vertical sections at a point above the top of the shorter of said sections and opening into said section tangentially of the wall thereof, means for heating material passing through said horizontal section and means for cooling material passing through said shorter vertical section.

2,103,594

GLOVE

John M. Murray, New York, N. Y.

Application December 12, 1936, Serial No. 115,480
1 Claim. (Cl. 2—160)



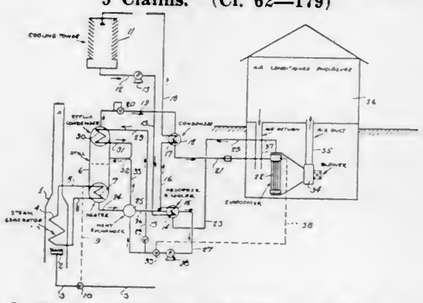
A glove, a piece of material on the underside of the palm of the glove and extending transversely of the palm entirely across the base of the finger-receiving portion of the glove and rearwardly toward the wrist-receiving portion of the glove so as to underlie substantially the entire palm of the glove, the entire periphery of the material being stitched to the glove palm, the area of the material bounded by the stitching being greater than the corresponding portion of the glove palm to provide a pocket, a slit through the glove palm immediately adjacent the base of the finger-receiving portion of the glove to provide an opening for the pocket, and a slide fastener member for drawing and securing the edges of said slit together to close the pocket, said fastener being so disposed that the same must be moved transversely of the glove to open the slit.

2,103,595

INTERNAL COMBUSTION ENGINE

Alfred William Nelson, Camden, N. J.

Application October 13, 1936, Serial No. 105,419
1 Claim. (Cl. 123—33)



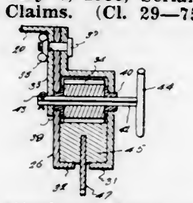
In combination, an engine consisting of a plurality of cylinders, each of these said cylinders being provided with a piston therein, a crank shaft, a pitman connection between each of the said pistons and the crank shaft, each of the said cylinders being provided with an air compression chamber, a plunger operative in the compression chamber, a cam for operating each of the said plungers, timing means between the cams and the crank shaft, a constricted passageway between the compression chamber and the cylinder, and a fuel injection nozzle projecting into the said constricted passageway, said passageway defining an annular shoulder between the cylinder and the compression chamber, said shoulder having by-pass ducts therethrough communicating the cylinder with the compression chamber, said by-pass ducts being each substantially less in diameter than the said passageway.

2,103,596

AIR CONDITIONING SYSTEM

Paul M. Raigorodsky, Tulsa, Okla.

Application January 23, 1935, Serial No. 3,177
5 Claims. (Cl. 62—179)



2. The method of refrigeration which comprises evaporating a liquid hydrocarbon refrigerant of relatively low boiling point, directly absorbing the vapors of said refrigerant solely under the self generated pressure of said vapors in a liquid hydrocarbon absorbent of relatively high boiling point, separating the refrigerant from the absorbent by flash vaporization and condensing the refrigerant solely under the self generated pressure of the vapors thereof.

2,103,597

CABLE CUTTER

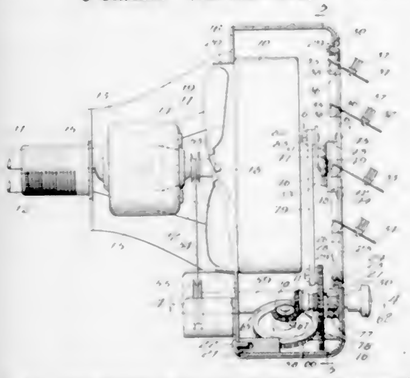
Arley E. Ravenscroft, Denbigh, Va.

Application July 7, 1936, Serial No. 89,453
2 Claims. (Cl. 29—75)

1. A cutting attachment for the handles of plier type tools comprising a bracket, means for securing the bracket to one handle of a tool, said bracket provided with a leg member, a guide on the leg member, a rack slidable in the guide, and having a saw blade extending therefrom, said gear and rack being in meshing relation, and adjusting means between the leg member and the guide whereby the guide can be set at various inclinations, said guide having a slot in the bottom thereof through which the saw blade projects.

2,103,598

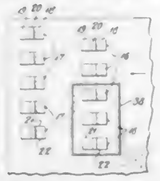
METALLIZING COMPOSITION FOR GLASS



Rowland D. Smith, Corning, N. Y., assignor to Corning Glass Works, Corning, N. Y., a corporation of New York

No Drawing. Original application February 11, 1935, Serial No. 6,066. Divided and this application November 21, 1935, Serial No. 50,960
4 Claims. (Cl. 106—36.2)

1. A metallizing composition which contains an easily reducible metal and a flux comprising



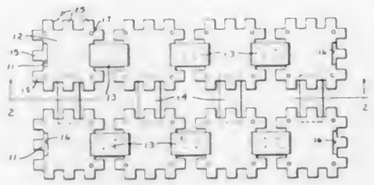
substantially equal parts of a borate and a fluoride of a metal of the group consisting of lead and barium.

2,103,599
AIR DISTRIBUTING MEANS
Philmore F. Sperry and Donald W. Lake, Chicago, Ill., assignors to Excel Auto Radiator Company, Chicago, Ill., a corporation of Delaware
Application April 18, 1936, Serial No. 75,125
6 Claims. (Cl. 230—274)

1. Air distributing means of the character described comprising, a housing member having an aperture therein, a frame journalled for rotation in said aperture, a plurality of shutters carried by said frame member and adjustable to control the air passage through said aperture, a crank arm on said frame, and power driven means for oscillating said crank arm, said power driven means comprising a motor, a worm driven by said motor, a train of gears driven by said worm and including a gear having a pivot pin eccentrically mounted thereon, and a link connecting said pivot pin with said crank arm.

2,103,600
SCOUR PREVENTION
John C. Stevens, Portland, Oreg.
Application December 21, 1935, Serial No. 55,668
9 Claims. (Cl. 61—18)

1. An hydraulic structure for controlling the flow of a liquid stream comprising a substantially horizontal apron and a plurality of baffle blocks arranged in rows thereon, the individual blocks in each row having faces sloping upstream and downstream respectively and being staggered with respect to the individual blocks in an adjacent row and each of the faces being in one plane extending transversely perpendicularly to the direction of flow of said stream.

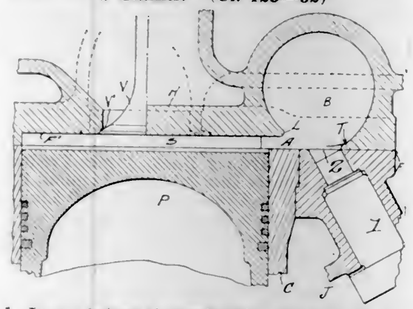


2,103,601
WITHDRAWABLE SUCKER ROD ASSEMBLY
William H. Stigall, Taft, Calif.
Application August 11, 1936, Serial No. 95,469
3 Claims. (Cl. 255—28)

1. In a structure of the class described, a sucker rod construction including a plurality of complemental sections joined by right hand screw-threaded joints, an upper coupling member carried on the lowermost section of said sucker rod construction and provided with an internal screw-threaded socket, the threads being left handed, a second longitudinally spaced axially alined lower coupling member in the form of a sleeve internally screw-threaded with right hand threads, a trip device comprising a rod having a screw-threaded head threaded into said sleeve, a jointing member between said upper and lower coupling members, said jointing member being longitudinally bored and having a threaded ex-

tension at its lower end, the threads of which are right handed and tapped into the right hand threads in said sleeve, said jointing member being provided at its upper end with a similar extension having left hand threads tapped into said correspondingly threaded socket, said upper coupler member being provided with a central bore and keyway, a reciprocatory spring-pressed latch member mounted in the bore in said jointing member and provided at its upper end with a cross-head normally connected with said jointing member, whereby to permit said parts to be separated automatically under predetermined rotative conditions.

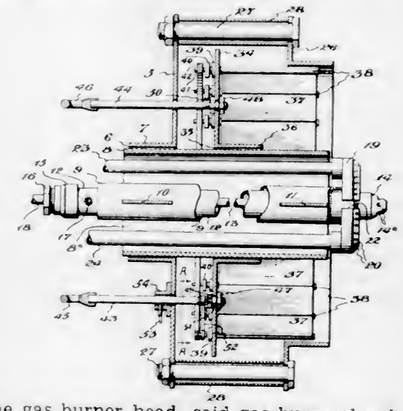
2,103,602
FLUE STRUCTURE
Winton A. Ticknor, Corning, N. Y., assignor to Corning Glass Works, Corning, N. Y., a corporation of New York
Application October 6, 1936, Serial No. 104,281
14 Claims. (Cl. 263—19)



1. In a regenerative furnace flue structure, a plurality of refractory units piled one upon another to form checker columns, and means cooperative only with occasional units for tying the columns together in a definite spaced relation with respect to each other.

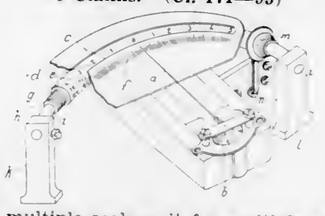
2,103,603
REMOVABLE LADDER STEP
Adolph Voigt, Miami, Fla.
Application October 24, 1936, Serial No. 107,453
2 Claims. (Cl. 228—60)

2. A removable ladder step having a substantially flat main body portion adapted to rest on the rung of a ladder and having cut away parts in its end portions adapted to receive the corresponding rail, the cut away part of each end portion having a pair of tongues for gripping the corresponding rail, said tongues being directed downwardly and toward each other so that they serve to maintain the face of the main body portion in a substantially horizontal position.



2,103,604
INTERNAL COMBUSTION ENGINE
Frank B. Yingling, Hamilton, Ohio, assignor to Cyrus J. Fitton, Hamilton, Ohio
Application June 19, 1936, Serial No. 86,174
2 Claims. (Cl. 123—32)

1. In an internal combustion engine, the combination with a cylinder and piston, of a removable engine-head closing the cylinder, said head having a recess in its under-face forming a space above the dead-center position of the piston, said head also having a precombustion chamber opening through said underface and a shallow passage having side walls flaring laterally from the chamber to the recess, the depressed face of said passage terminating in a lobe projecting partially over said chamber opening into the chamber, and said chamber having a charge-directing inner face terminating at said chamber opening opposite to the lobe.

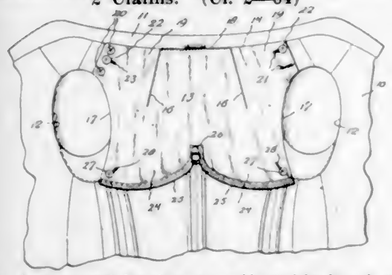


2,103,605
COMBINATION BURNER
John S. Zink, Tulsa, Okla.
Application January 11, 1937, Serial No. 120,073
7 Claims. (Cl. 158—11)

7. A combination oil and gas burner assembly comprising an outer tubular member, an inner tubular member extending through the outer tubular member and spaced from the latter by a substantially annular passageway, supporting means for the inner member secured to the outer member, oil conducting means having a portion extending through and projecting from the inner member, an oil burner head secured to the projecting end of said oil conducting means, a substantially annular gas burner head substantially surrounding said inner member and shaped to permit of its passage by said supporting means and by a portion of said oil conducting means, and gas conveying conduit means connected to

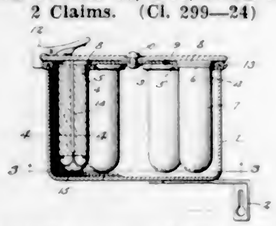
the gas burner head, said gas burner head and gas conveying conduit means being removable from the assembly while the oil burner head and said oil conducting means are in operation without disturbing the latter, and said oil conducting means and oil burner head being removable from the assembly while the gas burner is in operation without disturbing the latter.

2,103,606
MULTIRANGE INDICATING INSTRUMENT
Robert Abrahamsohn and Edmund Abrahamsohn, Berlin-Steglitz, Germany
Application July 16, 1936, Serial No. 90,987
In Germany September 6, 1935
9 Claims. (Cl. 171—95)



1. A multiple scale unit for multiple scale indicating instruments, comprising a stationary curved axial support, and a flexible tubular multiple scale carrier rotatable about the curved axis of the support, the multiple scales being borne by the said scale carrier.

2,103,607
METHOD OF PREVENTING CATERPILLAR INJURY TO EAR CORN
George W. Barber, New Haven, Conn., dedicated to the free use of the Public
No Drawing. Application September 15, 1936, Serial No. 100,860
1 Claim. (Cl. 47—58)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

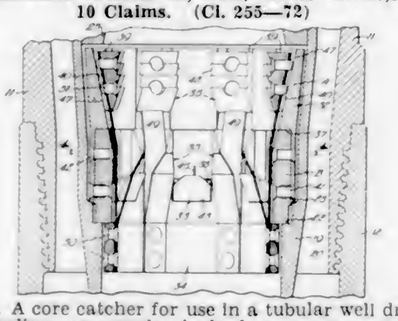


The method of protecting the ears of growing corn from insect attack, consisting of covering the silk end of the ear of corn with a substance that has been impregnated with a fumigant.

2,103,608
COMBINATION HOOD AND DOUBLE BACK FOR GARMENTS
Louis Blauer, Brookline, Mass.
Application June 12, 1936, Serial No. 84,965
2 Claims. (Cl. 2—84)

1. A garment having an adjustable hood, said hood comprising a sheet or material suspended from the inside neck portion of a garment and fitting snugly adjacent the inside of the back portion of said garment and extending substantially from the inner side of one arm hole of the garment to the other, said sheet further comprising two upper wing portions located inside the garment and terminating at the shoulders thereof providing short flaps adapted to be brought up under and secured in overlapped relation beneath the chin of the wearer when said sheet is in use as a hood, and means for securing said flaps in such overlapped relation.

2,103,609
CAR ODORIZER
Curtis E. Bradburn, Garden City, Kans., assignor to Harry L. Divine, Garden City, Kans.
Application October 15, 1936, Serial No. 105,816
2 Claims. (Cl. 299—24)

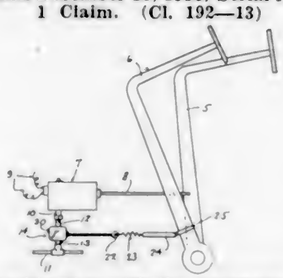


2. An odorizer including a head, a series of containers supported thereby and open at one end, a cover normally closing all of the containers and rotatably mounted on the head, said cover having an opening movable into or out of register with any one of the containers, an odorant in solid form supported in each container, a core seated in the odorant, and resilient means carried by the core for supporting the odorant on the core and for frictionally engaging the wall of its container to hold the odorant in a predetermined position.

2,103,610
ALLOY STEELS
William MacCormac Burden, Reginald Genders, and Reginald Harrison, Woolwich, London, England, assignors to Sofal Limited, London, England
No Drawing. Application December 21, 1936, Serial No. 117,092. In Great Britain April 30, 1935
4 Claims. (Cl. 148—31)

1. An article hardened in it marginal layers by nitrogenization, the article being made from an alloy consisting of iron, and containing carbon not substantially in excess of .2% and a proportion not exceeding 10% of at least one of the metals of the group consisting of tantalum, niobium in excess of any combined with carbon.

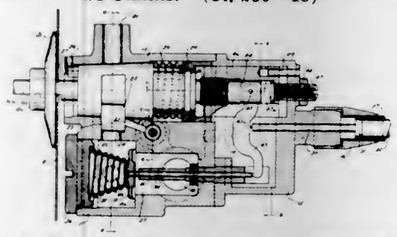
2,103,611
CORE CATCHER
Alfred C. Catland, Alhambra, and Philip C. Efromson, Whittier, Calif., assignors to Globe Oil Tools Company, Los Nietos, Calif., a corporation of California
Application October 13, 1936, Serial No.105,370
10 Claims. (Cl. 255—72)



1. A core catcher for use in a tubular well drill including, an annular body for arrangement in the drill to move vertically therewith, a free ring below the body, slips connected with the ring and actuated into gripping engagement with the core by cooperation with the body, and pivoted core gripping dogs on the body.

2,103,612
TREATMENT OF CHOCOLATE
William Clayton, Sydney Back, James Frederick Morse, and Robert Ian Johnson, London, England, assignors to Crosse & Blackwell Limited, London, England, a British company
No Drawing. Application January 15, 1937, Serial No. 120,822. In Great Britain January 18, 1936
8 Claims. (Cl. 99—23)

1. Process of treating chocolate which consists in incorporating a small proportion of an oxidized mono-unsaturated disaturated glyceride.



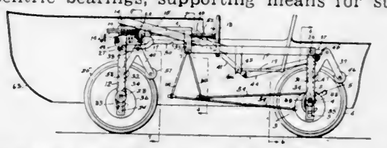
2,103,613
SAFETY BRAKE CONTROL
Otis Louis Dargis, Jr., Cincinnati, Ohio
Application December 15, 1936, Serial No. 116,012
1 Claim. (Cl. 192—13)

The combination with the compressor cylinder and piston of a hydraulic brake system, a brake pedal for operating the piston to effect compression in said cylinder, and a clutch pedal, of a

control valve interposed in the line of connection between the cylinder and brakes, said valve comprising a block-like casing having a through port therein for the passage of fluid therethrough from said cylinder and a by-pass therein including inlet and outlet ends communicating with said through port, a tensioned ball check normally closing the inlet end of said by-pass and means for closing and opening said through port under control of the clutch pedal and comprising a plunger slidable in said casing across said port and intermediate the by-pass ends into opening and closing positions, respectively, and tensioned for movement to closing position.

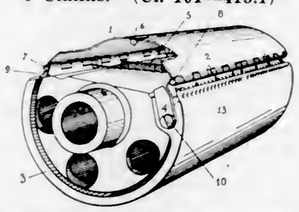
2,103,614
THERMOSTATIC VALVE
George J. Day, Buffalo, N. Y.
Application January 6, 1934, Serial No. 705,536
24 Claims. (Cl. 236—15)

3. A thermostatic fuel control comprising a casing, a valve in said casing, manual means to operate said valve, a second valve in the casing, a thermostat, mechanism within the casing comprising a lever whereby the thermostat actuates the second valve, mechanism within said casing and comprising the same lever whereby the setting of the manual means determines the temperature at which the first named mechanism actuates the second valve, and means operable without disturbing the manual means to adjust the temperature at which the thermostat actuates the second valve.



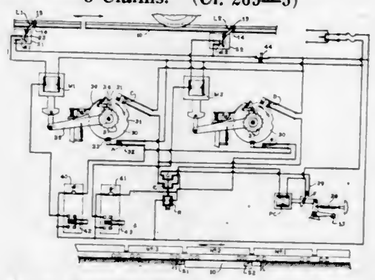
2,103,615
BUTTON OR THE LIKE
Paul E. Fenton, Thomaston, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut
Application February 10, 1937, Serial No. 124,970
3 Claims. (Cl. 40—20)

2. A button or the like of the top shell type, comprising a top shell and a body over which the shell is mounted, said shell having a design on the top thereof and a recess in the marginal portion of the shell bearing a definite relation to the design for registering the design with a button-attaching means.



2,103,616
PERAMBULATOR
George W. Gartner, Houston, Tex.
Application November 1, 1935, Serial No. 47,756
11 Claims. (Cl. 280—223)

8. A vehicle comprising a framework, a front and rear axle, traction wheels fixed on one axle and a steering wheel fixed on the other axle, bearings concentrically mounted on the axles, bearings eccentrically mounted on the axles, supporting means for supporting the frame on the concentric bearings, supporting means for sup-



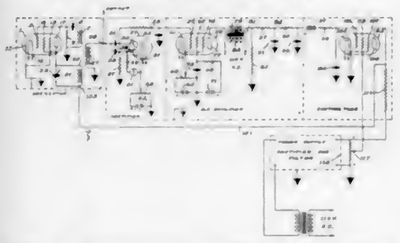
porting the frame on the eccentric bearings, and means for selectively shifting the respective supporting means into supporting, or non-supporting position.

2,103,617
STRETCHING BRIDGE FOR METAL SHEETS OF ROTARY PRINTING MACHINES
Erich Gericke, Berlin-Pankow, Germany, assignor to the firm Rotaprint Akt.-Ges., Berlin, Germany
Application January 12, 1937, Serial No. 120,236
In Germany January 14, 1936
9 Claims. (Cl. 101—415.1)

1. A device for stretching printing sheets on printing cylinders and covering the stretching gap in the cylinder, comprising in combination with a cylinder body forming a part of the periphery of the cylinder and having a stretching gap, a stretching bar fixed on said body on one side of said gap, a second stretching bar articulated on said body on the other side of said gap, and parts hingedly connected to both of said bars and at the same time bridging the gap.

2,103,618
COUPLED WEIGHING
Otto P. Haegele, Chicago, Ill., assignor to Streeter-Amet Company, Chicago, Ill., a corporation of Illinois
Application July 26, 1935, Serial No. 33,306
8 Claims. (Cl. 265—5)

1. Apparatus for weighing cars in a coupled train comprising in combination a scale including a scale platform, a recorder adapted to record the weight of a car on the platform, entrance and exit switches adapted to be actuated respectively a predetermined number of times by



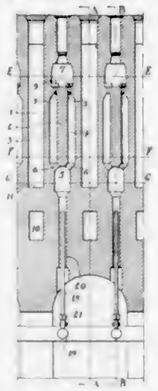
cars passing on and off the scale platform, counter mechanism for counting the number of actuations of said switches respectively, and recorder actuating mechanism controlled by said counter mechanism for operating said recorder when each of said switches have been actuated a predetermined number of times.

2,103,619

CONSTANT VOLTAGE GENERATOR

Clyde E. Hallmark, Camden, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application January 31, 1936, Serial No. 61,669
7 Claims. (Cl. 250—36)



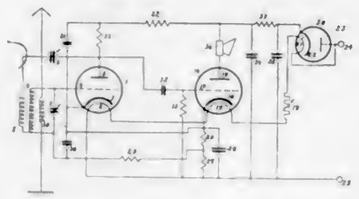
1. In a thermionic oscillator including an anode circuit, means for supplying a controlled anode potential to said anode circuit, means for deriving a biasing potential from said oscillator, means for amplifying about one hundred times said biasing potential, means for energizing said bias amplifying means by alternating current, a control tube including a grid circuit and an anode circuit, means for applying said amplified biasing potential to said grid circuit so that the anode potential of said control tube varies inversely with the output voltage of said oscillator, and a connection for supplying said controlled anode potential to said oscillator from the anode circuit of said control tube.

2,103,620

COKE OVEN

Gwynne Cellan-Jones, Linthorpe, Middlesbrough, England

Application November 9, 1936, Serial No. 109,817
In Great Britain November 20, 1935
20 Claims. (Cl. 202—151)



1. Coke ovens comprising a series of elongated retorts, heating units disposed between adjacent retorts, and means for carrying off gases from said units, each heating unit comprising two series of vertical flues, one series of vertical flues being disposed along one side of the heating unit and adjacent one retort, the other series of vertical flues being disposed along the other side of the heating unit and adjacent the other retort, a series of chambers disposed at the bottom of and communicating with the vertical flues, each chamber only communicating with vertical flues in one series thereof, supply passages by which combusted gases pass from suitable burners to the said chambers, an upper horizontal flue disposed above and communicating with both series of vertical flues, a lower horizontal waste gas flue disposed below the sole of the retort, and at least one flue connecting the upper and lower horizontal flues, each chamber being connected to a pair of adjacent vertical flues, successive chambers being connected to pairs of adjacent vertical flues in alternate series thereof, that is, at alternate sides of the heating unit, the communications between the vertical flues and the upper horizontal flue being damper controlled.

2,103,621

DEVICE EMPLOYING ELECTRONIC TUBES

Paul Kapteyn, Berlin, Germany, assignor to Radioaktiengesellschaft D. S. Loewe, Berlin-Steglitz, Germany, a company of Germany

Application June 24, 1933, Serial No. 677,525
In Germany June 24, 1932
1 Claim. (Cl. 179—171)

An arrangement comprising a plurality of electron valves with anode, grid, and cathode, an input circuit, an output circuit, an anode current source, and means for coupling said valves with each other, the first of said valves having a high amplification factor of more than 30, the grid of said first valve connected over said input circuit with a resistance capacity combination for effecting a negative potential on this grid relative to the cathode of this valve, said resistance-capacity combination included in the anode circuit of the final power amplifier valve on the cathode side for producing a voltage drop forming said negative potential of the grid of said first valve equal to the quotient of the potential of said anode-current-source and the amplification factor of said first valve, said resistance capacity consisting of a resistance connected through a second resistance to the negative pole of the supply, a condenser being connected in parallel to said two resistances, the input circuit of said first valve connected to the connection point of said resistances.

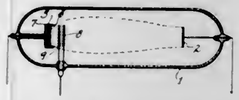
2,103,622

SIDE TRACKING APPARATUS

Robert B. Kinzbach, Houston, Tex.

Application July 25, 1936, Serial No. 92,492
11 Claims. (Cl. 255—1)

1. Side tracking apparatus comprising a whip stock adapted to be located in a pipe in a well and having a tapering face, a milling tool, said face having a fixed boss and the tool having a guide



arranged to slidably engage the boss to move the tool laterally as the tool is moved downwardly.

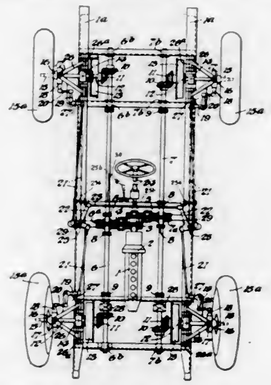
2,103,623

ELECTRON DISCHARGE DEVICE FOR ELECTRONICALLY BOMBARDING MATERIALS

Hermann Kott, New York, N. Y., assignor, by mesne assignments, to Ion Corporation, Short Hills, N. J., a corporation of New Jersey

Application September 20, 1933, Serial No. 690,174
6 Claims. (Cl. 250—27.5)

1. The method of electrically disintegrating and projecting deposits of material which comprises disposing the said material adjacent the electron emitting surface of a cathode but electrically insulated therefrom, confining said material and cathode to direct any gaseous conduction discharge through the material to and from the said surface, disposing an anode rearwardly of said cathode surface, enclosing said cathode and anode from the atmosphere introducing in said enclosure a reduced pressure of ionizable gases substantially inert towards said material, establishing a gaseous conduction discharge between said cathode and anode, and impressing a voltage to said discharge adapted to effect a disintegration of said material through bombardment by positive and negative ions of said discharge and a projection of the disintegrated particles outwardly from the said cathode surface.



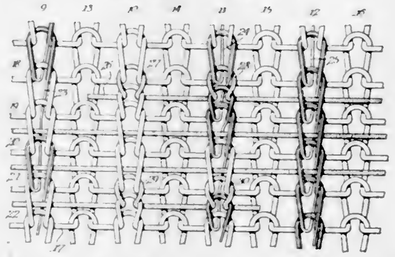
2,103,624

MOTOR ROAD VEHICLE

Hugh Lewis Pingo Lester, Greens Norton, Towcester, England

Application May 25, 1936, Serial No. 81,743
In Great Britain April 16, 1936
4 Claims. (Cl. 180—50)

1. In a motor road vehicle, a main frame, two pairs of driven road wheels, four live axles carrying said wheels, longitudinal shafts carried by said frame, gear wheels on the ends of said shafts meshing with gear wheels on said axles, joints in said axles dividing each of them into two parts, one being mounted in fixed bearings on the frame and the other providing independent shock absorbing movements of the outer ends of the axles relatively to the vehicle frame and said shafts, stub axles pivoted to the outer ends of



said live axles, steering means connected to said stub axles, an engine disposed between said shafts, a differential gear at one end of and driven by said engine, and gearing connecting said differential gear to both of said shafts.

2,103,625

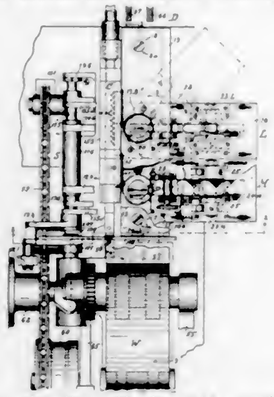
HOSIERY

William J. Longtin, Reading, Pa., assignor to Infant Socks Company, Reading, Pa., a corporation of Delaware

Application July 19, 1934, Serial No. 736,087
7 Claims. (Cl. 66—172)

6. A rib knitted ground fabric made up entirely of wales and courses of textile yarn stitches and a rubber yarn incorporated in and extending coursewise of said ground fabric, an end portion of the rubber yarn being interknitted by means of one or more single yarn stitches with the body stitches.

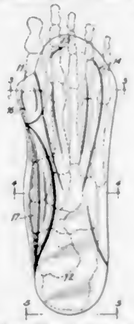
2,103,626



CIGAR LABELING AND WRAPPING MACHINE

Francis X. Malocsay, Upper Saddle River, N. J., assignor to International Banding Machine Company, a corporation of New York

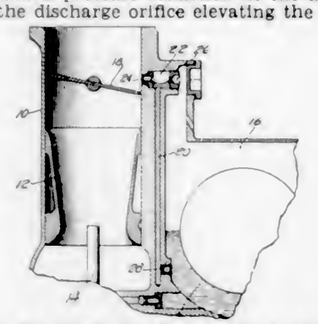
Application January 24, 1935, Serial No. 3,215
13 Claims. (Cl. 216—21)



2. In a wrapping and labeling machine of the class described, comprising a reel for carrying a roll of labels, a reciprocating conveyor adapted to carry a cigar wrapper across the path of the unwound end of said roll, mechanical means cooperatively connected with and actuated by the reciprocating conveyor to intermit-

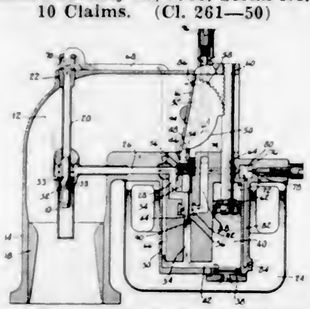
tently feed predetermined lengths of said roll toward and across the wrapper, and cooperating

means to fixedly attach said predetermined lengths to said wrapper.



2,103,627
ARCH SUPPORT
August Mirenta, Tacoma, Wash.
Application April 9, 1935, Serial No. 15,364
10 Claims. (Cl. 36—71)

1. A support for the human foot comprising a flexible insole provided with an elongated pad adapted to support the anterior metatarsal arch, said pad beginning at a point substantially at the location of the cuneiform bones of the foot and gradually increasing in thickness therefrom until it reaches its greatest thickness substantially at the articulation of the phalanges with the metatarsal boneheads.



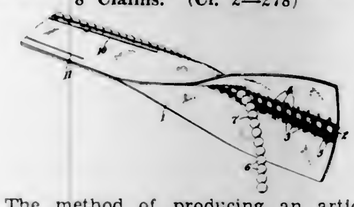
2,103,628
METHOD OF SUPPLYING FUEL FOR ENGINE IDLING
Arlington Moore, New York, N. Y., assignor, by mesne assignments, to Maxmoor Corporation, New York, N. Y., a corporation of Delaware
Application March 17, 1932, Serial No. 599,420
3 Claims. (Cl. 261—75)

1. Process of supplying charges for internal combustion engines comprising causing air to sweep over a concave meniscus of fuel, and drawing the resulting mixture through a highly constricted orifice subjected at the posterior side to the pressure reduction in the intake at the engine side of the throttle, the quantity of air introduced being such as to produce at high depressions a pressure reduction at the anterior side of the discharge orifice elevating the fuel to

maintain the meniscus at a level in proximity to the air stream passing to said discharge orifice.

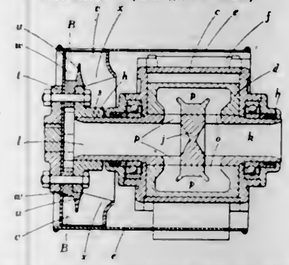
2,103,629
ANTERIOR THROTTLE CARBURETOR
Arlington Moore, New York, N. Y., assignor, by mesne assignments, to Maxmoor Corporation, New York, N. Y., a corporation of Delaware
Application February 10, 1933, Serial No. 656,058
10 Claims. (Cl. 261—50)

8. In apparatus for supplying and proportioning charges for internal combustion engines comprising an intake, a throttle therein, a float chamber, means partially submerged in the float chamber fuel for conducting primary air into the intake at the engine side of the throttle, said submerged portion filling with fuel to close off the primary air at low depression, a fuel metering orifice opening into the submerged portion of said primary air conducting means, and having a variable pressure differential thereon attenuated by the primary air, cam means operated adjunctively to throttling for producing at various throttle positions metering orifice areas coordinated with the pressure differential effective on the orifice for producing desired mixture ratios, said orifice areas being proportional to the amount of primary air admitted for reducing frictional coefficients in the orifice.



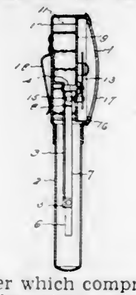
10. In apparatus for supplying and proportioning charges for internal combustion engines comprising an intake, a throttle therein, a constant level float chamber, means for conducting fuel and controlling the flow thereof from said constant level float chamber into the intake, a fuel pump operated upon opening movement of the throttle, a by-pass extending upwardly from said fuel pump into the intake at the engine side of the throttle, and means for controlling the suction in said by-pass to retain the same substantially primed with fuel for immediate discharge of fuel into the intake upon actuation of said pump.

2,103,630
CLEAT
Paul Gerard Morin, Apponaug, R. I.
Application August 1, 1934, Serial No. 737,922
5 Claims. (Cl. 114—101)



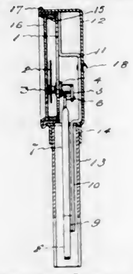
1. Cord securing means comprising a base, a plate, means for spacing said plate from said base, an inclined projection on the under side of said plate affording varying distances between it and said base for clamping a rope by lateral movement thereunder, and ribs on said base at either side of said projection for causing a rope placed under said projection to be disposed in a sinuous path.

2,103,631
BEADED EDGED ARTICLE AND METHOD
Walter Myers, Bridgeport, Conn., assignor to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey
Application December 21, 1935, Serial No. 55,538
8 Claims. (Cl. 2—278)



1. The method of producing an article of manufacture having an ornamental edge-finish, comprising, providing in a body material a row of spaced apart bars of the body material with intervening apertures, doubling said body material about a bead-string disposed along the line of said apertures, causing successive beads of said bead-string to protrude through successive apertures of said body material, and securing the overlying plies of the doubled body material adjacent to the fold-edge thereof.

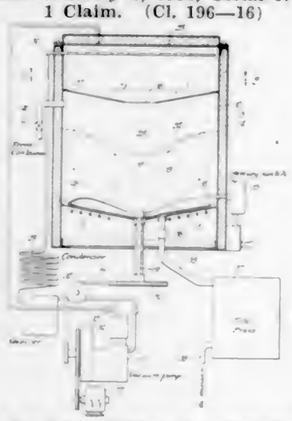
2,103,632
COOLING SYSTEM FOR ROTARY MACHINES
Thomas Winter Nichols, London, England, assignor of one-half to Tilghman's Patent Sand Blast Company, Limited, Broadheath, near Manchester, England
Application January 31, 1936, Serial No. 61,651
In Great Britain February 6, 1935
7 Claims. (Cl. 230—210)



1. A rotary pump or compressor of the eccentric type, including a stator, a housing surrounding said stator and defining a cooling chamber around said stator, a hollow shaft, a hollow rotor carried by said shaft and rotatable in said stator, inlet and outlet passages for providing communication between the interior of said shaft and said rotor whereby a cooling passage is provided through said shaft and rotor, and rotatable means carried on said shaft outside said stator and inside said housing, said means including a dual fan having sets of blades coaxial with said shaft and cooperating respectively with said cooling chamber and the interior of said shaft for urging parallel currents of cooling fluid respectively through said cooling chamber and through said passage in said shaft and rotor.

2,103,633
THERMOMETER
Frederick A. Nodine, Terryville, Conn., assignor to The Cooper Oven Thermometer Company, Pequabuck, Conn., a corporation of Connecticut
Application March 19, 1937, Serial No. 131,827
1 Claim. (Cl. 73—365)

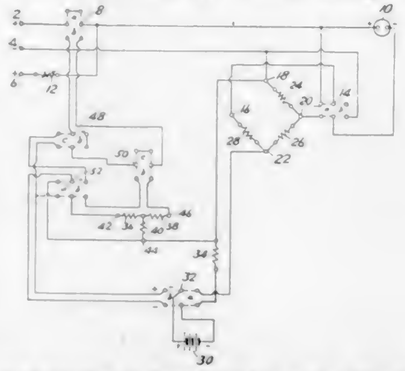
A thermometer which comprises a cup-shaped casing, a tubular stem extending from and opening into the casing, a rigid plate with one end attached to the back wall of said cup and its other end extending into said stem and having an integral outwardly bent lug, a short U-shaped thermo-responsive strip with one end attached to said lug, an arm extending from the free end of said strip through the stem and terminating in a loop in the casing, a dial with temperature indicia mounted in said casing, an oscillatory pointer movable over the dial, and a stud projecting from said pointer into the loop in the end of said arm.



2,103,634
THERMOMETER
Frederick A. Nodine, Terryville, Conn., assignor to The Cooper Oven Thermometer Company, Pequabuck, Conn., a corporation of Connecticut
Application July 2, 1937, Serial No. 151,592
5 Claims. (Cl. 73—365)

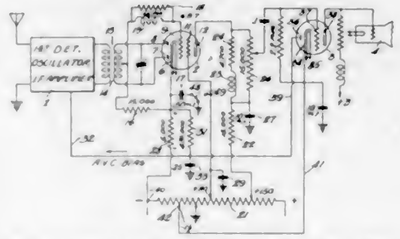
3. A thermometer comprising a dial with temperature indicia, an arbor extending through and

rotatably supported by the dial, a pointer attached to said arbor in front of the dial, an arm attached to said arbor in back of the dial, a strip with its upper end secured to the back of the dial, an end of a thermo-responsive ribbon secured to the lower end of said strip, a finger with one end attached to the free end of said ribbon, means connecting the other end of said finger with said arm on the pointer arbor, a casing enclosing said dial and pointer, and a tubular stem extending from said casing and protecting said thermo-responsive strip.



2,103,635
APPARATUS FOR PURIFYING OIL
De Witt H. Palmer, Elkhart, Ind.
Application January 2, 1934, Serial No. 704,934
1 Claim. (Cl. 196—16)

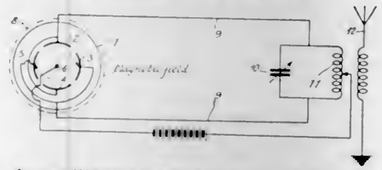
Apparatus for purifying oil comprising in combination a closed vessel for heating batches of oil with a purifying agent, said vessel being substantially deeper than the level of a batch of oil, means for heating the oil to a temperature above the boiling point of water, an agitator for keeping the purifying substance in suspension in said oil, a baffle across the vessel substantially above the oil level and substantially below the top of the vessel, said baffle having a relatively small opening therein to cause the foam formed on heating the oil to spread slowly over the baffle so as to break up the bubbles of foam and being inclined slightly to cause the liberated oil to flow back into said vessel, a condenser connected to said vessel, said baffle being otherwise imperforate except for small openings adjacent its upper edge to allow the escape of trapped vapors, and a vacuum pump for drawing off the distillate into a condenser and for maintaining the oil at sub-atmospheric pressure during the heating process.



2,103,636
ELECTRICAL MEASURING METHOD AND APPARATUS
John M. Pearson, Aldan, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Application March 7, 1935, Serial No. 9,906
12 Claims. (Cl. 175—183)

1. The method of measuring current flowing in a portion of a low resistance conductor such as a buried pipe line, or the like, by the use of a meter of known resistance adapted to be connected across said portion by leads making contacts with the conductor, including adjusting the external circuit of the meter, including the leads, said portion of the conductor, and contacts, to attain a predetermined resistance thereof, connecting the meter to take current through the

leads following such adjustment, and, while the meter is so connected, varying the current through said portion of the conductor by a known amount.



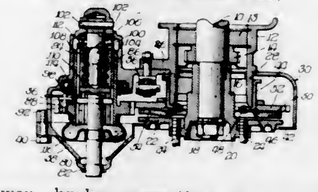
2,103,637
AUTOMATIC VOLUME CONTROL CIRCUIT
Waldemar J. Poch, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application July 25, 1936, Serial No. 92,497
10 Claims. (Cl. 250—20)

1. In combination, an amplifier, the gain of which is to be controlled, an electric discharge tube having a cathode, a control grid and an anode, means for rectifying the output of said amplifier and for impressing the resulting signal and direct current component across said cathode and control grid for amplification by said tube whereby the direct current component of the plate current of said tube is decreased in response to an increase in signal strength, a power supply unit having negative and positive terminals and having an intermediate point connected to ground, said cathode being connected to said negative terminal through a cathode resistor, said anode being connected to said positive terminal through an output impedance unit, a conductive connection from a control point on said cathode resistor to said amplifier for controlling its gain, said tube and its associated circuit being so adjusted that said control point is slightly positive when there is no signal supplied by said amplifier, and a rectifier connected between a point on said cathode resistor having at least approximately the same potential as said control point and a point on said power supply unit which is less positive with respect to ground than said control point, said rectifier being connected in such direction

that current flows therethrough when said control point is positive a certain amount with respect to ground.

2,103,638
OSCILLATION GENERATOR
Klaas Posthumus, Eindhoven, Netherlands, assignor to Radio Corporation of America, a corporation of Delaware
Application July 25, 1934, Serial No. 736,859
In the Netherlands September 6, 1933
2 Claims. (Cl. 250—36)

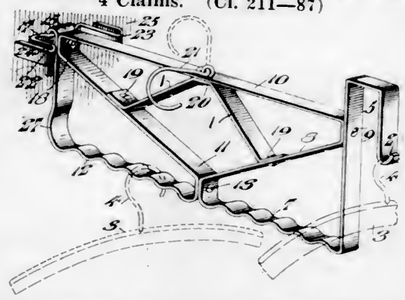
1. An oscillation generator comprising an electron tube having an electron emissive cathode, a plurality of anode sections surrounding said cathode all within an evacuated envelope, and means for producing a magnetic field surrounding said electrodes, comprising two pairs of oppositely disposed anode segments in the form of arcuate segments on a circle, opposite segments of each pair being connected together, in combination with a tunable oscillatory circuit comprising an inductance and a condenser in parallel, a connection from one terminal of said oscillatory circuit to one pair of segments, and a connection from the other terminal of said oscillatory circuit to the other pair of segments, a connection from a point intermediate the ends of said inductance including a source of potential to said cathode, and a utilization circuit coupled to said inductance.



2,103,639
PRECIPITATION OR SETTING OF HYDROXY-CELLULOSE ETHERS FROM ALKALINE AQUEOUS SOLUTIONS
George A. Richter, Berlin, N. H., assignor to Brown Company, Berlin, N. H., a corporation of Maine
No Drawing. Application February 9, 1934, Serial No. 710,562
5 Claims. (Cl. 18—54)

1. In the precipitation of the hydroxy-cellulose ethers from alkaline aqueous solutions in the form of films, filaments, and the like, that step which comprises causing such precipitation through the reaction of sulphur dioxide admixed with steam on such solution, thereby developing substantially only completely water-soluble sulphite as the reaction product of the sulphur dioxide while the sulphur dioxide is exercising a bleaching action.

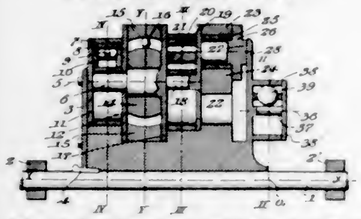
2,103,640
PAPER MANUFACTURE
George A. Richter, Berlin, N. H., assignor to Brown Company, Berlin, N. H., a corporation of Maine
No Drawing. Application March 30, 1935, Serial No. 13,989
4 Claims. (Cl. 91—68)



3. A method of producing a water-absorbing paper product of high wet-strength, which comprises impregnating a highly porous paper body substantially uniformly throughout with a dilute organic solvent solution of a water-repellent cellulose ester in such amount as to incorporate into said body about 0.5% to 2.0% of said cellulose ester, based on the dry weight of said paper body, and removing the organic solvent from the impregnated paper body and depositing said cellulose ester therein from solution in an attenuated and discontinuous film such that water brought into contact with the resulting paper product spreads by capillary action to the bodies of the fibers as well as entering the pores and interstices in said paper body.

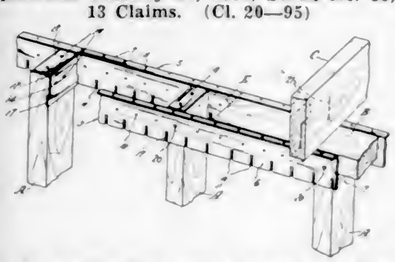
2,103,641
POWER BRAKE SYSTEM
Edward A. Rockwell, Chicago, Ill., assignor, by mesne assignments, to General Auto Parts Corporation, a corporation of Delaware
Application July 21, 1933, Serial No. 681,483
24 Claims. (Cl. 188—140)

1. Power brake operating mechanism for motor vehicles including a control unit concentrically positioned with respect to the propeller shaft of the vehicle and actuator means offset with respect to the propeller shaft, said control unit comprising a clutch element fixed to and rotatable with the propeller shaft, a second normally stationary clutch element concentrically positioned with respect to the first-mentioned clutch element, input means for bringing said clutch elements into engagement, said offset actuator means comprising a driving member coupled to said second clutch element and rotatable in either direction dependent upon the direction of rotation of the propeller shaft, a reciprocable output member and means for transmitting brake actuating movement to said output member in the same direction from said driving member regardless of the direction of rotation thereof.



2,103,642
MULTIPLE MASTER HANGER
Robert Roller, Haddonfield, N. J.
Application April 27, 1936, Serial No. 76,641
4 Claims. (Cl. 211—87)

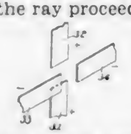
1. A device of the character stated comprising, in combination, a bracket adapted to be secured to a support and having recesses formed therein at an angle to each other, a master hanger having one end thereof deflected to engage one of



said recesses when said hanger is parallel to said support and the other of said recesses when said hanger is at an angle to said support, and the other end thereof deflected to engage the upper edge of a door or the like for temporarily supporting said master hanger when the same is not supported by said bracket.

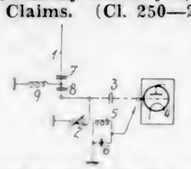
2,103,643
DEVICE ADAPTED TO ELIMINATE OSCILLATIONS
François Marie Michel Bernard Salomon, Paris, France
Application March 31, 1933, Serial No. 663,866
In France April 7, 1932
22 Claims. (Cl. 74—574)

18. Means for damping oscillations in a rotatable shaft comprising a part fixed to and rotatable with said shaft, said part being provided with at least one arcuate guideway the center of curvature of which is eccentric to the axis of rotation of said shaft, and a structurally integral damping mass freely movable substantially frictionlessly along said guideway in the direction of and in response to shaft vibrations, and in response to centrifugal force.



2,103,644
BUILDING STRUCTURE OR TIE
Robert M. Schaffer, St. Louis, Mo.
Application January 17, 1936, Serial No. 59,534
13 Claims. (Cl. 20—95)

1. In combination with a series of wall studs as set up vertically in spaced relation, hangers secured atop the studs, and tie bars supported upon the hangers laterally of the studs.

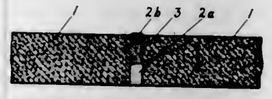


2,103,645
BRAUN TUBE
Kurt Schlesinger, Berlin, Germany
Application December 14, 1933, Serial No. 702,314
In Germany December 20, 1932
3 Claims. (Cl. 250—27.5)

3. A Braun tube comprising a cathode, an anode, electrodes for controlling the intensity of the ray, electrodes for concentrating the ray, a picture receiving screen, at least one deflecting electrodes system mounted between said anode and said screen for applying scanning deflections to the ray, and at least one electrode incorporated between the deflecting electrodes of at least one of said deflecting electrodes systems to produce electro-static fields for causing the cross-section of the ray proceeding to said screen

to assume a constant shape other than that which the cross-section of the ray possesses when projecting from said anode, and means for connecting all of said electrodes with the respective operating voltages.

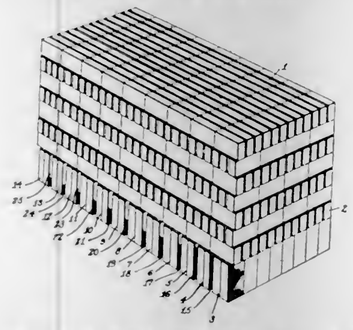
2,103,646
RECEIVING AERIAL FOR ULTRASHORT WAVES
Kurt Schlesinger, Berlin, Germany
Application January 7, 1935, Serial No. 724
In Germany January 9, 1934
9 Claims. (Cl. 250—20)



1. In an ultra-short wave receiver an antenna circuit being equivalent to an aerial wire the length of which is one-quarter or a multiple of one quarter of the received wave length, said antenna circuit consisting of an aerial wire being a little shorter than said multiple of one quarter of the received wave length, an adequate earthing arrangement and an adjustable inductance between said aerial wire and said earthing arrangement for tuning the whole antenna circuit to resonance with said multiple of the wave length to be received, said inductance being coupled with a receiving apparatus.

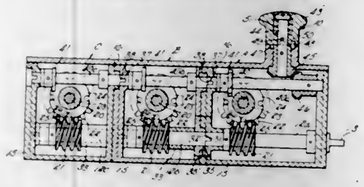
2,103,647
PREPARATION OF NITROCELLULOSE
Milton O. Schur, Berlin, N. H., assignor to Brown Company, Berlin, N. H., a corporation of Maine
No Drawing. Application July 31, 1935, Serial No. 34,052
5 Claims. (Cl. 260—146)

1. In a process of producing with high yield a nitrocellulose product of low solution viscosity from cellulose fiber in shredded condition, that practice which comprises first treating the cellulose fiber in interfelted sheet form with a reagent that effects a marked lowering of the solution viscosity of the cellulose and shortens the fiber units while leaving them in the sheet, shredding the sheet to produce shredded stock of high bulkiness containing substantially all the short and fine fibers developed by the initial viscosity-lowering treatment, and nitrating the shredded stock containing such short and fine fibers to produce with high yield a nitrocellulose product of low solution viscosity.



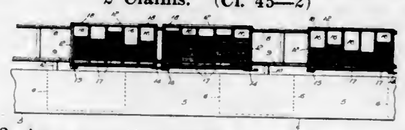
2,103,648
METHOD OF SEALING EXPANSION JOINTS
Walter O. Snelling, Allentown, Pa.
Application February 3, 1934, Serial No. 709,555
11 Claims. (Cl. 94—18)

1. The method of sealing pavement joints which comprises placing within the open space defining such joints a product obtained by heating a solid vulcanized material to a temperature sufficient to decompose a substantial portion of the solid material into highly adhesive and cohesive liquid



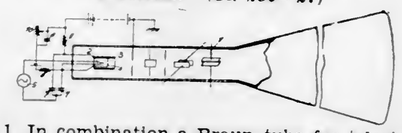
and semisolid-decomposition products, differing in both their chemical composition and in their physical characteristics from the initial vulcanized material.

2,103,649
METHOD OF BRICK HACKING FOR UNIT HANDLING
William J. Sullivan, Chicago, Ill., assignor of one-half to Cyril P. Mertens, Chicago, Ill.
Application November 5, 1936, Serial No. 109,243
1 Claim. (Cl. 214—152)



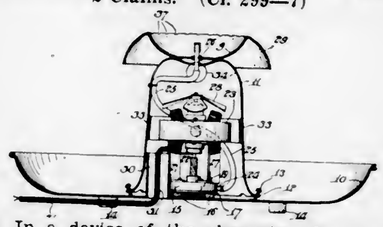
A unit brick stack built with spaced finger courses and formed with pairs of brick up-ended to automatically compensate for the expansion of pallets on which the brick rest and the shrinking of the brick when both are subjected to the heat of drying.

2,103,650
COUNTER FOR MACHINES
Harvey L. Spaunburg, West Hartford, Conn., assignor to Veeder-Root Incorporated, Hartford, Conn., a corporation of Connecticut
Application January 23, 1937, Serial No. 121,941
17 Claims. (Cl. 235—110)



1. In combination, a plurality of separable counter units arranged in abutting relation; each unit including a casing, a counter device within each casing and having numeral members, a sectional drive member journalled in each casing, and a breakable connection within each casing between the drive member and the counter device therein; means for securing said casings together in abutting relation, and means for selectively shifting said breakable connections into and out of operative engagement and including a manually operable member common to all of said breakable connections.

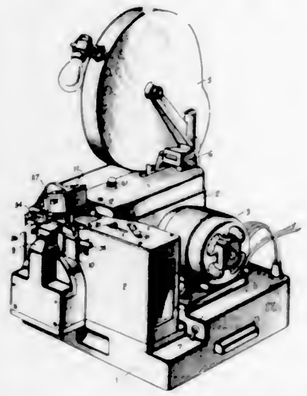
2,103,651
ACCOUNTING SYSTEM
Lester C. Thomas, Denver, Colo.
Application December 1, 1936, Serial No. 113,642
2 Claims. (Cl. 45—2)



2. An accounting system comprising a track, carriages separately movable on the track, means for connecting the carriages end to end in a train for conjoint movement along the track, card-holding files removably fitted on the carriages, record-bearing cards systematically positioned in the files, and a desk-like surface connected with the track and positioned therealong to support individual cards for making entries thereon.

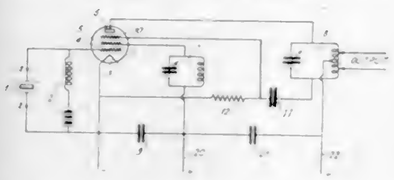
2,103,652
INTENSITY CONTROL SYSTEM FOR CATHODE RAY BEAMS
Manfred von Ardenne, Berlin, Germany
Application October 24, 1936, Serial No. 107,467
In Germany October 25, 1932
3 Claims. (Cl. 250—27)

1. In combination a Braun tube for television purposes comprising means including a cathode for producing a cathode beam, a Wehnelt cylinder surrounding said cathode, and a perforated plate mounted inside said Wehnelt cylinder, means to supply said Wehnelt cylinder with an adapted initial potential and means for supplying both said Wehnelt cylinder and said perforated plate with a control voltage to control the intensity of said cathode beam.



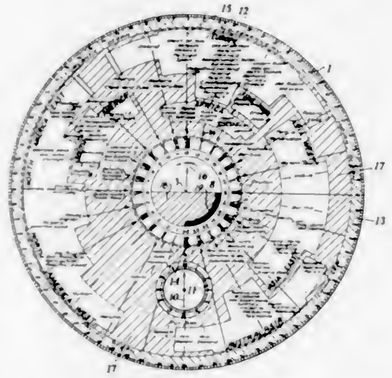
2,103,653
PORTABLE FOUNTAIN
Lewis P. Weil, Philadelphia, Pa.
Application April 8, 1936, Serial No. 73,288
2 Claims. (Cl. 299—7)

1. In a device of the character described, a shallow vessel having an upturned rim, a pumping unit comprising a pump and a motor secured to and supported by the pump, the pump provided with supporting feet adapted to rest loosely upon the bottom of the vessel, a housing for enclosing the pump unit, having a smaller vessel secured directly to and supported by the housing,



said housing also adapted to rest loosely upon the bottom of the first mentioned vessel, the housing provided with air discharge ports near the top thereof, and an air duct extending upwardly to one side of the pump and delivering beneath the motor.

2,103,654
MACHINE FOR ATTACHING PRICE TAGS
Joseph Weimont, Bogota, and Frank A. Hazard, Elizabeth, N. J., assignors to A. Kimball Company, New York, N. Y., a corporation of New York
Application May 21, 1936, Serial No. 80,928
13 Claims. (Cl. 93—88)

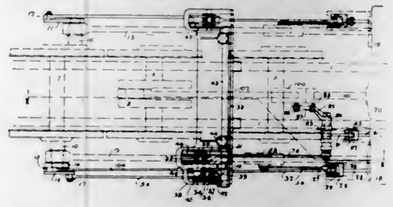


1. In a machine for attaching tags having a tab therein, in combination, a platen having a printing surface, an anvil having an attaching surface, said surfaces being offset from one another, means for receiving a tag from said printing surface and carrying the same to said attaching surface, and means for advancing said tag along said attaching surface while held in the said receiving means.

2,103,655
OSCILLATION GENERATOR
James N. Whitaker, Tuckahoe, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application October 18, 1933, Serial No. 694,016
9 Claims. (Cl. 250—36)

1. A generator comprising an electron discharge tube having an anode, a cathode, a first grid, a second grid and a third grid, a primary oscillation generating means including a piezoelectric crystal and a tuned circuit regeneratively connecting together said cathode, first grid and second grid, said tuned circuit being tuned to the crystal frequency, a secondary oscillation generating means including a biasing device interposed between the third grid and the cathode and including a tuned circuit regeneratively connecting together said third grid, anode and cathode and means operative by virtue of the coupling action of the electron stream between the second and third grids for maintaining the oscillations of the secondary generating means in step with those of the primary generating means.

2,103,656
CHRONOLOGICAL DEVICE
John Henry Willis, Norwich, England
Application July 25, 1934, Serial No. 736,829
In Great Britain June 14, 1934
8 Claims. (Cl. 58—43)

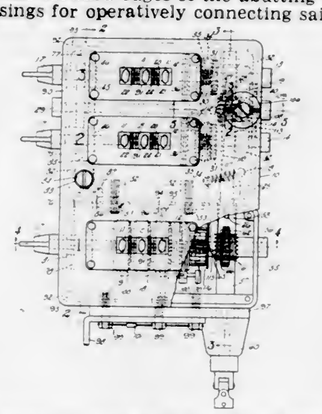


5. A chronological device as specified in claim 2 in which the primary dial member is provided with a gear and the graduations of the supplementary chart correspond to minutes divisions of the hour and the supplementary member is operatively connected with the primary dial member so as to revolve against the said minutes divisions, the said supplementary member being pivoted to revolve about a center different from the center of revolution of the primary dial member, the operative connections of the supplementary member comprising a single gear meshing with the said gear of the primary dial, and the said supplementary member extending across the entire diameter of the supplementary chart, whereby, when one end of the supplementary member shows minutes past the hours of places observing the said adopted times, its reverse end will show simultaneously the minutes past the hours of places observing intermediate times.

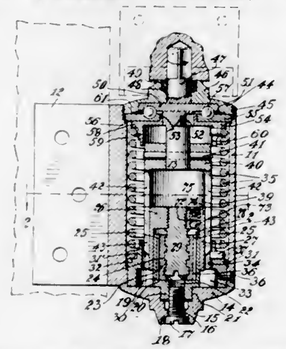
2,103,657
ORGANIC MERCURY COMPOUNDS
Carl N. Andersen, Wellesley Hills, Mass., assignor to Lever Brothers Company, a corporation of Maine
No Drawing. Application October 16, 1935, Serial No. 45,320
20 Claims. (Cl. 260—13)

1. A new organic mercury compound having the general formula $(RHg)_xR_1$, in which R represents an aromatic structure to a carbon atom of which the mercury is directly attached, and in which none of the carbon atoms has direct linkage with any element other than hydrogen, carbon and mercury; in which R_1 represents a halogen nuclear substituted aromatic acid radical which is linked to the RHg group through the

replacement of an acidic hydrogen atom and in which x represents the number of RHg groups in the compound and is an integer representing the number of acidic hydrogen atoms in the acid.



2,103,658
VALVE GEAR FOR THREE-CYLINDER LOCOMOTIVES
Everett W. Blanchard, Schenectady, N. Y., assignor to American Locomotive Company, New York, N. Y., a corporation of New York
Application November 14, 1936, Serial No. 110,845
5 Claims. (Cl. 121—116)

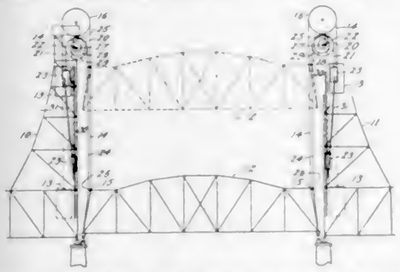


1. In valve gear for two cylinders of a locomotive, a bracket having two vertical openings spaced from each other by a bridge, said bracket having means disposed inwardly of said openings for securing it to the main frame of said locomotive whereby said openings and said bridge will be disposed in a direction longitudinally of said locomotive and laterally outward beyond the same side of said main frame, said bracket being provided with a pair of bearings having the axis thereof crossing one of said openings in a direction transversely thereof and having one of its bearings extending across said bridge and its other bearing disposed in said bracket at the opposite side of said one of said openings, a reversing link extending in a vertical direction through said opening between said bearings and having trunnions mounted in said bearings, another pair of bearings, spaced in a longitudinal direction from said first mentioned pair of bearings, having the axis thereof crossing the other of said openings in a direction transversely thereof and having one of its bearings extending across said bridge and its other bearing disposed in said bracket on the opposite side of said other of said openings, and another reversing link extending in a vertical direction through said other of said openings and having trunnions mounted in said last mentioned pair of bearings.

2,103,659
MULTIPLEX COUNTING MACHINE
Harvey N. Bliss, West Hartford, and Edward Wild and William L. Tancred, Hartford, Conn., assignors to Veeder-Root Incorporated, Hartford, Conn., a corporation of Connecticut
Application February 20, 1936, Serial No. 64,846
11 Claims. (Cl. 235—110)

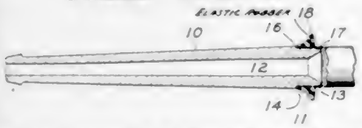
1. In combination, a plurality of counter units arranged in abutting relation, each unit including a casing, a counter device within the casing and having numeral members, a sectional drive member journalled in the casing, and a breakable connection between said drive member and the counter device; means for securing said casings together with adjacent walls in abutting relation; a cover for said casings; and means for selectively shifting said breakable connections into and out of operation and including manually operable means carried by said cover and a shift member supported by said cover and extending across the forward edges of the abutting walls of the casings for operatively connecting said manually operable means with one of said breakable connections.

2,103,660
DOOR CHECK AND CLOSER
Emil Bommer, Brooklyn, N. Y.; Gustav Bommer, John F. Voelkel, and Charles F. Gehrmann executors of said Emil Bommer, deceased
Application December 26, 1934, Serial No. 759,170
5 Claims. (Cl. 16—50)



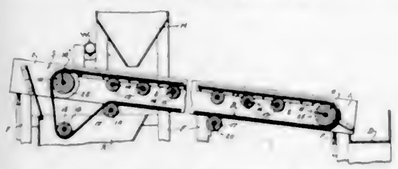
1. A door check and closer comprising a fixed casing, a rotatable door-engaging spindle, a connecter within the casing fastened to the spindle to turn therewith, a two-part dashpot forming a checking fluid chamber within the casing comprising a telescoping piston and stationary element fixed to the casing and connected to cause axial movement of the piston on the turning movement thereof, and a sliding connection between said connecter and piston to cause turning of the piston with the turning of the spindle in either direction and permitting axial movement of the piston in either direction as a part forming with the stationary element the checking liquid chamber.

2,103,661
COUNTERBALANCING MECHANISM FOR LIFT BRIDGES
Thomas E. Brown, Jr., Tuxedo, N. Y.
Application March 14, 1934, Serial No. 715,458
6 Claims. (Cl. 14—42)



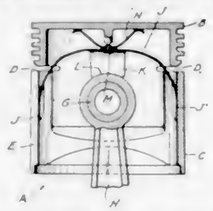
6. Counterbalancing apparatus for vertical lift bridges and the like comprising a rising part

which moves upward in a straight line, said counterbalancing apparatus comprising a plurality of counterweights, a drum supporting one of said counterweights, a sheave supporting another of said counterweights, flexible connections interconnecting the counterweights, the rising part, the sheave and the drum and in all positions of the rising part substantially vertically disposed, an axle supporting said drum, a spiral groove



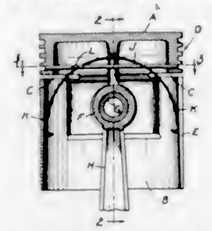
provided in said drum, said groove having a substantial varying lever arm about said axle throughout its operable portion, one of said flexible connections running in said groove, and said counterweights being so proportioned in relation to the lever arms of said groove as to maintain a substantially exact balance of said rising part, said counterweights and said flexible connections in all their positions.

2,103,662
CIGARETTE HOLDER
Elbert Orson Brower, Philadelphia, Pa.
Application November 23, 1934, Serial No. 754,452
3 Claims. (Cl. 131—10)



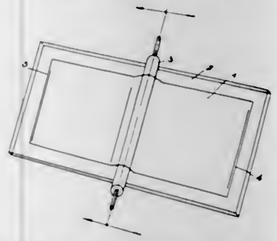
1. A stem having a shoulder near one end and an elastic band under tension on said stem, said band having a position of rest on either side of said shoulder, between which extreme positions the band is manually movable by rolling the same about one of its marginal edges and thereby causing it to pass thru an intermediate condition of greater tension, and in one of which positions of rest the band is adapted to clamp an end of a cigarette wrapper thereunder.

2,103,663
MEANS FOR CONCENTRATING MINERALS
Edward S. Curtis, Los Angeles, Calif.
Application January 7, 1935, Serial No. 621
4 Claims. (Cl. 209—430)



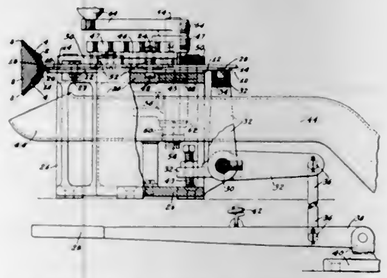
1. An apparatus for recovering minerals from ore comprising an inclined support, a flexible bed carried by said inclined support and having a relatively resilient surface, means holding the side marginal edge portions of said flexible bed in an upturned position to define a relatively shallow water-tight inclined trough substantially U-shaped in cross-section, a riffle positioned in said inclined trough, said riffle having a plurality of transverse and horizontal strips of thin cross-section embedded in the resilient surface of said bed and defining relatively shallow pockets, said strips being embedded in said resilient surface to form a seal and prevent underflow of material between adjacent pockets, said riffle extending transversely of said bed to the upturned side marginal portions thereof, and means for feeding finely divided ore and water to the upper portion of said inclined bed.

2,103,664
PISTON EXPANDER
Dallas M. Smith, Kirkwood, Mo.
Application March 25, 1937, Serial No. 133,053
6 Claims. (Cl. 309—12)



6. A piston expander comprising a U-shaped member arranged to engage and expand the skirt of a piston at substantially diametrically opposed points, said member extending across the hollow interior of the piston above the pin bosses thereof, a pair of parts formed integral with said member and extending downwardly from the upper portion thereof and positioned so that the lower end of each of said parts engages the upper surfaces of one of said pin bosses, and a spring extending upwardly from said member to engage the head of said piston and exert a tension to hold the lower ends of said parts in firm engagement with said pin bosses.

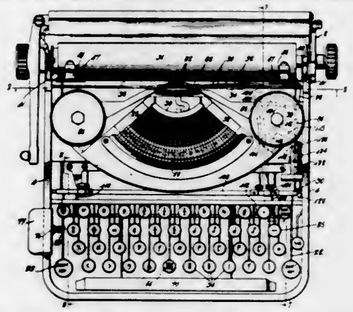
2,103,665
PISTON EXPANDER
Walter C. Knoebel, Kirkwood, Mo., assignor to Dallas M. Smith, Kirkwood, Mo.
Application March 25, 1937, Serial No. 133,061
6 Claims. (Cl. 309—12)



1. A piston expander including parts arranged to engage the piston skirt and exert an expansive force thereon, a rod adapted and arranged to extend across the hollow interior of the head of the piston in which said expander is used, and said skirt engaging parts being secured to said rod.

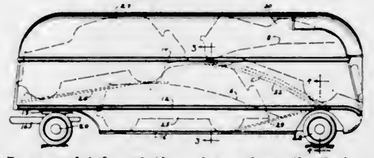
2,103,666
ANTIFROST DEVICE
Manuel Luis Jose d'Ornellas, Talence, France
Application March 11, 1937, Serial No. 130,406
In France December 17, 1936
15 Claims. (Cl. 20—40.5)

1. A system which comprises, in combination, a rigid transparent element, at least one transparent sheet of a supple material arranged to be normally applied flat against the outer surface of said rigid transparent element, and means for deforming said sheet in such manner as to break any layer of frost or ice as may have formed thereon.



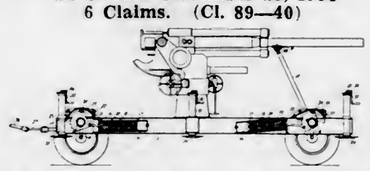
2,103,667
MACHINE FOR REMOVING LACINGS FROM SHOE UPPERS
Joseph Fossa, Lynn, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application March 5, 1937, Serial No. 129,213
20 Claims. (Cl. 12—1)

1. A machine for operating upon a lasted shoe, the upper of which is held stretched in close fitting relation to a last by one or more lacings passing through eyelets in opposite sides of the upper comprising cutting means for severing the lacings, and means for locating the shoe in an operative position on the machine before the lacings are severed.



2,103,668
TYPEWRITER
William A. Fowler, Lincoln, Nebr.
Application May 20, 1936, Serial No. 80,871
9 Claims. (Cl. 197—8)

1. In a typewriter for musical notation, a platen having a substantially flat supporting surface for a paper; a frame upon which said platen is mounted to move bodily in a horizontal direction; typing means comprising type bars and keys for actuating the same; said type bars bearing types for musical notation, including one for printing the five lines of the musical staff; and means for imparting step by step movement to said platen comprising a key adjacent the key for actuating



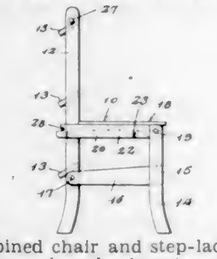
said musical staff type bar, whereby said two keys can be struck together.

2,103,669
VEHICLE CONSTRUCTION
Lynn M. Francis, Birmingham, Mich., assignor to Mechanical Handling Systems, Inc., Detroit, Mich., a corporation of Michigan
Application December 19, 1935, Serial No. 55,193
20 Claims. (Cl. 296—1)

6. In a vehicle of the class described, in combination with a framework, wheels near one end thereof, a substantially horizontal lower support, a pair of raised inclined supports partly overlying opposite ends of said lower support, holding means for maintaining said raised supports in substantially aligned elevated position at their adjacent ends whereby a car may be run from one to the other, and for maintaining said inclined supports in another separated elevated position, at least one of said inclined supports having a portion normally blocking access to the lower support but movable vertically to afford access from one end of the vehicle to said lower support, and an approach runway extending from one end of the vehicle to said lower support.

2,103,670
WHEELED FIREARM
Victor Hammar, Edvin Emanuel Jansson, and Otto Olsson, Bofors, Sweden, assignors to Aktiebolaget Bofors, Bofors, Sweden
Application November 23, 1935, Serial No. 51,316
In Sweden November 23, 1934
6 Claims. (Cl. 89—40)

1. A four wheeled gun carriage comprising a framing, a front and rear axle turnably mounted in said framing, cranks in operative connection with each of said axles at the ends thereof and



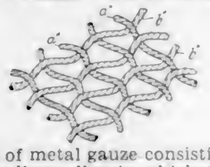
forming journals for the wheels, a link system between each of said cranks and the associated axle, a spring suspension device between each of the link systems and the axle, means for lowering said framing on to the ground and for raising it into the travelling position consisting of a hand operated lever firmly secured to each of said axles for turning the axles together with the associated cranks and wheels, and balancing means between said framing and each of said axles for facilitating the said lowering and raising of the firearm into firing position and the raising thereof into travelling position.

2,103,671

COMBINED CHAIR AND STEPLADDER

Andrew A. Harju, Ashtabula, Ohio

Application March 18, 1937, Serial No. 131,734
2 Claims. (Cl. 155—42)



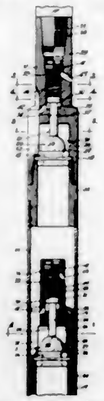
2. A combined chair and step-ladder comprising upright members having step members connected therebetween, a pair of front leg members, the front legs having a rung member extended rearwardly therefrom and pivotally connected to respective upright members, a seat member including side frame members, said frame members being pivotally connected to the upper ends of the front leg members, each of the frame members having a slot formed upon the under face thereof, a link member pivoted at one end to respective uprights at a point slightly below the pivot of the front legs, the other end of the links being pivoted to the seat, the links normally occupying a position within and abutting the base of the slot, a laterally extended lug on each upright adjacent the upper ends thereof, and the free ends of the frame members having a notch for reception of respective lugs, in one position of the parts.

2,103,672

METAL GAUZE

Wilhelm Heinrich Heraeus, Hanau, Germany, assignor to the firm W. C. Heraeus, G. m. b. H., Hanau, Germany

Application August 3, 1935, Serial No. 34,551
In Germany March 23, 1935
1 Claim. (Cl. 23—234)



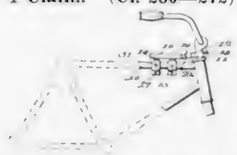
A catalyst of metal gauze consisting of wires of platinum rhodium alloy in which the weft wires are of lower rhodium content and the warp wires are of higher rhodium content for the purpose of making the weft wires softer to conform to the positions of the warp wires and distribute stress evenly throughout the gauze, both of said wires being substantially circular in cross section throughout their length.

2,103,673

PUMP VALVE

Daniel W. Hoferer, Long Beach, Calif.

Application April 26, 1935, Serial No. 18,456
3 Claims. (Cl. 251—121)



1. A well pump valve including, a free ball valve, a cage for the valve, a seat in the cage engageable by the valve, a cylinder projection on the upper end of the cage having a cylinder opening, the cylinder opening extending to the upper end of the projection, a removable plug closure in the cylinder opening below its upper end, the portion of the cylinder opening above the plug closure being threaded to receive a pump part, there being a guide opening from the lower end of the cylinder opening to the cage, a pin separate from the valve and slidable in the guide opening to have its lower end engage the valve, a head on the pin shiftable in the cylinder opening, said cylinder projection having fluid ports through its wall above and below the head, and a spring confined in the cylinder opening and acting on the head to normally yieldingly urge the pin downwardly against the ball valve.

2,103,674

STEERING GEAR LOCK FOR MOTOR VEHICLES

Andrew Jackson, Memphis, Tenn.

Application June 16, 1936, Serial No. 85,579
1 Claim. (Cl. 280—272)

A steering gear lock for motor vehicles comprising a member adapted for attachment to a stationary part of the vehicle and a member adapted for attachment to a movable part of the steering gear, said latter member comprising jaws adapted to surround said movable part, spaced ears on said jaws, a perforated lever having an end positioned between said ears, a pivot connecting said ears and passing through said lever end, means on said first named member adapted for engagement within a perforation of said lever, washers surrounding said pivot at opposite sides of said lever, springs surrounding said pivot between said ears and said washers for urging the latter against the lever, and a clamping bolt passing through said ears between said lever and said jaws.

2,103,675

BRIDGE FOOT PIECE FOR STRINGED MUSICAL INSTRUMENTS

Jim Johannessen, Bergen, Norway, assignor to Gylden Tone A/S. Bergen, Norway, a joint-stock company of Norway

Application January 10, 1935, Serial No. 1,231
In Norway March 6, 1934
2 Claims. (Cl. 84—309)

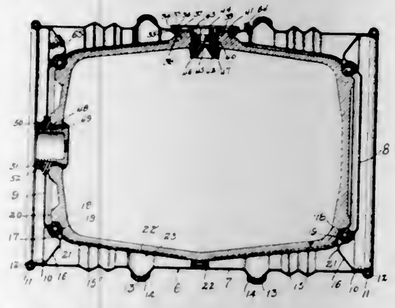
1. A foot piece for the uses described consisting of a flat extremely thin plate of hard sheet material of highly resonant quality in the shape of spaced apart foot plates and a narrow connecting bar, whereby all may lie in continuous bearing contact with the face of the belly of a musical instrument and whereby said plates may receive the respective feet of a bridge; whereby the vibrations transmitted through the bridge will be imparted to an area of the belly greater than that of the superposed bridge piece.

2,103,676

CURLING AND CRIMPING DEVICE

Cornelia Karasiewicz, Detroit, Mich.

Application January 6, 1936, Serial No. 57,815
4 Claims. (Cl. 132—37)



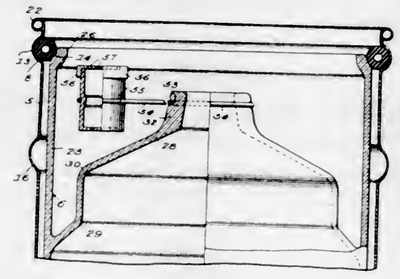
1. An electric curling and crimping device comprising a pair of crossed shank members pivoted together, elongated longitudinally tapered jaw members on one end of said shanks, said jaws being hollow, electric heating elements arranged in said jaws, said jaws having inter-fitting roughened areas on their meeting surfaces to effect a positive hold on the article clamped therebetween.

2,103,677

SPACED WALL RECEPTACLE

Walter Kline, Wellington, and William A. Brubaker, Akron, Ohio; said Kline assignor to Ethel H. Morrison, Wellington, Ohio

Application October 9, 1934, Serial No. 747,630
8 Claims. (Cl. 220—15)



1. In a spaced wall receptacle, an outer metallic shell, an inner container of ceramic or the like material, complementary circular seats formed on the ends of the shell and container, hollow ring like resilient cushions occupying said seats for suspending the container within the shell in spaced relation thereto, a hollow circular radial band embracing the container around the middle thereof to assist the rings in the suspension of the container, resilient shock absorbing bands encircling the outside of the shell and at the ends thereof, said shell and container having registering openings for filling and dispensing the contents of the container and means joining the container and shell at said openings to permit a restricted floating movement of the container relative to said shell.

2,103,678

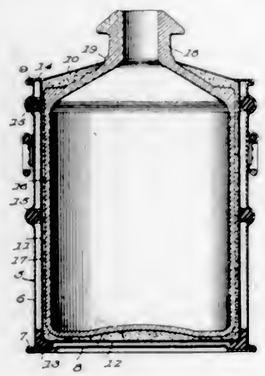
REFRIGERATED SHIPPING AND/OR STORING VESSEL

Walter Kline, Wellington, and William A. Brubaker, Akron, Ohio; said Kline assignor to Ethel H. Morrison, Wellington, Ohio

Application February 9, 1935, Serial No. 5,810
1 Claim. (Cl. 220—14)

A vessel of the class described embodying in its construction, a container having a bell-like dome joining the side of the container intermediate the top and the bottom of the same and deflected inwardly of the side of the container to provide a refrigerating compartment below the level of the top of the container, said dome having a filling opening in the top thereof and means for supporting a refrigerating medium in the refrigerating compartment out of contact with the container, comprising a supporting arm secured to and extending laterally from the dome of the container and a holder for solidified carbon dioxide supported by said arm, said holder having a removable cover for filling the holder and said cover having perforations for releasing the carbon dioxide gas into the refrigerating compartment.

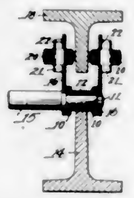
2,103,679



SHIPPING AND/OR STORING CARBOY

Walter Kline, Wellington, and William A. Brubaker, Akron, Ohio; said Kline assignor to Ethel H. Morrison, Wellington, Ohio

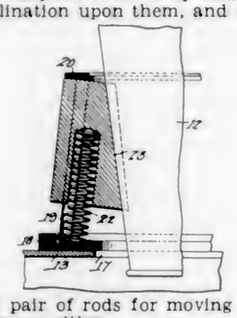
Application July 15, 1935, Serial No. 31,471
1 Claim. (Cl. 220—10)



A carboy or the like receptacle comprising an outer shell and an inner non-corrosive container spaced within said shell with the space therebetween filled with a poured protective substance, said container being fashioned with its upper portion presenting a relatively thick and abrupt offset shoulder leaving a substantial concave area inwardly of the shoulder to thereby

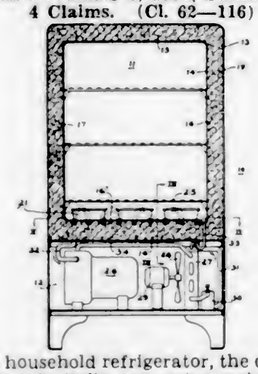
enlarge the space between it and the outer shell for accommodating an increase in the thickness

of the poured protective substance at this particular location.



2,103,680
CONVEYER
Hermann Klaucke, Worcester, Mass., assignor to Baldwin-Duckworth Chain Corporation, Worcester, Mass., a corporation of Massachusetts
Application April 10, 1935, Serial No. 15,616
9 Claims. (Cl. 198—189)

8. In a conveyer, the combination of a supporting rail, a chain composed of links and rollers, said rollers resting on said rail, pins extending through the rollers, the links connecting said pins, means carried by said pins at intervals for supporting the load, plates constituting arms of the links of the chain and extending outwardly, a guide rail in the plane of said rail, and rollers mounted on said plates and projecting inwardly from the plates to engage the guide rail to prevent tilting of the chain.

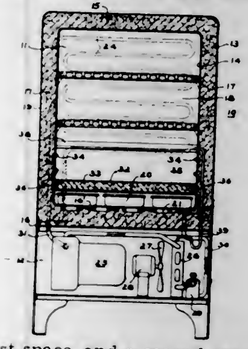


2,103,681
CHUCK
Hermann Klaucke, Worcester, Mass., assignor to Baldwin-Duckworth Chain Corporation, Worcester, Mass., a corporation of Massachusetts
Application September 17, 1936, Serial No. 101,293
2 Claims. (Cl. 198—131)

1. A chuck for carrying conical containers comprising a frame, pairs of inclined rods carried thereby and each pair constituting an inclined guide for a jaw, a plurality of jaws located on said guides and adapted to move up and down at an inward inclination upon them, and a spring be-

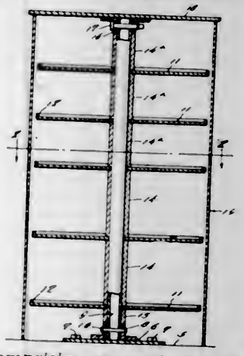
tween each pair of rods for moving the jaws to their clasping position.

2,103,682
REFRIGERATION APPARATUS
John H. Ashbaugh, Springfield, Mass., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application November 3, 1934, Serial No. 751,309
4 Claims. (Cl. 62—116)



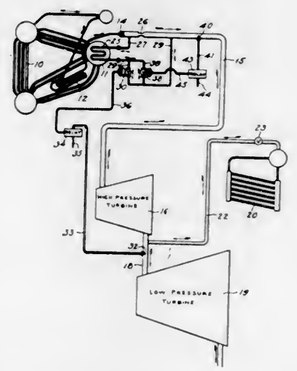
1. In a household refrigerator, the combination of a cabinet including an outer casing, an inner metallic casing or food liner having a plurality of wall portions disposed in spaced relation to and heat insulated from the respective wall portions of the outer casing and including a bottom wall portion, trays for congealing liquids supported on said bottom wall portion, means including an evaporator on the underside of said bottom wall portion for maintaining a sub-freezing temperature of said wall portion and for maintaining a refrigerated temperature above freezing in the upper portion of the food liner, said last-mentioned means including means for circulating a volatile refrigerant through the evaporator and vaporizing the same therein at a pressure and temperature sufficiently low to freeze water in said trays, and shelves mounted in said food liner above said ice trays.

2,103,683
REFRIGERATION APPARATUS
Milton Kalischer, Springfield, Mass., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application November 3, 1934, Serial No. 751,324
6 Claims. (Cl. 62—116)



5. A refrigerator cabinet comprising a liner having top, bottom and vertical wall portions,

a horizontal heat insulated partition for dividing the interior of the food liner into a first space adjacent the bottom of the liner and a second space adjacent the top of the liner, means for supporting said partition at any one of a plurality of positions for varying the sizes of said spaces, a first evaporator disposed below said partition when in the lowermost of said positions for cool-



ing said first space, and a second evaporator disposed above said partition when in the uppermost of said positions for cooling said second space, one of said evaporators being adapted to cool the associated space to a temperature sufficiently low for freezing water and the other evaporator being adapted to cool the associated space to a temperature above freezing but sufficiently low for preservation of food.

2,103,684
DISPLAY STAND
Leonard D. Long, Charleston, S. C.
Application November 24, 1936, Serial No. 112,594
1 Claim. (Cl. 312—172)

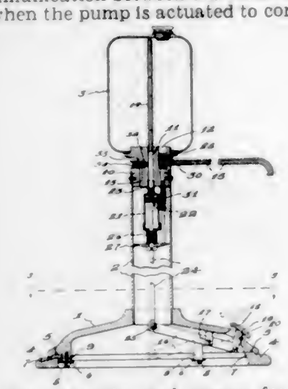
A stand comprising an anchored base, a post rising from the base, a plurality of removable spacing sleeves on the post, a plurality of trays removably disposed on the post and being spaced apart by said spacing sleeves, a top plate, means on the bottom side of the top plate for removably securing the top plate to the top of the post, and a case open at its upper and lower ends and constructed in sections, fastening means between the sections of the case whereby the case can be removably disposed around the trays, said top plate being of a diameter greater than that of the case so that the upper end of the case will abut the bottom of the top plate when the case is in closed position around the trays.

2,103,685
POWER PLANT
Max H. Kuhner, Worcester, Mass., assignor to Riley Stoker Corporation, Worcester, Mass., a corporation of Massachusetts
Application November 7, 1935, Serial No. 48,723
7 Claims. (Cl. 60—104)

1. The method of producing power from steam comprising the steps of expanding the steam through two stages successively, and controlling the temperature of the steam entering the first stage in accordance with variations in the temperature of the steam between the stages, to minimize such variations.

2,103,686
RUBBER COMPOSITION AND PRESERVATION OF RUBBER
George D. Martin, Nitro, W. Va., assignor, by mesne assignments, to Monsanto Chemical Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application June 2, 1934, Serial No. 728,753
23 Claims. (Cl. 18—50)

21. The method of preserving rubber which comprises treating rubber with a product possessing the formula

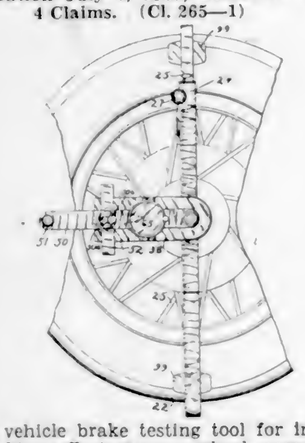


where R^1 and R^2 are alkyl or aryl radicals, R^3 is a methylene or alkylidene radical and R^4 is an alkyl radical.

2,103,687
LIQUID DISPENSING DEVICE
Maurice L. McKenney, Syracuse, N. Y.
Application July 9, 1936, Serial No. 89,799
11 Claims. (Cl. 221—94)

8. In a liquid dispenser, the combination of a stand including a base and a tubular upright body having a plug in its upper end formed with a valve passage and with an air passage, an air-tight liquid reservoir mounted on the upper end of the plug, a pump supported by the plug and located in the tubular body and communicating with the reservoir through the air passage, the pump including a movable member, a valve mounted in the valve passage normally closing the nozzle and movable into position to estab-

lish communication between the reservoir and the nozzle when the pump is actuated to compress the



air in the reservoir, and means for actuating the movable member of the pump and the valve.

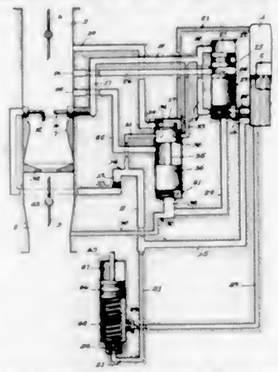
2,103,688

BRAKE ADJUSTING TOOL

Theodore A. Milutin, Dearborn, Mich.

Application July 3, 1935, Serial No. 29,596
4 Claims. (Cl. 265—1)

1. A vehicle brake testing tool for indicating the braking effect upon a wheel, comprising a contractible yoke adapted to span the wheel and grip the periphery thereof, a rigid arm rotatably mounted on said yoke near the center thereof, reversible ratchet means connected therewith for prevention of rotation of said arm in a selected direction while allowing rotation in the opposite direction, crank means also rotatably mounted on said yoke and concentric with said arm, a second yoke carried by said crank means, resilient means embraced by said second yoke, and abutments carried by said arm and against which said resilient means acts to resist relative movement of said crank and arm, and means to indicate the force required to deform said resilient means and produce such relative movement.



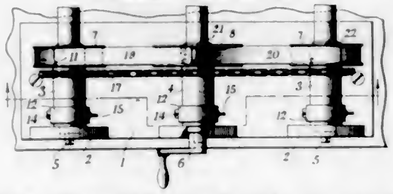
2,103,689

CARBURETOR

James F. Mullen, Jr., Lincoln Park, Mich.

Application November 1, 1935, Serial No. 47,757
18 Claims. (Cl. 261—34)

11. In a carburetor for an internal combustion engine, such as the motor of an automobile, the combination of means forming a float chamber for the fuel, a main siphon gravity and suction feed passage leading from said chamber, an auxiliary gravity and suction feed passage leading



from said chamber, for acceleration, and a suction operated valve which, when released by the suction, admits air to both siphon passages, for the desired purpose.

2,103,690

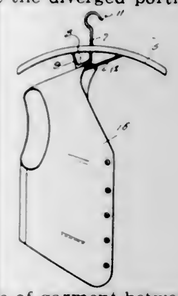
MEANS FOR COMMUNICATING TRANSFER MEDIUM

Samuel A. Neidich, Burlington, N. J., assignor, by mesne assignments, to Underwood Elliott Fisher Company, New York, N. Y., a corporation of Delaware

Application January 2, 1936, Serial No. 57,165
1 Claim. (Cl. 91—54)

In a ribbon-inking mechanism, the combination of a plurality of rotatable ribbon holders; a single rotatable ribbon holder; means to rotate the single ribbon holder to withdraw a plurality of ribbons from the first-mentioned plurality of holders, and wind them on the single ribbon holder in intercoiled relation; and driving means to connect the first-named plurality of ribbon holders for simultaneous rotation, to enable rotation of one of the first-named ribbon holders to turn all of such holders to unwind the intercoiled ribbons from the single holder, and to rewind the ribbons on their respective individual holders.

2,103,691



COAT AND VEST HANGER

Edward E. Palmer, Fitzwilliam, N. H.

Application August 12, 1936, Serial No. 95,638
2 Claims. (Cl. 223—91)

1. A hanger of the character described comprising an arcuate-shaped coat hanging member, a hook member provided with a depending shank disposed through the intermediate portion of the arcuate-shaped member to depend below the same, the lower end portion of the said shank being bent in diverging relation to the intermediate portion of the arcuate member, and a spring rod having one end embedded in the hanging

member and extending in diverged direction from the lower portion of the arcuate-shaped member and having its free end portion tensionally disposed against the diverged portion of the shank

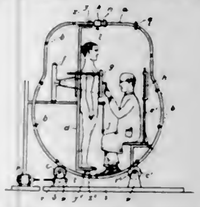
to hold a piece of garment between itself and the diverged portion of the hook shank, said diverged portion and spring rod extending downwardly with respect to the hanging member.

2,103,692

PROCESS FOR THE PRODUCTION OF SECONDARY AND TERTIARY ALKYL MONOCHLORIDES

Wacław Junosza Piotrowski and Józef Winkler, Drohobycz, Poland

No Drawing. Application August 31, 1931, Serial No. 560,520. In Germany October 15, 1930
11 Claims. (Cl. 260—166)



1. A process for the production of secondary and tertiary alkyl monochlorides from normally liquid olefines which comprises vaporizing said olefines and passing the vapor mixture with hydrogen chloride over a polyvalent metal halide catalyst deposited upon substances of high surface activity selected from the group consisting of silica gel and active carbon.

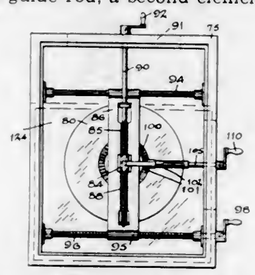
2,103,693

RADIOGRAPHIC COUCH

Ernst Pohl, Kiel, Germany

Application October 5, 1934, Serial No. 747,100
In Germany February 12, 1934
8 Claims. (Cl. 250—34)

1. A radiographic couch comprising a base, a frame tiltably mounted on said base, and two supports for practically the whole length of the body of the patient capable of being mounted in said frame in opposition to each other for receiving the patient between them, the distance between said supports being variable depending on the thickness of the patient.



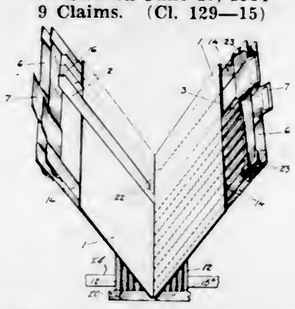
2,103,694

PHOTOGRAPHIC APPARATUS

John G. Reiser, Toledo, Ohio

Application September 27, 1934, Serial No. 745,716
1 Claim. (Cl. 95—38)

In combination with a camera having an objective, a film adapter having a housing frame, a partition extending in a plane parallel to the focal plane of the objective and separating the interior of the camera from the interior of the frame, the partition having an opening located in light transmitting relation to the objective, a film carrier, a member for rotatably supporting the film carrier in a plane parallel to the plane of the partition and in light receiving relation to the partition opening, a cross plate for slidably supporting the member, an element rotatably mounted on the cross plate, one end of the said element extending through the frame and having a manipulating handle for causing rotatable movements of the element, the other end of the element having threaded portions adapted to engage the said member whereby, on rotation of the element, the member and film carrier are caused to move linearly in a plane parallel to that of the partition, the frame having a guide rod, the cross plate slidably supported on the guide rod, a second element rotatably



supported in the frame, one end of said second element having a manipulating handle for causing rotatable movements of said second element, the other end of said second element having a threaded portion adapted to engage the cross plate whereby, on rotation of said second element, the cross plate, member and film carrier are caused to move linearly in a plane parallel to that of the partition and in directions at right angles to that of first-named linear movement, and manipulative means extending through the frame for causing the film carrier to rotate in a plane parallel to that of the partition whereby any desired increment of movement of the film carrier in any desired direction with respect to the partition opening and objective may be obtained by conjoint actuation of said first element, said second element and said means.

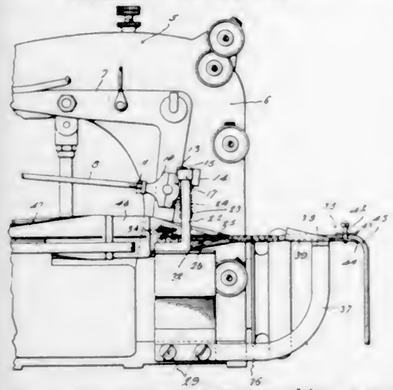
2,103,695

CARD REGISTER

Nils Ivar Rosén, Stocksund, Sweden

Application June 7, 1935, Serial No. 25,463
In Sweden June 19, 1934
9 Claims. (Cl. 129—15)

1. A register for loose cards or the like, arranged one behind the other comprising a base



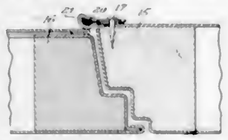
for supporting the cards, a plurality of narrow strips adapted to be arranged between said cards and having their inner ends swingably mounted on said base, said strips being adapted to extend from said base beyond the outer edges of the cards, and arranged adjacent and obliquely behind each other in rows, the planes of the strips in each row forming an acute angle with the longitudinal direction of the row.

2,103,696

CIRCULAR KNIT TUBING CUTTER ATTACHMENT FOR SEWING MACHINES

Charles A. Scheaffer and Clifton C. Foil, Port Carbon, Pa.

Application February 13, 1937, Serial No. 125,663
2 Claims. (Cl. 112—122)



1. In combination, a sewing machine, a movable part of the sewing machine, a scissors structure secured to the base of the machine adjacent the standard of the overhanging arm to sever material as it advances to the sewing point and consisting of a stationary blade and a pivotal blade, a connection between the pivotal blade and the movable part of the sewing machine, and material guide means for guiding the material to the scissors, said guide means consisting of an elongated guide finger upon which the stationary blade is secured and beyond the free end of which the finger projects.

2,103,697

WEATHER STRIPPING AND METHOD OF MAKING THE SAME

Charles P. Schlegel, Rochester, N. Y., assignor to The Schlegel Manufacturing Company, Rochester, N. Y., a corporation of New York

Application February 8, 1936, Serial No. 62,919
8 Claims. (Cl. 20—69)

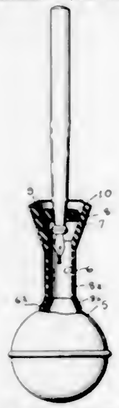
1. Weather stripping comprising a strip of material having one portion for attachment to one member near an edge thereof and another portion to project beyond said edge of said member for contact with a second member, said attaching portion of said strip being laminated and having one layer formed to provide substantial resistance to compression in the plane of the layer and having another layer tensioned in order to give said projecting portion of said strip a bias in a direction transverse to the plane of said attaching portion.

2,103,698

SAFETY IGNITION COMPOSITION CONTAINING SEMI-PYROPHORIC METAL

Alfred Schmid, Berlin-Dahlem, Germany

No Drawing. Application December 29, 1936, Serial No. 118,171. In Germany August 28, 1931
4 Claims. (Cl. 52—25)



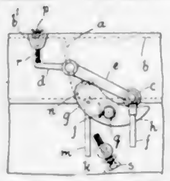
1. Safety ignition mixture ignitable by friction on friction surfaces, consisting of a mixture of substances yielding oxygen, semi-pyrophoric metals, abrasive substances and binding agents.

2,103,699

FOUNTAIN PEN CLEANER

Joseph D. Sheehan, Brooklyn, N. Y.

Application November 30, 1934, Serial No. 755,331
2 Claims. (Cl. 120—108)



1. A fountain pen cleaner consisting of a bulb, a flexible rubber tube connected therewith, a rubber cone connected with the bulb, the bulb being constructed of yielding rubber to permit of manual compression, and adapted to react to produce suction, a metal cone enclosing the rubber cone and having a flange engaging the upper end of the rubber cone, and a resilient rubber ring slidable against the rubber cone and adapted to be retained therein by the flange of the metal cone.

2,103,700

FUEL MIXTURE SUPPLY CONTROL FOR THE INTERNAL-COMBUSTION ENGINES OF MOTOR VEHICLES

Algernon Smart, Newcastle-upon-Tyne, England

Application December 13, 1935, Serial No. 54,239
In Great Britain December 15, 1934
8 Claims. (Cl. 192—.01)

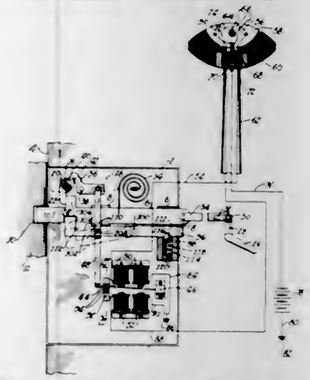
1. Apparatus for controlling the supply of fuel-mixture to the internal-combustion engine of a motor vehicle comprising means for completely shutting-off said supply and simultaneously admitting air in lieu thereof while the engine is connected to the transmission system of the vehicle and is being driven thereby, said means being associated with means for restoring a supply of mixture and simultaneously shutting-off said air which latter means function automatically to prevent the engine stalling when the vehicle ceases to drive the engine.

2,103,701

RAIL HEAD AND WHEEL FLANGE LUBRICATOR

Charles Stern, Jersey City, N. J., assignor to Ardco Manufacturing Company, Hoboken, N. J., a corporation of Delaware

Application July 10, 1934, Serial No. 734,553
10 Claims. (Cl. 184—3)



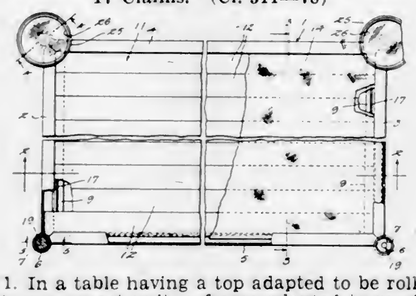
1. A rail head and wheel flange lubricator, comprising a manifold adapted to receive lubricant under pressure, means for detachably securing the manifold to one side of a rail, a plurality of independent tubes detachably branched from the manifold and having flattened outer ends for positioning against the side of a rail head to project into the bight between the rail head and the flange of a wheel, a removable protecting member, and detachably securing means for securing the protecting member on the manifold over the tubes and having a reduced upper end portion projecting into said bight to protect the free ends of the tubes.

2,103,702

MOTOR VEHICLE LATCH

Milton Tibbetts, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan

Application July 30, 1934, Serial No. 737,506
12 Claims. (Cl. 292—164)



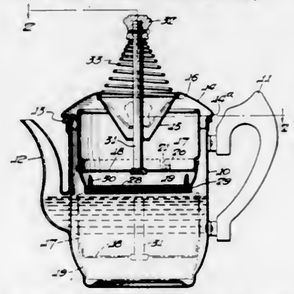
1. A door securing means for motor vehicles comprising a spring pressed bolt, means operable from outside the vehicle for retracting the bolt, means operable from inside the vehicle for retracting the bolt, a locking device movable to render the outside retracting means inoperable and to substantially increase the resistance of the bolt to movement by the inside retracting means.

2,103,703

FOLDABLE TABLE

Jacob van Kooten, Brooklyn, N. Y.

Application May 25, 1935, Serial No. 23,481
17 Claims. (Cl. 311—78)



1. In a table having a top adapted to be rolled into a compact unit, a frame adapted to receive and encircle the top comprising a series of bars, means hingedly coupling the ends of the bars together at two diagonal corners of the frame, means securing the top within and below the plane of the top of the frame bars when the bar ends at the other diagonal corners are joined together, and legs each detachably coupled with the frame at the corners thereof.

2,103,704

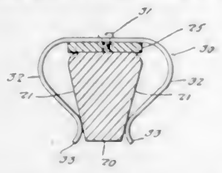
SPRING DRIP BEVERAGE MAKER

Leon Wygodsky, deceased, late of Baltimore, Md., by Helen Wygodsky, executrix, Baltimore, Md., assignor of one-half to said Helen Wygodsky and one-half to Julienne M. Wygodsky

Application January 5, 1937, Serial No. 119,155
6 Claims. (Cl. 53—3)

1. An infusion making device comprising a receptacle for water, a cover for closing the top of the receptacle, said cover having a depending central guide thereon, a coffee basket having a detachable perforated bottom closure member and a water container the lower end of the latter fitting within and being detachably connected to said basket, said container and basket constituting an assembly vertically movable within the receptacle, a push rod connected with said assembly and slidable through said guide, and a spring connected with said push rod for normally urging said assembly upwardly.

2,103,705



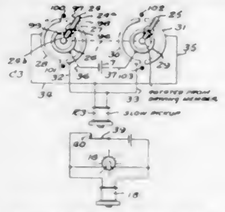
DRILL STEEL SHARPENER

Charles W. Beamer, Mojave, Calif.

Application May 19, 1936, Serial No. 80,604
11 Claims. (Cl. 121—32)

1. In a structural assemblage of the class described, in combination, a fixed bushing, a re-

movable pneumatically operated dolly mounted in said bushing and provided with a keeper notch,



and reciprocatory pneumatically returned bodily slidable latch means engageable with said notch in the manner and for the purposes described.

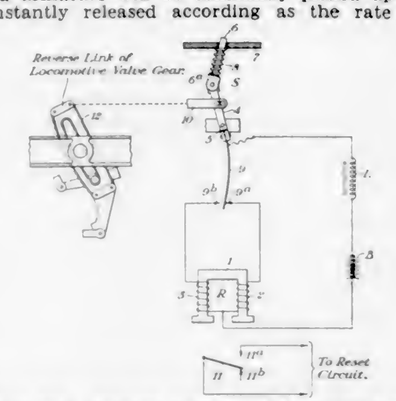
2,103,706

SPEED RESPONSIVE APPARATUS

Herbert L. Bone, Pittsburgh, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania

Application May 17, 1935, Serial No. 22,029
11 Claims. (Cl. 175—355)

1. Speed responsive apparatus comprising a member adapted to be rotated at different speeds, circuit controlling mechanism operated by said member and including a first pair of contacts closed during a first predetermined portion of each rotation of the member and a second pair of contacts closed during a second predetermined portion of each rotation of the member, a current source, a time limit electromagnetic device including an energizing winding; a first control circuit including the source, said winding and said first pair of contacts for energizing said device with current of one polarity; a second control circuit including the source, said winding and the second pair of contacts for energizing the device with current of the other polarity; and an operating circuit including a contact operated by said device.



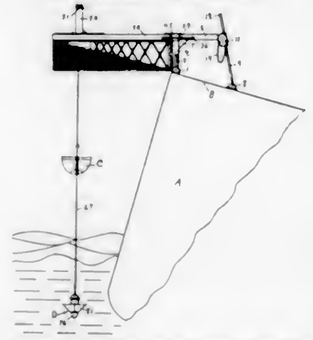
2,103,707

SPEED RESPONSIVE APPARATUS

Ralph K. Crooks, Pittsburgh, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania

Application December 10, 1935, Serial No. 53,746
10 Claims. (Cl. 175—355)

1. Speed responsive apparatus comprising a pair of contacts which are alternately opened and closed at a variable rate, a relay having a magnetizable core provided with two separate windings, a reactor, a source of direct current, means for connecting each of said windings with said source in series with said reactor over a different one of said contacts in such manner that the resultant current which is supplied to said windings will always flow in the same direction in said reactor but will cause an alternating flux to be induced in said core, and an armature controlled by the alternating flux which is induced in said core, the parts being so proportioned that said armature will be constantly picked up or constantly released according as the rate at



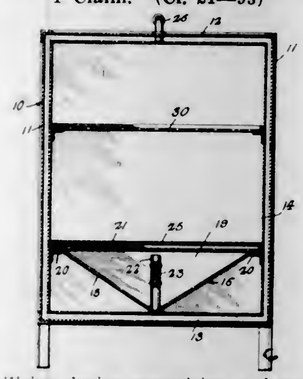
which said contacts are alternately opened and closed is below or above a relatively slow rate.

2,103,708

DEVICE FOR HANDLING BOATS AND OTHER LOADS

Willard Campbell, Los Angeles, Calif.

Application January 7, 1935, Serial No. 677
12 Claims. (Cl. 9—22)



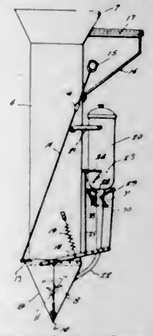
1. A device for the purposes described comprising a support, a cradle pivotally mounted upon said support, a gate at each end of the cradle, said gates being hinged to the latter so as to close in front of the cradle or to open and extend outwardly over the side of the support and above the water; track rails on the cradle, complementary track-rails on the gates in alinement with the rails on the cradle when the gates are open, a carriage having wheels for rolling on said rails, a boat, a latch member on said boat, means on said carriage for supporting the boat whereby the latter may be lowered to or raised from the water, said supporting means being in engagement with said latch member, a hoisting mechanism on the carriage, steadying cables extending from said mechanism downwardly past the supported boat and into the water, a weight for and attached to the lower end of each of said steadying cables and detachable means on the boat for slidably engaging said cables as the boat moves up and down, said detachable means being normally held to the boat by said latch member, said latch member being adapted to disengage the detachable means from the boat automatically when the boat comes to rest upon the water.

2,103,709

STERILIZER

Harry E. Cann, West Chester, Pa.

Application December 5, 1931, Serial No. 579,314
1 Claim. (Cl. 21—93)



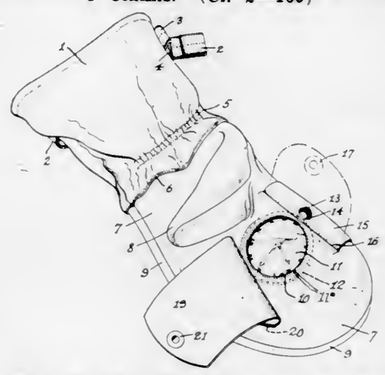
A sterilizing device comprising a closed cabinet for receiving previously washed but undried receptacles, converging plates in the lower portion of the cabinet forming a valley for receiving the drippings from inverted receptacles, a horizontal perforated plate above said valley, a reticulated member above said plate for supporting inverted receptacles and through which said drippings are adapted to pass to said perforated plate, and a heating means within said valley for converting said drippings into steam, whereby to retard the rise of heated air so as to produce an even and continuous circulation of heat by convection to all parts of the interior of the cabinet.

2,103,710

COMBINED PLANT SETTING AND FERTILIZING IMPLEMENT

John J. Carner, Cloudcroft, N. Mex.

Application August 18, 1936, Serial No. 96,672
4 Claims. (Cl. 111—4)



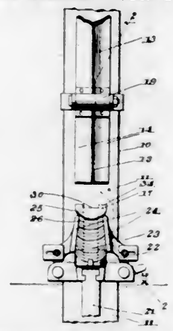
2. In a structure of the class described, a cylinder adapted to receive the plant, a conical ground penetrating device at the lower end of said cylinder embodying a relatively fixed semiconical section and a relatively movable semiconical companion section, a rod slidably mounted on said cylinder and connected with said movable section, a lever also connected with said movable section, a fertilizer tank supported on said cylinder, a delivery conduit leading down from said tank and connected with the fixed section of said conical device, a valve in said conduit and an operating connection between said valve and lever.

2,103,711

TIMER'S MITTEN

Eben W. Cole, Littleton, N. H.

Application November 13, 1936, Serial No. 110,757
3 Claims. (Cl. 2—160)

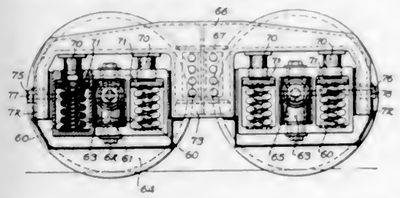


1. In a timer's mitten, the combination of a mitten having a leather palm and a fabric lining, a circular opening in the leather palm of a size substantially corresponding to the face of a watch, and a semi-circular line of stitching securing the leather palm to the lining and spaced a sufficient distance from the edge of the aforesaid circular opening to allow room for the rim of a watch; a slit spaced from the circular opening and near the edge of the mitten for insertion of a watch in the space between the lining and the leather palm of the mitten until the face of the watch is centered in the circular opening by the aforesaid semi-circular line of stitching; a small flap stitched to the palm of the mitten and adjacent the slit through which the watch is inserted, said flap having an opening for the knurled stem of a watch, and having a snap fastener socket, a snap fastener stud on the mitten positioned to engage the aforesaid snap fastener socket when the flap is in closed position, and a second and larger flap stitched to the palm of the mitten on the other side of the circular opening for the watch and adapted to be brought over said opening, said flap having a snap fastener socket engageable with the aforesaid snap fastener stud.

2,103,712

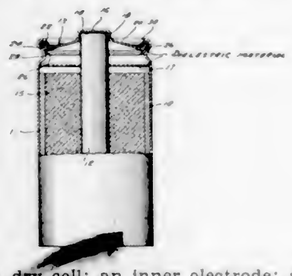
HEEL BUILDING MACHINE

Charles H. Coulson, Hanover, Pa.



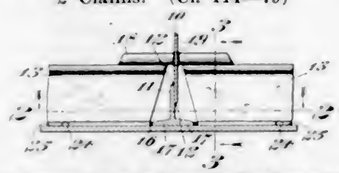
Application December 19, 1936, Serial No. 116,829
12 Claims. (Cl. 12—50)

1. The method of building heels which comprises assembling lifts in heel-form, forcing the



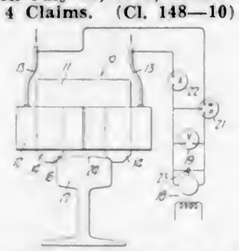
assembled lifts through a confined space while subjecting the lifts to a compressive action and a lateral pressure, the lateral pressure depending upon sliding contact at two points on each of the assembled lifts.

2,103,713
CAR TRUCK
William S. Dietrich, Greenville, Pa.
Application March 22, 1935, Serial No. 12,418
4 Claims. (Cl. 105—169)



1. The combination with a truck having two pairs of wheels, of a cross beam disposed between the wheels of each pair, a spindle mounted on each end of the beams, for oscillation about a vertical axis, an axle carried by each spindle, for the adjacent wheel, a truck frame having portions extending to the sides of the truck, frame-supporting springs interposed between said portions and the said cross beams, the springs and the spindles at each side of the truck being disposed in a common vertical plane, and the springs being arranged in pairs, with one spring in front of and one behind each spindle, and guide members for holding the cross beams in cooperative relationship to the truck frame.

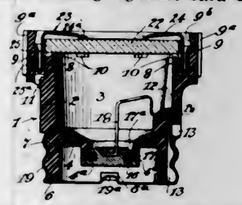
2,103,714
METAL TOP FOR DRY CELLS
Price Drummond, Rocky River, Ohio, assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York
Application November 30, 1932, Serial No. 645,007
4 Claims. (Cl. 136—133)



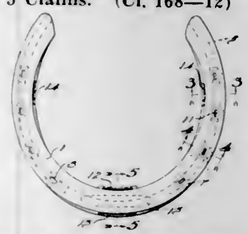
1. In a dry cell; an inner electrode; an outer container electrode having an inwardly and downwardly open recess in the upper end thereof; a unitary conductive metal closure having a mid-portion permanently in electrical contact with an end of said inner electrode and having an upwardly turned flanged outer margin thereof secured in said recess but spaced from said container electrode, the said mid-portion of the closure being above the plane of the outer margin, and a di-electric member in the recess for insulating the said container electrode from said closure.

2,103,715
SHIP CONSTRUCTION
Hugo P. Frear, New York, N. Y., assignor to Bethlehem Shipbuilding Corporation, Ltd., a corporation of Delaware
Original application July 19, 1934, Serial No. 735,923. Divided and this application January 15, 1936, Serial No. 59,211
2 Claims. (Cl. 114—79)

1. In a vessel of quasi longitudinal construction, transverse bulkheads, fore-and-aft walls, water-tight means attaching the peripheral edges of said bulkheads to said walls, longitudinal stiffeners comprising inner and outer flanges cut through by said bulkheads in such a manner that the cut ends are in proximity to but in spaced relation to said bulkheads on each side thereof, said outer flanges being attached to their adjacent one of said walls and at said cut ends being welded to their adjacent one of said means, and round tie rods piercing said bulkheads and welded water-tight and completely around its periphery to said bulkheads and welded to said inner flanges of adjacent cut ends of said stiffeners.



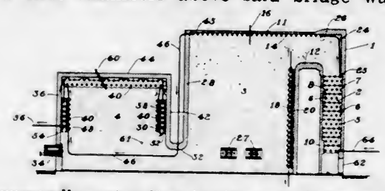
2,103,716
RAIL TREATMENT METHOD
Royal E. Frickey, San Francisco, Calif., assignor to Welding Service, Inc., San Francisco, Calif., a corporation of California
Application July 27, 1936, Serial No. 92,715
4 Claims. (Cl. 148—10)



4. In a method of heating steel rail ends preparatory to hardening the same by chilling, placing an upper layer of the rail ball, at one end of the rail, in a magnetic flux path, the path extending laterally across the rail between the upper parallel side edges of the rail ball, causing an alternating magnetic flux to thread said path to heat said layer to a temperature corresponding to the critical temperature of the rail metal, the major part of the flux entering and leaving said rail along narrow zones substantially coincident with said side edges, and thereafter continuing to subject the rail ball to said magnetic flux without a material shift in said zones, to heat the upper layer to a temperature materially substantially above said critical temperature.

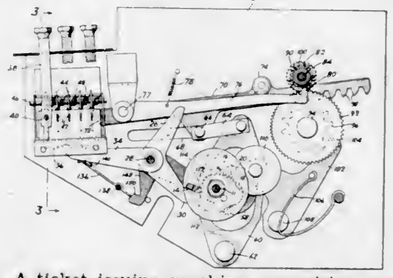
2,103,717
PLUG FUSE
Ernst A. G. Ganoe, Rochester, Pa., assignor to National Electric Products Corporation, Pittsburgh, Pa., a corporation of Delaware
Application July 6, 1935, Serial No. 30,097
10 Claims. (Cl. 200—130)

1. A plug fuse comprising: a one-piece, cup-shaped body of molded insulating material, the body having an annular hand grip adjacent to its upper end and exterior threads adjacent to its lower end, and having within the cavity of the cup formation annularly located closure supporting means; a threaded contact thimble screwed onto the threaded portion of the body; a closure disc entering the cavity of the cup formation and resting against said closure supporting means; and closure retaining means removed from the hand grip portion of the body and located wholly within the space encircled by the hand grip, the closure retaining means being an annular sheet metal member that makes spring contact with the top of the closure disc, and also encircles the closure disc and depends below it to prevent the fuse gases from escaping to the top of the fuse.



2,103,718
HORSESHOE
Joseph A. Goodwin, Lexington, Ky.
Application March 1, 1937, Serial No. 128,364
5 Claims. (Cl. 168—12)

1. A horseshoe comprising a hoof contacting metal plate having nail holes for attachment to a horse's hoof, a ground contacting metal plate having openings opposite said nail holes and of larger size than the head of a horseshoe nail whereby the heads of the horseshoe nails will seat against the hoof contacting plate without engaging said ground contacting plate, and means permanently connecting said plates in superimposed relation for relative movement laterally as well as perpendicularly of the plates, said means constituting in its entirety a rubber layer between and bonded to said plates.



2,103,719
METHOD OF AND APPARATUS FOR HEATING OIL
Audley E. Harnsberger, Winnetka, Ill., assignor to The Pure Oil Company, Chicago, Ill., a corporation of Ohio
Application December 7, 1934, Serial No. 756,385
3 Claims. (Cl. 196—47)

1. An oil heater comprising three chambers, a bank of tubes in one chamber disposed in the direct path of combustion gases, a bank of tubes disposed adjacent the roof of an intermediate chamber, and a plurality of rows of tubes disposed adjacent the roof and side walls of the third chamber, means for passing oil from said first mentioned bank of tubes to said second mentioned bank, means for passing oil from said second mentioned bank to said rows of tubes, an upwardly extending bridge wall between said first and intermediate chambers, a passageway for combustion gases from said intermediate to said first chambers above said bridge wall, a

downwardly extending bridge wall between said intermediate and said third chambers, a passageway for combustion gases below said last mentioned bridge wall, heating means located in said third chamber, separate heating means in said intermediate chamber, said heating means in said chambers being so disposed as to impart mainly radiant heat to the tubes in said third and said intermediate chambers.

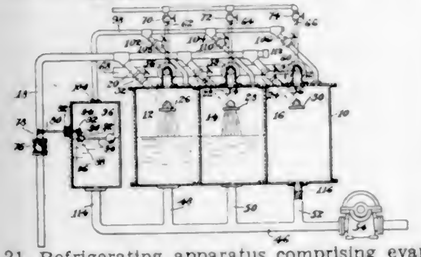
2,103,720
TICKET ISSUING MACHINE
Reuben H. Helsel, Long Island City, N. Y., assignor to General Register Corporation, New York, N. Y., a corporation of Pennsylvania
Application January 13, 1937, Serial No. 120,348
10 Claims. (Cl. 271—2.4)

1. A ticket issuing machine comprising means for feeding and guiding a ticket strip, and means for actuating the feeding means to issue different numbers of tickets in single cycles of operation, said last means including a member having an invariable stroke in each cycle of operation and means including a plurality of selective keys for causing said member to effect actuation of the feeding means during varying portions of said invariable stroke to thereby effect issuance of different numbers of tickets.

2,103,721
CIGARETTE MACHINE
Paul Johannes Herrmann, Dresden, Germany, assignor to "Universelle" Cigarettenmaschinenfabrik J. C. Mueller & Co., Dresden, Germany
Application July 16, 1936, Serial No. 90,873
In Germany March 6, 1936
4 Claims. (Cl. 131—43)

1. In combination with a cigarette machine, a shaping means comprising an elongated member

having a longitudinally extending groove opening through the under surface thereof, said groove being substantially semi-circular in transverse section, and said member having a plurality of narrow grooves within said first groove.



2,103,722

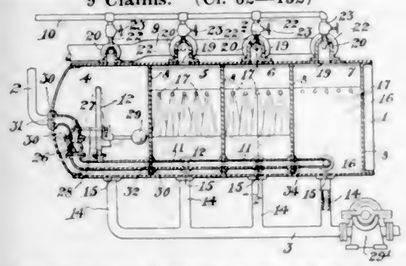
REFRIGERATING APPARATUS AND METHOD

Frederick H. Hibberd, Bayside, N. Y., assignor to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey

Application March 23, 1934, Serial No. 716,945

23 Claims. (Cl. 62—152)

21. Refrigerating apparatus comprising evaporating chambers for a liquid refrigerating medium which is to be cooled therein, means comprising individual vacuum producing devices having a common discharge header for controlling evaporation in said chambers, a common delivery conduit and riser pipes connecting said conduit to the lower portion of each of said chambers arranged to provide a hydrostatic seal for the several chambers.



2,103,723

REFRIGERATING CONSTRUCTION

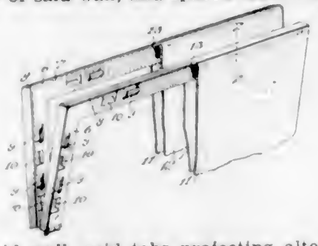
Frederick H. Hibberd, Bayside, N. Y., assignor to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey

Application March 23, 1934, Serial No. 716,947

9 Claims. (Cl. 62—152)

9. Refrigerating apparatus comprising an evaporator having a plurality of chambers, evacuating means for each chamber to reduce the pressure therein and to remove vapor therefrom, means to remove refrigerant from the chamber, and means including a well in each chamber to control the admission of refrigerant to the chamber in accordance with the pressure maintained therein, without interference with the admission of refrigerant to any other chamber.

2,103,724



HANDBAG FRAME

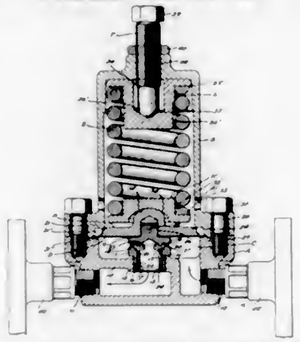
William C. Hiering, Newark, N. J., assignor to The J. E. Mergott Company, Newark, N. J., a corporation of Delaware

Application July 15, 1936, Serial No. 90,665

4 Claims. (Cl. 150—29)

1. A bag frame member having a side wall with its upper edge bent at right angles thereto to provide a flange, said flange being bent back upon itself to provide a flange projecting to the opposite side of said wall, and spaced tabs struck out

from said wall, said tabs projecting alternately in opposite directions and opening towards said flange.



2,103,725

VALVE

Wilgot J. Jacobsson, Buffalo, N. Y., assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York

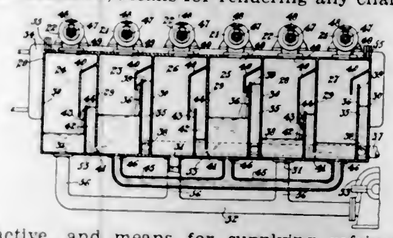
Application November 30, 1932, Serial No. 644,927

2 Claims. (Cl. 137—53)

1. In a valve, the combination of a nozzle having a tubular bore and a seat adjacent one end of said bore; a pressure-responsive diaphragm; a valve element secured to one side of said diaphragm, said element having a seating face cooperating with such nozzle seat and also having a tubular stem slidable axially in said bore, said stem having one or more ports adjacent the end thereof near such cooperating seating face and nozzle seat, said stem also having an exterior circumferential groove therein adjacent the other end of the stem; resilient means seated in said groove and bearing against the surface of said bore to dampen the movements of said valve element relatively to said nozzle; a spring; and a pair of members for transmitting the pressure of said spring to the other side of said diaphragm axially in line with said element and said nozzle, said members having cooperating curved surfaces of unequal curvature and one of said members being secured against said other side of the diaphragm.

2,103,726

REFRIGERATING APPARATUS



Alfred D. Karr, Newark, N. J., assignor to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey

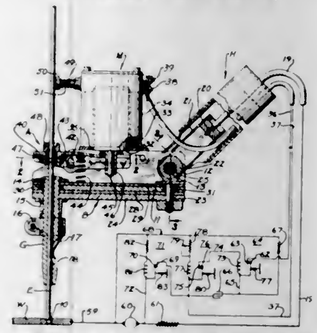
Application July 3, 1937, Serial No. 151,796

11 Claims. (Cl. 62—152)

1. In refrigerating apparatus, an evaporator comprising primary chambers and secondary

chambers in constant communication with the primary chambers, means to admit refrigerant to the chambers, means for rendering any chamber

inactive, and means for supplying refrigerant from an active primary chamber to any inactive primary chamber.



2,103,727

ELECTRIC WELDING

Harry E. Kennedy, Maynard A. Rotermund, and Lloyd T. Jones, Berkeley, Calif., assignors, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York

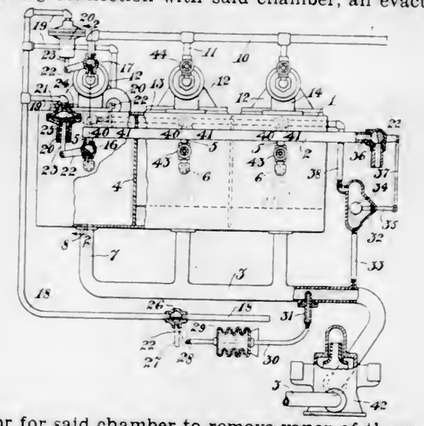
Application November 9, 1934, Serial No. 752,244

28 Claims. (Cl. 219—8)

18. In welding apparatus, the combination of a welding circuit including the work and a movable electrode, means for feeding the electrode to the work comprising an electrical translating device having a control circuit associated therewith, means for intermittently storing energy in said control circuit and effecting the discharge of said energy to actuate said translating device when the fusing end of the electrode is at or more than a predetermined distance from the work, and means responsive to an electrical condition of said welding circuit for rendering said last-mentioned means inoperative when the fusing end of the electrode is less than the predetermined distance from the work.

28. A feeder for electric welding electrodes comprising an apertured member adapted to have an electrode passed therethrough; and means for reciprocating said apertured member in a direction parallel to the axis of said electrode; said means also bodily oscillating said apertured member about an axis perpendicular to said first axis, said apertured member being immovable with respect to said means.

2,103,728



REFRIGERATING SYSTEM

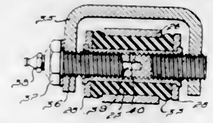
John Kirgan, Easton, Pa., assignor to Ingersoll-Rand Company, Jersey City, N. J., a corporation of New Jersey

Application July 26, 1934, Serial No. 736,994

12 Claims. (Cl. 62—152)

1. In a refrigerating system an evaporator having a chamber to which a liquid refrigerant is supplied to be cooled, means for regulating the refrigerant supplied comprising a float container having connection with said chamber, an evacu-

ator for said chamber to remove vapor of the refrigerant therefrom, and means for interrupting communication between said container and said chamber and rendering the evacuator inoperative under predetermined working conditions.



2,103,729

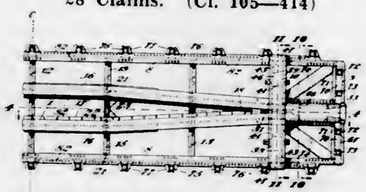
SPRING OR SHACKLE MOUNTING

John W. Leighton, Port Huron, Mich.

Application May 18, 1935, Serial No. 22,229

4 Claims. (Cl. 287—85)

4. A joint comprising an elongated member, resilient means around the member, means on one end of the member engaging the resilient means, an outwardly directed projection on the other end of the member, and a collar having an opening adapting it to pass over the latter end of the member, said collar having a shouldered recess in its outer side for receiving the projection and for locking the collar against turning and rendering it necessary to move the collar inwardly and to compress the resilient means before the collar can be turned to a position where it can be removed axially over the projection.



2,103,730

WELDED CAR UNDERFRAME

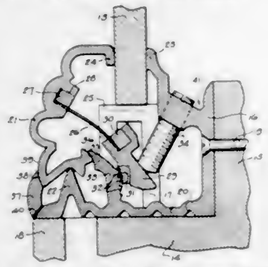
Roy A. Lewis, Bethlehem, and Charles Schenck, Coopersburg, Pa., assignors to Bethlehem Steel Company, a corporation of Pennsylvania

Application December 29, 1934, Serial No. 759,704

28 Claims. (Cl. 105—414)

1. A car underframe, a center sill comprising a pair of rolled flanged sections, side sills in-

tegrally connected to the center sill by means of end sills, body bolsters and cross-ties, a socket formed in the lower surface of the center sill at the center of each body bolster, and a center plate seated in each socket and welded to the pair of rolled flanged sections forming the center sill.



2,103,731

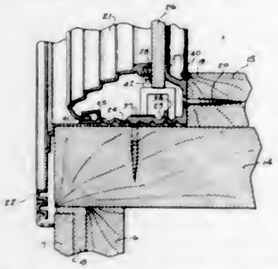
SASH AND STORE FRONT CONSTRUCTION

Clyde D. Lowry, Toledo, Ohio, assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio

Application May 8, 1937, Serial No. 141,481

15 Claims. (Cl. 20—56.4)

1. In a sash or store front construction, the combination of a fixed section and a movable section adapted to receive and grip a pane of glass therebetween, spring means carried by the movable section, a rigid member carried by the spring means, an adjusting member for acting upon the said rigid member to urge the sections into yielding engagement with the pane of glass, and means for limiting the movement of the said rigid member to prevent excessive pressure from being applied by the sections to the pane of glass.



2,103,732

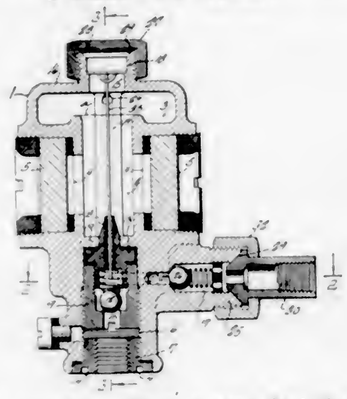
SASH AND STORE FRONT CONSTRUCTION

Clyde D. Lowry, Toledo, Ohio, assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio

Application May 8, 1937, Serial No. 141,482

12 Claims. (Cl. 20—56.4)

1. In a sash or store front construction, the combination of a fixed section and a movable section adapted to receive and grip a pane of glass therebetween, spring means carried by the movable section, a toothed end carried thereby, toothed means associated with the fixed section adapted to receive the toothed end of the spring means, and means for rocking the toothed end on the spring means when in engagement with the toothed portion of the rigid member to urge the sections into yielding engagement with the pane of glass.



2,103,733

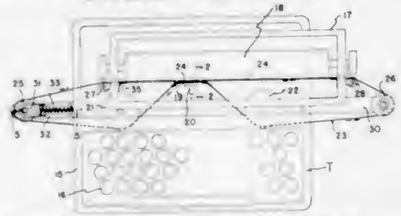
SIGHT FEED DEVICE

William James Powers, Detroit, Mich., assignor to McCord Radiator & Mfg. Co., Detroit, Mich., a corporation of Maine

Application October 27, 1933, Serial No. 695,425

1 Claim. (Cl. 184—96)

In a lubricator device, a sight feed chamber having a bore in a wall thereof, a passage communicating with said bore and having a diameter greater than that of said bore whereby to form a shoulder, a unitary feed nozzle and check valve assembly comprising a valve seat member having a threaded exterior for insertion in said passage, an aperture extending axially through said member, a shoulder in said aperture forming a valve seat, a feed nozzle fixed in said aperture and having an axial passageway therein, a check valve seated on said second shoulder, a spring cooperating with said valve to maintain it in closed position, said feed nozzle having a shoulder thereon cooperating with said first named shoulder, and a projecting tip, said tip extending through said bore into said chamber and said shoulder forming a seal against said first named shoulder between said chamber and said passage.



2,103,734

TYPEWRITER

William H. Schmidt, Wauwatosa, Wis.

Application March 9, 1936, Serial No. 67,945

4 Claims. (Cl. 197—153)

4. The combination with a typewriter including a frame, a reciprocating carriage on said frame, a platen roller rotatably mounted upon the carriage, spaced ribbon guides on said carriage, and feed and take-up spools on the frame, of means for making an original and a duplicate copy on the typewriter including, an endless ribbon, guide rollers for the ends of the endless ribbon carried by and extending beyond the sides of the frame, a longitudinally extending ribbon guide mounted upon said carriage in front of the platen roller and in rear of the first mentioned ribbon guides, guide rollers on said carriage disposed between the ribbon guides on the carriage and the guide rollers on the frame, the ribbon including front and rear stretches, the front stretch being threaded through the first mentioned guides and over the feed and take-up spools, the rear stretch being trained through the longitudinally extending guide on the carriage and over the guide rollers on the carriage.

2,103,735

METHOD OF ISOLATING THE FOLLICLE HORMONE FROM THE URINE OF PREGNANT INDIVIDUALS

Walter Schoeller, Berlin-Westend, Germany, Erwin Schwenk, New York, N. Y., and Friedrich Hildebrandt, Hohen Neuendorf, near Berlin, Germany, assignors to Schering-Kahlbaum A. G., Berlin, Germany

No Drawing. Application January 30, 1934, Serial No. 708,966. In Germany January 31, 1933

10 Claims. (Cl. 260—131)

1. A method of isolating follicle hormones from crude solutions containing small amounts of follicle hormones together with a relatively large amount of other substances of diverse character which normally accompany the hormones in such crude solutions, said solutions not having been treated by chemical means to obtain more concentrated solutions of said hormones or to isolate the same in more or less purified state, which comprises subjecting said starting material to the action of a reagent for ketonic compounds which is capable of forming condensation products with said hormones, and separating the reaction product.

2,103,736

ALKYL DERIVATIVES OF PHENOLS AND A METHOD OF PRODUCING THE SAME

Siegfried Skraup, Wurzburg, Germany, assignor to Schering-Kahlbaum A. G., Berlin, Germany, a corporation of Germany

No Drawing. Original application July 15, 1936, Serial No. 90,723. Divided and this application March 9, 1937, Serial No. 129,811. In Germany June 13, 1933

13 Claims. (Cl. 260—154)

1. A method for the production of alkyl substitution products of phenols, comprising condensing an alcohol with a phenol in the presence of a heteropolyacid.

3. A method according to claim 1, wherein 1 to 10% of heteropolyacid calculated on the weight of the reaction components are used as condensing agent.

2,103,737

MEANS FOR ATTACHING SKATES TO SHOES

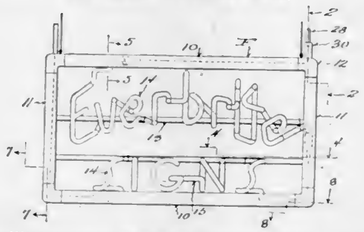
Frank Georg Tappé, Oslo, Norway

Application January 10, 1935, Serial No. 1,082

In Sweden October 5, 1934

6 Claims. (Cl. 280—11.31)

1. In a skate having a footplate rigidly connected thereto and toe clamps, the combination of springy lugs adapted to engage the heel of the shoe and mounted for swinging movement about an axis through the plane of the foot plate near to and rearwardly of the midportion of said footplate and spring means to draw said lugs resiliently towards said skate.



2,103,738

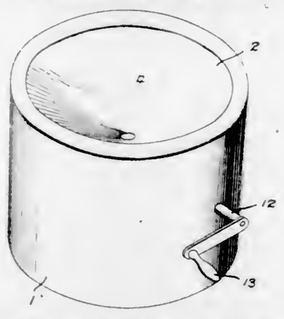
ILLUMINATED SIGN

Charles J. Wamser, Milwaukee, Wis.

Application October 2, 1936, Serial No. 103,650

1 Claim. (Cl. 40—130)

An illuminated skeleton display sign comprising, a tubular frame consisting of stretches split longitudinally to provide access to the interior of the frame, means for securing the sections together, brackets connecting the ends of said stretches, a support carried by said frame, and a gas tube attached to said support and having its electrodes and connections housed within said frame.



2,103,739

TALKING DEVICE

Howard J. Whelan, Baltimore, and Louis T. Clark, Ellicott City, Md.

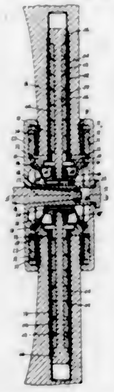
Application November 4, 1932, Serial No. 641,294

1 Claim. (Cl. 274—1)

In a manually operated phonograph, the combination of a box of hollow cylindrical form having an opening in one end thereof, a diaphragm disposed in the said opening, a stylus attached to said diaphragm, a shaft extending diametrically through said cylindrical box, a handle for turning said shaft, a record mounted on the shaft within the box, said record being engaged by said stylus to reproduce sound.

2,103,740

AIR SCREW BLADE PITCH CONTROLLING MECHANISM



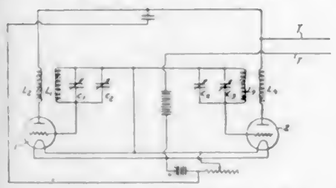
Grettir Algarsson, Montreal, Quebec, Canada, assignor to Hartland de Montarville Molson, Montreal, Quebec, Canada

Application April 23, 1936, Serial No. 75,961

14 Claims. (Cl. 170—162)

1. In an airscrew, a hub casing, blades having an axial bore rotatively mounted in said hub cas-

ing, a blade pitch controlling mechanism comprising rods sliding in the bore of said blades, a series of weights slidable on said rods, means for progressively intercepting said weights to vary the total effective centrifugal mass of the weights



and rods, and means to convert the movement of said weights and rods under certifugal force into rotary movement of the airscrew blades about their axes in equilibrating relation with the aerodynamic forces acting on the blades.

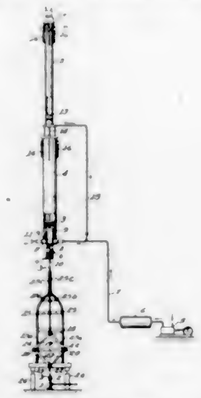
2,103,741

FLOWMETER

Isaac Bencowitz, New York, N. Y., assignor to Texas Gulf Sulphur Company, a corporation of Texas

Application March 12, 1932, Serial No. 598,529
2 Claims. (Cl. 73—205)

1. Apparatus for measuring the flow of fluid through a conduit which comprises two variable capacity electrical condensers, means for placing each condenser in operative engagement responsive to variations in pressures at spaced points in the conduit, means for operatively connecting each condenser with a separate oscillating electrical circuit, and means for combining the electrical effects of the separate circuits to indicate a measure of the fluid flow.



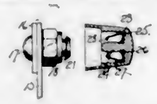
2,103,742

MOTOR APPARATUS FOR PUMPING AND OTHER PURPOSES

Richard H. Carr, Chicago, Ill., assignor to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

Application June 30, 1932, Serial No. 620,178
10 Claims. (Cl. 121—118)

1. Motor apparatus comprising a cylinder, a piston slidably mounted in said cylinder, said piston having a gravity load suspended therefrom, means for admitting an elastic working fluid under pressure into said cylinder to effect the elevation of said piston and its suspended load, and compensating means between said piston and the suspended load, said compensating means serving to effect substantially uniform linear travel of the piston and its load in the lower part of the up stroke of said piston and increased linear travel of said piston with respect to the suspended load during the upper portion of the up stroke of said piston.



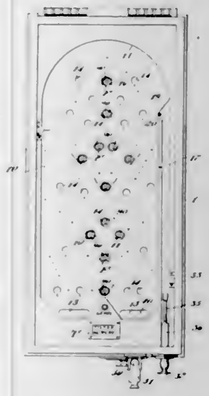
2,103,743

SEALED FASTENING DEVICE

Arthur A. Doty, East Hartford, Conn., assignor of one-third to Raymond S. Holcomb, East Hartford, Conn., and one-third to Howard L. Bitter, West Hartford, Conn.

Application April 30, 1935, Serial No. 19,035
6 Claims. (Cl. 292—327)

1. A sealed fastening device including two holding members engaged one with the other, a sealing cap of frangible material to cover and enclose one of said members, an interengaging stud and hole on one of said members and cap to tightly hold said cap to prevent rattling thereof and means within said cap to permanently retain said cap in place, said means comprising a spider having a hole to receive said stud, jaws to engage said stud to hold the spider in place, and retaining fingers to engage one of said holding members to permanently secure the cap in place.



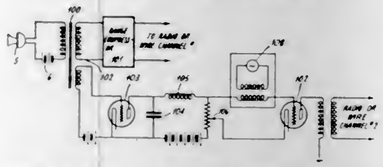
2,103,744

MACHINE FOR GAME PLAYING

Clifford R. Dumble, Arlington, Mass., assignor, by mesne assignments, to Joseph L. Zelaskow, New York, N. Y.

Application June 14, 1933, Serial No. 675,719
36 Claims. (Cl. 273—121)

8. A machine of the class described comprising a trigger switch adapted to be actuated under certain conditions of play, a playing disk-returning mechanism, including an electrically actuable mechanism, in circuit with said switch, a main switch in said circuit, means operable in response to energization of the electrically actuable mechanism to emit a set of playing disks, means operable thereafter to open said main switch and prevent further operation of the electrically actuable mechanism, and means to receive a playing disk and then to close the main



switch to permit repeated play and repeated operation of the disk-returning mechanism after another playing disk has been inserted in said last-named means.

2,103,745

TRANSMISSION AND RECEPTION OF INTELLIGENCE

Samuel G. Frantz and Brunson S. McCutchen, Princeton, N. J., assignors to Radio Corporation of America, a corporation of Delaware

Application April 23, 1935, Serial No. 17,775
6 Claims. (Cl. 250—6)

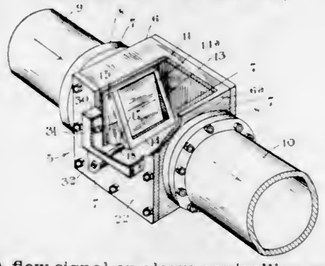
1. The steps in a method of communicating signals of variable intensity which comprise, compressing the intensity range of the original signals, transmitting the compressed intensity range signals by modulating a carrier wave by the compressed intensity range signals, generating an auxiliary frequency which is low relative to the frequency of the compressed signals, modulating a carrier wave by said auxiliary frequency and controlling the degree of modulation thereof by the average intensity of the original uncompressed signals.

2,103,746

LIGHT WEIGHT CONSTRUCTION COMPOSITION

Henry Guth, Cleveland, Ohio, assignor of one-twelfth to Hugo A. Maerlender, Cleveland, Ohio

No Drawing. Application November 18, 1935, Serial No. 50,404
5 Claims. (Cl. 106—10)



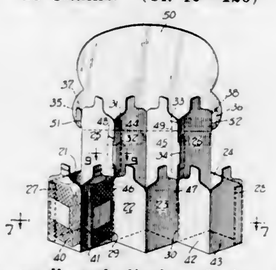
1. A lightweight construction composition comprising an ordinary clay, a yeast-like clay, fireclay, silicate of soda, sulphur and water and heated to from 650 degrees F. to 2100 degrees F.

2,103,747

FLOW CONTROLLED SWITCH

William R. Hamilton and Robert W. Hamilton, Montreal, Quebec, Canada, assignors to Dominion Electric Protection Company, Montreal, Quebec, Canada

Application February 26, 1936, Serial No. 65,760
5 Claims. (Cl. 200—81)



1. A flow signal or alarm controlling means for sprinkler systems and the like comprising a conduit, a magnet, a circuit controller, and means whereby the relative positioning of the magnet and circuit controller is automatically varied in accordance with hydraulic conditions prevailing in the conduit to control operation of the signal or alarm, the normal relative positioning of the magnet and circuit controller being such that the latter is prevented by the attraction of the magnet from effecting operation of the signal.

2,103,748

CARDBOARD DISPLAY DEVICE

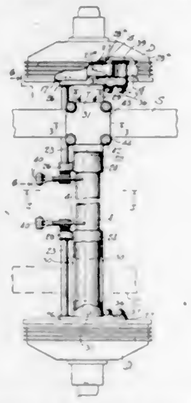
John V. Horr, Hastings on Hudson, N. Y., assignor to Einson-Freeman Co., Inc., Long Island City, N. Y., a corporation of Delaware

Application August 10, 1937, Serial No. 158,318
13 Claims. (Cl. 40—126)

1. In a cardboard display device, a pair of zigzag blanks in lazy-tongs interengagement, each blank having portions of lesser height and other portions of greater height, the low portions conjointly defining a continuous bottom tier of display panels arranged side by side in zigzag relation, the high portions conjointly defining a continuous upper tier of display panels arranged side by side in zigzag relation.

2,103,749

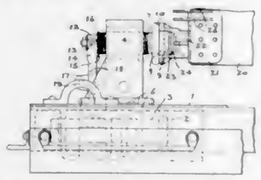
ACCELERATOR OF VULCANIZATION



William P. ter Horst, Silver Lake, Ohio, assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey

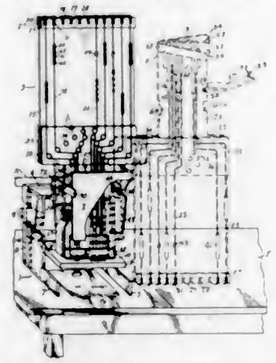
No Drawing. Application September 28, 1933, Serial No. 691,354. Renewed June 10, 1937. In Canada July 3, 1933
11 Claims. (Cl. 18—53A)

1. The process of accelerating the vulcanization of rubber which comprises vulcanizing in



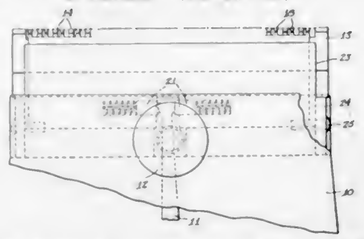
the presence of an organic sulphur-containing accelerator and diphenylguanidine neutral maleate.

2,103,750
BRAKE AND ANCHORING MEANS THEREFOR
Lloyd D. Kay, Alhambra, Calif., assignor to Kay Brunner Steel Products, Inc., a corporation
Application February 10, 1936, Serial No. 63,174
13 Claims. (Cl. 188—205)



1. In combination; a vehicle axle; a sleeve surrounding said axle and having means to permit constriction thereof to embrace the axle; a member fixed on the sleeve; a plate adapted to be superposed on a spring seated on said member; and U-bolts embracing the sleeve and adjustable in said plate for constricting the sleeve to clamp said axle.

2,103,751
MEANS FOR LOCKING GOODS CONTAINERS ON TRANSPORTATION VEHICLES
William P. Kellett, New York, N. Y.
Application February 28, 1935, Serial No. 8,685
8 Claims. (Cl. 105—366)

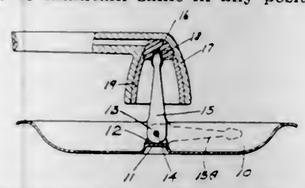


1. In a transportation vehicle having a goods container movably mounted thereon, the combination with jacks pivotally mounted on said vehicle to be lowered out of the path of movement of the container or raised to an obstructing position, of socket members carried by said containers having tapered sockets, a jack screw mounted on each of said jacks and having a tapered end to enter in locking engagement with the socket members on said containers irrespective of slight variations encountered in the heights and disposition of the sockets of different containers, and contact means engageable after entry of the tapered ends of the jack screws into said tapered sockets a predetermined distance to prevent further entry and thereby relieve said sockets of excessive wedging thrusts.

2,103,752
TAG PRINTING DEVICE
Herman I. Lippard, Lansdowne, Pa.
Application August 29, 1933, Serial No. 687,258
9 Claims. (Cl. 101—93)

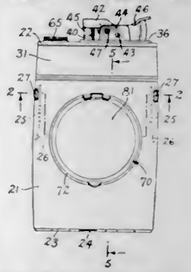
1. In a tag printing device, the combination of a base, a housing mounted on said base for reciprocation to and away from the printing surface, a type-carrying plate of flat form pivotally mounted on the housing so that it may be swung in and out of the housing and having one end parallel to the printing surface, a line of changeable type carried by said end of the plate and means to reciprocate the housing to bring said line of type into contact with the printing surface.

2,103,753
SHAVING IMPLEMENT
Joseph Muros, Cambridge, Mass., assignor to Gillette Safety Razor Company, Boston, Mass., a corporation of Delaware
Application April 29, 1936, Serial No. 76,999
4 Claims. (Cl. 30—42)



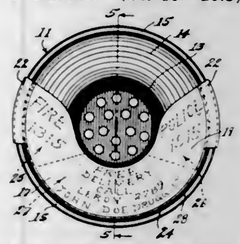
1. A shaving implement having relatively movable tooth-carrying members each equipped with a series of spaced teeth having their upper faces ground in a common plane, having rounded hair-directing ends and being shaped also to lift hairs into upright position as they enter the space between adjacent teeth.

2,103,754
ASHTRAY
Austin W. Pearce, Memphis, Tenn.
Application February 24, 1936, Serial No. 65,183
2 Claims. (Cl. 131—51)



1. The combination with an ash tray having a pair of lugs positioned inwardly from the periphery thereof, and extending rigidly upward from the base thereof, and a substantially flat blade pivotally secured between said lugs, said blade being adapted to be manually swung from

a substantially horizontal position on one side of said pivot to the similar oppositely disposed position, said lugs frictionally engaging the sides of said blade to maintain same in any position to

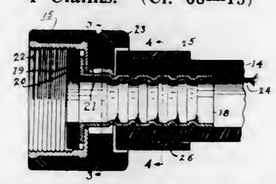


which said blade may be so swung, said tray being of such dimensions relative to the length of said blade, and said lugs being so positioned relatively to the edges of said tray that in no position shall said blade extend beyond said tray.

2,103,755
COMBINED VANITY CASE, CIGARETTE CASE, AND LIGHTER
Alfred F. Reilly, North Attleboro, Mass., assignor to Evans Case Company, a corporation of Massachusetts
Application January 22, 1934, Serial No. 707,694
5 Claims. (Cl. 206—41.4)

1. In an article of the class described, in combination, a container having an enclosure in the upper portion thereof, a cover plate hingedly connected to one edge of said container and extending therefrom to said enclosure, said cover plate having an aperture therein, a lighter mounted on one of the walls of said enclosure, and a receptacle mounted in said aperture in said cover plate and having a wall which forms a wall portion of the container when the cover plate is in closed position.

2,103,756
ADVERTISING DEVICE
Clarence Rinehimer, Chicago, Ill.
Application August 6, 1936, Serial No. 94,522
3 Claims. (Cl. 40—10.5)

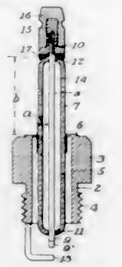


2. A telephone mouthpiece of the flared tubular type, in combination with an advertising device comprising a segmental web portion conforming substantially to the shape of the inner surface of said mouthpiece and extending more than 180° around the same, and a pair of resilient arms adjacent the ends of said web and engaging over the edge of said mouthpiece, said arms having portions extending on each side of a median passing through the longitudinal axis of the mouthpiece and detachably securing the web in position.

2,103,757
GATHERING OF SALT
John B. Semple, Sewickley, Pa.
No Drawing. Application June 29, 1937, Serial No. 150,959
1 Claim. (Cl. 23—41)

The method herein described of gathering crystalline material free of dross from a native bed of evaporation and incrustation, supplied from beneath with a continuous solution of the material to be collected which consists in spreading upon and in contact with the surface of the bed a mat of water-penetrable material, allowing the heat of the sun to evaporate the solution, with the consequent effect of bringing about upon the surface of the mat an incrustation that is separated from the native bed by the intervening substance of the mat, and removing the incrustation from the surface of the mat.

2,103,758
GROUND CONNECTION FOR ELECTRICAL APPLIANCES
Arthur W. Seyfried, Cleveland, Ohio, assignor to The Apex Electrical Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application August 8, 1933, Serial No. 684,191
4 Claims. (Cl. 68—15)



4. A portable electrically operated laundry machine comprising a tub having a working opening in the top thereof, an ambulant supporting structure for the tub having electrically non-conducting floor-engaging wheels, a hollow metal fixture for liquid fixedly carried at the top of the tub and in electrical contact with the structure of the machine, said fixture having a nozzle adapted to discharge into the upper portion of the tub, a liquid supply hose connected at one end to said fixture, a fitting at the other end of said hose for detachably connecting the same to a water supply line, and electrically conducting means carried by the hose having electrical contact with said fixture and fitting whereby the machine is electrically grounded to the water supply line when the hose is connected thereto, the exterior of said fitting being of substantial size and formed from an electrically insulating material whereby its manual manipulation may be readily effected without danger to the operator.

2,103,759
SPARK PLUG AND METHOD OF MAKING THE SAME
Semon H. Stupakoff, Pittsburgh, Pa., assignor to The Spark King Corporation, New York, N. Y., a corporation of Delaware
Application August 30, 1937, Serial No. 161,618
26 Claims. (Cl. 123—169)

1. A spark plug comprising a metal supporting body, a transparent insulator, an electrode pass-

ing through the insulator and sealed thereto, and a metal member permanently fused to the metal

body and fused to the insulator for securing the insulator to the body and forming a gas-tight seal.

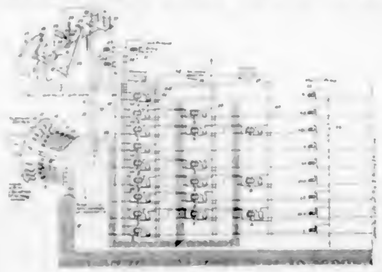
2,103,760

TUBE CLEANER

John R. Turner, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

Application April 15, 1935, Serial No. 16,292
3 Claims. (Cl. 15—104.14)

1. A rotary tube cleaner comprising, in combination, a central shaft, means for attaching one end of said shaft to a rotary motivating means, a cap attached to the opposite end of said shaft, transverse stationary pins extending through the sides of said cap and held in place by said shaft, weighted arms pivotally attached to said cap by means of said pins and extending generally parallel to the shaft, and cutters attached to one end of each of said weighted arms.



2,103,761

SELECTING SYSTEM

Evan R. Wheeler, North Plainfield, and Emerson J. Sortore, Metuchen, N. J., assignors to The Western Union Telegraph Company, New York, N. Y., a corporation of New York

Application January 20, 1930, Serial No. 422,150
13 Claims. (Cl. 177—353)

9. In a selecting system, a plurality of groups of selecting relays, a selector variably operable in accordance with received characters for selectively operating said relays, switching means operable at each actuation of said selector for associating said selector with a succeeding group of said selecting relays, a plurality of groups of electromagnets corresponding respectively to the groups of selecting relays, means for conditioning for operation an electromagnet in the first group in accordance with the selecting relay operated in the first group, and means for conditioning for operation an electromagnet in each succeeding group in accordance with the select-

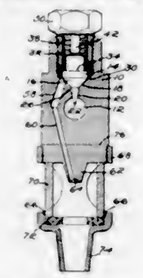
ing relay operated in the corresponding group and the selecting relay operated in each group preceding the said corresponding group.

2,103,762

PROCESS FOR REFINING METALS

Jesse O. Betterton, Metuchen, N. J., and Charles N. Waterman, Monterrey, Mexico, assignors to American Smelting and Refining Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application July 3, 1934, Serial No. 733,624
4 Claims. (Cl. 75—76)



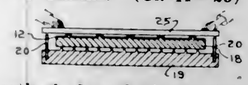
1. The process of treating copper alloys containing zinc, lead and tin which comprises forming a bath of the alloys, and halogenizing the resulting bath until a partial elimination of the tin and substantially complete elimination of zinc and lead is effected thereby leaving a refined copper-tin alloy in marketable condition as a residue.

2,103,763

FLUID PRESSURE RESPONSIVE FEEDER

Frederick C. Blanchard, Brookline, Mass.

Application January 11, 1935, Serial No. 1,360
20 Claims. (Cl. 184—7)



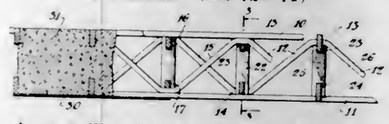
1. In a fluid pressure responsive feeder for a lubricating system in which the lubricant to be fed to one or more bearings is subjected to pulsating pressure, the combination of a valve seat, a valve which is normally seated on said seat and which is unseated and reseated in response to pressure pulsations, and a metering device having an orifice whose area increases toward said valve and through which orifice the lubricant flows to said valve to unseat the latter, said metering device including a metering element operated by said valve and cooperating with said orifice to increase the effective area of the latter to a predetermined amount when said valve is unseated.

2,103,764

METHOD OF MAKING LEVEL FACED MATRICES

Clarence E. Boutwell, Birmingham, Ala.

Application February 15, 1936, Serial No. 64,027
3 Claims. (Cl. 41—25)



2. The method of producing matrices for printing plates which comprises first forming a preliminary matrix by superposing a relatively thin metal foil sheet over a foundation of yieldable material capable of receiving and retaining an impression, forming an impression in the preliminary matrix by impressing a design into the metal foil, forming a wax cameo model from the preliminary matrix, stripping the foundation from the wax model leaving thereon a sheet of metal foil, mounting the wax model thus formed upon a grid comprising a multiplicity of sharp prominencies, leveling the cameo surfaces of the model by pressing downwardly thereon with a smooth level surfaced member, and casting a hard intaglio matrix from the wax model.

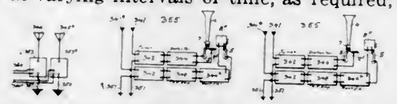
2,103,765

SLAB

Herbert H. Bunker, Jersey City, N. J.

Application June 26, 1936, Serial No. 87,445
4 Claims. (Cl. 72—71)

1. A metallic skeleton for a slab comprising longitudinally-extending truss beams and cross-bars, each truss beam having upper and lower chord members in the form of upper and lower bars and a bent bar in between the upper and lower bars with reverse loops at the ends of straight portions forming diagonal truss members, said bent bar being continuous for several loops and having the outside portions of the loops engaging the upper and lower bars, and vertical strut members each having an end abutting the inside of a loop in the bent bar and an end abutting the inside surface of the longitudinal chord member opposite the engaged loop so as to serve as a brace between the upper and lower chords of a truss beam, the alternate vertical strut members being arranged in inverted relation in reference to the intermediate vertical strut members so that all of the upper and lower loops of the bent bar are engaged by the vertical strut members.



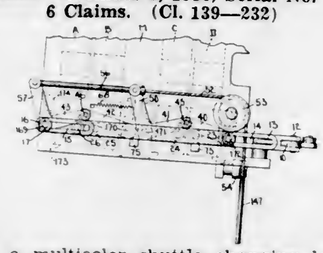
2,103,766

SYNCHRONIZED SOUND AND PICTURE CONTROL

Thaddeus Cahill, New York, N. Y.; Arthur T. Cahill, Eleanor Cahill, and George Frederick Cahill, executors of the estate of said Thaddeus Cahill, deceased

Application November 24, 1930, Serial No. 497,794
73 Claims. (Cl. 250—6)

1. The method of producing simultaneously on the premises of subscribers sounds and pictures relevant thereto, which consists in (*a*) producing pictures suitable to accompany the intended sounds; (*b*) duplicating these pictures in a suitable manner; (*c*) distributing the pictures so duplicated to the subscribers for use on their several premises respectively; (*d*) distributing from a central station electrical impulses by which words are carried that are to be heard on the premises of the subscribers; and (*e*) controlling electrically from the central station, the pictures aforesaid, changing them simultaneously on the premises of the subscribers from time to time and at varying intervals of time, as required, so



that said pictures show on the screen, in general, each for a period of time much greater than the time of visual persistence and, in some cases, for many times the time of visual persistence, and so that also the several pictures of a set are displayed on the premises of the subscribers at correct times with relation to the sounds broadcast from the central station and to which such pictures severally relate.

2,103,767

COLOR SELECTOR FOR SHUTTLE CHANGING LOOMS

Albert Cederlund, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application November 4, 1936, Serial No. 109,098
6 Claims. (Cl. 139—232)

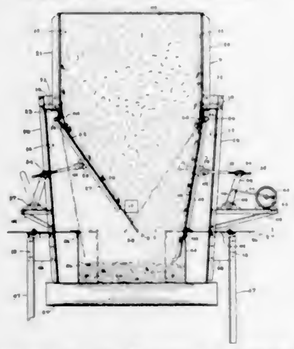
1. In a multicolor shuttle changing loom, a magazine having groups of distinctive reserve shuttles, a reserve shuttle releaser for each group, a reciprocable member, a rockable element secured to each releaser, a carrier arm secured to each rockable element, a plunger carried by each carrier arm, cam means on the reciprocable member to depress the plungers one at a time, and means operative when a shuttle changing operation of the loom is called to engage a depressed plunger and cause movement of the corresponding carrier arm and releaser.

2,103,768

ACID-PROOF SELF-HARDENING COMPOSITIONS

Karl Dietz, Frankfort-on-the-Main, and Karl Frank, Bad Soden in Taunus, Germany, assignors, by mesne assignments, to Pen-Chlor, Inc., Philadelphia, Pa., a corporation of Delaware

No Drawing. Application April 5, 1935, Serial No. 14,918. In Germany April 14, 1934
10 Claims. (Cl. 106—22)



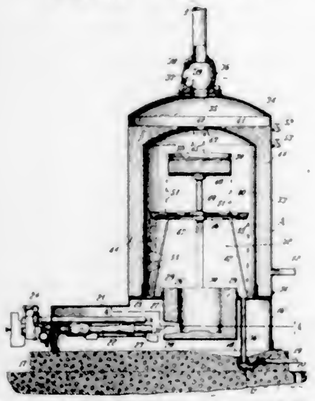
1. Acid-proof self-hardening compositions containing a liquid phenol-aldehyde resin capable of being hardened and a neutral ester of a mineral acid and an aromatic-aliphatic alcohol said ester being of a character and in an amount sufficient to render the composition self-hardening and stable against acids and alkalies.

2,103,769

METHOD OF AND MEANS FOR FORMING FELTED STRIPS

Daniel C. Drill, Wabash, Ind., assignor to American Rock Wool Corporation, Wabash County, Ind.

Application July 5, 1935, Serial No. 29,944
Renewed September 4, 1937
10 Claims. (Cl. 19—155)



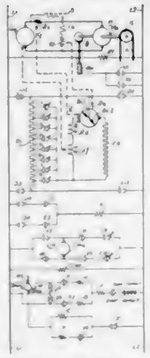
3. An apparatus for forming a layer of felted fibers comprising a chamber for receiving the fibers, a movable surface at the bottom of the chamber on which the fibers may be deposited, and a guide leaf hingedly connected with a side of the chamber and depending therefrom, and means for swinging the guide leaf back and forth over the movable surface whereby fibers which have settled on the guide leaf may be distributed over the movable surface.

2,103,770

METHOD AND APPARATUS FOR GENERATING HEATING MEDIUM

Clayton A. Dunham and Aubra R. Dunham, Glencoe, Ill., assignors to Experimental Laboratories Incorporated, Chicago, Ill., a corporation of Illinois

Application December 31, 1934, Serial No. 759,966
In Canada June 4, 1930
8 Claims. (Cl. 237—1)



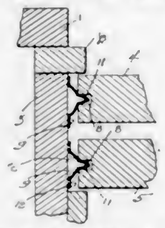
1. The method of supplying a mixed fluid heating medium consisting of products of combustion and steam, consisting in burning fuel within a closed combustion space substantially surrounded by a body of water, the water overflowing within the space in contact with the rising products of combustion, withdrawing the mixed heating medium from the closed space, and returning condensate from the withdrawn heating medium to the body of water.

2,103,771

CONTROL SYSTEM

William F. Eames, Pittsburgh, Pa., assignor to Westinghouse Electric Elevator Company, Chicago, Ill., a corporation of Illinois

Application October 30, 1935, Serial No. 47,465
10 Claims. (Cl. 172—239)



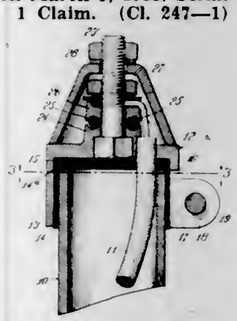
10. In a Ward-Leonard control system, in combination, a first dynamo-electric device operatively connected to a load, a second dynamo-electric device electrically connected to said first device, a field winding for said second device, a pair of direct current generators provided with series connected armatures connected to energize said field winding, each of said generators being provided with a shunt, series, and differential field winding, said shunt and series field windings being connected to be respectively responsive to the voltage across and the current flowing between said first and second devices, said differential field windings being connected in series circuit relation with said first mentioned field winding, and means for connecting said first mentioned field winding to a source of control current through a circuit connected between said armatures.

2,103,772

COMBINED WEATHER STRIP AND WINDOW GUIDE

Edmond J. Feiler, Madison, Wis.

Application February 29, 1936, Serial No. 66,480
2 Claims. (Cl. 20—69)



1. A combined window sash guide and weather strip comprising an elongated metal body having foot portions at its side edges for attachment to a window frame to hold the strip in place, a longitudinal medial rib formed on the body and having a relatively narrow top and sides flaring outwardly from the top toward the bottom of the strip, said rib adapted to be received in a groove of a window with the outwardly flaring side portions frictionally contacting the edges of the groove to seal the same and frictionally resist movement of the window, and similarly formed and shaped upwardly curved web portions between the foot portions and the medial rib and integral therewith and frictionally contacting the side edges of a window only at the point where the web portions meet the base of the medial rib and designed to contribute to maintainance of a tight closure and frictional support of the window.

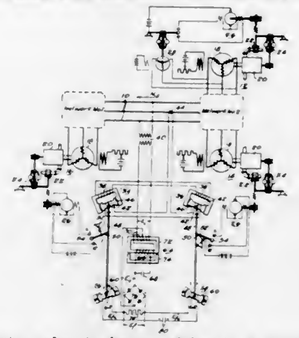
2,103,773

PARKWAY CABLE OUTLET TOP MEMBER

Otto S. Flath, Chicago, Ill.

Application March 9, 1935, Serial No. 10,166
1 Claim. (Cl. 247—1)

In a parkway cable outlet involving a tubular stand, a top member composed of a top plate portion coextensive with the top of said tubular stand so as to cover the top of the stand and having a depending skirt portion integral with the entire perimeter of the top plate and disposed about the upper end of the tubular stand, the top plate being provided with a bolt receiving opening and with a cable-wire receiving hole, the depending skirt portion on one side and at a distance beneath the top plate portion being provided with a circumferentially disposed kerf extending substantially half way about the skirt portion, a vertically disposed kerf extending downwardly from said circumferentially disposed kerf, intermediate of the ends thereof, to the lower perimeter of the skirt, a pair of outwardly extending apertured lobes on opposite sides of the vertically disposed kerf, and means disposed through said lobes and adapted to force said lobes toward each other and thereby contract the skirt portion beneath the circumferentially disposed kerf into clamping relation with the tubular stand.



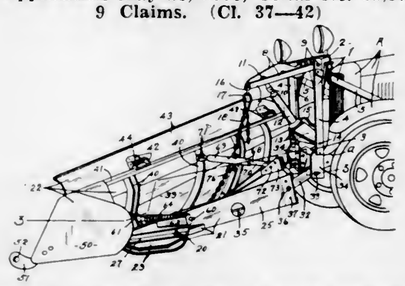
2,103,774

REGULATING SYSTEM

Erich Friedländer, Berlin-Siemensstadt, Germany, assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application November 29, 1935, Serial No. 52,075
In Germany February 27, 1935
14 Claims. (Cl. 171—119)

1. In an alternating-current system comprising apparatus, including a generating unit, having synchronously rotating masses, the combination with a regulator for maintaining within given limits a measure of the output of said unit of means for causing said regulator to be sensitive to departures in said output measure from a desired value and additional means for causing the regulator also to be sensitive to a measure of the energy supplied to or withdrawn from the rotating masses of said apparatus.



2,103,775

SNOW PLOW

Carl H. Frink, Clayton, N. Y.

Application May 28, 1936, Serial No. 82,304
9 Claims. (Cl. 37—42)

1. The combination with a snow plow mold board and a truck chassis having a supplemental frame connected therewith, of drive means including a single series of linkage elements having both forward and rearward horizontally disposed pivotal connections operatively connecting the mold board to the frame whereby the mold board may swing vertically about one of said pivotal connections and has forward and rearward tilting movement independent of said vertical movement about the second one of said pivotal connections, stop means associated with the linkage elements independently of the supplemental frame for limiting the downward vertical movement of the mold board to maintain the linkage elements in an upward inclination forwardly from their rearward pivots in all positions of the mold board, and adjustable means connected with the mold board for maintaining said mold board in a predetermined tilted position.

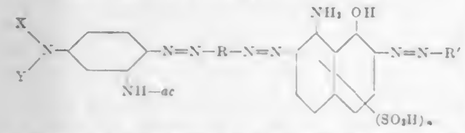
2,103,776

NOVEL GLUE PRODUCT FOR GLUING VENEERS AND CROSS-PLY SHEETS

Edouard Geistlich, Wolhusen, Switzerland

No Drawing. Original application December 24, 1934, Serial No. 759,085. Divided and this application November 18, 1936, Serial No. 111,555
In Germany October 28, 1933
7 Claims. (Cl. 134—23.8)

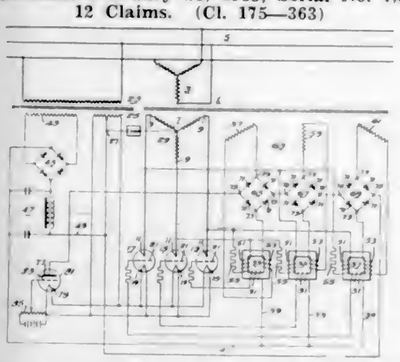
1. A glue product comprising a water solution of an animal glue material, carbamide, and aldehydes in a relation of said glue material to car-



bamide varying between 3:1 and 6:1, and a relation of carbamide to aldehyde varying between 3:1 and 2.1.

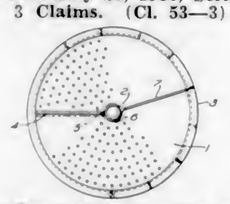
2,103,777
DUCTILIZING PROCESS
John R. Gier, Jr., Penn Township, Allegheny County, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Application September 13, 1935, Serial No. 40,417
2 Claims. (Cl. 148—11.5)

1. A process for improving the ductility of an iron cobalt alloy that has been reduced by a conventional rolling operation which comprises further working the alloy between 550° C. and 650° C. to deform it, raising the temperature of the alloy to between 900° C. and 975° C. and quenching the alloy to cool it at a rapid rate.



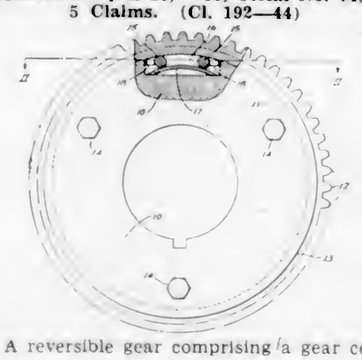
2,103,778
AZODYESTUFFS
Eugen Glietenberg and Friedrich Schubert, Leverkusen-I. G. Werk, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application January 24, 1936, Serial No. 60,702. In Germany February 2, 1935
5 Claims. (Cl. 260—74)

1. Azodyestuffs of the general formula:



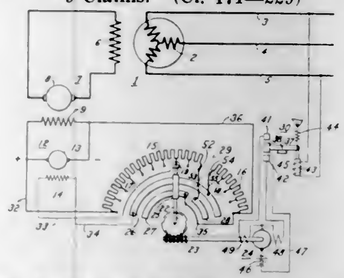
in which R represents a member selected from the group consisting of radicals of the benzene and diphenyl series, R′ means an aromatic radical, X and Y mean members selected from the group consisting of hydrogen, alkyl, aralkyl and aryl, *ac* means an acyl radical, and *n* stands for one of the numbers 1 and 2, dyeing in general black to bluish black shades and being particularly adapted for dyeing cellulose fibers and leather.

2,103,779
ELECTRIC DISCHARGE APPARATUS
Finn H. Gulliksen, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application February 23, 1935, Serial No. 7,696
12 Claims. (Cl. 175—363)



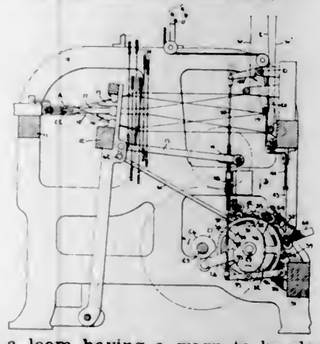
1. In combination a source of power, electric discharge means to be supplied from said source, said means comprising a plurality of pairs of electrodes between which a discharge is to be transmitted and means, independently associated with each pair of electrodes, for controlling the discharge between said pairs of electrodes, means for controlling the supply of power to said controlling means, the last said means including an element coupled to the controlling means associated with each pair of electrodes, the operation of which is dependent on variation in the current supplied thereto and means for varying the supply of current to each of said elements said means comprising a rectifying network having a pair of terminals to which alternating current is supplied through said elements and a pair of terminals from which direct current may be supplied, a unitary impedance supplied from the direct current terminals of all of said elements and means for varying said impedance.

2,103,780
SELF-MEASURING COFFEE BASKET
Donald Lee Hadley, Mansfield, Ohio, assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application February 20, 1936, Serial No. 64,865
3 Claims. (Cl. 53—3)



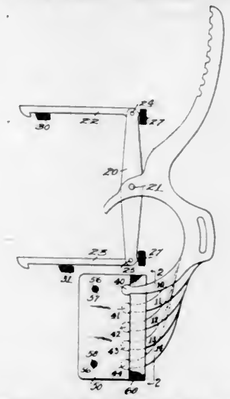
1. In a coffee-making machine, a cylindrical foraminate coffee container having a central tubular standard, a radial partition fixed to said standard and a movable radial partition pivotally secured on said standard whereby the closed portion of the container between said partitions may be varied, said tubular member being formed to receive a percolator tube, and graduations on the rim of said container adapted to cooperate with the movable partition to indicate the stationary volume between the partitions.

2,103,781
YIELDABLE GEAR
Harold F. Hanson, Forest Hills, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application April 16, 1936, Serial No. 74,676
5 Claims. (Cl. 192—44)



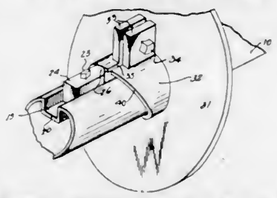
1. A reversible gear comprising a gear center, a gear rim rotatably mounted on the gear center, a pair of rollers disposed between the gear rim and the gear center, and resilient means disposed between the rollers and having a convex surface engaging both of said rollers to yieldingly hold them in contact with the gear rim, thereby wedging the rollers between the gear rim and the resilient means to transmit torque between the gear rim and the gear center.

2,103,782
REGULATOR
Edwin L. Harder, Forest Hills, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application March 20, 1937, Serial No. 132,071
9 Claims. (Cl. 171—229)



1. In a regulator system, a dynamo-electric machine having a field winding, means for controlling the excitation of said field winding comprising a resistor having two sections, means responsive to the regulated quantity for introducing varying parts of one resistor section in series with the field winding over a predetermined range in the required excitation of said machine, and for connecting said two resistor sections in series and varying the connection of said field winding in shunt relation to a portion of said resistor over another predetermined range in the required excitation of said machine.

2,103,783
SLACKENER CONTROL FOR LOOM WARPS
Elbridge R. Holmes, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts
Application March 2, 1936, Serial No. 66,530
14 Claims. (Cl. 139—20)



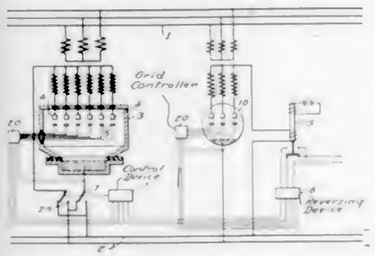
1. In a loom having a warp to be slackened, a slackener having a working slackening stroke followed by a return non-slackening stroke, a control member for the slackener to have two different motions one of which occurs during the working stroke of the slackener and the other of which occurs during the non-working stroke of the slackener, and two actuators for the member, the first actuator to be operatively related to the member at relatively long intervals to give said member the first of its said motions, and the second actuator brought into operative relation by the first motion of the member and operative to give said member its second motion.

2,103,784
LOOM DOBBY
Elbridge R. Holmes, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts
Application December 21, 1936, Serial No. 116,975
6 Claims. (Cl. 139—71)

4. A plurality of harness jacks, a pair of actuating dobby knives selectively connected to indicated jacks, and means to give all parts of each knife equal travel whereby all operative positions of each knife are parallel, said harness jacks being of such relative proportions and leverage that said defined movements of said knives will effect movements of said jacks which increase progressively toward the back of the loom.

2,103,785
WARP BEAM
Charles R. Howard, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts
Application October 18, 1935, Serial No. 45,586
3 Claims. (Cl. 242—124)

1. In a warp beam, a barrel having a smooth warp thread engaging surface, a warp space defining head movable along the barrel, a member to be secrued to the barrel along the length thereof, a second member carried by the head to engage the first member, one of said members having two cam faces each oblique with respect to the



axis of the barrel, the cam faces extending from a low point on one side of the barrel around opposite sides of the barrel to a high point diametrically opposite the low point, rotation of the head about the barrel in one direction when one cam face engages the first member causing the head to move along the barrel in a given direction, and rotation of the head in the opposite direction when the other cam engages the first member also causing the head to move along the barrel in said given direction.

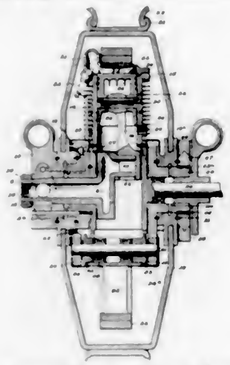
2,103,786

ELECTRICAL CONVERSION SYSTEM

Erwin Janetschke, Berlin-Charlottenburg, Germany, assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application April 25, 1935, Serial No. 18,095
In Germany April 26, 1934
4 Claims. (Cl. 171—97)

4. A reversible electric current transmitting system comprising two alternating current circuits, an intermediate direct current circuit, main valve type converters connected between said direct current circuit and the respective alternating current circuits, an auxiliary valve type converter connected in parallel with each of said main converters said auxiliary converters being of less capacity than said main converters but having sufficient capacity to carry the light load energy transfer between said circuits, said auxiliary converters having current-voltage characteristics such that at normal energy transfer, the main converters assume the load at low energy transfer, the auxiliary converters assume the load, switching means for reversing the terminal connections of said main converters and means responsive to the load conditions of said auxiliary converter for determining the operation of said switching means.



2,103,787

INTERNAL COMBUSTION ENGINE

Pierce R. McCrary, York, Pa., assignor of twenty-five percent to Irwin H. Linton and ten percent to Frances Perry Mauro, both of Washington, D. C.

Application February 28, 1936, Serial No. 66,275
5 Claims. (Cl. 123—44)

1. An internal combustion engine comprising: a stationary crank shaft; a rotatable cylinder-carrying member mounted on said crank shaft; a driving gear mounted upon a bearing constituting a support for said engine and rotatable upon said crank shaft, and a driven gear mounted upon a bearing constituting a support for said engine and rotatable with said support, each of said gears being concentric with said cylinder-carrying member; a clutch member for said driving gear, operable to hold said driving gear against rotation to transmit motion from said cylinder-carrying member to said driven gear

and when released to enable said engine to run idle; and a pair of concentric intermediate gears carried by said cylinder-carrying member.

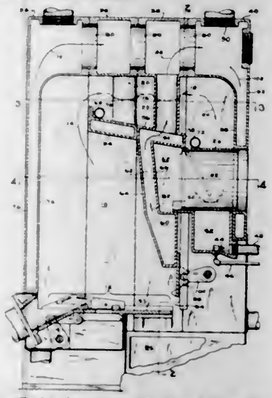
2,103,788

VENETIAN BLIND

Herbert H. Mohrfeld, Collingswood, N. J.

Application March 19, 1935, Serial No. 11,855
5 Claims. (Cl. 156—17)

1. A slat for Venetian blinds and the like, one face at least of said slat having a plurality of adjoining narrow highly reflecting surfaces disposed at an angle to the plane of the slat and to each other, the juncture of said surfaces being of clearly defined angular formation.



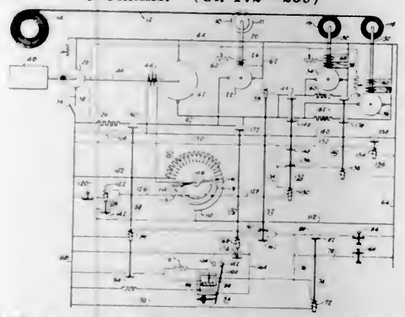
2,103,789

DOMESTIC HEATER

Donald J. Mosshart, Springfield, Pa., assignor of one-half to Harold F. Hildreth, Mansfield, Ohio

Application September 30, 1935, Serial No. 42,787
13 Claims. (Cl. 122—225)

4. In a domestic fluid heater, in combination, water cooled walls forming a closed compartment, a wall extending transversely of said compartment for a part of the height thereof to divide it into a combustion chamber and space for passages with convection-heated surfaces, a deflector wall on top of said transverse wall extending over the chamber and oppositely beyond said transverse wall, means in the vertical passage behind said transverse wall and below the deflector wall to split the gas stream and reduce its total cross-section and increase its velocity, a baffle for each section of the split stream and having a substantially horizontal lower edge, means to turn the gas streams sharply beneath said lower edge, said splitting means comprising a flue for merging and carrying off said streams and a fly-ash receptacle beneath said baffle edge.



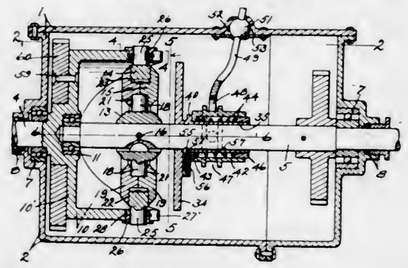
11. In a fluid heater of the type described, in combination, a combustion chamber, means forming water-cooled radiant heat absorbing surfaces immediately about the combustion chamber and more remote, water-cooled, convection-heated surfaces enclosing gas passages, means for burning a fly-ash forming fuel in the combustion chamber, and passing the products of combustion through said gas passages, perforated water spray pipes built permanently into said gas passages so as to be completely surrounded by convection-heated surfaces, the spray from the said pipes being directed to wash fly-ash from all of the surrounding convection-heated surfaces, the lower of such surfaces being inclined away from the combustion chamber and the sprays so directed that water may be sprayed over substantially all of the convection-heated surfaces to clean them while the fuel is burning without quenching its fire.

2,103,790

CONTROL SYSTEM

Horace E. Nason, Berwyn, Ill., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application August 7, 1936, Serial No. 94,822
6 Claims. (Cl. 172—239)



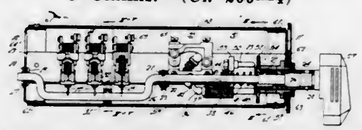
1. In a paper mill drive, a generator having a field winding, an exciter for the field winding, a slitter motor disposed to be connected to the exciter, a winder motor disposed to be connected to the generator, means for controlling the generator to control the voltage output therefrom, and means responsive to predetermined voltage conditions for transferring the slitter motor to the generator to control the speed of the slitter motor with respect to the speed of the winder motor.

2,103,791

POWER TRANSMISSION APPARATUS

Robert K. Pepper and Samuel C. V. Pepper, Syracuse, N. Y.

Application May 21, 1935, Serial No. 22,665
5 Claims. (Cl. 192—30)



1. In a power transmission mechanism, the combination with a drive member and a driven member mounted in co-axial relation, a pair of co-acting clutch elements, means pivotally connecting each of said elements with a respective one of said members to move from a position substantially normal to the axis of movement of the members to an angular position inclined to said axis of movement, one of said pivotal means including diametrically disposed trunnions mounted for limited movement axially of the corresponding member from the diametrical plane passing through the other pivotal means to one side of said plane, whereby said clutch elements may be tilted when the pivotal means therefor are in angular relation to each other, stop means arranged concentric with the trunnions when said trunnions are in said diametrical plane of the other pivotal means for maintaining the trunnions against movement axially of the member in the opposite direction, whereby the clutch elements will be locked to each other and thus caused to move in unison when in the tilting position, and means for moving the elements from the first to the second position.

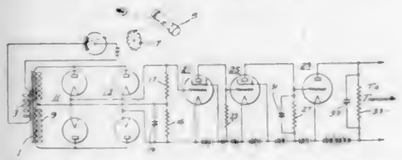
2,103,792

CONTROL SWITCH

Alfred J. A. Peterson and Carroll E. Valentine, Wilkinsburg, Pa., assignors to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application February 28, 1935, Serial No. 8,666
5 Claims. (Cl. 200—4)

1. A switch mechanism comprising a switch actuating bail rotatably movable in opposite directions from an intermediate position to a plurality of operative positions, a pair of switches movable in opposite directions to an operative position by the actuating bail, additional switching means operable by longitudinal movement of the actuating bail, spring means disposed on



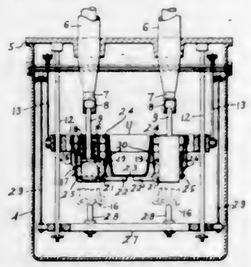
the ball for opposing longitudinal movement thereof, and interlocking means disposed to engage the ball for governing the rotative and longitudinal movements of said ball.

2,103,793

FACSIMILE TRANSMISSION

La Verne R. Philpott, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application July 30, 1932, Serial No. 626,851
8 Claims. (Cl. 178—7.1)



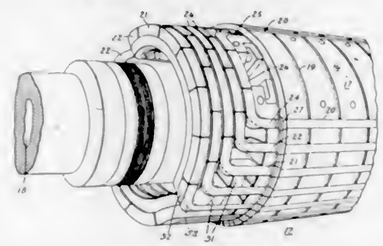
1. In combination, a source of signal energy, an electron discharge device having a circuit comprising a pair of resistors in series arrangement, means for rectifying potentials derived from said signal energy supply and establishing said rectified potentials across said resistors, the potentials thus established across said resistors being substantially equal but opposing during the absence of signals from said source, and means for unbalancing said potentials at such times as the condition of said source changes in response to signals, said last means comprising an electrical energy storing means connected across one of said resistors.

2,103,794

CIRCUIT BREAKER

Fritz Rampacher, Berlin-Charlottenburg, Germany, assignor to Westinghouse Electric & Manufacturing Company, a corporation of Pennsylvania

Application November 6, 1928, Serial No. 317,588
In Germany November 9, 1927
11 Claims. (Cl. 200—89)



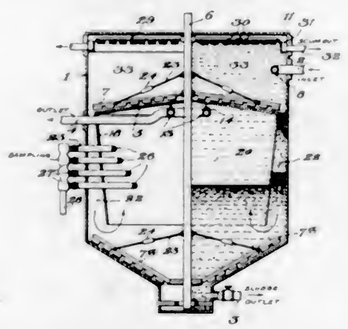
1. The combination with a pair of relatively movable contacts, of a movable carrier for one of the contacts having operating means movable to two operating positions, means for movably supporting the said contact upon the carrier for disengaging movement independently thereof, current-responsive means for releasably retaining the said contact in engagement with the other contact when the operating means for the carrier is in one of its operating positions, and means movable for resetting the said contact that is operable only when the operating means for the carrier is in its other operating position.

2,103,795

TURBINE-GENERATOR FIELD-WINDING

Bennie A. Rose, Swissvale, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application January 4, 1936, Serial No. 57,535
10 Claims. (Cl. 171—206)



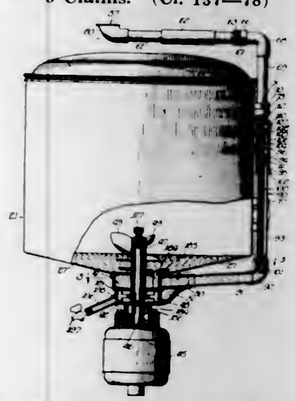
1. In a dynamo-electric machine having a stator member and a drum-type, slotted rotor member, the combination, with said rotor member, of a winding having less than 8 poles and having coil-sides lying in the rotor slots, at least substantially all of those portions of said winding which lie in said slots being strap-conductors composed of copper which has been hardened at least sufficiently to give it a yield point at least as high as 10,000 pounds per square inch.

2,103,796

APPARATUS FOR SEPARATING SOLIDS FROM LIQUIDS

John J. Seip, Allentown, Pa.

Application September 16, 1932, Serial No. 633,520
Renewed May 26, 1937
8 Claims. (Cl. 210—55)



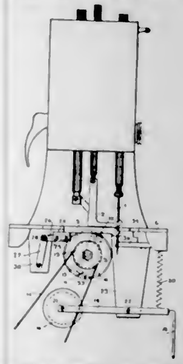
1. An apparatus for separating solids from liquids comprising a cylindrical tank, an inlet for liquids containing suspended matter at the top of said tank, at least one tray mounted substantially horizontally within said tank having a peripheral depending flange forming with the wall of said tank an annular discharge zone for solids and an inner clarifying chamber, the said flange being tapered in such manner as to produce a discharge zone of increasing cross sectional area towards the bottom of said zone, a clear liquor outlet located at an upper point of said clarifying chamber, a sediment draw-off located at the bottom of said tank, and means for moving precipitated solids towards said sediment draw-off.

2,103,797

CONDUIT FOR WASHING MACHINES

Edgar S. Stoddard, Berwyn, Ill., assignor to The Conover Company, Chicago, Ill., a corporation of Illinois

Original application March 19, 1928, Serial No. 262,652. Divided and this application April 25, 1935, Serial No. 18,085
5 Claims. (Cl. 137—78)



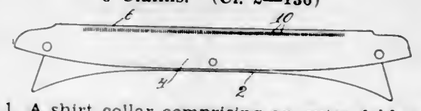
1. In a washing machine, a tank, a well chamber communicating with the bottom of said tank, a centrifugal pump in said chamber, an outlet conduit communicating with said chamber and cooperating with said pump to exhaust water from said well chamber, said outlet conduit having a vertical portion and a horizontal terminating portion connected thereto, and an inlet conduit directly communicating with said tank, said inlet conduit being directly connected to said outlet conduit.

2,103,798

TUFTING MECHANISM FOR TUFTING A FABRIC BASE

Mendel A. Taradash, Toronto, Ontario, Canada

Application March 2, 1936, Serial No. 66,509
In Canada February 29, 1936
5 Claims. (Cl. 112—79)



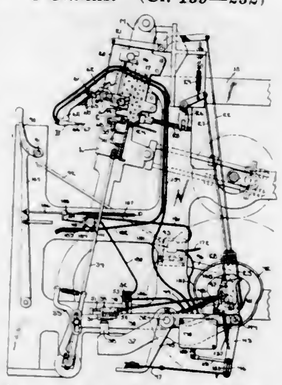
1. In combination with a sewing machine, a tufting mechanism comprising the following coacting parts: a thread engaging looper-bar having a sharply pointed tip portion, a relatively substantial body portion and a longitudinal slot in its underside; an arm whereon a connecting foot of such bar is centrally secured; link members pivotally secured at each end of the said arm the free end of one such link member being mounted on a rock shaft and the free end of the other being pivotally mounted on a stationary bracket depending from the machine frame, and the said parts so arranged that upon actuation the looper-bar-tip reciprocates along a curved path substantially transverse to a reciprocating needle.

2,103,799

COLLAR

Kurt Teubner, Leipzig, Germany, assignor to the firm Atlas Ago, Chemische Fabrik A. G., Leipzig, Germany

Application November 21, 1936, Serial No. 112,171
In Germany February 28, 1936
3 Claims. (Cl. 2—136)



1. A shirt collar comprising an outer fold and an inner fold, said inner fold having at least one substantially continuous narrow groove-like impression therein extending substantially parallel with the upper edge of the collar and located below such upper edge, said impression being located wholly within the upper part of the inner fold.

2,103,800

LOOM WITH SHUTTLE CHANGING AND LOOM STOPPING MECHANISM

Richard Greenleaf Turner, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application March 6, 1935, Serial No. 9,645
3 Claims. (Cl. 139—232)

1. In a loom operating with a shuttle which is on one side of the loom on one beat thereof and on the opposite side on the next beat thereof, stopping mechanism capable of stopping the loom on any beat thereof, a two part actuator for the stopping mechanism requiring two successive beats of the loom for a complete movement thereof, the first part being capable of actuating the stopping mechanism during the first part of a complete movement of the actuator on one beat of the loom and the second part being capable of actuating the stopping mechanism during the latter part of the same complete motion of the actuator on the second beat of the loom, a weft detector to indicate exhaustion of weft in the

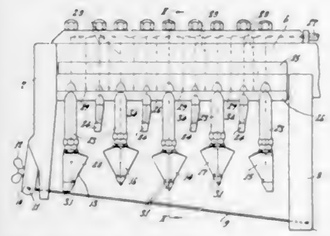
shuttle, means controlled by the detector when indicating weft exhaustion to cause the first of said parts to actuate the stopping mechanism during the first part of a complete movement of the actuator, and a warp stop motion operative upon occurrence of a warp fault to cause the second part to actuate the stopping mechanism during the second part of a complete movement of the actuator, to the end that the shuttle will be on one side of the loom when the detector effects stoppage and on the other side when the warp stop motion effects stoppage.

2,103,801

WEFT BOBBIN

Richard Greenleaf Turner, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application December 16, 1935, Serial No. 54,649
10 Claims. (Cl. 242—120)



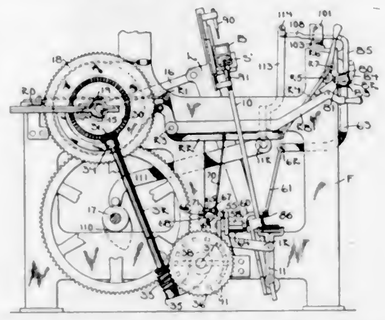
1. In a weft bobbin to cooperate with a spindle, a head having a spindle bore therethrough, holding metallic rings supported by the head and extending around the bore, a pair of metallic wires extending into the rings and supported by and extending from the head in a direction substantially parallel to the bore axis and located on opposite sides of the latter, and means integral with said wire strands defining an eye concentric with the bore axis and located to receive a spindle.

2,103,802

APPARATUS FOR SEPARATING IN ONE OPERATION HOLLOW BRICKS FROM A CLAY ROD OR THE LIKE AND FOR CLOSING SAID BRICKS

Alfred Heinrich Ullrich, Bandoeng, Java, Dutch East Indies

Application July 22, 1935, Serial No. 32,666
In the Netherlands October 8, 1934
4 Claims. (Cl. 25—1)



1. An apparatus for separating hollow bricks from a rod of clay or like material having interior cavities or passages and for closing the cavities or passages of the bricks, in one operation, comprising a cutting member adapted to cut through the rod, a plurality of closing elements for folding inwardly the upstanding walls, said closing elements being spaced a distance corresponding to the distance between the upstanding walls of the rod and being arranged in at least two rows, located above one another in the plane of the cutting member, and rearwardly of said member, the closing elements of one row and those of the next row being disposed in staggered relation, a row of wedge-shaped knife-elements located also in the plane of the cutting member and rearwardly between said closing elements, and a common frame to which all of the closing and cutting elements are attached, said frame being adapted to be moved in the cutting plane.

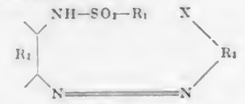
2,103,803

ELECTRIC FEELER FOR DROP BOX LOOMS

Lewis S. Vose, Needham, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application February 18, 1932, Serial No. 593,814
8 Claims. (Cl. 139—233)

1. In weft detecting and loom stopping mechanism, a lay movable back and forth, shifting shuttle boxes each to be in active position for two successive picks only at a time, an actuator having a working stroke at two pick intervals, an electric detector for each shuttle box, and means rendered effective by the actuator during the second backward movement of the lay after indication of weft exhaustion in a shuttle moving to inactive position to arrest the lay when the latter is in rear position.



2,103,804

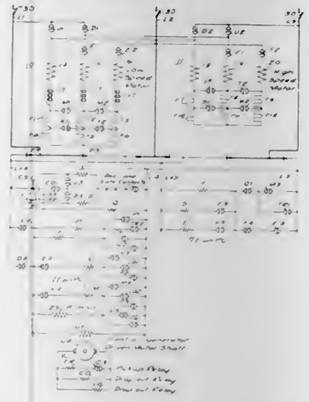
AZO DYESTUFFS AND PROCESS FOR THEIR MANUFACTURE

Walter Wehrli, Basel, Switzerland, assignor to the firm of Chemical Works formerly Sandoz, Basel, Switzerland

No Drawing. Application July 22, 1935, Serial No. 32,671. In Germany July 28, 1934
15 Claims. (Cl. 260—92)

9. Azo dyestuffs containing in their molecule at least one sulpho group and at least one group of the general formula

wherein R_1 represents a group selected from the class consisting of alkyl, aryl and aralkyl groups, R_2 represents a radical of an aromatic compound, R_3 represents a radical selected from the class consisting of radicals of pyrazolones and aromatic compounds of the benzene and naphthalene series, and X represents a substituent contiguous to the azo group and selected from the class consisting of hydroxy, alkoxy, amino, alkylamino, arylamino and aralkylamino groups,



which dyestuffs are in dry state yellow to dark powders, dyeing textile fibres yellow to black shades and which are capable of yielding complex metal compounds useful for dyeing purposes.

2,103,805

CONTROL SYSTEM FOR ELECTRIC MOTORS

Harold W. Williams, Chicago, Ill., assignor to Westinghouse Electric Elevator Company, Chicago, Ill., a corporation of Illinois

Application November 7, 1936, Serial No. 109,685
18 Claims. (Cl. 172—152)

18. In a control system for operating an elevator car in a hatchway, a low speed and a high speed motive means for driving the car, a switch, means responsive to operation of the switch to its "on" position for connecting the motive means to a source of power to accelerate the car to a normal speed and responsive to operation of the switch to its "off" position for effecting deceleration of the car, a retarding resistor for the motive means, means responsive to operation of said switch for controlling the resistor to effect acceleration and deceleration of the car at predetermined rates, a generator, means responsive to operation of the car for operating the generator at a speed corresponding to the speed of the car, means responsive to the generator accelerating to a predetermined speed within a predetermined time for controlling the resistor controlling means to maintain approximately said predetermined rate of acceleration of the car, means responsive to deceleration of the generator to a predetermined speed within a predetermined time for controlling the resistor controlling means to maintain the deceleration of the car at approximately said predetermined rate, a stopping means, and additional means responsive to deceleration of the generator to a predetermined speed for operating the stopping means to stop the car.

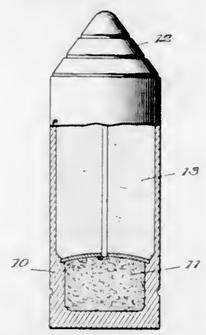
2,103,806

PARACHUTE

Mark S. Willing, Mount Holly, Va.

Application November 3, 1936, Serial No. 109,035
4 Claims. (Cl. 244—149)

1. In a parachute, a canopy, a plurality of rigid annular members, means detachably securing said members in the interior of the canopy, said members being of less diameter than the canopy when the latter is distended and said securing means being capable of being ruptured to free said members from the canopy, connecting elements between each two juxtaposed members,



and means for successively removing said members from the free edge of the canopy when the latter is released for opening.

2,103,807

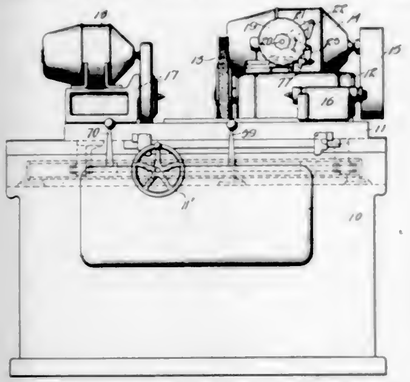
ANTIAIRCRAFT PROJECTILE

Mark S. Willing, Mount Holly, Va.

Application September 20, 1937, Serial No. 164,803
4 Claims. (Cl. 102—29)

1. An anti-aircraft projectile containing a bursting charge, and a charge of finely divided material capable of impairing the operation of internal combustion engines.

2,103,808



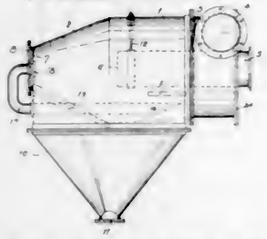
CYLINDRICAL GRINDING MACHINE

Harold E. Balsiger, Waynesboro, Pa., assignor to Landis Tool Company, Waynesboro, Pa., a corporation of Pennsylvania

Application March 23, 1931, Serial No. 524,706
9 Claims. (Cl. 51—233)

1. In a machine having a carriage, a hydraulic motor for traversing said carriage comprising two cylinders, a piston in each cylinder, means connecting said motor with the said carriage, means for supplying fluid under pressure to one end of each cylinder, a closed conduit connecting the opposite ends of said cylinders with each other to

permit the fluid from one cylinder to pass to the other, means for restricting the flow of fluid

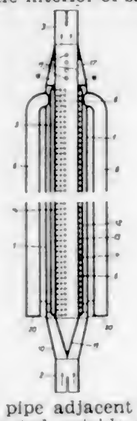


through said conduit, and automatic means to replace leakage from said cylinders and said conduit.

2,103,809

SEPARATOR

Tom Conrad Bieth, Hedemora, Sweden
Application November 4, 1935, Serial No. 48,237
In Germany November 5, 1934
6 Claims. (Cl. 183—90)



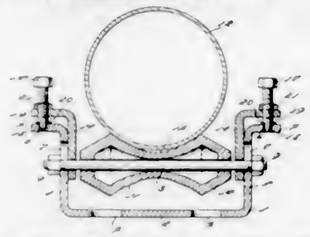
1. Apparatus for separating solid particles from gases consisting of a separating drum, having at one end a considerably larger cross sectional area than at the other end, and having a portion progressively diminishing toward the latter end, a substantially central gas outlet at the first mentioned end, a collecting chamber for the solid particles, the separator having an outflow slit for the separated particles communicating with the collecting chamber, the particles being separated by the gas being forced to follow, under rotation, the progressively diminishing diameter of said portion and then in purified form escape through said outlet, and means providing communication between the smaller end of said portion and the inlet end of the collecting chamber so that the gas rotating under pressure in said smaller end produces a suction in the said means in the direction towards the separator chamber, by which means the over-pressure in the collecting chamber is diminished and consequently the flow through the said slit is increased in the direction to the collecting chamber.

2,103,810

SILENCER FOR THE EXHAUST GASES OF INTERNAL COMBUSTION ENGINES

Eduard Caspar, Zurich, Switzerland
Application April 15, 1936, Serial No. 74,530
In Germany April 16, 1935
2 Claims. (Cl. 181—59)

1. A silencer for exhaust gases, comprising a cylindrical casing having a main chamber to the front end of which casing the exhaust gases are admitted and from the rear end of which casing the gases are discharged; a pipe within said casing having apertures and having its forward end closed and its rearward end communicating with the rear end of said casing; said casing having a secondary chamber near its rear end communicating only with the interior of said pipe through

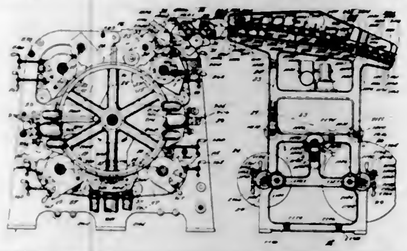


apertures in said pipe adjacent thereto; and at least one pipe located outside said casing and spaced therefrom, one end of said last named pipe being closed and the other end being in communication with the interior of said casing adjacent but to the rear of said secondary chamber, a partition in said casing dividing said secondary chamber from the main chamber.

2,103,811

ADJUSTABLE CHAIR AND ROLLER FOR PIPES

Anthony E. Davis, Philadelphia, Pa.
Application July 17, 1937, Serial No. 154,135
3 Claims. (Cl. 248—55)



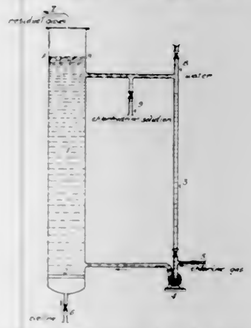
1. An adjustable chair and roller, comprising a body portion having an apertured bottom member, and sides having apertures, with the sides terminating at their upper ends in laterally extending extensions, a shaft extending into the side apertures, a roller on said shaft, angle brackets through which said shaft extends, and means cooperating with said angle brackets and extension to effect vertical adjustment of said shaft and roller relatively to the body portion.

2,103,812

MULTIPLE IMPRESSION PRINTING APPARATUS AND METHOD

Emil Ericksson, Chicago, Ill., assignor to Standard Process Corporation, Chicago, Ill., a corporation of Delaware
Application September 22, 1932, Serial No. 634,406
26 Claims. (Cl. 101—152)

1. A printing press comprising an impression means; a plurality of movable printing means spaced along said impression means; means for simultaneously moving said printing means into and out of contact with said impression means; means for independently moving any one of said

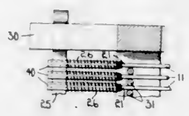


printing means into and out of contact with said impression means; and a single means for increasing and decreasing the contact pressure between said impression means and said printing means.

2,103,813

PROCESS FOR THE PREPARATION OF CHLORHYDRINS

Paul Ferrero, Tertre, and Corneille Vandendries, Baudour, Belgium, assignors to Societe Carbochimique, Société Anonyme, Brussels, Belgium, a Belgian company
Application April 3, 1936, Serial No. 72,640
In France April 15, 1935
3 Claims. (Cl. 260—157)



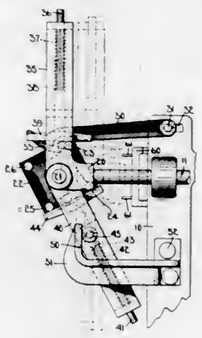
1. In a continuous process of preparing chlorhydrin from chlorine, water and olefine, causing water to react with chlorine at a comparatively high rate of speed to form a solution of hypochlorous acid and of hydrochloric acid, causing said solution to react with an olefine at a comparatively low rate of speed, circulating the solution in a closed circuit while avoiding any discontinuity in the liquid phase, and controlling the circulation in such manner that a chlorine solution of at least 15% of saturation is formed in the absence of any neutralizing agent, before it is brought into contact with the olefine.

2,103,814

JACQUARD NEEDLE SPRING GUIDE

Herbert Victor Foster, Providence, R. I., assignor to Crompton & Knowles Jacquard & Supply Company, Pawtucket, R. I., a corporation of Massachusetts
Application February 12, 1937, Serial No. 125,517
7 Claims. (Cl. 139—317)

1. In a jacquard mechanism, a needle, a compression spring surrounding the needle to resist movement of the latter in one direction, and



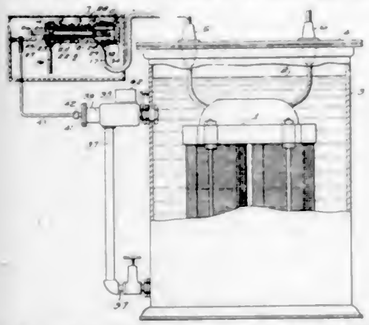
means located between the needle and the spring to prevent substantial lateral displacement of the coils of the spring when the latter is compressed.

2,103,815

JACQUARD CYLINDER MOTION

Herbert Victor Foster, Providence, R. I., assignor to Crompton & Knowles Jacquard & Supply Company, Pawtucket, R. I., a corporation of Massachusetts
Application September 25, 1936, Serial No. 102,561
11 Claims. (Cl. 139—329)

1. In a cylinder motion for a jacquard, a needle board having needles, a cylinder, means to move the cylinder away from and toward the needles, means to give the cylinder a primary angular motion in a given direction as the cylinder moves away from the needles, pressure means thereafter tending to give the cylinder a secondary angular motion in said given direction, and a controller for the pressure means to restrain the latter but operative by motion of the cylinder toward the needles to render the pressure means effective to give the cylinder the secondary angular motion in said given direction.



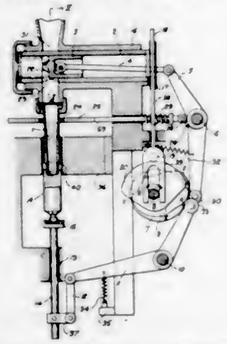
2,103,816

ELECTRICAL APPARATUS

William J. Hart, Sharon, Pa., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application October 31, 1933, Serial No. 696,049
6 Claims. (Cl. 200—81)

1. In a protective system for electrical apparatus, a circuit interrupting device, the circuit interrupting device comprising a spring actuated plunger, a latch for holding the plunger in its circuit closing position, means responsive to a predetermined current flow through said plunger for releasing said plunger, means responsive to

an unnormal temperature within said apparatus and to an unnormal pressure within said appa-



ratus for independently tripping said latch to release said plunger.

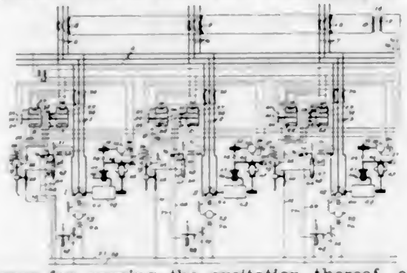
2,103,817

APPARATUS FOR FILLING CONTAINERS

Bror Emil Johnson, Ålsten, Sweden, assignor to Aktiebolaget Gerh. Arehns Mekaniska Verkstad, Stockholm, Sweden

Application March 18, 1936, Serial No. 69,575
In Sweden March 4, 1935
8 Claims. (Cl. 226—125)

1. In a machine for filling containers, the combination with a filling spout and a carrier for the container, of means for relatively moving said carrier and said spout to position said container around said spout, means providing relative withdrawing movement between said container and spout, means for supplying material through said spout to the container during said withdrawing movement, means for interrupting the supply of material, means for retarding said withdrawing movement at a predetermined moment after interrupting said supply, and means for thereafter accelerating said withdrawing movement.



2,103,818

REGULATING SYSTEM

Jaroslav Kucera, Prague, Czechoslovakia, assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application March 13, 1937, Serial No. 130,708
In Czechoslovakia March 16, 1936
8 Claims. (Cl. 290—4)

1. In combination, a plurality of synchronous generators operating in parallel circuit relation, individual prime movers for driving the several generators, means associated with each prime mover for varying the power input thereto, means responsive to a regulated quantity resulting from the operation of said several generators for controlling the power input to said prime movers, regulating means associated with each prime

mover for varying the excitation thereof, and means responsive to the regulated quantity resulting from the operation of said several generators for controlling the setting of said regulating means.

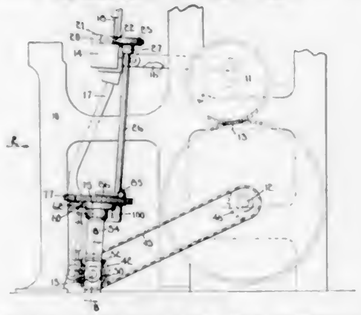
2,103,819

MANUFACTURE AND USE OF WETTING PREPARATIONS

Heinrich Lier, Basel, Switzerland, assignor to the firm of Chemical Works, formerly Sandoz, Basel, Switzerland

No Drawing. Application August 20, 1935, Serial No. 37,101. In Switzerland August 24, 1934

4 Claims. (Cl. 8—20)



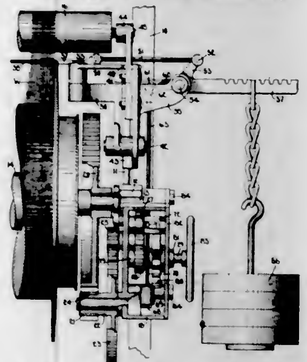
1. The alkaline mercerizing solutions possessing high wetting action and containing a mixture consisting of 95–50 per cent of naphthenic acids and of 5–50 per cent of organic compounds with at least six carbon atoms selected from the class consisting of saturated and unsaturated aliphatic, alicyclic, araliphatic and aromatic hydrocarbons and their water-insoluble ethers and their non-phenolic halogenated derivatives.

2,103,820

PICKING MOTION FOR LOOMS

Oscar V. Payne, Leicester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application November 21, 1936, Serial No. 111,996
16 Claims. (Cl. 139—145)



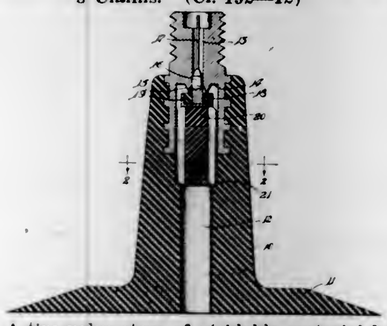
1. In a loom having a lay and operating with a shuttle, an endless belt having a portion movable longitudinally along the lay in frictional contact with a side of the shuttle to pick the latter, a rotary element to drive the belt, a spring connected to the element and effective to cause angular movement of the latter to drive that part of the belt in frictional contact with the shuttle longitudinally along the lay in a direction to pick the shuttle by a force transmitted through the friction surface, and means to reverse the rotary element to restore the belt to position for another pick and also store energy in the spring.

2,103,821

LET-OFF FOR LOOMS

Oscar V. Payne, Leicester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application January 7, 1937, Serial No. 119,515
10 Claims. (Cl. 139—100)



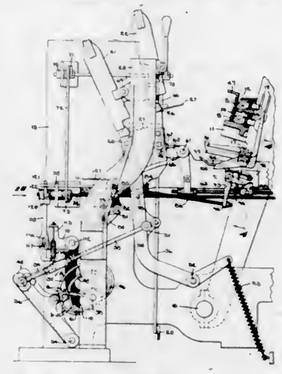
1. In a let-off for a loom, a rotatable warp beam tending to turn forwardly under tension of the warp, an escapement wheel connected to and turning with the beam, an escapement device oscillatable by a force derived from the escapement wheel and capable of preventing rotation of the wheel when oscillation of said device is prevented, brake means to prevent oscillation of the escapement device when the warp tension is normal, means actuated by increased tension of the warp to move the braking means out of braking relation with respect to the escapement device, whereupon tension of the warp turns the beam and wheel, and means to return the braking means to braking relation with respect to the escapement device to prevent further rotation of the escapement wheel and beam when the warp tension returns to normal.

2,103,822

TIRE VALVE AND THE LIKE

Ira D. Perry, Muskegon, Mich.

Application January 14, 1936, Serial No. 59,109
3 Claims. (Cl. 152—12)



3. A tire valve stem of yieldable material having a through passageway, said passageway being of larger diameter in its inner portion than in its outer portion and having a shoulder facing said outer portion, a tubular metal insert secured within the material of the stem and forming the outer passageway of less diameter, said insert having an annular valve seat about the inner end of the passageway therethrough, and a yieldable valve member insertable through the larger passageway in the inner portion of said stem for supporting engagement with said shoulder, whereby said valve member is supported in sealing engagement with the valve seat by the yieldable material of the valve stem below the valve seat carrying insert.

2,103,823

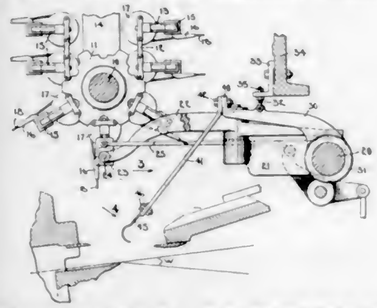
CONTROL MECHANISM FOR SHUTTLE CHANGING LOOMS

William W. Robertson, Marlboro, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application August 5, 1935, Serial No. 34,660
10 Claims. (Cl. 139—231)

1. In a shuttle changing loom having a shuttle box from which a depleted shuttle is removed during the shuttle changing period, protector mechanism to be positioned by a shuttle in the shuttle box, stopping means to stop the loom during the shuttle changing period, shuttle changing mechanism effective to place a reserve shuttle into the shuttle box, preventing mechanism to arrest operation of the shuttle changing mechanism, control means for the preventing mechanism, actuated by the stopping means to move the preventing mechanism into arresting relation with respect to the shuttle changing mechanism, the protector mechanism thereafter operative when the shuttle box is occupied by a depleted shuttle to actuate the control means and thereby cause the latter to move the preventing mechanism out of arresting relation with respect to the shuttle changing mechanism.

2,103,824



VIBRATION ARRESTER FOR TUBE FRAMES

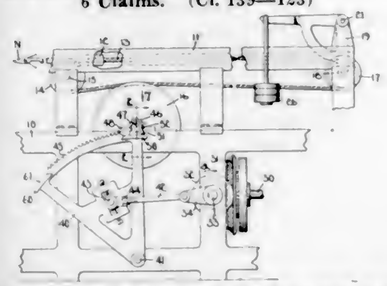
William W. Robertson, Northboro, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application April 15, 1936, Serial No. 74,527
9 Claims. (Cl. 139—9)

1. In an Axminster loom, a transporting chain, a series of yarn tubes carried by the chain and from which project tuft yarns, carrier means to

convey the yarn tubes and yarns from the transporting chain to cloth forming position along a given path, and yielding stationary means lo-

cated intermediate the ends of the tube frame and projecting into the path of the carrier means to engage the latter and exert a yielding pressure thereon to arrest vibration of said carrier means.



2,103,825

NEEDLE MOTION FOR AXMINSTER LOOMS

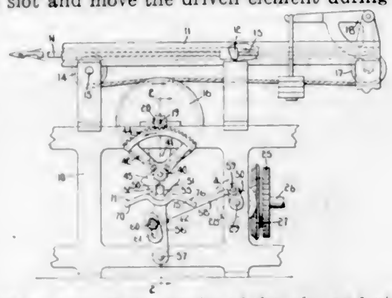
William W. Robertson, Northboro, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application December 21, 1936, Serial No. 116,967

6 Claims. (Cl. 139—123)

1. In a needle motion for an Axminster loom, a drum to be rotated to actuate the needle, a pinion fixed with respect to the drum, an arcuate set of teeth to mesh with the pinion, a locking surface concentric with the arcuate teeth and moving therewith and extending beyond the teeth in the direction of motion of the latter, and a lock rotating with the pinion and having a curved surface to engage said concentric surface to prevent rotation of the pinion when said concentric surface moves with respect to the lock.

2,103,826



NEEDLE MOTION FOR AXMINSTER LOOMS

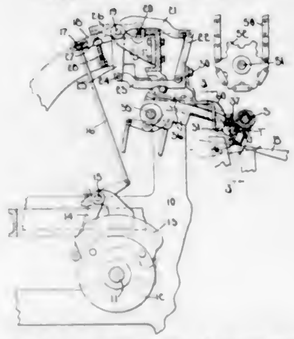
William W. Robertson, Northboro, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application December 21, 1936, Serial No. 116,968

5 Claims. (Cl. 139—123)

1. In a needle motion for an Axminster loom, a drum to be rotated to actuate the needle, a pinion fixed with respect to and rotating with the drum, a segment gear meshing with the pinion at all times, a driven element fixed with respect to the segment and having a slot and locking surface, a constantly moving crank arm, an actuating pin reciprocated by the crank arm and having a stroke part of which is working and part of which is non-working, and a lock moving with the pin, the crank arm to cause the pin to enter the slot and move the driven element during the

working part of the stroke of the pin, and at the conclusion of the latter move the locking surface of the element into holding relation with respect to the locking surface of the pin to prevent movement of the segment during the non-working part of the stroke of the pin.



2,103,827

VIBRATION ARRESTER FOR TUBE FRAMES

William W. Robertson, Northboro, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application January 2, 1937, Serial No. 118,801

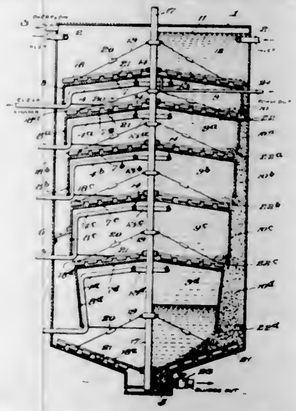
10 Claims. (Cl. 139—7)

1. In an Axminster loom, a tube frame movable toward cloth forming position along a given path, a brace movable into supporting relationship with respect to the tube frame as the latter moves toward cloth forming position, and means carried by the brace and extending into said given path to engage and prevent vibration of the tube frame prior to engagement of the brace with respect to the tube frame.

2,103,828

PROCESS OF AND APPARATUS FOR CLARIFYING LIQUIDS

John J. Seip, Allentown, Pa.



Application December 8, 1932, Serial No. 646,346

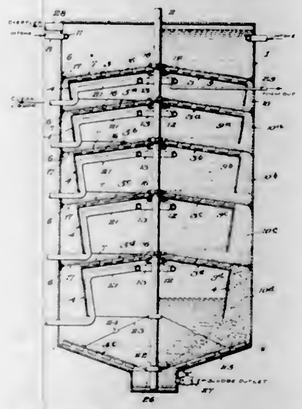
Renewed August 26, 1937

7 Claims. (Cl. 210—55)

7. In an apparatus for clarifying liquors from suspended solids, a tank, a plurality of superimposed trays centrally mounted in said tank having diameters smaller than that of said tank

and being provided with peripheral flanges depending close to the tops of the next lower trays, said trays being closed at the top being substantially horizontal but sloping slightly downwardly towards their periphery and defining a plurality of central clarifying zones and a peripheral discharge zone for solids, the spaces left between said flanges and said trays providing the sole entrance for liquor to be clarified into said clarify-

ing zones, means for introducing liquor to be clarified into the tank above said trays, means for withdrawing clarified liquor mounted centrally at the upper part of said clarifying zones, means for mechanically propelling solids precipitated on said trays peripherally along the surface of said trays through said entrances and into said discharge zones in counter flow to the liquor passing through said entrances and means for withdrawing sludge from the bottom of said tank.



2,103,829

CLARIFYING LIQUIDS AND APPARATUS THEREFOR

John J. Seip, Allentown, Pa.

Application November 20, 1936, Serial No. 111,941

8 Claims. (Cl. 210—55)

1. In the clarification of liquors containing solids in suspension, the process which comprises establishing and maintaining a plurality of superimposed clarifying zones communicating with a discharge zone for solids and separated by transverse precipitation surfaces, passing liquor to be clarified from said discharge zone into the lower sections of said clarifying zones, passing precipitated solids along said surfaces into said discharge zone in a direction counter to the flow of said liquor and at such a rate that beds of solids in suspension are produced in the lower sections of said clarifying zones in such a position that substantially all liquor entering said zones is forced to pass upwardly through said stratified beds of suspended solids and withdrawing clarified liquor from the upper sections of said clarifying zones.

2,103,830

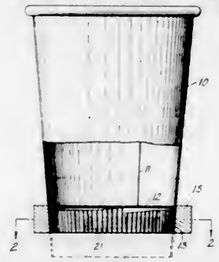
METHOD FOR MASKING THE ODOR OF DRYING PAINTS, VARNISHES, AND THE LIKE AND FRAGRANT ODOR-MASKED PAINT

Leroy W. Shuger, Baltimore, Md., assignor to Baltimore Paint and Color Works, Inc., Baltimore, Md., a corporation of Maryland

No Drawing. Application May 20, 1936, Serial No. 80,920

4 Claims. (Cl. 134—39)

2. The method of masking the odor of drying paints, varnishes and the like containing volatile solvents having pungent odors and drying oils which comprises adding thereto a fragrant odor-masking composition composed of a plurality of individual fragrant odor-masking ingredients of progressive volatility, some of said fragrant odor-masking ingredients serving to mask the odor of the evaporating volatile solvents in the paint or varnish as it dries, the quantity of said fragrant ingredients masking the odor of the evaporating volatile solvents being sufficient to complete the masking of the odor of the evaporating volatile solvents and to disappear with said evaporating solvents, other of said individual fragrant odor-masking ingredients serving to mask the odor of oxidation of said drying oils after the evaporation of said solvents as the paint or varnish dries, the quantity of said fragrant ingredients masking the odor of the oxidizing drying oils being sufficient to complete the masking of the odor of the oxidizing drying oils and to disappear with the completion of the oxidation of said drying oils.



2,103,831

CUP

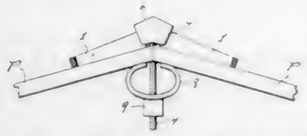
Max Sidon, Fulton, N. Y., assignor to Oswego Falls Corporation, Fulton, N. Y., a corporation of New York

Application December 11, 1936, Serial No. 115,407

3 Claims. (Cl. 229—5.5)

1. A container comprising a tapered body portion formed of flexible material, a bottom member arranged in the body and having a depending annular flange extending toward and being spaced apart from the lower end of said body, said lower end portion of the body being folded

over the end of said flange, said infolded portion being expanded outwardly into engagement with the inner side of said flange and being formed with lengthwise extending corrugations.



2,103,832

CORNER CLAMP FOR MITERED STORE FRONT CONSTRUCTIONS

Donald J. Tindall, Orlando, Fla.

Application October 13, 1936, Serial No. 105,418

5 Claims. (Cl. 189—78)

1. A corner clamp for store front construction comprising two clamping plates substantially in endwise alignment with opposed end faces in spaced relation, a flexible connecting means between the opposed portions of the plates, a screw carrying a cap, a wedge member carried by the screw for engagement between the opposed faces of the clamping plates, and clamping means carried by the screw for coaction with the plates.

2,103,833

COMBINED FASTENING STRUCTURE

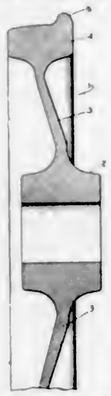
George A. Tinnerman, Rocky River, Ohio, assignor to Albert H. Tinnerman, Cleveland, Ohio

Original application November 19, 1936, Serial No. 111,653. Divided and this application June 15, 1937, Serial No. 148,363

4 Claims. (Cl. 189—36)

1. In securing parts not accessible from both sides, the combination of a support readily accessible from one side only and provided with a bolt passage, a part to be connected to said support and a one-piece connecting device comprising a pair of members, one of which is provided with bolt receiving means deformed therefrom and is applicable from the accessible side to be positioned on the inaccessible side of the support to receive a bolt fastening and to cooperate with the other of said members to maintain the device in applied position, said other member having an opening receiving the bolt and cooperating therewith in the securing operation to retain the connecting device in applied position and suitably register said bolt receiving means with the said bolt passage in the support thereby facilitating ready fastening engagement of the bolt in securing said part to be connected to the support.

2,103,834



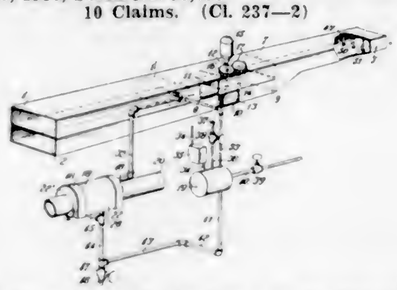
WHEEL

John D. Tyson, Derry Township, Mifflin County, Pa.

Application November 29, 1933, Serial No. 700,272

6 Claims. (Cl. 295—30)

4. A plain carbon steel railway wheel rim of medium carbon content normally having a troostitic and sorbitic structure formed by heating the wheel rim above its recalescence point and then quenching the same, whereby the generation of heat during braking action and subsequent cooling allows substantially the same metallographic structure to be maintained.



2,103,835

STEAM HEATING SYSTEM

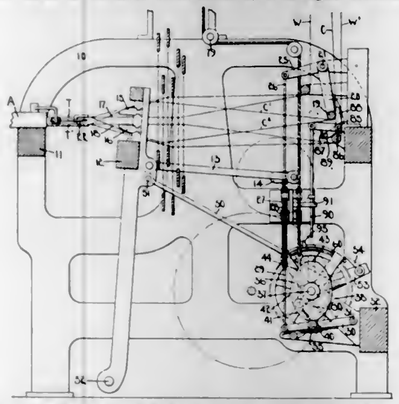
John Van Vulpen, Chicago, Ill., assignor to Vapor Car Heating Company, Inc., Chicago, Ill., a corporation of New York

Original application January 17, 1936, Serial No. 59,568. Divided and this application August 13, 1936, Serial No. 95,758

10 Claims. (Cl. 237—2)

1. In a system for heating a compartment, a main conduit for delivering air into the compartment, a pair of inlet conduits for delivering air into the main conduit, each inlet conduit having an inlet opening through which outside air flows in and having a pair of alternative discharge outlets one leading into the main conduit and the other to the outside air, means for maintaining a continuous air flow through each of these inlet conduits, a radiator positioned in one of the inlet conduits between the inlet and outlet openings thereof, means continuously supplying heating medium to the radiator, valve means in each inlet conduit for alternatively opening or closing the respective outlets, and means for simultaneously adjusting the valves to determine the proportions of heated and unheated air delivered into the main conduit.

2,103,836



WARP SLACKENER FOR LOOMS

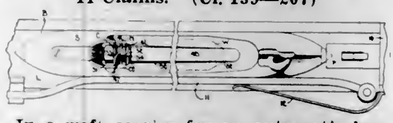
Walter H. Wakefield, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application December 14, 1936, Serial No. 115,713

10 Claims. (Cl. 139—20)

1. In a loom having a warp to be slackened, a slackener having warp slackening and return movement, a regulator for the slackener having two different motions the first of which occurs when the slackener has a slackening movement and the second of which occurs when the slackener has a return movement, a single actuator

means for the regulator, and a controller for the actuator means to render the latter effective to give the regulator a relatively quick large motion when the slackener is to have a slackening movement and effective to give the regulator a gradual slower movement when the slackener is to have a return movement.



2,103,837

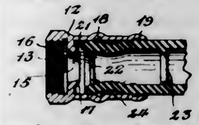
WEFT CARRIER FOR AUTOMATIC LOOMS

Walter H. Wakefield, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application January 2, 1937, Serial No. 118,797

11 Claims. (Cl. 139—207)

1. In a weft carrier for an automatic loom, a pair of spring jaws, a weft carrying bobbin having a head, supporting means for the bobbin having portions thereof out of engagement with the jaws and in close engagement with the head and having other portions thereof resilient and spaced from the head and engaging the jaws to constitute the supporting relation between the jaws and bobbin, said other portions being yieldable in a direction parallel to the axis of the bobbin.



2,103,838

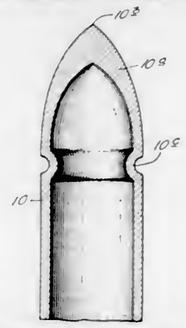
HOSE COUPLING

Anton Marinus Bach, Palo Alto, Calif.

Application August 30, 1937, Serial No. 161,666

6 Claims. (Cl. 285—71)

1. A hose coupling comprising in combination, a metallic fitting having an internal tapered collar, an internal annular recess in advance of the collar, an expansible rubber fitting of a diameter to loosely fit within the fitting and having an end complemental to the collar, a shoulder on the exterior of the rubber fitting for seating engagement within the annular recess of the fitting, and said fitting having an annular recess adjacent its end whereby to permit expansion of a portion of the hose thereinto.



2,103,839

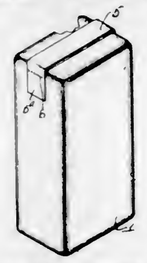
METHOD OF MAKING POSTS

Nicholas J. Bardell, Chicago Heights, Ill., assignor to Mid-West Forging Company, Chicago, Ill., a corporation of Illinois

Application June 15, 1936, Serial No. 85,406

2 Claims. (Cl. 29—156)

1. The process of making a metal post with a closed upper end and having an exterior annular groove, consisting of providing a suitable length of metal tubing, heating the end to make the same malleable and while hot, swedging the end until the same is closed and hermetically sealed and thickened and while still hot and malleable, forming an exterior annular groove therein approximately at the juncture of the thickened end with the remainder of the post.



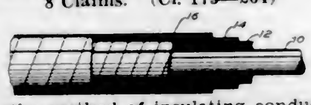
2,103,840

PACKAGE FASTENING MEANS

Hans A. Bauer, Chicago, Ill., assignor to B. F. Gump Co., Chicago, Ill., a corporation of Illinois

Application March 7, 1936, Serial No. 67,646

6 Claims. (Cl. 229—65)



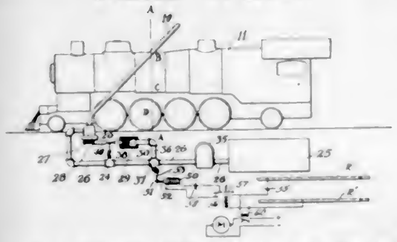
1. A package comprising a bag having a folded neck portion, a metal tie associated with said folded neck portion and having its ends folded inwardly in parallel relation with the body of the strip, a sealing strip secured to the folded neck portion of the bag and having terminal flaps glued to the body of the bag below the top, said strip having weakened sections adjacent said flaps and being unsecured to said bag between said weakened sections and the top edge of the bag.

2,103,841

METHOD OF INSULATING CONDUCTORS

John F. Calvert, Ames, Iowa, assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application January 30, 1937, Serial No. 123,243
8 Claims. (Cl. 173—264)



1. In the method of insulating conductors, in combination, covering the conductor with a layer of self-polymerizing material containing an inhibitor, covering the layer of self-polymerizing material containing the inhibitor with a layer of self-polymerizing material containing a catalyst, exposing the covered conductor to sufficient heat to cause the layer of material containing the catalyst to harden without causing polymerization of the material containing the inhibitor, and subjecting the covered conductor to heat and pressure to cause the material containing the inhibitor to harden, the layer of material hardened before the polymerization of the material containing the inhibitor preventing vaporization of the materal polymerized under the heat and pressure.

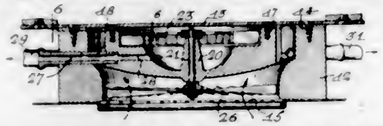
2,103,842

VEHICLE WASHING MACHINE

Harcourt C. Drake, Hempstead, N. Y., assignor to Sperry Products, Inc., Brooklyn, N. Y., a corporation of New York

Application February 17, 1933, Serial No. 657,230
9 Claims. (Cl. 141—1)

1. In a washing apparatus for vehicles, a hollow standard having a plurality of nozzles therein through which washing fluid can flow, means whereby said standard is swivelly mounted for actuation to operating and non-operating positions, means for supplying washing fluid under pressure to said standard and means whereby the flow of said fluid under pressure to said standard moves said standard to one of said positions.



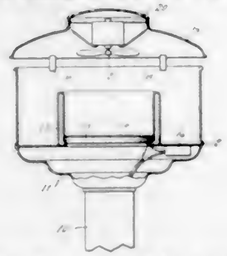
2,103,843

VENTILATOR

Melanie Filion, née Le Compte, Montreal, Quebec, Canada

Application March 27, 1936, Serial No. 71,323
1 Claim. (Cl. 98—2)

A ventilator of the character described, comprising a shell constituted of an annular member closed at the top and having a bottom opening, a case mounted against the closed top of the shell and spaced from the annular member, said case having an upper interior chamber concentrically formed therein with a central lower depression of smaller diameter, a driving wheel rotatably mounted within the upper case chamber in close proximity to the walls thereof, a suction conduit having communicative connection with the lower depression of the case for operation of the wheel by suction, the said case having an air inlet aperture formed in the upper portion at the wheel periphery, a fan connected



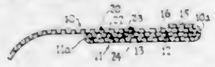
with the driving wheel below the case and across the shell opening, and outlet conduits connected with the inside of the shell for expelling therefrom air drawn therein by the wheel-driven fan.

2,103,844

AIR CONDITIONING DEVICE

Arthur W. Conley, Shaker Heights, Ohio

Application December 23, 1935, Serial No. 55,755
6 Claims. (Cl. 219—39)



3. In combination, in an air conditioning device, a receptacle, an upstruck boss in the bottom thereof, a heater in said boss beneath said receptacle, and a heat insulating partition received loosely over said boss whereby water may pass slowly from outside to inside of said partition, and means including a fan for producing a circulation of air from outside said receptacle in vapor absorbing relation to the space within said partition and thence to the outside of said receptacle.

2,103,845

TROUSER CUFF AND METHOD OF FASTENING SAME

Charles B. Goodstein, New York, N. Y.

Application February 15, 1937, Serial No. 125,777
12 Claims. (Cl. 2—232)

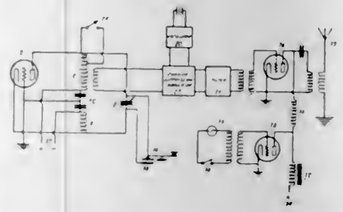
1. A plurality of superimposed layers of flexible sheets, and means for fastening said sheets together, comprising a staple having a crown at the outer surface of an outer sheet, legs having pointed ends piercing said outer sheet and at least one other sheet, going in and coming out, the ends of said legs being hooked back into U-shape to point toward the crown at the outer surface of said outer sheet, and being embedded in said outer sheet.

2,103,846

TRIPHENYLMETHANE DYESTUFFS

Hans Grotowsky, Krefeld-Uerdingen, Germany, assignor to General Aniline Works, Inc., New York, N. Y., a corporation of New York

No Drawing. Application October 2, 1936, Serial No. 103,669. In Germany October 8, 1935
5 Claims. (Cl. 260—68)



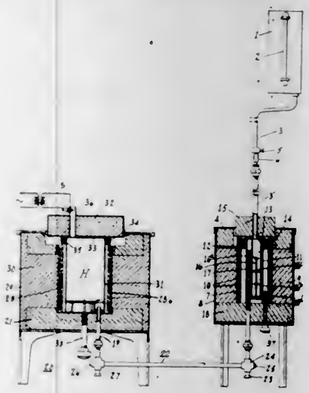
1. A triarylmethane dyestuff containing at least one aryl radicle carrying at least one auxochrome and at least another aryl radicle carrying at least one amino radicle substituted by at least one arylated ethylsulfonic acid radicle.

2,103,847

SIGNALING

Clarence W. Hansell, Rocky Point, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Application October 2, 1928, Serial No. 309,877
10 Claims. (Cl. 179—15)



1. The method of transmitting multiplex signals on a high frequency carrier which includes continuously changing the frequency of the carrier through each frequency of a band of frequencies in accordance with one of the signals to be transmitted, selecting a side band from the resultant modulated energy and amplitude modulating the side band in accordance with another of the signals to be transmitted.

2,103,848

HEAT TREATMENT OF STEELS

John W. Harsch, Gwynedd, Pa., assignor to Leeds & Northrup Company, Philadelphia, Pa., a corporation of Pennsylvania

Application May 12, 1934, Serial No. 725,280
1 Claim. (Cl. 148—16)

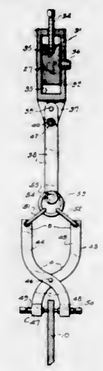
In the art of hardening, tempering or toughening steels or alloy steels of high carbon content, the method of maintaining, during heating to quenching temperature within a range of from about 1300° F. to 2000° F., the carbon content of the steel substantially constant and its surface in condition ensuring high rate of and uniform quenching, which comprises bringing the steel to quenching temperature, simultaneously providing about the steel an atmosphere comprising products of endothermic cracking of an organic compound, or mixture of organic compounds, of chemically definite composition of carbon, hydrogen and oxygen, and maintaining in said atmosphere a concentration of carbon preventive of oxidation and decarburization of and case-formation upon the steel.

2,103,849

METHOD OF MAKING GLYCOLS

Joseph R. Heard, Jr., New York, N. Y., assignor to Cesare Barbieri, New York, N. Y.

No Drawing. Application June 1, 1936, Serial No. 82,679½
7 Claims. (Cl. 260—156.5)



1. The process of manufacturing a mixture of glycols which comprises continuously passing finely dispersed gases containing alkylenes from a vapor phase cracking of petroleum into water at a temperature below 20° C., continuously passing finely dispersed chlorine into said water to form chlorohydrins and alkylene chlorides, drawing off a solution containing below 20% chlorohydrins of said gaseous alkylenes, conveying said solution of chlorohydrins to distilling equipment, continuously removing alkylene chlorides and chlorohydrins by steam distillation into separate receivers, passing said chlorohydrins into a suspension of lime of about 50 parts of lime in about 100 parts of water heated to about 80° C., hydrolyzing said chlorohydrins to alkylene oxides and neutralizing hydrochloric acid produced by said hydrolysis, continuously passing said alkylene oxides into about 0.5% sulfuric acid at about 20° C., to form glycols, adding a calcium compound to precipitate said sulfuric acid as calcium sulfate, filtering off said sulfate and continuously evaporating said substantially sulfuric acid free solution of glycols whereby mixed glycols of the alkylenes are produced.

2,103,850

APPARATUS FOR SUPPORTING GLASS SHEETS

Robert S. Hinsey, Toledo, Ohio, assignor to Libby-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio

Application December 26, 1935, Serial No. 56,179
7 Claims. (Cl. 49—14)

1. Apparatus for use in the tempering of glass sheets, comprising movable supporting means including a horizontal supporting bar, a tong supporting unit secured to said bar and including a pivotally mounted hanger element, means for

securing the hanger element against pivotal movement, and a tong carried by said hanger element and having work gripping portions adapted to engage the glass sheet.

2,103,851

RAIL FLAW DETECTOR MECHANISM

George L. Jones, Garden City, and Abraham Winburn, Brooklyn, N. Y., assignors to Sperry Products, Inc., Brooklyn, N. Y., a corporation of New York

Application February 6, 1935, Serial No. 5,250
8 Claims. (Cl. 177—311)

1. In a rail flaw detector mechanism, means responsive to flaw, the degree of energization of said responsive means varying with different flaws, a supply of marking fluid, means for separating from said supply a measured quantity of said fluid, and means controlled by energization from said responsive means in excess of a predetermined degree, irrespective of the amount of excess, for discharging said measured quantity of fluid in the region of flaw.

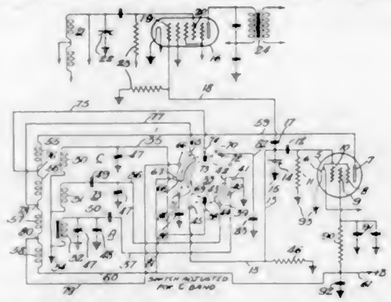
2,103,852

KNITTING MACHINE

Julius Kessler, Brooklyn, N. Y.

Application August 23, 1935, Serial No. 37,413
3 Claims. (Cl. 66—86)

1. In a knitting machine having yarn rods, a main shaft for actuating said machine, a pattern chain on each end of the machine, a pair of pivoted pattern chain supporting members, crank arms connected to said supporting members for moving said pattern chains synchronously but alternately toward and away from the yarn rods and power transmission means associating the crank arms with the main shaft to produce a forward and backward movement of both pattern chains during each revolution of the main shaft.



2,103,853

MULTI-RANGE TUNABLE OSCILLATOR

Loren R. Kirkwood, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application June 30, 1936, Serial No. 88,175
12 Claims. (Cl. 250—36)

11. In an oscillator for a battery operated receiver, an oscillator circuit comprising a plurality of secondary windings selectively connectible into the oscillator circuit, means providing a high and a low frequency primary winding in coupled relation to each of said secondary windings, and means for connecting the low frequency primary for a higher frequency secondary winding in circuit to provide a high frequency

primary winding for a lower frequency secondary winding.

2,103,854

GARMENT SUPPORTING ATTACHMENT

Clarence Knol, Grand Rapids, Mich.

Application April 6, 1936, Serial No. 72,923
2 Claims. (Cl. 223—88)

1. In combination with a coat hanger having a horizontal rod member, of a garment supporting attachment comprising, a length of wire bent to substantially inverted V-shape adapted to pass over and to be pendant from said rod, one leg of the V-shaped portion depending each side of the rod member, means whereby said attachment is held positively on said rod from downward movement and held yieldably from upward and longitudinal movement along said rod, the legs of said V-shaped portion terminating in hook portions.

2,103,855

ALLOY

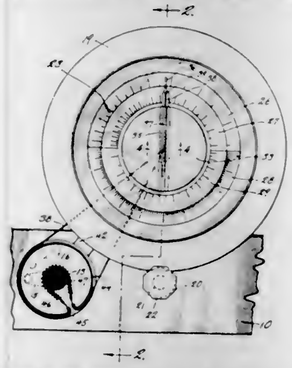
Harry E. La Bour, Elkhart, Ind., assignor to The La Bour Company, Inc., Elkhart, Ind., a corporation of Indiana

No Drawing. Application May 27, 1935, Serial No. 23,699
2 Claims. (Cl. 75—171)

1. A corrosion resisting alloy consisting of the following:

	Percent
Nickel	50 to 55
Chromium	20 to 30
Iron	2 to 12
Silicon	3½ to 5
Molybdenum	2 to 6
Tungsten	1 to 3
Carbon	under .30
Manganese	under 1
Copper	3½ to 7

2,103,856



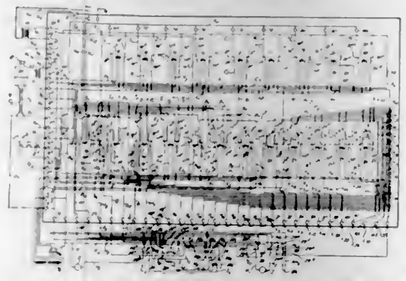
DIAL

Frederick Liessmann, Chicago, Ill., assignor to Electrical Research Laboratories, Inc., Chicago, Ill., a corporation of Illinois

Application October 7, 1935, Serial No. 43,890
9 Claims. (Cl. 116—124.1)

1. A wave band indicator for a multi-wave band radio set having a wave band selector

switch, comprising a dial having a scale thereon for each such wave band, a pointer rotatable over the face of said dial, and means to move said pointer longitudinally in a straight-line path



through its axis of rotation to indicate a wave band scale on said dial, said means comprising a continuously operable connection between said pointer and said selector switch.

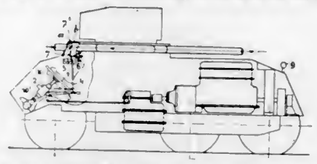
2,103,857

SIGNAL SYSTEM

William D. Lindsey, South Orange, N. J., assignor, by mesne assignments, to The Sealand Corporation, a corporation of Connecticut

Application November 17, 1933, Serial No. 698,389
13 Claims. (Cl. 179—5)

1. In a signal system, a sound reproducing system, a central station for controlling the operation of the sound reproducing system including means for operating the sound system as an address system, additional means for effecting the operation of the sound system to give audible directions including a record and means for delivering the recorded sound into the sound reproducing system, and means adapted to be operated upon the existence of a particular condition for effecting the operation of said additional means to effect the operation of the sound system.



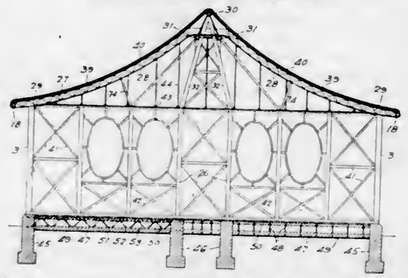
2,103,858

AUTOMOBILE VEHICLE FOR FORWARD AND BACKWARD TRAVEL

Eugen Luschinsky, Vienna, Austria

Application January 15, 1936, Serial No. 59,177
In Austria February 2, 1935
9 Claims. (Cl. 280—87)

1. In a power driven vehicle having a steering gear and adapted for travelling forwardly and rearwardly, the combination of an optical viewing device for the driver having change over means for enabling the driver to see optionally in front or behind him without turning his head or body, and a reversing gear interposed in the steering gear for changing over the steering movement produced during the actuation of the



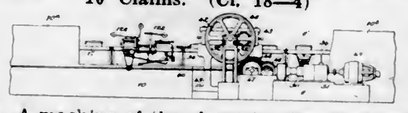
steering gear by the driver, said reversing gear being adapted to be placed into and out of operation and having means operatively connected to the change over means of the optical viewing device for changing over the steering movement simultaneously with the change over of the optical viewing device from forward to rearward viewing.

2,103,859

BUILDING CONSTRUCTION

Walter W. Macfarren, Los Angeles, Calif.

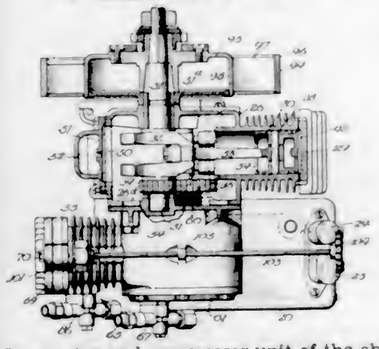
Application July 25, 1936, Serial No. 92,575
15 Claims. (Cl. 108—1)



1. In a building structure, supporting members such as columns or walls, a roof comprising a sheet of material adapted to resist tensile stresses, the said sheet being suspended in the form of a catenary curve, and continuous bracing means extending from one sheet support to the other, to prevent distortion from the said catenary curve.

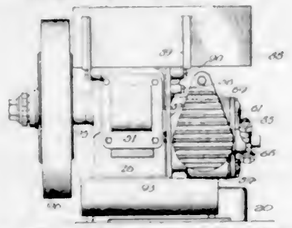
2,103,860

MACHINE FOR PRODUCING RUBBER AND SIMILAR ARTICLES



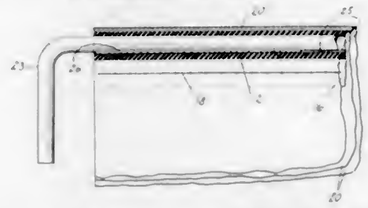
Hector Mazzeo, Buenos Aires, Argentina

Application December 12, 1936, Serial No. 115,461
10 Claims. (Cl. 18—4)



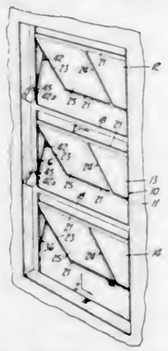
1. A machine of the character described comprising a series of mold boxes having hinged covers provided with mold cavities, means for moving said mold boxes in an endless path, means for feeding moldable material to said mold boxes, while the covers thereof are open, means rendered operable by movement of said mold boxes to swing the covers thereof toward closed positions and to press said covers to completely closed positions, and a thermal treatment chamber through which the mold boxes travel while moving in their endless path.

2,103,861
MOTOR AND COMPRESSOR UNIT
Lee W. Melcher, Waukesha, Wis., assignor to Waukesha Motor Company, Waukesha, Wis.
Application May 31, 1934, Serial No. 728,229
Renewed June 8, 1936
5 Claims. (Cl. 230—56)



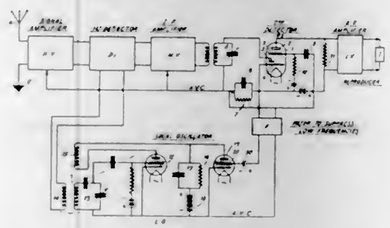
1. In a motor and compressor unit of the character described, the combination of a base provided with a reservoir for liquid fuel and also provided with an integral side extension; an internal combustion motor comprising a casing embodying a cylinder and a crank case joined to the cylinder and fitting on and secured to the top of the side extension; a compressor comprising a casing secured to one side of the motor casing and overlying and spaced from the reservoir; and a shaft extending from the crank-case of the motor casing into the compressor casing for driving the compressor from the motor.

2,103,862
REFRIGERATING UNIT
Lee W. Melcher, Waukesha, Wis., assignor to Waukesha Motor Company, Waukesha, Wis., a corporation of Wisconsin
Original application May 31, 1934, Serial No. 728,229. Divided and this application October 18, 1934, Serial No. 748,883
5 Claims. (Cl. 62—115)



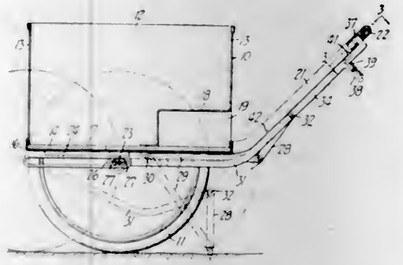
1. In a refrigerating unit of the character described, the combination of an internal combustion motor comprising a crank-case, a cylinder connected to and extending outwardly from one side of the crank-case and a crank-shaft journalled in said crank-case and having one end thereof projecting through, and extending beyond, one end of the case; a compressor associated with and driven by the motor; a condenser connected to receive compressed refrigerant from the compressor and consisting of a coil positioned adjacent to the cylinder; and a flywheel mounted on said one end of the crank shaft of the motor and provided with blades arranged to force streams of air from them around the condenser coil and the motor cylinder during operation of the motor.

2,103,863
VISOR CONSTRUCTION
William O. Meller, Monroe, Mich., assignor to Woodall Industries Incorporated, Detroit, Mich., a corporation of Michigan
Application December 28, 1936, Serial No. 117,732
8 Claims. (Cl. 296—95)



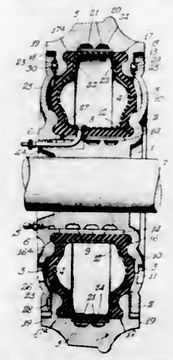
1. In a visor assembly, a visor panel provided with a tubular rubber pivot mounting, a supporting rod received within said mounting supporting the visor for rotatable adjustment about the rod, a soft metal wire extending lengthwise through said tubular mounting engaging said rod and holding the mounting away from the rod along the wire.

2,103,864
WINDOW CONSTRUCTION
Tomlinson I. Moseley, San Francisco, Calif., assignor to Dalmo Sales Corporation, San Francisco, Calif., a corporation of California
Application April 22, 1935, Serial No. 17,640
10 Claims. (Cl. 189—67)



1. In a multiple sash window, a rectangular frame including vertical side members which are formed to afford vertical channels, at least two sashes carried by the frame for swinging movement about generally horizontal axes, means including a pair of travel bars extending vertically within said channels for interconnecting the sashes, thereby enabling conjoint movement of the sashes, a disengageable clutch mechanism interposed in said connecting means whereby upon disengagement of said clutch mechanism one of said sashes can be manipulated between open and closed positions independently of the other, a horizontal member extending between the vertical side members of the frame and rigidly secured to the same, and cam means serving to effect automatic engagement and disengagement of said clutch mechanism, said cam means including one cam element carried by a travel bar and another operating cam element carried by one end of said horizontal member.

2,103,865
SUPERHETERODYNE AUTOMATIC GAIN CONTROL SYSTEM
Jacobus C. Nonnekens, Eindhoven, Netherlands, assignor to Radio Corporation of America, a corporation of Delaware
Application June 27, 1934, Serial No. 732,558
In the Netherlands August 3, 1933
4 Claims. (Cl. 250—20)

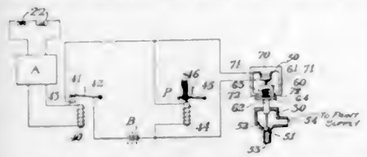


1. In a signal receiver, a frequency changer network adapted to have signals impressed thereon, a local oscillator coupled to the said network and impressing current thereon of a frequency differing from the signals by a desired beat frequency, a detector adapted to have the beat current impressed thereon, and means, responsive to the variations in the direct current component of the detected beat current, for varying the amplitude of the oscillator current in a direction such that the amplitude of the beat current is substantially constant, said last means including an electron discharge tube having its input electrodes arranged to have the said component impressed therebetween, and an impedance common to the space current paths of said tube and the local oscillator.

2,103,866
HAND CART
Kathleen Norris, Palo Alto, Calif.
Application October 19, 1936, Serial No. 106,278
3 Claims. (Cl. 280—51)

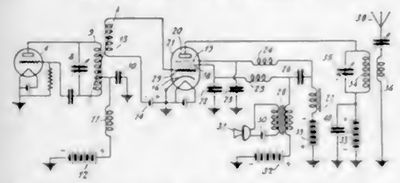
1. In a cart, a cart body, a handle extending from one end of the body, a shaft extending laterally across the body, a pair of wheels carried by the ends of the shaft, means for movably mounting the shaft near the underside of the body whereby the axis of the shaft can be shifted from a position near the center of gravity of the cart, to a position adjacent one end of the cart, a retractable ground engaging support for the other end of the body, and manually operable means for simultaneously actuating both the retractable support and for moving the shaft between said two positions.

2,103,867
RESILIENT WHEEL
Andrew J. Park, Pueblo, Colo.
Application July 2, 1934, Serial No. 733,350
11 Claims. (Cl. 152—41)



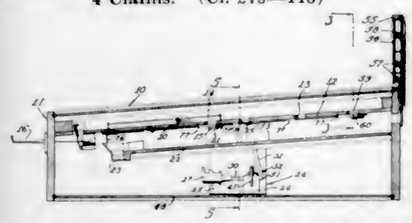
1. In a wheel of the class described the combination of a hub portion provided with a series of peripheral grooves a valve stem exit and a peripheral flange; said peripheral flange having a convex concave portion containing a plurality of cooling vents, an annular channel adjacent to said hub portion and a series of ball retaining pockets, a band disposed on said hub portion over said peripheral grooves so as to form dead air spaces in said peripheral grooves; a pneumatic tire casing, having an inner and an outer bead on each exterior side, disposed on said band so that the adjacent inner bead of said tire casing fits in said annular channel in said peripheral flange; an inner tube disposed in said casing so that the valve stem emerges through said valve stem exit; a rim provided with a pair of internal flanges, a pair of external flanges, an external rail guide flange, and a series of internal grooves, each internal flange being provided with an annular channel, and a series of ball retaining pockets, said rim being disposed on said tire casing so that each outer bead of said casing fits into an annular channel of each internal flange of said rim; a hoop disposed within said rim so as to cover said internal grooves and form dead air spaces within said internal grooves; a side plate having a convex portion containing a series of cooling vents and provided with an annular bead receiving channel and an annular ball receiving channel, said side plate being mounted on said hub portion so that the adjacent inner bead of said casing fits into the bead receiving channel of said side plate; a ball disposed in each pair of registering ball retaining pockets in said peripheral flange of said hub portion and the adjacent internal flange of said rim; and a ball disposed in each ball retaining pocket in the remaining internal flange of said rim and the annular ball receiving channel of said side plate.

2,103,868
RAIL FLAW DETECTOR MECHANISM
Walter M. Perry, Brooklyn, N. Y., assignor to Sperry Products, Inc., Brooklyn, N. Y., a corporation of New York
Application February 9, 1935, Serial No. 5,754
8 Claims. (Cl. 177—311)



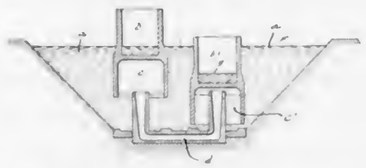
1. In a flaw detector mechanism, means responsive to flaw, the duration of response varying with different flaws; marking means, means including an operating connection whereby said

responsive means actuates said marking means as long as said connection remains effective, and means for limiting the actuation of said marking means regardless of the duration of the re-



sponse of said responsive means, said last-named means comprising means for rendering said connection ineffective after a predetermined duration of actuation of said marking means.

2,103,869
SIGNALING CIRCUIT
Harold Olaf Peterson and Martin Katzin, Riverhead, N. Y., assignors to Radio Corporation of America, a corporation of Delaware
Application October 26, 1933, Serial No. 695,254
18 Claims. (Cl. 179—171)

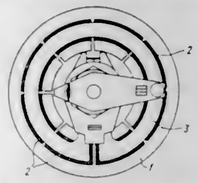


1. The method of effecting distortionless modulation of carrier frequency oscillations by means of a thermionic tube having a control grid electrode, a cathode electrode, an anode electrode and a plurality of intermediate auxiliary electrodes which includes the steps of, impressing the carrier frequency oscillations on said control grid electrode, and applying the modulating potentials in phase to a pair of said auxiliary electrodes while maintaining the same at different direct current potentials with respect to said cathode.

2,103,870
GAME APPARATUS
David C. Rockola, Chicago, Ill., assignor, by mesne assignments, to Rock-Ola Manufacturing Corporation, Chicago, Ill., a corporation of Delaware
Application August 23, 1935, Serial No. 37,423
4 Claims. (Cl. 273—118)

2. A control device comprising switch means including a pair of switch arms, a switch-operating arm, means normally urging said arm into operative engagement with said switch means, said arm having serrations for engagement with one of said switch arms to position the same in operated condition, and said arm having a part engageable with the other switch arm of said pair to urge the same into circuit closing condition when said operating arm is initially moved for operative engagement with said switch means, an electro-magnetic device including a moving element and switch means operable to energize said device, means on said moving element engageable with said operating arm to latch the same against switch-operating movement but effective to release said arm when said electro-magnetic device is energized.

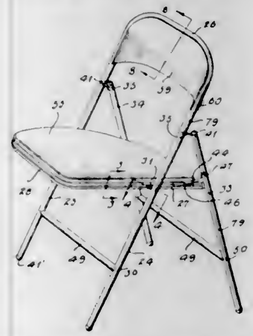
2,103,871
CANAL LOCK
Leopold Rothmund, Stuttgart, Germany
Application April 23, 1935, Serial No. 17,760
In Germany May 12, 1934
3 Claims. (Cl. 61—8)



1. In combination with a waterway having an upper water level portion including a lock basin having the same water level as said upper water level portion, a lower water level portion, and gates between said lock basin and said lower water level portion; a pair of floating troughs in said lock basin one to be elevated while the other is lowered and vice-versa, said troughs having end gates, each trough also having as a fixed part thereof an open-bottom air chamber closed at its top and sides, and an air conduit connecting said air chambers, said air chambers being disposed relative to said troughs so as to be at all times completely submerged in the water of the lock basin.

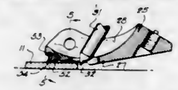
2,103,872
HIGH MOLECULAR NITROGENOUS ORGANIC COMPOUNDS CONTAINING CARBOXYLIC GROUPS
Conrad Schoeller and Paul Koerding, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application December 8, 1934, Serial No. 756,706. In Germany December 12, 1933
7 Claims. (Cl. 260—112)

1. Assistants for the textile and related industries comprising a polyamine the different amino groups of which are separated from one another by a hydrocarbon radicle containing from 2 to 12 carbon atoms, containing attached to at least one of the amino nitrogen atoms an organic radicle containing at least 12 carbon atoms and containing at least one low molecular aliphatic radicle with at least one carboxylic acid group.



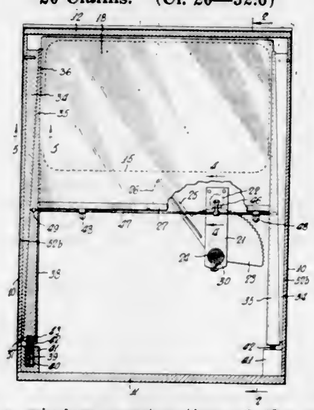
3. Assistants for the textile and related industries comprising a polyamine the different amino groups of which are separated from one another by a lower alkylene radicle, containing attached to at least one of the amino nitrogen atoms an aliphatic radicle containing at least 12 carbon atoms and containing at least one low molecular aliphatic radicle with at least one carboxylic acid group.

2,103,873
VARIABLE RESISTOR DEVICE
Edwin Severin and Friedrich Schierl, Berlin, Germany, assignors to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application April 22, 1936, Serial No. 75,688
In Germany April 13, 1935
4 Claims. (Cl. 201—48)



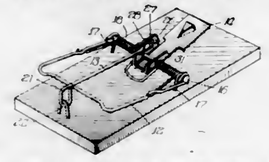
1. In a variable resistor, the combination of a rotatable shaft, a plurality of contacts having their surfaces formed with a plurality of grooves, a flexible conducting member normally separated from said contacts, stationary insulation discs in contact with the opposite faces of said flexible member and serving to retain it in a fixed position and an arm carried by said shaft and arranged to force a limited area of said conducting member into contact with one of said grooved surfaces.

2,103,874
FOLDING CHAIR
Ben Shwayder, Ecorse, Mich.
Application February 27, 1936, Serial No. 66,035
1 Claim. (Cl. 155—142)



In a folding chair, a pair of spaced supporting legs, a seat positioned between and pivotally mounted, intermediate its ends, on said legs, a second pair of spaced legs adapted, when in use, to extend at an angle to said first mentioned pair of legs, means for connecting the upper end of each of said second pair of legs to one of said first mentioned legs at a point above the position of mounting of said seat, said connecting means comprising a U-shaped clip inwardly of the legs and having one arm thereof pivotally attached to one of said first mentioned legs and the other arm thereof fixed to one of said second mentioned legs, an arm pivoted at one end thereof to said seat and pivotally mounted at its opposite end to one of said second pair of legs, and an abutment member carried by said seat for engaging said arm upon swinging movement of the front of said seat downwardly a predetermined distance.

2,103,875
CUTTING MECHANISM
Harry C. Shock, Charleston, W. Va., assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Application September 12, 1936, Serial No. 100,439
4 Claims. (Cl. 33—32)



1. In apparatus for cutting glass sheets, cutting mechanism including a pivotally mounted lever, a bracket carried by said lever, a cutting tool carried by said bracket, and means for preventing the said bracket from striking the glass sheet upon downward movement thereof when the cutting tool leaves the edge of said sheet.

2,103,876
WINDOW CONSTRUCTION
Jay D. Silberman, Scarsdale, N. Y.
Application April 8, 1937, Serial No. 135,611
20 Claims. (Cl. 20—52.6)

8. In a window construction of the class in which there is included a frame casing having a pair of spaced plates forming a housing therebetween, and having a window opening above said housing, a window slidable between said opening and said housing means for holding said window against rattling, and a crank handle for raising and lowering said window; a mechanical transmission means between said handle and said holding means concealed within said housing for releasing said means, to permit the raising or lowering of said window.

2,103,877
ANIMAL TRAP
Herbert A. Stilson, Chicago, Ill.
Application February 6, 1936, Serial No. 62,609
4 Claims. (Cl. 43—81)

1. An animal trap including a base, a jaw pivoted on said base, a spring urging said jaw to a

closed position, and jaw retaining and releasing means including a latch for engaging said jaw, and a treadle, said treadle being pivoted about a horizontal spindle secured to said base and including a flat bottom portion, one end of which has bait-retaining means thereon, and the other end of which has a pair of extensions bent therefrom, and a pair of alined holes in said extensions through which said spindle extends, one of said extensions having a slot therein, and said latch having an elbow formed thereon for projecting into said slot, said slot and elbow being so shaped that when said treadle is pivoted, said latch is expelled from said slot.

2,103,878

SELECTIVE RADIO RECEIVING SYSTEM

Leland E. Thompson, Merchantville, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application April 30, 1936, Serial No. 77,253

16 Claims. (Cl. 250—20)

5. The method of obtaining selectivity in a heterodyne beat limiter system, which comprises deriving a signal wave by broadly selecting the same, applying local oscillations of a predetermined amplitude to the selected signal wave to limit the amplitude of the received signal wave and interference by means of a heterodyne beat, and subsequently demodulating the interference modulating effects of the limiting process.

2,103,879

PRODUCTION OF ORGANIC SULPHUR COMPOUNDS

Hanns Ufer, Ludwigshafen-on-the-Rhine, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application November 22, 1935, Serial No. 51,081. In Germany December 17, 1934

8 Claims. (Cl. 260—158)

1. The process of producing organic sulphur compounds which comprises reacting vinyl sulphones having the general formula

$$R(SO_2—CH=CH_2)_x$$

in which R is an aliphatic radicle containing at least 7 carbon atoms and x is a whole number, with bisulphites of light metals selected from the group consisting of sodium, potassium and calcium.

5. Alkyl-sulphone-ethyl-sulphonic acid salts of light metals selected from the group consisting of sodium, potasium and calcium, the alkyl group of which contains at least 7 carbon atoms.

2,103,880

PRODUCTION OF ORGANIC SULPHUR COMPOUNDS

Hanns Ufer, Ludwigshafen-on-the-Rhine, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application November 22, 1935, Serial No. 51,082. In Germany December 17, 1934

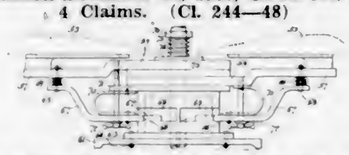
7 Claims. (Cl. 260—158)

1. The process of producing organic sulphur compounds which comprises reacting vinyl sulphones having the general formula

$$R(SO_2—CH=CH_2)_x$$

in which R is a cyclic radicle selected from the group consisting of isocyclic and heterocyclic radicles and x is a whole number, with bisulphites of light metals selected from the group consisting of sodium, potassium and calcium.

5. Sulphonic acid salts of the general formula $R(SO_2—CH_2—CH_2—SO_3Me)_x$ in which R is a cyclic radicle selected from the group consisting of isocyclic and heterocyclic radicles, Me is a light metal selected from the group consisting of sodium, potassium and calcium and x a whole number.



2,103,881

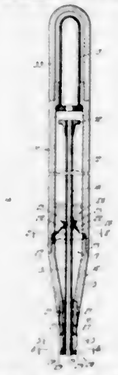
AUTO MONOPLANE

Edward F. Wagner, Philadelphia, Pa.

Application December 16, 1935, Serial No. 54,538

4 Claims. (Cl. 244—48)

4. An aeroplane comprising a fuselage, a mast mounted in said fuselage and projecting above the same, a lock keeper comprised of an inverted cup encircling the mast just above the fuselage, said lock keeper having oppositely positioned circular slots with notches at both ends, means to support said lock keeper, wing supporting arms having their inner ends journalled on the mast one above the other and both above the lock keeper, means to urge said arms toward the lock keeper, spring actuated catches carried by the wing supporting arms and projecting into the lock keeper slots for registration with the notches, means projecting through the catches and threaded into the arms for withdrawing said catches from the notches, and wings carried by said arms.



2,103,882

WRITING PEN

George S. Walter, Chicago, Ill.

Application April 25, 1936, Serial No. 76,400

10 Claims. (Cl. 120—44)

1. In a fountain pen having a body portion and a hollow nozzle mounted thereon providing an ink reservoir, the combination of a core member positioned in and extending through the opening formed in said nozzle in spaced relation thereto to provide an ink channel communicating with said reservoir, the lower end portion of said member engaging the lower end portion of said nozzle for completely closing the lower end of said channel, said nozzle having a plurality of annularly spaced discharge openings formed therein and communicating with said ink channel for discharging the ink laterally therefrom.

2,103,883

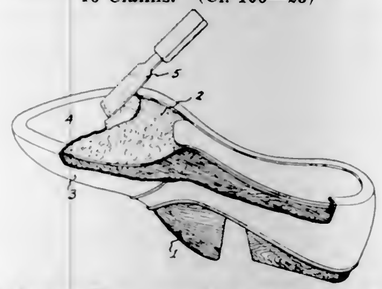
LAMINATED SAFETY GLASS

George B. Watkins and Roy W. Wampler, Toledo, Ohio, assignors to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio

No Drawing. Application December 20, 1933, Serial No. 703,252

8 Claims. (Cl. 49—81)

5. Laminated safety glass comprising two sheets of glass and an interposed layer of cellulose acetate plastic formed from raw cellulose acetate plasticized with a mixture of an ester of phthalic acid and carbitol acetate in the ratio of approximately 76 parts of total plasticizer to 100 parts of raw cellulose acetate in the finished sheet.



2,103,884

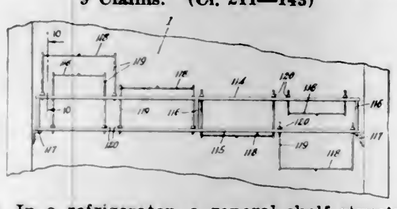
COMPOSITION FOR SHOE MANUFACTURE AND PROCESS OF MAKING SHOES

Pearl J. Wentworth, Fort Thomas, Ky.

Application July 31, 1934, Serial No. 737,811

16 Claims. (Cl. 106—23)

1. A shoe filler, comprising as a principal ingredient, ground-up tire carcass, a binder, a solvent therefor, and a contraction preventing material selected from a group consisting of the natural gums of wax-like or bituminous substances dissolved in a solvent.



2,103,885

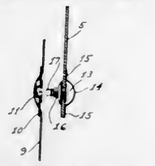
REFRIGERATOR

John T. Whalen, New York, N. Y.

Application June 16, 1936, Serial No. 84,414

9 Claims. (Cl. 211—143)

1. In a refrigerator, a general shelf structure extending across the interior, and supported from the side walls, of the refrigerator, said shelf structure comprising a plurality of separate members having interchangeable horizontal supporting areas disposable side by side, and having upright supports attached to and extending from said horizontal areas, said supports on the various shelf members being of different lengths, whereby contiguous side by side supporting areas may be at different levels with selectively variable amounts of headroom, said separate members being supportable by general shelf structure.



2,103,886

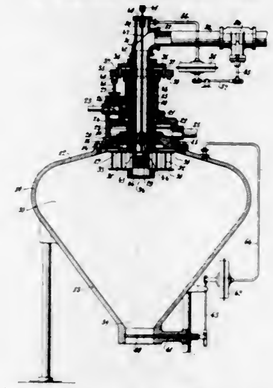
SWIMMING CAP

Walter Pierre Barnes, Chicago, Ill.

Application June 18, 1936, Serial No. 85,903

2 Claims. (Cl. 2—68)

1. As an article of manufacture, a swimming cap having an inflatable portion therein, a valve controlling the inflation of said portion, and a chin strap having a free end engageable over the outer part of said valve to anchor the end of the strap and conceal the valve.



2,103,887

HOMOGENIZING MECHANISM

William Spencer Bowen and Julius Freeman, Westfield, N. J.

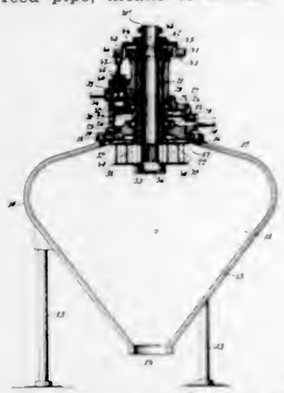
Application February 16, 1934, Serial No. 711,614

9 Claims. (Cl. 99—266)

1. A homogenizing apparatus comprising a chamber forming housing, a homogenizing head therein, a feed pipe to direct a substance to the head, means to control the flow of substance through the feed pipe, and means responsive to pressure within the pipe to actuate the control means.

2,103,888

HOMOGENIZING APPARATUS



William Spencer Bowen, Westfield, N. J.

Application February 20, 1934, Serial No. 712,132

10 Claims. (Cl. 99—266)

5. A homogenizing apparatus comprising a housing, a hollow feed pipe associated therewith, a homogenizing element on the feed pipe re-

ceiving therefrom substance to be homogenized, said element and said pipe being subjected to variations of torque reactance by reason of variations in physical properties and rate of feed of the substance being homogenized, means to rotate the feed pipe, means to actuate the last

named means, and means responsive to the aforesaid variations in physical properties and rate of feed of the substance being homogenized to control the last named actuating means whereby the rate of rotation of the homogenizing element is controlled by the substance being homogenized.

2,103,889

GOLF CLUB HANDLE

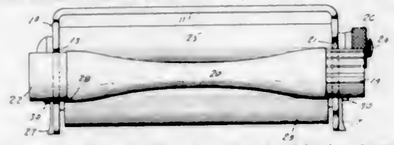
Joseph C. Brisick, Irvington, N. J., assignor to The Kroydon Company, a corporation of New Jersey

Application July 20, 1933, Serial No. 681,288

1 Claim. (Cl. 273—81)

The combination with a metal shaft for golf clubs and the like, of a handle or grip for the same, such shaft being longitudinally grooved beneath said handle and receiving the handle structure in the said groove or grooves of said shaft, said groove or grooves extending outside said handle but for a part only of the length of the shaft.

2,103,890



PERMANENT WAVING DEVICE

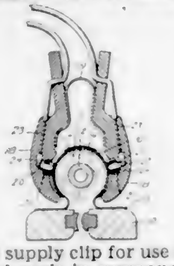
William H. Brown, Bedford, Ohio

Application April 17, 1936, Serial No. 74,976

10 Claims. (Cl. 132—33)

1. A permanent waving device comprising, in combination, a pair of rotatable rollers, means for holding said rollers in position to clamp a strand of hair therebetween, means for applying a rotation resisting force to one of said rollers

and means for winding a strand of hair clamped between said rollers and causing it to pass between said rollers as it is being wound.



2,103,891

PERMANENT WAVING DEVICE

William H. Brown, Bedford, Ohio

Application February 24, 1937, Serial No. 127,475

5 Claims. (Cl. 219—24)

2. In a current supply clip for use in electrolytic heating of wound curls in permanent waving, a jaw element, a contact element projecting from said jaw element and a yieldable sealing gasket surrounding said contact element and being of a length greater than the distance which said contact element projects beyond said jaw element.

2,103,892

WRAPPER

Harry W. Brown, Saxonville, Mass., assignor to Edward H. Angier, Framingham, Mass., as trustee under agreement and declaration of trust designated as Angier Laboratories

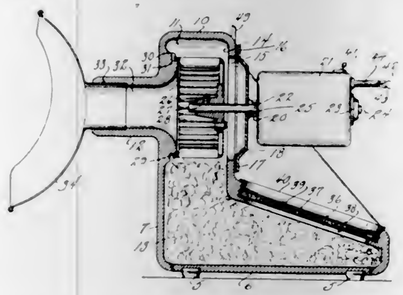
Application August 7, 1935, Serial No. 35,116

2 Claims. (Cl. 154—52)

1. A wrapping in the form of a narrow band of indefinite length adapted to be helically wound about a commodity comprising a pair of strips of paper, adhesive connecting said strips, longitudinal strands between the strips solely adjacent the margins thereof, and a substantially single, continuous, fibrous, reinforcing strand extending throughout the area between said longitudinal strands substantially as a gently sinuous, longitudinally extending curve.

2,103,893

PORTABLE AIR PURIFIER UNIT



Elmore E. Buskirk, Adrian, Mich.

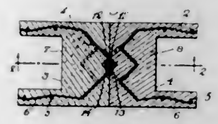
Application September 22, 1936, Serial No. 101,981

3 Claims. (Cl. 183—36)

2. An air purifier unit housing embodying a base, there being walls rising from the base to

provide a chamber and upwardly narrowed to provide a fan housing portion having an opening toward an inlet port terminus, a multi-blade fan mounted in the fan housing portion and adapted for suction action on the inlet port terminus,

there being a shaft for the fan extending outside the housing, and a motor on the housing overhanging said base and providing bearing for said shaft, said housing having filter screen discharge port means from the chamber overhung by said motor.



2,103,894

JOINT FOR CONCRETE BUILDING UNITS

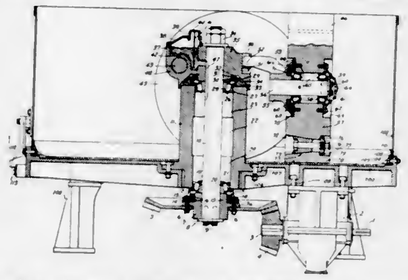
Herman Bussmann, Englewood, N. J.

Application April 14, 1937, Serial No. 136,717

5 Claims. (Cl. 72—107)

3. A joint for pre-cast plastic building units comprising a pair of sheet metal joint members each bent along its longitudinal central line forming wings extending substantially at right angles to each other, said members at spaced intervals along said line of bend being cut transversely thereto forming a plurality of alined spaced loops at the front of said member, the intervening metal between said spaced loops bent rearwardly along said central line forming a plurality of alined spaced angular braces at the back of said joint members.

2,103,895



MULLER

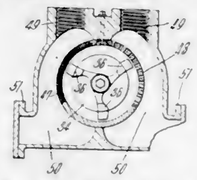
Alfred C. Christensen, Chicago, Ill., assignor to Herbert S. Simpson, Chicago, Ill.

Application March 13, 1933, Serial No. 660,549

4 Claims. (Cl. 83—45)

1. In combination, a muller pan, having bearings muller means, a muller means driving shaft in the bearings, a spider on the upper part of said shaft, for connecting said shaft to said muller means, a lubricant reservoir in said shaft spider, and means for connecting said lubricant reservoir with the inner sides of said bearings whereby to lubricate the connection of the muller means to the spider and the bearings for the shaft in the muller pan, said lubricant reservoir being connected to direct lubricant outward from said

bearings toward the joints between the rotating parts and their supports.



2,103,896

MACHINE FOR DISINTEGRATING, SCREENING, AND PUMPING FIBROUS OR PAPER MAKING STOCKS

William T. Doyle, Boston, and Thomas J. Sturtevant, Wellesley, Mass., assignors to Sturtevant Mill Company, Boston, Mass., a corporation of Massachusetts

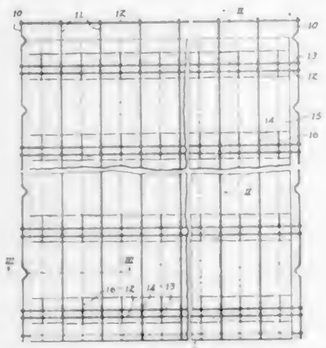
Application December 12, 1935, Serial No. 54,054

9 Claims. (Cl. 92—20)

1. A centrifugal pump for effecting a disintegrating and screening action on aqueous fibrous stock fed thereinto, comprising a substantially cylindrical internal wall defining a disintegrating and pumping chamber and comprising a substantially imperforate sector and at least two peripherally successive but separate discharge sectors each containing discharge openings and each leading into an independent discharge compartment, the openings in one sector being larger than those in the other, a blade-carrying rotor within said chamber capable of developing under rotation pumping pressure on stock fed into said chamber and of causing an emission of a relatively fine stock fraction radially through said discharge sector containing the smaller openings and a relatively coarse stock fraction radially through said discharge sector containing the larger openings, said discharge sectors constituting only a portion of said cylindrical internal wall and the remainder of said wall being substantially imperforate and occupying at least about 120°, and means for feeding said stock into said chamber substantially axially thereof.

2,103,897

REINFORCEMENT MESH



Walter S. Edge, Pittsburgh, Pa., assignor to Pittsburgh Steel Company, Pittsburgh, Pa., a corporation of Pennsylvania

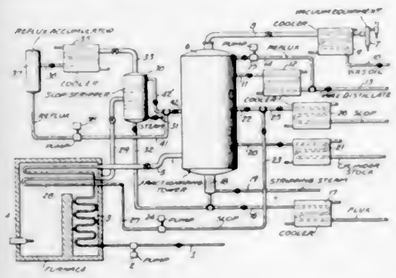
Application August 8, 1936, Serial No. 94,985

9 Claims. (Cl. 72—119)

4. A plaster ground structure comprising reinforcing mesh, and a backing sheet therefor, the

said sheet being resistant to the absorption of water and having perforations in closely spaced relation and of sufficiently small size to prevent

substantial quantities of wet plaster being pushed therethrough, but permitting the passage of water.



2,103,898

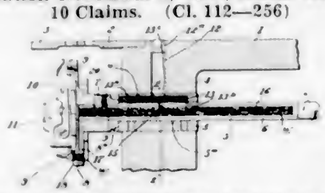
METHOD OF DISTILLING LUBRICATING OILS

Fred G. Fellows, Ponca City, Okla., assignor to Continental Oil Company, Ponca City, Okla., a corporation of Delaware

Application April 11, 1932, Serial No. 604,441

1 Claim. (Cl. 196—77)

A process of distilling hydrocarbon oils including heating a wax bearing hydrocarbon oil to distillation temperatures, flashing the heated oil into vapors and unvaporized oil in a fractionating zone, withdrawing the unvaporized oil from the process, fractionally condensing the vapors in the fractionating zone, withdrawing reflux condensate containing amorphous wax from the fractionating zone, heating a portion of the amorphous wax bearing condensate to wax cracking and vaporizing temperatures whereby a portion of the amorphous wax is converted into vapors containing wax which, upon condensation, will form wax crystals having pressing qualities, separating the thus heated amorphous wax bearing condensate into vapors and unvaporized oil in a second fractionating zone, withdrawing the unvaporized oil from the process, condensing the vapors and introducing the condensate containing pressable wax into the first fractionating zone as an intermediate reflux, and withdrawing reflux condensate containing pressable wax from said fractionating zone.



2,103,899

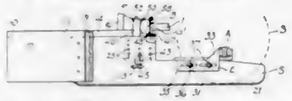
LUBRICATING DEVICE FOR SEWING MACHINES

George A. Fleckenstein, Stratford, and Max L. Waterman, Fairfield, Conn., assignors to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey

Application November 1, 1935, Serial No. 47,766

10 Claims. (Cl. 112—256)

1. In a sewing machine, a bed-plate provided with a bearing; a lubricant reservoir supported thereby; a loop-taker shaft rotatably journaled in said bearing; a loop-taker actuated by said shaft and provided with a raceway; means to supply lubricant to said bearing adjacent the ends thereof, said shaft being provided, in its surface within said bearing, with a plurality of oppositely inclined grooves which diverge in the direction of rotation of said shaft and serve to transmit lubricant from the ends of said bearing to the central portion thereof; and means to conduct lubricant from the central portion of said bearing to said loop-taker raceway.



2,103,900

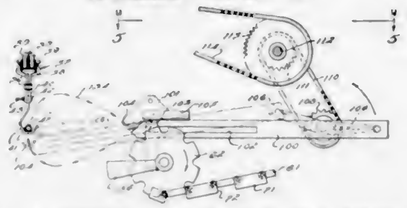
AUTOMOBILE SNOW PLOW

Robert E. Gay, Tewksbury, Mass.

Application December 3, 1935, Serial No. 52,678

13 Claims. (Cl. 37—44)

8. The combination with an automobile having a fixed axle and a bumper spaced therefrom; of a detachable snow plow including V-shaped snow moving members all of which are entirely supported away from the ground by a sled which sled includes parallel runners which extend under the axle, a member of the sled which extends up and bears against the axle and another member of the sled which extends up and bears against the bumper.



2,103,901

CONVEYER MECHANISM

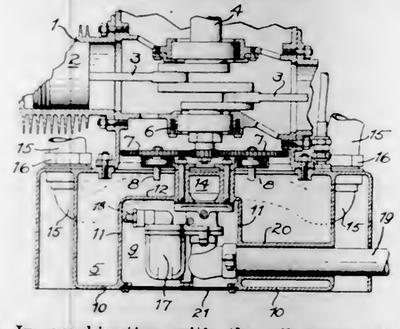
Robert H. Gordon, Detroit, Mich., assignor to Parker Rust Proof Company, a corporation of Michigan

Application February 14, 1935, Serial No. 6,417

14 Claims. (Cl. 198—20)

1. Conveying apparatus including a system of rails having adjacent mono-rail and double rail

sections provided with angularly disposed transfer portions, said transfer portions of said rail sections each being substantially horizontally disposed, means for movably supporting articles associated with each rail section, respectively, separable holders movable by said means, and apparatus for automatically transferring said article holders from one of said adjacent transfer portions of said rail sections to the other including a carrier constructed and arranged to move said article holders bodily in the general direction of movement thereof on one of the transfer portions of said rail sections.



2,103,902

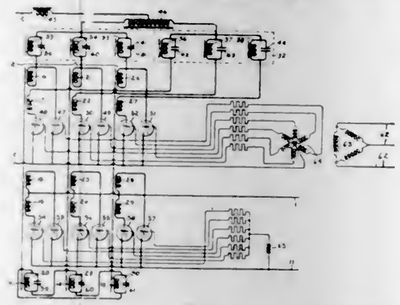
CARBURETOR TEMPERATURE CONTROL

Ralph M. Heintz, Palo Alto, Calif., assignor, by mesne assignments, to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware

Application July 11, 1936, Serial No. 90,165

5 Claims. (Cl. 123—195)

1. In combination with the oil sump of an internal combustion engine, reentrant walls extending from the bottom of said sump upwardly to enclose and define a chamber therein bathed in oil and open below to the atmosphere, a carburetor in said chamber, and an intake line running from said carburetor to a cylinder of said engine through said sump.



2,103,903

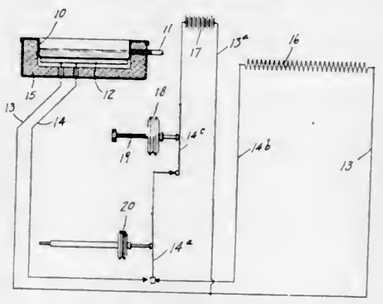
ELECTRIC VALVE CONVERTING SYSTEM

Carl C. Herskind, Scotia, N. Y., assignor to General Electric Company, a corporation of New York

Application March 20, 1937, Serial No. 132,153

8 Claims. (Cl. 171—97)

8. An electric valve converting system for transferring energy between two constant potential direct current circuits comprising an *n*-legged transformer having two primary windings, two secondary windings and a tertiary winding on each leg thereof, an *n*-legged core structure having two primary and two secondary windings on each leg thereof, a capacitor for each leg of said structure, each capacitor being associated with one of the primary windings to form an energy storage circuit, an inductive winding having an intermediate point connected to one side of one of said direct current circuits, means connecting one terminal of said inductive winding with one terminal of one of the primary windings on each leg of said structure, means connecting the other terminal of said inductive winding with one terminal of each of the remaining primary windings of said structure, means for connecting each of the remaining terminals of the primary windings of said structure with a different primary winding of said transformer, a plurality of controlled electric discharge paths interconnecting the remaining terminals of the primary windings of said transformer with the other side of said direct current circuit, means connecting one terminal of each of the secondary windings of said device with one side of the other of said direct current circuits, means connecting the remaining terminals of each of the secondary windings of said structure with one terminal of a different one of said secondary windings of said transformer, a plurality of electric discharge paths interconnecting the remaining terminals of the secondary windings of said transformer with the other side of said second direct current circuit, a capacitor for each of said tertiary windings of said transformer arranged to form energy storage circuits, means interconnecting all of said tertiary windings and associated capacitors in a closed circuit, and means for controlling the conductivities of said electric discharge paths.



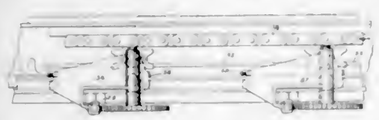
2,103,904

HUMIDITY AND TEMPERATURE CONTROL SYSTEM

Dewey H. Hill, Macomb, Ill., assignor to Globe American Corporation, Kokomo, Ind., a corporation

Application February 5, 1937, Serial No. 124,187

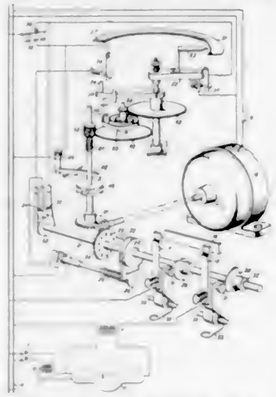
3 Claims. (Cl. 236—44)



2. In a humidity and temperature control system for incubators, a vapor producing electric heating element, a dry heat producing electric heating element spaced therefrom, an electric circuit including a source of current common to said elements, a dry temperature thermostat for making and breaking said circuit, and a humidity control thermostat for simultaneously making said circuit with one element and breaking it with the other.

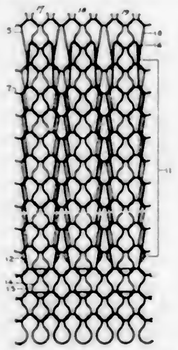
2,103,905
TURBINE BUCKET WHEEL NOTCH BLOCK
Rudolph Hillner, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application January 4, 1936, Serial No. 57,593
2 Claims. (Cl. 253—77)

1. A bucket wheel comprising a disk member having a rim and a row of buckets having bases forming a dovetail connection with the rim, a portion of the rim being cut away to form a notch opening through which the buckets are inserted during assembly, means for closing the notch opening to prevent relative movement between the disk member and the buckets, said means comprising an element having legs straddling the rim and disposed in the notch opening and grub screw means secured in threaded radial bores formed in adjacent portions of the rim and the legs, and means to prevent loosening of the grub screw means.



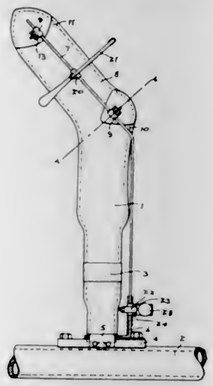
2,103,906
CONVEYER MECHANISM
Henry Kaupp, Long Island, N. Y., assignor to U. S. Galvanizing & Plating Equipment Corporation, Brooklyn, N. Y., a corporation of West Virginia
Application July 26, 1933, Serial No. 682,199
29 Claims. (Cl. 204—5)

1. In combination, a constantly driven conveyer chain; carriers guided one after another, along said chain; a control sprocket rotatably mounted on each carrier and meshing with the chain and comprising gear portions of different diameters; and control members engaging the sprocket member one at a time only and including control rack members of limited length adapted to mesh with said gear portions.



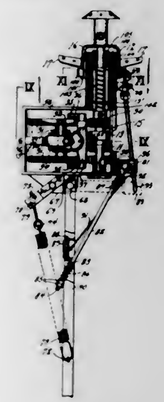
2,103,907
TIME SWITCH
William K. Kearsley, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application May 15, 1937, Serial No. 142,836
11 Claims. (Cl. 175—375)

1. A time switch comprising, a constant-speed motor, a cam shaft, a clutch for connecting and disconnecting said shaft to and from driving relation with the motor, a switch, cam means on said shaft for closing said switch during only a selected part of each revolution of said shaft, a solenoid for connecting said clutch, means for disconnecting the clutch when the solenoid is deenergized, an energizing circuit for said solenoid having two parallel branches, each branch containing two sets of control contacts in series relation, a cam on said shaft for operating one set of control contacts of each branch so that one set is closed when the other is open and vice



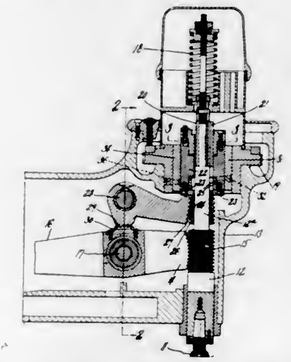
versa, said cam being positioned with respect to the first mentioned cam means to open one set of contacts operated thereby when said switch is open and to open the other set of contacts operated thereby when said switch is closed, the other sets of control contacts in the parallel branches being normally open, and timing means for momentarily closing one of the normally open contacts and closing the other normally open contacts a selected time period thereafter.

2,103,908
KNITTED FABRIC AND METHOD OF KNITTING THE SAME
Robert H. Lawson, Pawtucket, and Arthur N. Cloutier, Lonsdale, R. I., assignors to Hemphill Company, Central Falls, R. I., a corporation of Massachusetts
Application April 9, 1931, Serial No. 528,808
6 Claims. (Cl. 66—172)



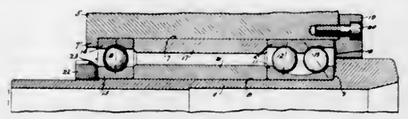
4. A two-faced fabric, one face thereof consisting of alternating rib and plain wales, and the other face thereof consisting of plain wales.

2,103,909
HOSIERY DRYING AND PRESSING DEVICE
John Lipson and Nathaniel Lipson, Toronto, Ontario, Canada
Application December 28, 1935, Serial No. 56,432
7 Claims. (Cl. 223—76)



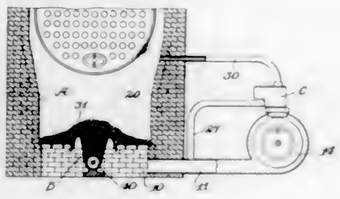
1. A hosiery drying apparatus, comprising a drying form upon which the hose are adapted to be stretched, means for applying pressure locally at spaced points to the toe and heel portions only of said hose during the drying thereof whereby the remaining foot and leg portions of the hose are free to conform naturally to the shape of the form, and means for adjusting the toe and heel pressing means in relation to the said form and to each other to bring the same into accurate cooperative pressing relation with the toe and heel portions of the hose.

2,103,910
WINDMILL
Kenneth R. Lung, Kendallville, Ind., assignor to Flint & Walling Manufacturing Company, Kendallville, Ind., a corporation of Indiana
Application January 25, 1937, Serial No. 122,204
9 Claims. (Cl. 170—46)



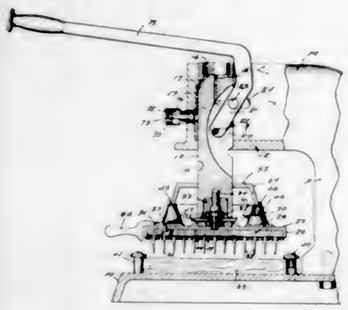
1. A windmill comprising a shaft, a swivel axis support for the shaft, a wind wheel outboard from the support on the shaft, an arm having a pivotal connection with the support parallel with the swivel axis and opposite from the wheel, a rudder plane carried by the arm, a bracket fixed with the support, a rockable pin in the bracket having an axis parallel to the axis of the arm, a stem through said pin, a spring connected to the stem and extending to the arm with the pin as rockable to allow the stem to take the direction of the spring, and adjusting means for the stem at the pin.

2,103,911
HELICAL GEAR SHAPING MACHINE
Edward W. Miller, Springfield, Vt., assignor to The Fellows Gear Shaper Company, Springfield, Vt., a corporation of Vermont
Application March 8, 1935, Serial No. 9,969
11 Claims. (Cl. 90—9)



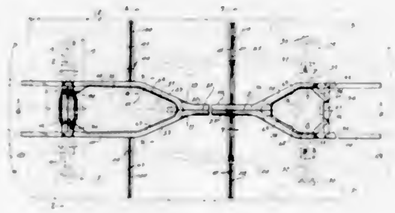
1. A machine tool comprising a rotatable and reciprocative spindle, means for reciprocating said spindle, helical guide means for imparting back and forth rotational movements to the spindle during its reciprocations in opposite directions, including a guide element secured to the spindle, a complemental helical guide element, means for reciprocating said complemental element oppositely to the reciprocations of the spindle and simultaneously therewith, and means for limiting such movements of said complemental element to a prescribed path.

2,103,912
BEARING
Donald H. Montgomery, West Hartford, Conn., assignor to The New Britain Machine Company, New Britain, Conn., a corporation of Connecticut
Application September 22, 1936, Serial No. 101,935
7 Claims. (Cl. 308—233)



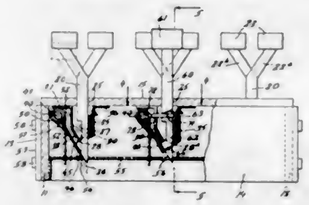
1. An inherently preloaded double row angular contact ball bearing, the angle of contact of the row to take maximum thrust being substantially greater than the angle of contact of the other row.

2,103,913
STOKER CONTROL AND METHOD OF MAINTAINING DESIRED FUEL BED RESISTANCE
Harold S. Morton, St. Paul, Minn.
Application May 16, 1934, Serial No. 725,930
4 Claims. (Cl. 236—15)



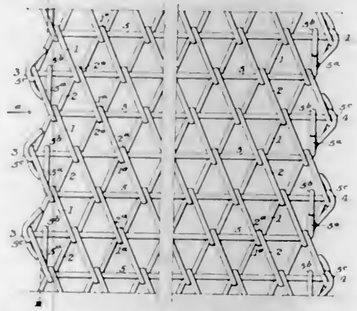
1. In a fuel feed control for stokers and the like comprising, a large disc subjected to atmospheric pressure on one side and to reduced pressure inside the air inlet orifice of the stoker fan or draft on the other side, a shaft for floatingly supporting said disc, a smaller disc mounted on said shaft subjected to the pressure in the windbox of the stoker on one side, and to the pressure of the combustion chamber on the other side, and an electric switch connected to said shaft controlling the operation of the fuel feeding mechanism operable by the movement of said discs and shaft, whereby the change in pressure differentials acting on said discs will control the feeding of fuel to a furnace.

2,103,914
MEAT TENDERER
Stephen W. Neldner, Milwaukee, Wis.
Application February 6, 1936, Serial No. 62,620
9 Claims. (Cl. 17—25)



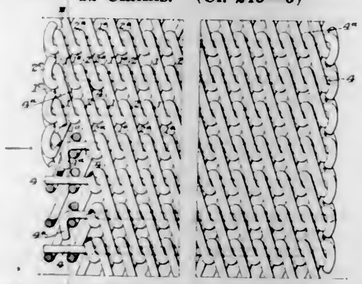
1. A meat tenderer comprising a base, a standard on one end of said base having a forwardly extending arm overlying the base, a plunger slidably mounted in said arm, means for raising and lowering the plunger, a head, a cutter carried by said head having a plurality of rows of cutting knives, a bearing stud on said head having an annular groove, a bearing socket carried by the lower end of the plunger for rotatably and removably receiving the stud, said plunger having spaced ways communicating with the bore of the socket, and a removable U-shaped pin detachably fitted in said ways for engaging the walls of the annular groove to rotatably and detachably support said head.

2,103,915
VEHICLE CONSTRUCTION
Karl K. Probst, Toledo, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application May 15, 1934, Serial No. 725,769
Renewed January 11, 1937
14 Claims. (Cl. 280—106)



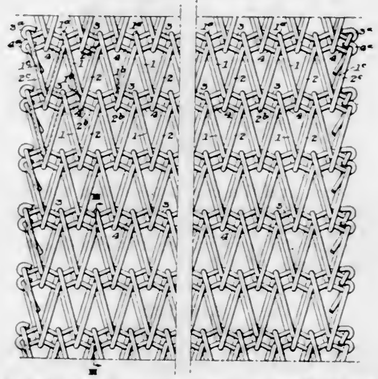
1. A vehicle frame comprising a central tubular portion terminating in spaced furcations; two U-shaped members, one U-shaped member secured to and embraced by each of said furcations; and a transversely extending member joining the branches of each of said furcations forming vehicle spring supporting means.

2,103,916
CRIBBAGE SCORING DEVICE
Fred Herman Robinson, Rye, N. H.
Application May 27, 1936, Serial No. 82,065
2 Claims. (Cl. 235—90)



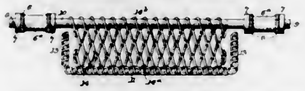
1. An operating mechanism for a scoring device having at least one row of depressible keys each provided with a depending plunger, each plunger having a recessed portion adjacent its lowermost end and formed at one side thereof to define a shoulder, a stop plate common to all of said plungers fixedly mounted relative thereto and provided with an abutment edge extending into each of said plunger recesses for engagement by said shoulders, spring return means individual to each plunger for maintaining the same in their normal engagement with said stop plate; a spring controlled swinging locking plate common to all of said plungers oscillatably mounted on a horizontal shaft in opposed spaced and juxtaposed relation to said stop plate and in contacting engagement with the lower end of said plungers including a torsion helical spring mounted on said shaft having one end fixed relative thereto and its other end bearing on the side of said locking plate remote from said plungers, an abutment edge on said locking plate arranged beneath and substantially in the plane of said stop plate abutment edge; whereby upon the depressing of any one plunger the shoulder thereon will move downwardly into engagement with the abutment edge of said locking plate for locking engagement therewith.

2,103,917
WIRE FABRIC AND METHOD OF MAKING THE SAME
Otto Carl Scherfel, Haddon Heights, N. J., assignor to Audubon Wire Cloth Corporation, Philadelphia, Pa., a corporation of New Jersey
Application April 29, 1936, Serial No. 76,922
8 Claims. (Cl. 245—6)



1. Belt fabric made up of continuous helically coiled wires in interengaging relation transversely of said fabric throughout their extent with the free ends of pairs of said wires knuckled together, and cross rods or wires passing through each set of interconnecting bights of said helically coiled wires; each of said cross rods or wires having a bend at one end disposed within the knuckled connection of the helically coiled wires and terminating in looped connection with an adjacent cross rod or wire alternately at opposite edges of the fabric.

2,103,918
WIRE FABRIC AND METHOD OF MAKING THE SAME
Raymond J. Guba, Philadelphia, Pa., assignor to Audubon Wire Cloth Corporation, Philadelphia, Pa., a corporation of New Jersey
Application May 18, 1936, Serial No. 80,441
12 Claims. (Cl. 245—6)

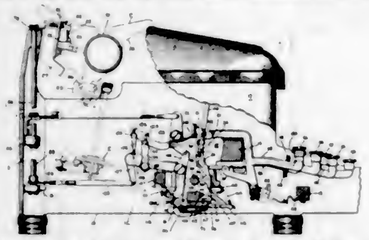


1. A wire fabric comprising helically coiled wires arranged in pairs and interconnected with the wires of other pairs; each wire of each pair having its ends in knuckled engagement with the wires of adjacent pairs in alternate relation and the interconnection of said wires providing two sets of bights in parallel alignment throughout the full extent of the fabric; each wire of each pair being freely movable with respect to the other wire of such pair and the wires of adjacent pairs, and cross wires located in the interconnecting bights of all of the adjacent sets of helically coiled wires and having their ends wholly embedded within the fabric between helices of the helically coiled wires.

2,103,919
WIRE FABRIC AND METHOD OF MAKING THE SAME
Raymond J. Guba, Philadelphia, Pa., assignor to Audubon Wire Cloth Corporation, Philadelphia, Pa., a corporation of New Jersey
Application May 22, 1936, Serial No. 81,140
12 Claims. (Cl. 245—6)

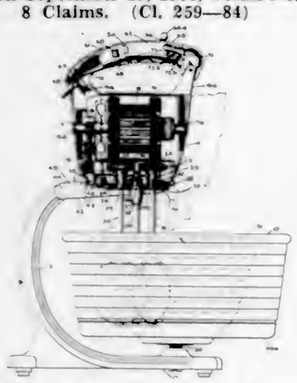
1. A belt fabric made up of a plurality of sets of helically coiled wires of right and left twist; the wires of one twist alternating with wires of opposite twist throughout the entire extent of the fabric, and pairs of cross connector wires associated with each of said helically coiled wires; one wire of each pair of said cross connector wires being positively attached to a helically coiled wire.

2,103,920
CONVEYER BELT
Raymond J. Guba, Philadelphia, Pa., assignor to Audubon Wire Cloth Corporation, Philadelphia, Pa., a corporation of New Jersey
Application December 8, 1936, Serial No. 114,734
14 Claims. (Cl. 198—194)



1. A conveyer belt comprising a plurality of chains arranged in a parallel relation, cross-bars connecting and spacing said chains at intervals, a continuous fabric formed of transversely arranged and interlocking helically coiled wires disposed between said chains; said fabric being spaced some distance below the pitch line of the chains and in substantial parallel relation therewith, and flexible supporting means for said fabric hung from said cross-bars and forming with the fabric a succession of pockets.

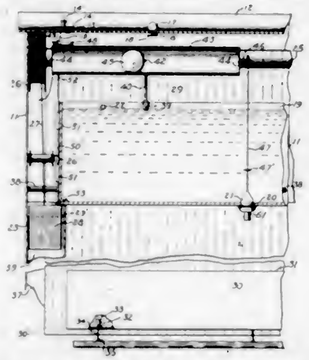
2,103,921
TYPEWRITING MACHINE
Russell G. Thompson, West Hartford, Conn., assignor to Underwood Elliott Fisher Company, New York, N. Y., a corporation of Delaware
Application February 20, 1937, Serial No. 126,903
5 Claims. (Cl. 197—17)



1. In a power-driven typewriter having a frame, a carriage adapted to traverse the frame, a multiplicity of type actions, a carriage-return mechanism, a driving unit, actuators transiently engageable with the driving unit to operate the type actions and the carriage-return mechanism,

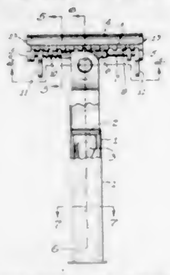
and keys for causing said engagement; the combination of a locking mechanism for the said keys, comprising a row of relatively shiftable units loosely confined within limits, and blades controlled respectively by the said actuators for the

type actions and the carriage-return mechanism, any one of which blades is adapted to enter between the limits and take up the looseness of the units to thereby prevent the introduction of more than one blade at a time.



2,103,922
MIXING DEVICE
Walter Van Guilder, Oak Park, Ill., assignor to General Electric Company, a corporation of New York
Application September 19, 1935, Serial No. 41,248
8 Claims. (Cl. 259—84)

1. A household food mixing device comprising a standard, a combination motor, and beater operating unit removably mounted on said standard, whereby said beater can be operated while mounted on said standard, or as a portable device removed from said standard, a handle for said unit for supporting it when removed from said standard, a switch for said motor provided with a switch controlling member, means biasing said controlling member to its off position, and a latch for said controlling member arranged to hold it in its motor energizing position against the force of said biasing means when said unit is positioned on said standard, and positioned to be engaged and moved to a releasing position by the operator when said handle is grasped to support and operate said unit as a portable device.

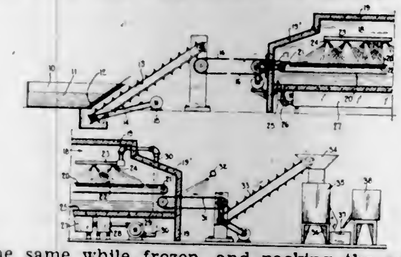


2,103,923
AUTOMATIC AWNING
Otto Vogel, Farmingdale, N. Y.
Application April 7, 1936, Serial No. 73,076
9 Claims. (Cl. 156—44)

9. An automatic window-guard of the charac ter described comprising a roller awning mounted in a housing, a receptacle on the awning for facilitating the lowering thereof, a controlled drip outlet in the receptacle, a reservoir for water combined with the housing and having an overflow, rain-actuated means for controlling the dispensing of water from the reservoir to fill the receptacle and cause lowering of the awning, a gutter combined with the housing for collect-

ing rain-water, valves in said gutter adapted to open with a rise of rain-water therein for replenishing the reservoir and causing an overflow to keep the receptacle filled, and means, automatically operable when the water draining from the receptacle reaches a predetermined level, for rewinding the awning and resetting the rain-actuated means.

2,103,924
SAFETY RAZOR
Leonard A. Young, Detroit, Mich.
Application January 2, 1936, Serial No. 57,098
6 Claims. (Cl. 30—50)



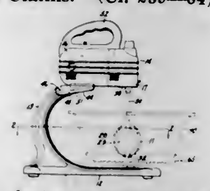
1. A razor comprising a handle, a blade seat member extending transversely of said handle opposite an end thereof, dual blade guards pivotally mounted upon said member to swing toward and from the seat side thereof, and spring means common to both of said guards for urging said guards toward said member with equalized pressures to clamp a blade between said member and guards.

2,103,925
METHOD OF FREEZING FRUITS
Wladimir M. Zarotschenzeff, Englewood, N. J., assignor to Z Pack Corporation, a corporation of Delaware
Application April 10, 1934, Serial No. 719,843
Renewed January 12, 1937
6 Claims. (Cl. 99—193)

1. A method of treating edible products having

pits, comprising quick freezing the same, pitting

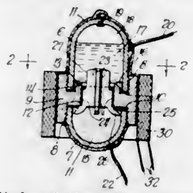
the same while frozen, and packing the same with sugar syrup in containers for cold storage.



2,103,926
METHOD OF PRODUCING DIAZODINITROPHENOL AND PRODUCT THEREOF
Harvey B. Alexander, Kingston, N. Y., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application August 8, 1936, Serial No. 95,014
4 Claims. (Cl. 260—69)

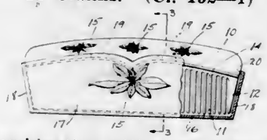
1. Method of producing free-flowing diazodinitrophenol which includes reacting a salt of picramic acid, a soluble nitrite, and a strong acid in the presence of mother liquor derived from the manufactue of picramic acid.

2,103,927
NONGUMMING MOTOR FUEL
Lester S. Bale, Shaker Heights, Ohio, assignor to The Standard Oil Company (Ohio), Cleveland, Ohio, a corporation of Ohio
No Drawing. Application April 23, 1935, Serial No. 17,832
4 Claims. (Cl. 44—9)



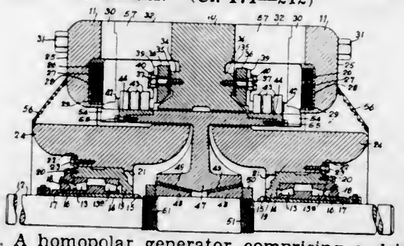
1. A motor fuel, comprising a gasoline having its gum-solventicity raised with about 0.2–1.6 per cent of a mineral oil of 18–35 gravity devoid of lubricating viscosity for internal combustion engine temperature and about 0.02–0.4 per cent of a halogenated aromatic compound.

2,103,928
MIXING DEVICE
Robert F. Bean, Bridgeport, Conn., assignor to General Electric Company, a corporation of New York
Application July 31, 1935, Serial No. 34,010
13 Claims. (Cl. 259—84)



1. A mixing device comprising a base, a support on said base, a motor-driven beater unit, means detachably mounting said beater unit on said support, means pivotally connecting said support to said base so that said beater unit can be swung from and returned to a working position, and locking means on said unit operative to engage a part of said base when said support is swung to carry the unit into its working position to prevent separation of said beater unit from said support.

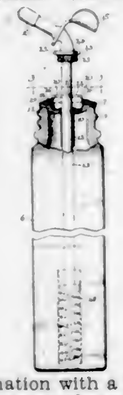
2,103,929
SWITCH
Paul S. Bear, Dowagiac, Mich., assignor, by mesne assignments, of three-fourths to Herbert E. Bucklen, Elkhart, Ind., and one-fourth to said Paul S. Bear
Application December 26, 1934, Serial No. 759,153
34 Claims. (Cl. 200—112)



1. In a switch of the class described, a switch housing comprising a pair of hollow metal electrodes secured to an intermediate ceramic spacing member, a body of mercury in one of said electrodes, means defining an annular groove between said ring and the other of said electrodes and having an inner defining edge formed at an acute angle, and magnetically responsive means within said housing for displacing a portion of said mercury over said acute angled edge into contact with the other electrode.

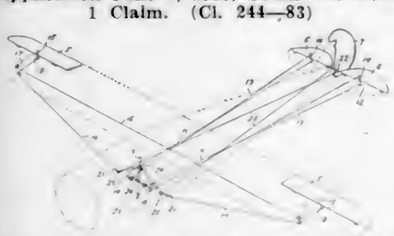
2,103,930
COMB AND CASING
Siegfried Behr, Flushing, N. Y., assignor to Ben Hur Products, Inc., New York, N. Y., a corporation of New York
Application March 5, 1937, Serial No. 129,117
11 Claims. (Cl. 132—1)

1. In combination with a comb having a projecting portion, a one-piece casing for the comb, said casing having resilient side walls and an integral projection on each side wall adapted to engage the projection on the comb to hold the latter in place.



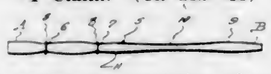
2,103,931
INSULATED HOMOPOLAR GENERATOR
Clarence E. Berger, Shrewsbury, N. J., assignor to Hanson-Van Winkle-Munning Company, Matawan, N. J., a corporation of New Jersey
Application May 22, 1935, Serial No. 22,840
4 Claims. (Cl. 171—212)

1. A homopolar generator comprising a drive shaft, a unitary rotor thereon including a hub having a central portion with an annularly



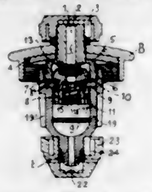
flanged rim portion thereon, an outer stationary magnetic structure disposed adjacent the outer surface of said flanged rim portion, an inner stationary magnetic structure disposed adjacent the inner surface of said flanged rim portion, means for collecting the electricity from said rotor at opposite sides of said outer stationary magnetic structure, and means for preventing the conduction of electricity between said rotor and said shaft whereby to confine the passage of the current generated from end to end of said flanged unitary rotor.

2,103,932
CONTAINER AND PUMP
Rudolph Bernhardt, Chicago, Ill.
Application September 12, 1933, Serial No. 689,106
2 Claims. (Cl. 299—97)



2. The combination with a bottle, of a closure, said bottle having a neck and having a reciprocating pump mounted therein with its piston rod freely movable through the closure, said closure comprising a cap formed of thin metal mounted on the bottle and having a central opening therethrough, a disc positioned between the top of the bottle and the cap, a bearing mounted in the disc and engaging with the rod, an annular plate formed of heavier material than the cap which is positioned between the disc and the cap and having a raised portion extending outwardly through said central opening in the cap said disc and plate being marginally secured to the bottle neck by the cap, means associated with the rod adapted to detachably engage with the plate and hold the rod in retracted position, and means for making a tight packing between the rod and the bearing.

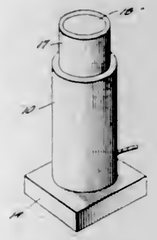
2,103,933
AEROPLANE CONTROL
George A. Clark, Filer, Idaho
Application June 2, 1936, Serial No. 83,095
1 Claim. (Cl. 244—83)



In a control mechanism for aeroplanes, a shaft rotatably journaled in the fuselage of an aeroplane transversely thereof, a control stick pivoted to the shaft for independent transverse movement, said stick being also operable to rotate the shaft upon a forward and rearward movement of the stick, rocker arms on the respective opposite ends of the shaft, a pair of elevator control wires secured at one end to the respective opposite end of each of the rocker arms, a plate member secured on said control stick, a pair of aileron control wires secured at one end to said plate at opposite sides of the control stick and connected to the ailerons of the aeroplane, a second plate secured to the control stick adjacent the first named plate, and control wires secured at one end to the respective opposite ends of the second named plate at opposite sides of the control stick and connected to the rudder of the aeroplane for simultaneously actuating the rudder and ailerons, a control wire and laterally spaced pulleys adjacent said ailerons, said control wire being trained over said laterally spaced pulleys and connected at its respective opposite ends with the ailerons for transmitting movement of one aileron to the other.

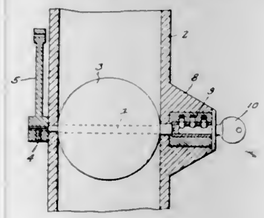
2,103,934
HAIR WAVER
Julia A. Cogswell, Jackson, Mich.
Application April 22, 1936, Serial No. 75,831
1 Claim. (Cl. 132—33)

A hair waving rod consisting of an elongated member provided with a pair of reduced areas adjacent one end thereof, and a rib member circumferentially disposed in each of the said reduced areas.



2,103,935
DEVICE FOR PREVENTING EVAPORATION OF VOLATILE PRODUCTS
Raoul Eugéne Cossais, Maisons-Alfort, France
Application December 10, 1935, Serial No. 53,833
In Luxemburg December 13, 1934
2 Claims. (Cl. 220—44)

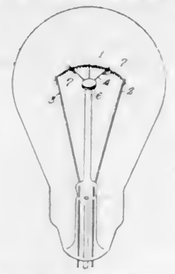
1. In combination with a container, a device for preventing evaporation of a volatile or similar product, present in said container, which comprises, in combination, means for closing said container in a fluidtight manner, check valve means for the inflow of air into said container, a safety valve for the outflow of fluid from said container in case of an overpressure therein, a cup adapted to contain a liquid disposed under said means, and an air inlet tube connected with said check valve means and adapted to dip in the liquid in said cup so as to form a hydraulic joint.



2,103,936
MULTIPLE EFFECT PYROTECHNIC
Josef B. Decker, Elkton, Md.
Application October 9, 1935, Serial No. 44,263
5 Claims. (Cl. 102—20)

1. A pyrotechnic device of the type described including, in combination, a cardboard mortar tube, a base therefor, a lifting and salute charge therein, a cardboard projectile tube containing a bursting charge, means to ignite the first charge, delay means to communicate the flame of the ignited first charge to the second charge, the

mortar tube housing a large portion of the lower end of the projectile tube and being initially of less internal diameter than the external diameter of the projectile tube whereby it fits the same with sufficient friction to develop the full lifting and salute effects of the first charge.

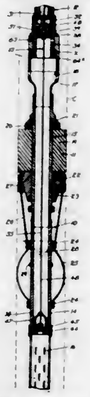


2,103,937
AUTOMOBILE LOCK
Oris M. Driscoll, Trenton, N. J., assignor of one-half to Geo. J. Perlman Co., Trenton, N. J., a corporation of New Jersey
Application March 29, 1935, Serial No. 13,776
4 Claims. (Cl. 70—242)

1. An engine intake manifold lock comprising, in combination, a valve journaled in the manifold, means connected to one end of said valve for closing the same, a lock mounted on the manifold and connected to the other end of said valve for releasably securing the same in closed position, and resilient means for returning the valve to open position when said valve is released by the second-named means.

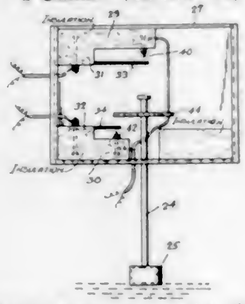
2,103,938
MANUFACTURE OF ELECTRIC INCANDESCENT LAMPS HAVING COILED-COIL FILAMENTS
Bernard Phineas Dudding and Reginald Edward Leeds, Middlesex, England, assignors to General Electric Company, a corporation of New York
Application April 14, 1937, Serial No. 136,940
In Great Britain March 6, 1936
2 Claims. (Cl. 176—39)

1. In an electric incandescent lamp having an arcuately mounted coiled-coil filament securely held at its ends, means for supporting said filament intermediate its ends consisting of support wires having loops engaging said filament, said loops being elongated in the direction in which the filament tends to move relatively to the supports by virtue of its contraction during aging



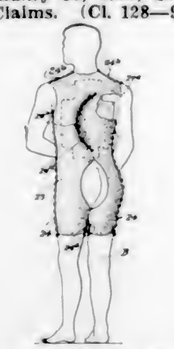
but fitting the filament comparatively closely in the direction normal thereto.

2,103,939
ORNAMENTAL BASE FOR CHRISTMAS TREES
William M. Flanagan, Philadelphia, Pa.
No Drawing. Application February 17, 1937, Serial No. 126,307
2 Claims. (Cl. 41—10)



2. An ornamental Christmas tree base comprising a thin unsized bat of fibrous material needled at widely spaced points to a backing material, the strands of said fibrous material being so arranged as to stand away from the backing material, and the fibers thereof being suitably multi-colored.

2,103,940
WELL TESTER
Allen H. Fletcher, Bakersfield, Calif., assignor of three-ninths to George D. Slusher, two-ninths to Burton W. McCune, and two-ninths to Bernard P. Meyer, all of Bakersfield, Calif.
Application July 14, 1934, Serial No. 735,252
13 Claims. (Cl. 166—1)



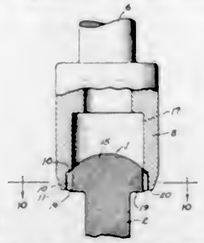
1. A well tester for use on a test string including a body, a packer on the body for sealing off the lower portion of a well, a pump connecting the body with the string and operable by the string to transfer fluid from below the packer into the string, and means made operative by manipulation of the string for admitting fluid pressure from the well above the packer to the well below the packer to equalize the well pressures above and below the packer.

2,103,941
ELECTRICAL SWITCH
Arthur Ellsworth Franey, Ecorse, Mich.
Application March 1, 1935, Serial No. 8,949
Renewed July 8, 1937
1 Claim. (Cl. 200—84)

In a switch structure of the character described, a contactor assembly, said assembly consisting of a pair of elongated flat spring conductor members, said conductor members being provided with a strip of insulation between the same for insulating the same, a pair of leg members projecting laterally in opposite directions from the assembly at one end thereof, one leg member projecting from each of the conductor members, a pair of contact fingers projecting laterally from the opposite end of the assembly, one finger projecting from each of the conductor members, a pair of stationary contacts in opposed relation to the said contact fingers, and actuating means for urging the said contact finger ends of the assembly toward and against the said stationary contacts.

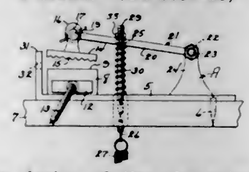
2,103,942
DETACHABLE PLASTER CAST
Harry M. Gillin, Millville, N. J.
Application January 30, 1936, Serial No. 61,588
5 Claims. (Cl. 128—91)

1. A cast of the class described comprising a body having a slit formed therein, a separable fastening means secured around the marginal edges of the slit and formed to provide a movable flap to permit access under the cast.



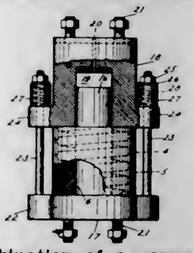
5. As a new article of manufacture, a lining for a plaster cast formed of fabric and having spaced marginal edges defining a longitudinally extending slit, a sealing tongue secured along one marginal edge of the lining and of a width adapting it to extend across the slit, anchoring strips extending along marginal edges of the lining and attached thereto and having free portions extending from the margins in overlying relation to the lining and adapted to be embedded in plaster applied to the lining, and interengaging fastener means extending along the length of the slit and attached to marginal edge thereof.

2,103,943
DRAWING BOOK
Elidore H. Gorton, Baltimore, Md., assignor to The Baltimore Salesbook Company, Baltimore, Md., a corporation of Maryland
Application December 11, 1934, Serial No. 757,050
11 Claims. (Cl. 35—26)



1. In combination, connected severable sheets disposed one over the other, the lowermost sheet initially having incomplete graphic matter thereon, the other sheet having indicia on its upper surface for guidance of a stylus applied thereover to supplement said matter of the first sheet to complete the same through the aid of a transfer medium disposed intermediate the sheets.

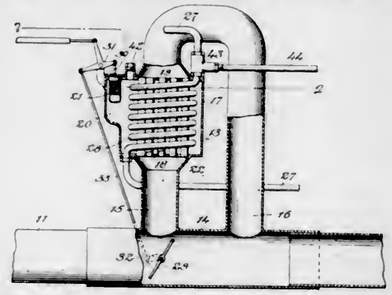
2,103,944
SCREW PART AND DRIVER
Arthur V. Gullborg, Chicago, Ill.
Application April 29, 1935, Serial No. 18,716
5 Claims. (Cl. 145—50)



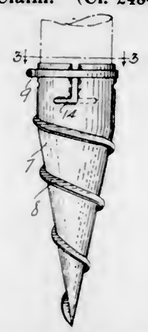
1. The combination of a screw-driving tool having a head-receiving socket formed with internal teeth and intervening notches extending parallel to the socket axis, a threaded fastening element to be turned by said tool comprising a metal head having fine teeth formed around its periphery parallel to its axis and adapted to be received in the notches of said tool and to engage the surfaces of said teeth when the tool is rotated, the internal radius of said socket at the roots of said notches being greater than the radius of said head at the tips of teeth thereon whereby to provide radial clearance for facilitating entry of said head in said socket, the engaging surfaces of the teeth on said head and tool being disposed at approximately forty-five degrees with respect to a radius therethrough and coacting during application of turning torque to said tool to cam said head automatically to centered position in said socket.

2,103,945
ELECTRIC BAG SEALER
Norris B. Henley, Fort Myers, Fla.
Application December 14, 1936, Serial No. 115,845
1 Claim. (Cl. 226—56)

A sealing device of the character described comprising a base plate, a block-like heating element arranged on said base plate and having a flat horizontally arranged work engaging top, a presser head above said top and having a fluted work engaging face, a lever frame hinged to the base plate, winged screws adjustably attaching the said head to the frame for vertical swinging adjustment thereof, means operating said lever frame for the raising and lowering of the head relative to the heating element and urging said frame to normal raised position, a vertical work guide adjacent to said heating element and having a slot with its lowermost edge flush with the top of the latter for directing work between the heating element onto the top thereof and the head when the latter is in raised position, and a yieldable element included in the operating means for the lever frame.



2,103,946
SHOCK ABSORBER
John H. Herr, Palisade, N. J.
Application May 20, 1936, Serial No. 80,852
3 Claims. (Cl. 267—33)

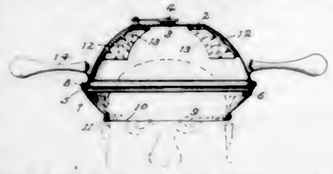


1. The combination of a compression spring embedded in a cylinder of resilient material having an axial bore thru same, a guide rod disposed in said bore and projecting beyond same, a sleeve journalling said guide rod and abutting said cylinder, a saddle plate carrying said rod and abutting said cylinder, and a plurality of tension rods projecting from said saddle plate and having their free ends engaging said sleeve whereby to compress said sleeve against said resilient cylinder.

2,103,947
FUEL HEATER FOR INTERNAL COMBUSTION ENGINES
Frederick J. Holmes, Detroit, Mich.
Application February 26, 1935, Serial No. 8,386
Renewed May 17, 1937
4 Claims. (Cl. 257—241)

1. A unit for utilizing hot gases to heat a liquid, said unit comprising a pipe section to be interposed in a hot gas conducting conduit, a liquid containing chamber, a plurality of hot gas conducting tubes extending through said chamber, a hot gas delivery conduit leading from said pipe section to adjacent ends of said tubes and a hot gas return conduit leading from the other ends of said tubes to said pipe section for circulation of hot gases through said tubes to heat the liquid contained in said chamber, and a conduit for the liquid to be heated extending through said chamber and maintaining the liquid therein separated from the liquid in the chamber.

2,103,948
BEACH UMBRELLA POINT
Elmer Jones, Los Angeles, Calif.
Application July 22, 1936, Serial No. 91,954
1 Claim. (Cl. 248—44)

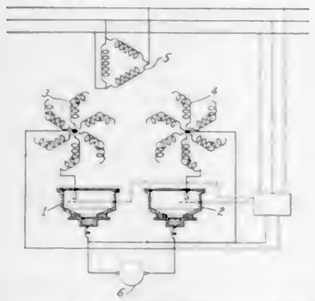


A ground penetrating attachment for an umbrella comprising a hollow cone-shaped body having a pointed lower end and an open upper end to receive the staff of the umbrella therein, said body being slotted on diametrically opposite sides from the open end and the edges of the slot being inturned to provide tongues to penetrate the staff, detachable means surrounding the body about the upper end thereof and cooperating with the tongues for securing the staff in the body, and a thread formed on and extending outwardly from the body and spirally arranged about the same from the pointed end thereof.

2,103,949
SCALP-TREATING DEVICE
Maxemilian E. Koehler, Washington, D. C.
Application February 13, 1937, Serial No. 125,629
1 Claim. (Cl. 128—299)

A scalp-treating device including a helmet in the form of a hollow rigid metallic body fully open at the bottom, handles projecting from the

body, the interior dimensions of the helmet being materially greater than the similar dimensions of the head of a person with which the helmet is to be used, whereby to permit free manipulation of the helmet in all directions relative to the head of the person without contact with the head, the upper end of the helmet being formed with an air vent, a valve controlling the air vent to permit direct exit from and prevent entrance of air into the helmet, a flexible elastic apron having an upper edge in removable sealing cooperation with the lower free edge of the helmet and the lower edge formed for sealing cooperation with the head of the person to which the helmet has been applied, the length of the apron from the edge



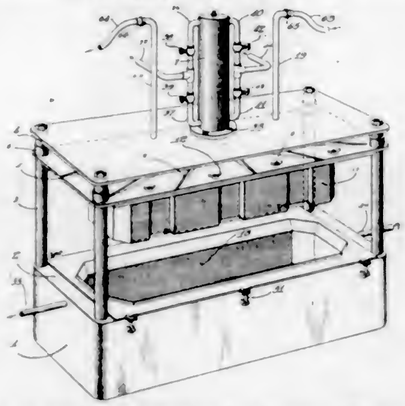
engaging the helmet to the edge engaging the head of the person being of such length as to permit manual manipulation of the helmet in all directions without disturbing the sealing cooperation of the helmet and head, and massage elements secured to the inner surface of the helmet and capable of being brought into contact with the head of the person by manipulation of the helmet by means of the handles to provide a massage operation through subsequent movement of the helmet, the movement of the helmet toward and from the head of the person by means of the handles serving to create a vacuum condition within the helmet and within that portion of the apron above the line of sealing cooperation of the apron with the head.

2,103,950

CONVERTING SYSTEM FOR REVERSIBLE ALTERNATING CURRENT-DIRECT CURRENT CONVERSION

Wilhelm Leukert, Berlin-Siemensstadt, Germany, assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application January 26, 1937, Serial No. 122,382
In Germany January 24, 1936
4 Claims. (Cl. 175—363)



1. A reversible electric current converting system comprising an alternating current circuit, a regenerative load circuit, two cross-connected, grid controlled polyphase converters for controlling current flow between said circuits, transformer means for supplying energy to said converters, said transformer means being arranged to feed potential to one of said converters having a shifted phase angle with respect to the potentials supplied to the other.

2,103,951

APPARATUS FOR MAKING BURIAL COFFINS

Everett Marion Lewis, Tulsa, Okla.

Application March 2, 1936, Serial No. 66,694
3 Claims. (Cl. 18—55)

1. A molding apparatus for burial coffins and lids therefor, comprising a base, guide means rising from the base, a plate mounted for travel on the guide means, a male mold including spaced walls providing a chamber therein, a flange disposed about and outwardly beyond the top of the mold and closing the chamber, means for detachably securing the flange to the traveling plate for movement of the mold therewith, a female mold receiving the male mold for cooperation therewith and including spaced walls providing a chamber therein, a flange disposed about and outwardly beyond the top of the female mold for closing the chamber thereof to rest upon the base, slotted means extending from the outer edges of the flange of the female mold, means pivotally mounted to the base and received in the slots for detachably securing the female mold to the base, ram means for the traveling plate to raise and lower the male mold with respect to the female mold, means for introducing steam in the chambers, and exhaust means therefor.

2,103,952

CARBOHYDRATE DERIVATIVES AND PROCESSES FOR MAKING THE SAME

Leon Lilienfeld, Vienna, Austria

No Drawing. Application July 16, 1934, Serial No. 735,520. In Great Britain July 17, 1933
7 Claims. (Cl. 260—152)

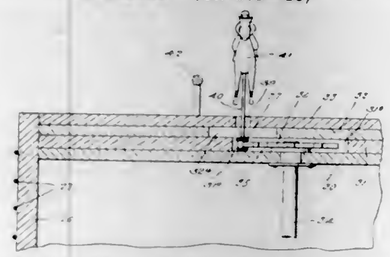
1. Process for the manufacture of water-soluble alkyl derivatives of cellulose, wherein the alkylation is effected by means of an alkyl halide and is conducted in the presence of a proportion of caustic alkali to cellulose of at least 0.3 but not substantially over 0.8 part of caustic alkali calculated as NaOH, to 1 part of cellulose and in the presence of a proportion of water to cellulose of at least 0.5 part of water to 1 part of cellulose, the quantity of water present being in every case larger than the amount of caustic alkali present calculated as NaOH, but smaller than three times the weight of the caustic alkali calculated as NaOH.

2,103,953

COLLOIDAL PLANT FOOD AND STIMULANT

Charles Northen, Orlando, Fla.

No Drawing. Application October 22, 1936. Serial No. 107,101
6 Claims. (Cl. 71—2)



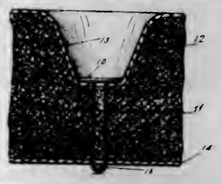
1. A composition of matter for stimulating plants comprising an intimate mixture of finely divided natural colloidal phosphate fertilizer and colloidal compounds of calcium, magnesium, copper, zinc, iodine, boron, and manganese, the ratio by weight of the phosphate fertilizer to the added calcium and magnesium compound each being as 100 is to between 2.0 and 30.0 constituting a homogeneous composition in which all of the ingredients are in a finely divided colloidal state and in substantial and beneficial quantities.

2,103,954

AMUSEMENT APPARATUS

Frank E. Pavelka, San Antonio, Tex.

Application April 22, 1935, Serial No. 17,750
2 Claims. (Cl. 273—86)



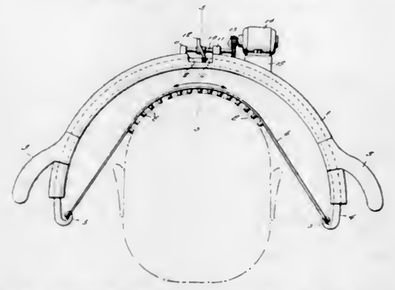
1. A game apparatus comprising a trackway including a plurality of superimposed plies, the uppermost ply having a plurality of slots therein, one of the intermediate plies having a plurality of slots therein underlying the slots of the uppermost ply, sprocket chains extending longitudinally in the slots of the second-mentioned ply, said second-mentioned ply having pockets therein at the edges of the slots therein, sprocket wheels in the pockets, drive means extending through the lowermost ply and operatively connected with the sprocket wheels, and figure supporting members extending upwardly from the chains and through the slots of the top ply.

2,103,955

UPHOLSTERY BUTTON

Bion C. Place, Detroit, Mich., assignor of one-half to George E. Gagnier, Detroit, Mich.

Application April 20, 1935, Serial No. 17,525
3 Claims. (Cl. 155—185)



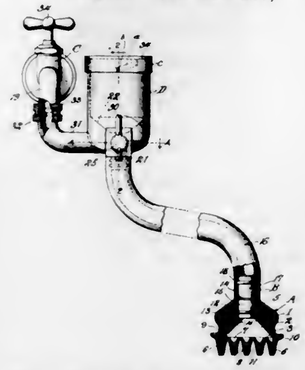
1. An upholstered cushion of the type in which the cushioning material is secured to wires, comprising the cushioning material, the wires, and means to secure said material to said wires at spaced points consisting in one-piece wire tufting buttons each having a head part and a part rigidly attached to said head part to pass through said material and be interlocked to one of said wires, said last named part consisting only in a pair of spaced legs disposed at opposite sides of one of said wires and terminating in U-shaped ends, said U-shaped ends being disposed in side by side relation with the bottom of each U and the wire contacting therewith directly beneath the center of said head part.

2,103,956

MASSAGE MACHINE

August Schumacher, Flushing, N. Y.

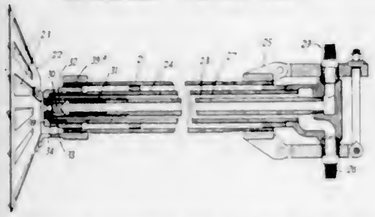
Application November 24, 1936, Serial No. 112,577
5 Claims. (Cl. 128—63)



1. A massage machine comprising an arcuate housing, an arcuate bar mounted for reciprocation in said housing the arc of each of the housing and bar being a portion of a circle, a flexible belt connected to the end portions of said bar, and means for reciprocating the bar.

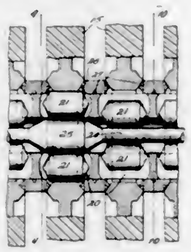
2,103,957

BRUSH AND AN APPLIANCE FOR USING THE SAME



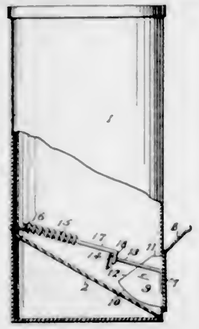
William H. Scott, Rochester, N. Y.

Application May 29, 1936, Serial No. 82,607
3 Claims. (Cl. 15—127)



1. In an appliance of the class described, a brush including a body portion having an interior chamber and provided at the bottom wall thereof with outwardly extending massaging fingers having ducts communicating with the interior chamber, said body being also provided with a continuous rib extending outwardly and upwardly from the body and arranged to receive the finger tips and prevent the same from slipping out of contact with it and coming in contact with a person when the brush is used for massaging.

2,103,958
FUEL BURNER
Thomas B. Stillman, South Orange, N. J., assignor to The Babcock & Wilcox Company, Newark, N. J., a corporation of New Jersey
Application May 22, 1935, Serial No. 22,702
13 Claims. (Cl. 299—141)



6. A sprayer member for a liquid fuel burner adapted to be mounted in a furnace wall air inlet opening and having a discharge orifice flaring towards its furnace side, a central whirling chamber of circular cross-section formed in one face thereof tapering towards and discharging through said discharge orifice, a fuel nozzle slot formed in said face and having its discharge end opening substantially tangentially into said chamber, and a series of fluid passages arranged substantially symmetrical relative to said discharge orifice and at an angle to the axis thereof and having their discharge ends opening adjacent the furnace end thereof.

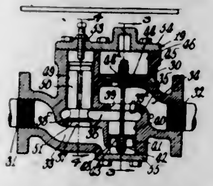
2,103,959
CLUTCH FOR TRANSMISSION GEARING
Edson Fitch Spinner, Ava, Ill.
Application October 21, 1935, Serial No. 45,997
3 Claims. (Cl. 192—71)

1. Apparatus of the class described comprising a hollow shaft, a rotatable member surrounding the shaft, rings surrounding the shaft and supporting the rotatable member with a portion of its bore wall in outwardly spaced relation to the periphery of the shaft, the engagement between the rotatable member and rings being along surfaces diverging with respect to the axis of rotation whereby in combination with the shaft a three-bearing floating motion is provided for the rotatable member, said shaft in line with said wall having a slot therethrough, a clutch member, a rod slidable in the bore of said shaft having portions of different diameter, said clutch member being in said slot and of greater dimension than the slot in a direction radially of the shaft, whereby the portion of the rod of greater diameter may contact the clutch member to project it partly beyond the periphery of the shaft to engage said bore wall of the rotatable member and such portion may be disaligned with the clutch member for release of the latter.

2,103,960
DISPENSER
George C. Spiro, Yonkers, N. Y.
Application November 24, 1936, Serial No. 112,580
7 Claims. (Cl. 221—6)

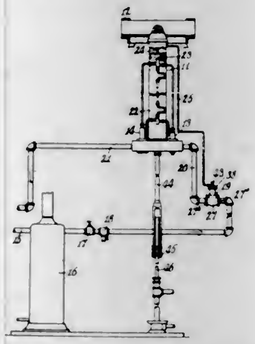
1. A dispenser including a container formed with a discharge opening, a gate for controlling the flow of material through said opening, a finger plate forming an extension of the gate and operable to swing the gate to open position, the movement of the finger plate to open the gate being limited by contact of said finger plate with the container, a bar extending from the gate, an agitator at one end of the bar, and a spring connected at one end to the bar in advance of the agitator and at the opposite end to the container.

2,103,961
EXPOSURE FRAME FOR RÖNTGEN FILM
Gustav Wilmanns, Wolfen Kreis Bitterfeld, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
Application March 28, 1935, Serial No. 13,511
In Germany March 31, 1934
3 Claims. (Cl. 250—34)



3. An exposure frame for Röntgen film comprising a cassette, a lid for closing said cassette, a fluorescent sheet arranged in said cassette, a second fluorescent sheet arranged in the lid of said cassette, and pins mounted in said cassette, said pins co-operating with holes in a sheet of the same size as has the cassette so that the lid of said cassette cannot be closed when inserting therein a sheet of the same size as has the cassette, but having a different arrangement of holes.

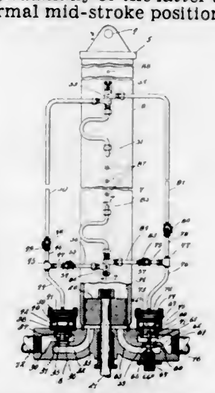
2,103,962
SAFETY DEVICE
Wade H. Wineman, Michigan City, Ind., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application May 8, 1936, Serial No. 78,691
51 Claims. (Cl. 121—130)



1. In a valve mechanism, a casing providing a passage, a plurality of valves in said casing each adapted to interrupt flow through said passage,

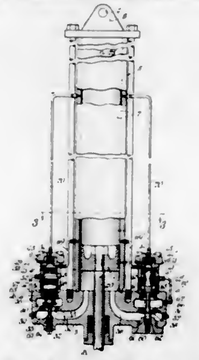
means associated with one of said valves for producing a differential in pressure between the opposite sides of said valve during flow through said casing, and means governed by such differ-

ential in pressure and associated with the other of said valves whereby the same is caused to close after a predetermined period of uniform flow past the first mentioned valve.



2,103,963
MOTOR APPARATUS
Wade H. Wineman, Michigan City, Ind., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application July 21, 1933, Serial No. 681,543
14 Claims. (Cl. 121—47)

1. In a pumping system, in combination, a single acting pumping motor having a load, fluid connections leading to said motor, controlling means for said connections normally yieldingly maintained in flow-permitting position but having associated releasable latch means by which it is held in closed position, when moved thereto, and means controlled by pressure built up in the non-working end of said pumping motor upon loss of pumping load for effecting movement of said controlling means to flow-interrupting position.

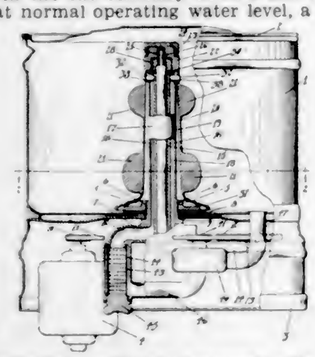


2,103,964
MOTOR FOR PUMPING MECHANISMS
Wade H. Wineman, Michigan City, Ind., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application September 29, 1934, Serial No. 746,170
28 Claims. (Cl. 121—126)

1. In a motor, in combination, a cylinder, a piston reciprocable therein, and valve mechanism for said motor including a valve and controlling means therefor having a pressure area acting to move said valve, and means for supplying pressure to said area and venting pressure therefrom including conduits respectively having their extremities remote from said area opening into communication with the cylinder bore at points widely spaced longitudinally of the latter and at opposite sides of normal mid-stroke position but both cov-

ered and also uncovered by each end of the piston during each complete cycle of piston movement.

2,103,965
MOTOR FOR PUMPING MECHANISMS
Wade H. Wineman, Michigan City, Ind., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application October 10, 1934, Serial No. 747,677
23 Claims. (Cl. 121—126)



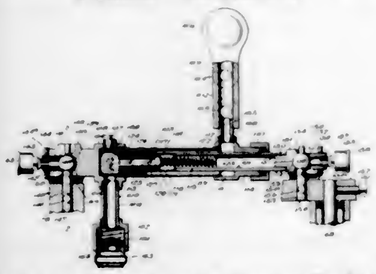
1. In a motor, in combination, a cylinder, a piston reciprocable therein, and fluid distribution means for said motor including a valve and controlling means therefor having a plurality of pressure areas acting in the same direction, means for constantly supplying pressure fluid to one of said areas, and means for supplying pressure to two others of said areas during one pass of the piston, from a space within said cylinder at the same side of said piston, in a predetermined order to cause said valve to perform one of its functions after both said last mentioned areas are supplied with pressure and venting the pressure from said last mentioned areas in a reverse order during the opposite pass of the piston to cause reverse movement of the valve after venting of both said last mentioned areas.

2,103,966
WASHING MACHINE
Thomas W. Behan, Binghamton, N. Y.
Application December 1, 1934, Serial No. 755,625
6 Claims. (Cl. 68—15)

1. A washing machine comprising a tub, an agitator therein above the clothes supporting

portion of the tub for turning the clothes, a circulatory water system for effecting turbulency including a pump positioned below said tub, a passage for water communicating at one end with the suction side of the pump and at its other end with the tub centrally thereof and substantially at normal operating water level, a passage

communicating with the pressure side of said pump and with said tub at a point below the normal operating water level thereof, means in said first passage substantially at water level for removing and retaining dirt carried by the water, and a common source of power for driving said agitator and said pump.



2,103,967

COMBINED OSCILLATORY RECIPROCATORY SELF-CENTERING PUMP

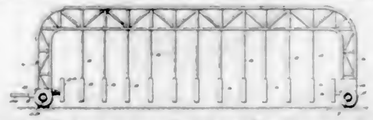
Jesse B. Boyett, Nashville, Ga.

Application July 17, 1936, Serial No. 91,201

2 Claims. (Cl. 103—178)

1. In a pump structure, a horizontally disposed oscillatory hollow body provided with an intake and an outlet, a combined oscillatory-reciprocatory plunger operating within and bodily oscillating said body in unison therewith, an upstanding horizontally revoluble means at the outer end of the plunger, and an upstanding stationary means at that end of said body opposite the outer end of the plunger, said revoluble and stationary means coacting for centering the plunger during its operation, said revoluble means imparting a combined oscillatory-reciprocatory movement to the plunger, and said stationary and revoluble means providing supports for said body and plunger.

2,103,968



STARTING GATE

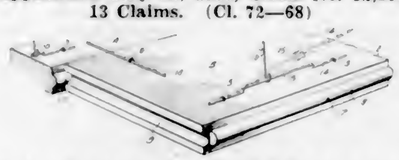
John M. Mason, Washington, D. C.

Application April 9, 1936, Serial No. 73,526

20 Claims. (Cl. 119—15.5)

10. A portable starting gate including an overhead structure, having a plurality of stall members rigidly attached thereto, a stall member movably attached adjacent one end of said overhead structure, a truck at each end of the overhead structure, at least one truck comprising an upper truck member attached to said overhead structure, and a lower truck member having an axle and wheels thereon, said lower and upper truck members being pivotally connected to each other whereby said lower truck member may be swung in a horizontal plane, said movable stall

member having a part thereof adjacent to said lower truck member and spaced from the same, and said lower truck member having means spaced from said movable stall member part, and means interposed between said last named means and said movable stall member to permit free turning movement of said lower truck member relative to said overhead structure to cause swinging movement of said movable stall member relative to said overhead structure.



2,103,969

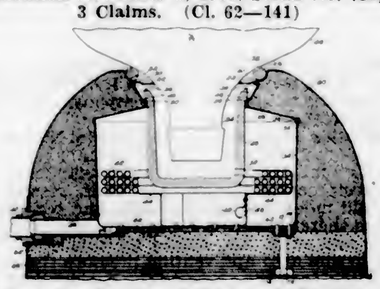
CEILING CONSTRUCTION AND SLAB THEREFOR

Clarke F. Davis, Short Hills, John G. Brush, Westfield, and Lyle K. Mayne, Linden, N. J., assignors to American Cyanamid & Chemical Corporation, New York, N. Y., a corporation of Delaware

Application July 19, 1935, Serial No. 32,166

13 Claims. (Cl. 72—68)

9. A precast slab of set cementitious material having a longitudinal channel in one face thereof and a hanger engaging element partially embedded in said slab and bridging said channel crosswise thereof.



2,103,970

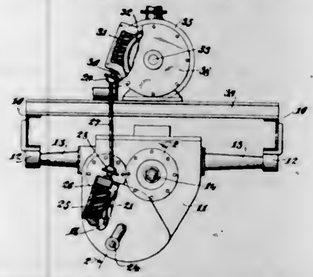
LIQUID COOLER

William D. Drysdale, Mount Clemens, Mich., assignor to Walter J. Sugden, West Roxbury, Mass.

Application November 2, 1934, Serial No. 751,180

3 Claims. (Cl. 62—141)

1. In a liquid cooler of the inverted bottle type, the combination of a housing having an opening at the top for the downward insertion of the bottle neck, a reservoir within said housing for the liquid to be cooled, said reservoir having an opening at the top to receive the bottle neck, a liquid outlet conduit leading from said reservoir to the exterior of said housing, a refrigerant expansion coil disposed within said reservoir to cool the liquid in the latter, and a cup within and spaced from the internal surface of said reservoir to receive the bottle neck, said cup having an outlet into said reservoir, said cup outlet being remote from said outlet conduit, thereby to compel the liquid to flow over a considerable area of said coil before reaching said outlet conduit, and said coil being disposed in the space between the internal surface of said reservoir and the external surface of said cup.



2,103,971

ENCLOSED DRIVE FOR PUMPS

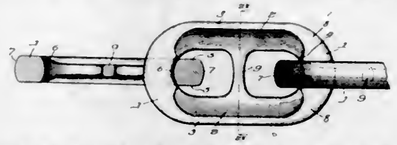
John Goldsmith, Sunnyside, N. Y., assignor to Mack Manufacturing Corporation, a corporation of Delaware

Application October 8, 1936, Serial No. 104,590

2 Claims. (Cl. 74—11)

1. In combination with a vehicle chassis having a power unit and transmission mechanism thereon having a main and countershaft supporting partition and an overhanging extremity on the countershaft which provides for an over-speed gear connection thereon between a countershaft and the transmission driven shaft, mechanism mounted on the frame to be driven by the power unit, a gear in the transmission mechanism rotatably mounted on the overhanging extremity on the countershaft provided for an over-speed connection, a clutch between the said extremity on the countershaft and the gear, a gear housing and gears mounted on the frame, a permanent drive connection between the mechanism to be driven and the gears in the last named gear housing, and a permanent drive connection between the gears in the last named gear housing and the gear mounted rotatably on the overhanging extremity on countershaft.

2,103,972



HEAVY DUTY ABRASION RESISTING CHAIN

Leonard T. Harris, Chicago Heights, Ill., assignor, by mesne assignments, to The American Brake Shoe & Foundry Co., New York, N. Y., a corporation of Delaware

Application October 12, 1936, Serial No. 105,226

4 Claims. (Cl. 59—84)

1. In a chain, interengaging links each comprising side bars and closed ends; the side bars being of trapezoidal section with their minor thickness presented inwardly and their greater thickness presented outwardly and thereby developing opposite concave faces upon the links defined by outer marginal ridges; the interengaging ends of the links having their inner portions corresponding in thickness substantially to that of the sides at said ridges and thereby providing full bearing contact between the in-

terengaging surfaces of the link; each face of the link having its side ridges in the same plane with its end faces, and the end faces and side ridges collectively providing in two parallel planes perimetrically continuous ground contacting surfaces that define the link concavities.

2,103,973

WINDSHIELD WIPER

Erwin C. Horton, Hamburg, N. Y., assignor to Trico Products Corporation, Buffalo, N. Y.

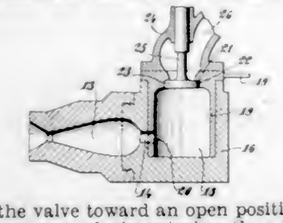
Application March 27, 1935, Serial No. 13,320

8 Claims. (Cl. 15—250)

1. A windshield cleaner having a wiper, a wiper carrying arm urging the wiper against the windshield glass, said wiper being connected to the arm for lateral rocking movement beneath the arm and said arm having oppositely disposed stop parts freely straddling the wiper for determining the extent of rocking movement, and a rubber buffer supporting the arm on the wiper and disposed between said stop parts and said wiper for cushioning and silencing the contacts therebetween during such rocking movement.

2,103,974

SUPERCHARGING MECHANISM FOR DIESEL ENGINES



Bruno Loeffler, Plainfield, N. J., assignor to Mack Manufacturing Corporation, a corporation of Delaware

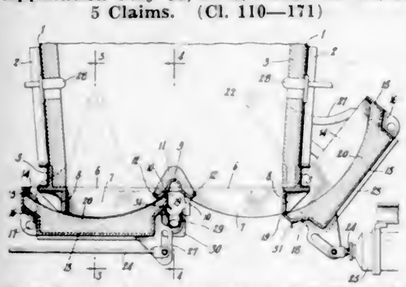
Application June 4, 1935, Serial No. 24,824

3 Claims. (Cl. 123—30)

1. In combination with a Diesel engine head having a combustion chamber formed therein and an air chamber communicating therewith, a source of air under pressure, a valve between the air chamber and combustion chamber, means to adjust the last-named valve, and a masked valve between the air chamber and the source of air, said masked valve moving away from the

source of air during its opening movement and being formed to prevent communication between the chamber and source of air during initial mo-

tion of the valve toward an open position whereby the amount of air entering the chamber is increased upon initial flow thereof past the valve.



2,103,975

WATER SEALED DOOR FOR BOTTOM-DISCHARGING RECEPTACLES

Anthony M. Meyerstein, Nutley, N. J., assignor of three-fourths to Rosoff Bros., Inc., Brooklyn, N. Y., a corporation of New York, and one-fourth to Anthony M. Meyerstein, Inc., New York, N. Y., a corporation of New York

Application July 30, 1936, Serial No. 93,349

5 Claims. (Cl. 110—171)

1. A hopper having side walls slightly converging toward the bottom and provided with a bottom-discharge opening and an arcuately movable water-sealed door therefor all of whose upper edges are outside and above the edges of the discharge opening when the door is in closed position and scrapers on the outside of the hopper walls extending toward the adjacent sides of the door and adapted to remove some of the material discharged from the hopper from the space between the hopper walls and said door sides during opening movement of the door.

2,103,976

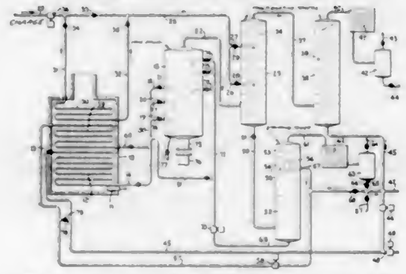
PRODUCTION OF MAGNESIUM FROM MAGNESIFEROUS RAW MATERIALS BY THERMAL REDUCTION

Robert Suchy and Hellmuth Seliger, Bitterfeld, Germany, assignors, by mesne assignments, to Magnesium Development Corporation, a corporation of Delaware

No Drawing. Application November 12, 1936, Serial No. 110,482. In Germany September 23, 1936

5 Claims. (Cl. 75—67)

1. A process for producing magnesium by thermal reduction of magnesiferous compounds by means of silicon, which comprises incorporating in the reaction mixture at least one substance of the group consisting of alkali, alkaline earth metal, and aluminum fluorides in quantities ranging between about 0.5 to about 5 per cent by weight of such reaction mixture, the reaction mixture being such as to yield an exclusively solid residue at the reaction temperature, and subjecting the reaction mixture thus treated to temperatures adapted to cause volatilization of the magnesium.



2,103,977

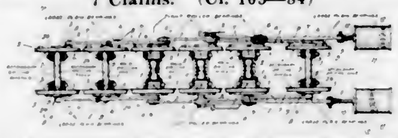
TREATMENT OF HYDROCARBON OILS

George Armistead, Jr., Scarsdale, N. Y., assignor to Gasoline Products Company, Inc., Newark, N. J., a corporation of Delaware

Application November 9, 1933, Serial No. 697,272

9 Claims. (Cl. 196—48)

1. In the treatment of hydrocarbon oils, wherein the oil is converted into ultimate products consisting principally of a motor fuel and a solid or semi-solid residue, the process which comprises heating an oil containing higher boiling hydrocarbons to a temperature and for a period of time sufficient to convert higher boiling hydrocarbons into lower boiling ones, while maintaining said hydrocarbons under a pressure materially above atmospheric, fractionating vapors evolved during said conversion treatment in a plurality of independent fractionating zones, contacting the hot products from said conversion treatment with fresh oil in the first of said fractionating zones to thereby heat said oil and vaporize lighter constituents therefrom, distilling residual products from said first fractionating zone under a pressure materially lower than that existing in said first fractionating zone to thereby vaporize lighter constituents therefrom, passing the residual products from said distillation to a residue-forming zone, heating the distillate resulting from said distillation, passing the heated distillate and products undergoing conversion into said residue-forming zone in direct contact with the residue products resulting from said distillation, whereby heat from said distillate and products undergoing conversion is utilized to form an ultimate product substantially solid at normal room temperatures, withdrawing vapors from another of said fractionating zones and condensing a desired gasoline fraction therefrom.



2,103,978

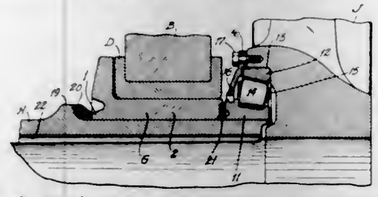
LOCOMOTIVE RUNNING GEAR

Tracy V. Buckwalter, Canton, Ohio, assignor to The Timken Roller Bearing Company, Canton, Ohio, a corporation of Ohio

Application February 8, 1937, Serial No. 124,580

7 Claims. (Cl. 105—84)

1. A locomotive running gear comprising a main driving axle and crank pins and a secondary driving axle and crank pins, roller bearings for said main driving axle and crank pins, and plain bearings for said secondary axle and crank pins, said roller bearings being initially relatively tight and said plain bearings being initially relatively loose.



2,103,979

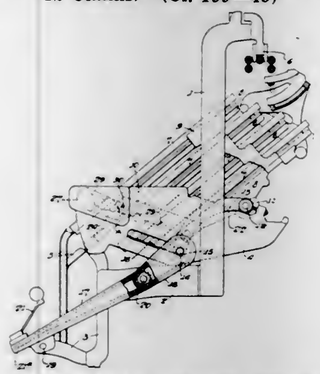
TRUCK

Clifford L. Eastburg, Canton, Ohio, assignor to The Timken Roller Bearing Company, Canton, Ohio, a corporation of Ohio

Application February 14, 1936, Serial No. 63,854

7 Claims. (Cl. 105—79)

1. A truck axle construction comprising an axle, a wheel thereon, an antifriction bearing supported by said wheel, said bearing including an inner raceway member, a housing for said axle having one end fitting in and supported by said inner raceway member, said housing provided with an external thrust shoulder, a pedestal box surrounding said housing between said inner raceway member and said thrust shoulder, and an adjusting ring mounted on said housing between said inner raceway member and said pedestal box, said housing being of substantially uniform diameter between said end thereof and said exterior shoulder.



2,103,980

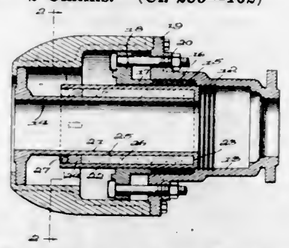
TYPOGRAPHICAL MACHINE

Herman R. Freund, Brooklyn, N. Y., assignor to Intertype Corporation, Brooklyn, N. Y., a corporation of New York

Application February 26, 1937, Serial No. 128,008

12 Claims. (Cl. 199—45)

1. A typographical machine comprising a frame supporting matrix assembling means, a magazine unit containing a column of matrix magazines, said unit being shiftable relatively to said frame, means for guiding the magazines to bring one or another thereof, in a predetermined order, into operative relation with said assembling means, and means operable at will and cooperable with said guiding means to bring certain of the magazines in a different order, into operative relation with said assembling means.



2,103,981

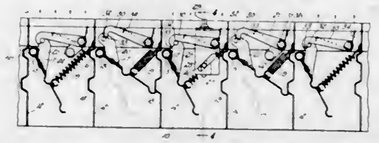
EXPANSION JOINT STRUCTURE

Robert Hall, Lockport, N. Y., assignor to American District Steam Company, North Tonawanda, N. Y., a corporation of New York

Application June 11, 1936, Serial No. 84,742

2 Claims. (Cl. 285—162)

2. An expansion joint comprising inner and outer sliding joint members, a sealing member between said sliding members, said inner joint member having a laminated wall structure including an outer metallic section in sliding contact with the sealing member, an intermediate porous section of heat insulating material, an inner metallic section, and sealing means at the ends of the intermediate insulating section.



2,103,982

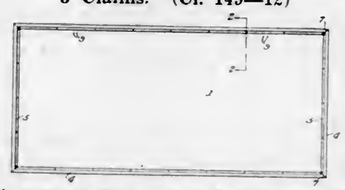
ADJUSTABLE REGISTER

Stanley Hart, Berlin, Conn., and Leonard Zavorski, Easthampton, Mass., assignors to Tuttle & Bailey, Inc., New Britain, Conn., a corporation of Connecticut

Application August 31, 1934, Serial No. 742,236

9 Claims. (Cl. 98—110)

1. In a register of the character described, a frame having a plurality of passages therethrough, a plurality of pivoted shutters, one in each passage, a latch engaging member on each shutter, means common to all of said shutters for adjusting the same, and a readily accessible, quickly detachable latch connectible between each latch engaging member and said adjusting means, and yieldable means urging each latch into operative engagement with its latch engaging member.

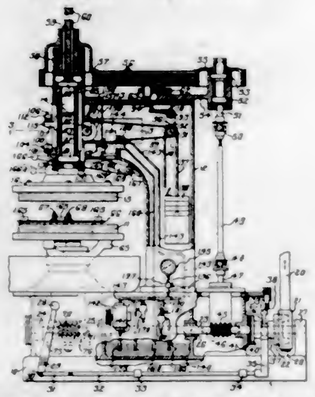


2,103,983

TANNING BOARD

Edwin A. Headland, Beaver, Pa., assignor to Ingram-Richardson Manufacturing Company, Beaver Falls, Pa., a corporation of Pennsylvania

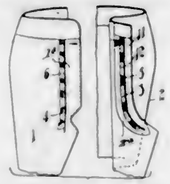
Application January 4, 1936, Serial No. 57,484



3 Claims. (Cl. 149—12)

2. A support for leather drying comprising a thin metal plate, and vitreous enamel fused on

both sides of said plate and presenting the unaltered fused surface of the enamel to the leather.



2,103,984
LAPPING MACHINE
Herbert S. Indge, Westboro, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts
Application September 11, 1935, Serial No. 40,118
9 Claims. (Cl. 51—117)

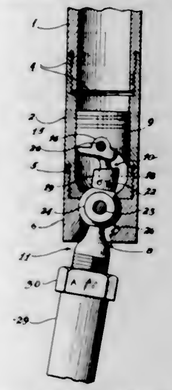
5. A lapping machine of the type having a pair of opposed rotatable lapping elements which are movable relatively toward and from each other and a work carrying cage therebetween arranged to carry a plurality of work pieces through an irregular path between the operative faces of said laps, a fluid pressure system including a piston and cylinder which are arranged to cause a relative approaching or receding movement between said lapping elements, a control valve to convey fluid under pressure to either end of said cylinder, means including a fluid pump and a pipe to convey fluid under pressure to said control valve and cylinder, a pressure regulating valve in said pipe between the pump and control valve to maintain the laps in engagement with the work at a predetermined positive pressure for a rough lapping operation, a second pressure regulating valve in said pipe which is connected in series with the first pressure regulating valve to maintain the laps in engagement with the work at a second predetermined positive pressure for a finish lapping operation, and means including a valve between the pipe and said second pressure regulating valve to render said second pressure regulating valve inoperative during the rough lapping operation.

2,103,985
TROUSERS AND METHOD OF MAKING THE SAME
Michael Jacobs, Toronto, Ontario, Canada, assignor, by direct and mesne assignments, to Talon, Inc., a corporation of Pennsylvania
Application May 27, 1935, Serial No. 23,689
1 Claim. (Cl. 2—234)

The method of constructing trousers having a front opening closed by a slide fastener which consists in taking the separated mating stringers of a slide fastener which comprises a pair of tapes each having a row of fastener members uniformly spaced along its edge, sewing one of said stringers to the face of one of a pair of trouser flies, sewing the other of said stringers to the face of the other fly and in such position that when the trousers are completed the fastener elements of one tape will be disposed opposite the spaces between the fastener elements of the other tape and with the end elements of each row adjacent one another, sewing one of said flies and its attached stringer to a trouser section, sewing the other of said flies and its attached stringer to a complementary trouser sec-

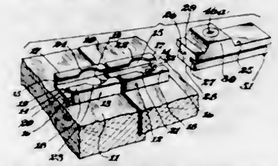
tion, joining the trouser sections, threading both fastener tapes through a slider after the trouser sections are joined together and thereafter permanently securing the tapes together in such position that the fastener elements of one tape are opposite the spaces between the fastener elements of the other tape by attaching a bottom stop to both tapes adjacent the end fastener element of the series which is adjacent the crotch of the trousers.

2,103,986
ELECTRIC SWITCH
Gustaf A. Johnson, New Bedford, Mass.
Application December 15, 1933, Serial No. 702,516
Renewed September 10, 1936
25 Claims. (Cl. 200—64)



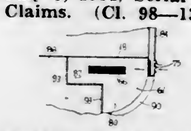
19. In an electric switch, an insulating body recessed in its top face, a pin bridge mounted in said recess, the wall of said recess at opposite points adjacent said top face and the ends of said bridge interlocking when said bridge is turned in one direction, a movable contact and an actuating member loosely mounted on the pin portion of said pin bridge, a pull-chain for rotating said actuating member through a limited arc to turn said movable contact, and a cone-shaped spiral spring for returning said actuating member to initial position when said pull-chain is released and for holding said pin bridge in locked position, said actuating member being recessed in its top face for housing said spring to permit free movement of said member longitudinally said pin portion.

2,103,987
SASH LOCK SECURING DEVICE
Herman H. Kistner, Baltimore, Md., assignor to Kistner Lock & Appliance Company, a corporation of Maryland
Application February 23, 1937, Serial No. 127,225
3 Claims. (Cl. 70—451)



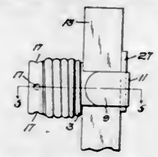
1. A sash lock securing device comprising a split sleeve conformable to a bore in the sash and adapted to receive a bolt barrel, said sleeve having a portion adapted to engage a recess in said barrel to retain it in position when assembled therein, a portion of said sleeve also engaging the side wall of the bore to secure the sleeve and barrel in place.

2,103,988
FISHING TOOL FOR WELL DRILLING
George F. Le Bus, Longview, Tex.
Application May 16, 1936, Serial No. 80,053
2 Claims. (Cl. 294—86)



1. A knuckle joint for well fishing tools comprising a housing having a base, a socket formed in the base and the lower end of the housing, a socket member having one end rounded to provide a ball-like formation and said formation comformably seated in the socket, the other end of said socket member projecting below the base and adapted to be connected to a well fishing tool, a piston being reciprocally disposed within said housing, and means co-acting with the piston and said socket member, and wherein said ball-like formation of said socket member has an integrally-formed socket above the ball-like formation, and wherein said piston has a groove in the lower surface thereof; said co-acting means of the piston and socket member comprising a member with a ball on its lower end conformably receivable in said socket of the socket member, and including angularly-disposed lip portions and a rib on its upper end, whereby the rib is receivable in said groove of the piston, and said lip portions co-acting with the under surface of the piston.

2,103,989
BAR LOCK
Harold Machinist, Sunnyside, Long Island, N. Y., assignor to Dudley Lock Corporation, Chicago, Ill., a corporation of Illinois
Application September 22, 1936, Serial No. 101,934
9 Claims. (Cl. 70—129)



1. A lock of the character described comprising in combination twin channels arranged to be affixed in alignment with each other and flush with the adjacent edges of a door and frame, respectively, said channels having longitudinal inwardly turned flanges, a lock bar formed with grooves to receive said flanges for slidably mounting said lock bar in said channels, said lock bar including a rotatable bolt disposed in the path of the grooves and keying stops or cutouts formed on the flanges of one of said channels for locking said lock bar in overlapping position on said channels.

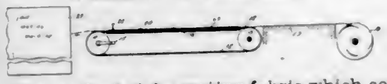
2,103,990
VEHICLE VENTILATING SYSTEM
William J. Mayer, Glenside, Pa., assignor to Edward G. Budd Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania
Application July 5, 1934, Serial No. 733,809
4 Claims. (Cl. 98—13)

1. An air intake for streamline trains comprising, in combination, a step well, a movable floor section forming a top to the step well, car doors forming closed sides of the step well and a pivoted step completing a closed compartment of the step well and means providing a fresh air intake into said compartment and means at right angles to said last named means transferring the air into a conditioning duct system of the vehicle.

2,103,991
LOOM PICKER
Frank W. Merrick, Boston, Mass., assignor to American Stay Company, East Boston, Mass., a corporation of Massachusetts
Application October 6, 1933, Serial No. 692,411
6 Claims. (Cl. 139—159)

6. A loom picker having, in combination, a shuttle engaging part, a holder for said part having a portion for engaging the side of the picker stick opposite said part, said holder having a tubular portion of lesser length than said part and which is open at opposite ends and receives

said part, said holder also having a portion adjustably screw-threadedly connected to said tubular portion for engaging the outer end of said part for clamping both the latter and said holder to said stick.



2,103,992

DECORATED FABRIC AND METHOD AND MEANS FOR MAKING THE SAME

Norman C. Thackeray, Providence, R. I., assignor to Decorative Fabrics Company, a corporation of Rhode Island

Application May 9, 1934, Serial No. 724,683

4 Claims. (Cl. 101—115)

1. The method of decorating fabric which comprises flock printing a design onto the fabric, registering the printed design by hand adjustment with a transparent guide, substituting therefor a metal stencil with a different design having a predetermined relation to the former design without disturbing the relative positions of the threads of the fabric, applying adhesive through the second or metal stencil, then applying to the fabric bearing the adhesive a shower of flock so that the second design is flock printed thereon.

2,103,993

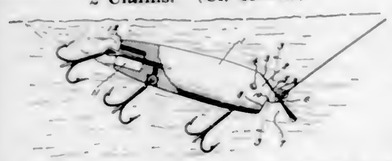
TREATING CASEIN PLASTICS

Will E. Vawter, Bainbridge, N. Y., assignor to American Plastics Corporation, New York, N. Y., a corporation of New York

No Drawing. Application October 6, 1936, Serial No. 104,299

5 Claims. (Cl. 18—47.5)

1. A process of treating shaped casein plastics having a predetermined color, which comprises first polishing said articles by subjecting same to the action of a hypochlorite solution to polish the same whereby the color is injured and the surface rendered slimy, and thereafter to the action of a solution having a weak acidic reaction, to restore the color.



2,103,994

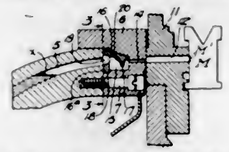
FISH LURE

Linus A. Verzi, Arlington, Va., assignor of one-half to Emery N. Hosmer, Arlington County, Va.

Application January 5, 1937, Serial No. 119,137

2 Claims. (Cl. 43—46)

1. A diving plug comprising a buoyant body having the upper portion of its forward end formed with a flat transverse face sloping downwardly toward the front, having the lower portion of its forward end under-cut to form a transverse upper face and a transverse back shoulder with a transverse groove between said face and shoulder, said shoulder lying approximately in a plane perpendicular to the axis of said body, and a plate secured to said sloping face extending downwardly beyond said face at a diving angle.



2,103,995

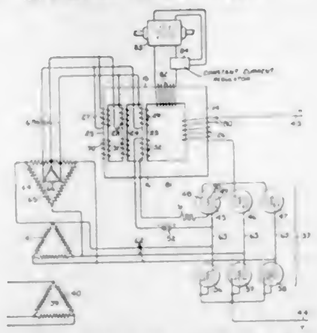
METAL POT FOR SLUG CASTING MACHINES

Le Roy W. Willis, Stamford, Conn., and Edmund M. Goodbody, Long Island, N. Y., assignors to Intertype Corporation, Brooklyn, N. Y., a corporation of New York

Application April 20, 1936, Serial No. 75,476

1 Claim. (Cl. 22—70)

A metal pot for slug casting machines having a metal reservoir to contain a body of molten metal, a well to receive metal from the reservoir and having means for forcing metal therefrom, a throat extending upwardly from the well to a level above that of the metal in the reservoir and to a horizontally elongated outlet of substantially the same width as the portion of the throat adjacent thereto for injecting metal discharged from the throat into a slug casting mold, a transverse chamber substantially as wide as the outlet and located between the normal level of metal in the throat and the outlet for the flow of metal therethrough, and a solid baffle extending horizontally across said chamber in parallel relation to the outlet and disposed for the flow of metal around and beyond it in at least one unbroken stream before reaching the outlet.



2,103,996

CONSTANT-CURRENT MAGNETIC BRIDGE

Burnice D. Bedford, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

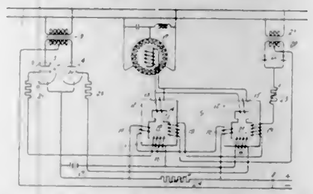
Application February 1, 1935, Serial No. 4,480

22 Claims. (Cl. 175—363)

1. A magnetic bridge sensitive to variations in magnetomotive force comprising a core of magnetic material having a pair of arms spaced apart from each other, a yoke portion joining said arms at one end and adapted to be subjected to a magnetomotive force, a pair of bridging members between said arms forming parallel magnetic paths therebetween, each including an air gap and a saturating portion of reduced cross section on either side of a polar portion, and means responsive to a reversal of polarity of the magnetic field between the polar portions of said bridging members, the relative positions of the air gap and the saturating portion in one bridging member being reversed with respect to the relative positions of

the corresponding parts in the other bridging member.

17. A device for interconnecting direct current and alternating current circuits comprising a discharge valve having a control electrode, and a magnetic comparison device having a magnetic core with a saturable portion, a direct-current winding carried by said core and connected in series with said discharge valve, means for producing a magnetomotive force of predetermined value in said core, a primary alternating-current winding on said saturable portion, and a secondary winding also on said saturable core portion, said secondary winding being connected to said control electrode.



2,103,997

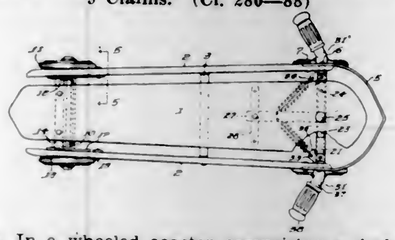
ELECTRIC CONTROL CIRCUIT

Burnice D. Bedford, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application December 9, 1936, Serial No. 114,998

13 Claims. (Cl. 175—363)

1. In combination, a core member, a source of alternating current, a winding connected to be energized from said source of alternating current for impressing on said core member an alternating magnetomotive force, a winding inductively associated with said core member for providing an alternating voltage of peaked wave form, a winding for impressing on said core member a unidirectional magnetomotive force, and a control winding for impressing on said core member a unidirectional magnetomotive force which opposes said first mentioned unidirectional magnetomotive force and which varies in accordance with a predetermined controlling influence to control the phase of said alternating voltage of peaked wave form relative to the voltage of said source.



2,103,998

WHEELED COASTER

Frank G. Birkhead, Philadelphia, Pa., assignor to S. L. Allen & Co., Inc., Philadelphia, Pa., a corporation of Pennsylvania

Application February 5, 1937, Serial No. 124,193

9 Claims. (Cl. 280—88)

1. In a wheeled coaster comprising a deck, a front axle and wheels disposed at its opposite ends, a U-shaped carrier rising from the axle and pivoted to the forward part of the deck adjacent its longitudinal center line, means for turning the carrier about its pivot comprising a rotatable shaft extending across the carrier and a head providing a handle secured to each end of the shaft, braking means carried by the heads respectively adapted to engage the wheels when the shaft is rotated in one direction and a pair of oppositely inwardly directed tension springs respectively interposed between the heads and the deck adapted to yieldingly maintain the axle and carrier substantially normal to said center line and to resist rotation of the shaft in said direction.

DISINFECTIVE AND ANTISEPTIC COMPOUND FOR THE TREATMENT OF ULCERS, SORES, AND THE LIKE

John H. Müller, Secane, Pa.; Anna L. Müller and Provident Trust Co., executors of said John H. Müller, deceased, assignors to Silver Oxide Products Company, Incorporated, a corporation of Pennsylvania

No Drawing. Application May 25, 1936, Serial No. 81,645

6 Claims. (Cl. 167—72)

3. Anhydrous colloidal silver oxide in the form of particles of an average diameter of less than one micron and small enough so that when a thin film of a dispersion of such particles in an inert, oily, anhydrous vehicle is brought into contact with a moist body such as the human skin, the silver particles will migrate to the contact boundary and pass into solution as silver hydroxide without leaving any substantial surface marking of reduced silver.

PRODUCTION OF POLYMERIZATION PRODUCTS FROM VINYL ETHERS

Walter Reppe and Otto Schlichting, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application November 9, 1931, Serial No. 574,040. In Germany June 27, 1929

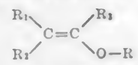
11 Claims. (Cl. 260—2)

1. The process for the polymerization of vinyl ethers, corresponding to the general formula

in which R denotes a radical selected from the group consisting of aliphatic, aromatic or hydroaromatic hydrocarbon radicals and the radicals of the glycols and polyglycols and the monovinyl, monovinylalkyl, monoalkyl, monocycloalkyl and monoaryl ethers thereof and R_1, R_2 and R_3 denote hydrogen or alkyl radicles, which comprises contacting the said ethers with a small amount of an inorganic, practically anhydrous acid reacting condensing agent.

2,104,001

PRODUCTION OF POLYMERIZATION PRODUCTS FROM VINYL ETHERS



Walter Reppe and Otto Schlichting, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application September 23, 1936, Serial No. 102,176. In Germany June 27, 1929

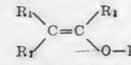
4 Claims. (Cl. 260—2)

1. From viscous liquid to solid amorphous poly-

meric vinyl ethers, the monomers of which correspond to the general formula

in which R denotes a cyclic hydrocarbon radical selected from the aryl and cycloalkyl radicals, and R_1, R_2 and R_3 stand for a member of the group consisting of hydrogen and the alkyl radicals, the said polymeric ethers being saturated substances practically inert to bromine and stable to dilute aqueous acids and alkalis.

2,104,002



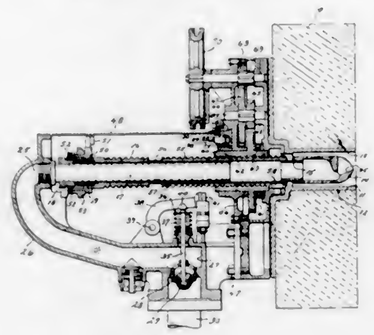
PRODUCTION OF POLYMERIZATION PRODUCTS FROM VINYL ETHERS

Walter Reppe and Otto Schlichting, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application September 23, 1936, Serial No. 102,177. In Germany June 27, 1929

4 Claims. (Cl. 260—2)

1. From viscous liquid to solid amorphous polymeric vinyl ethers, the monomers of which correspond to the general formula



in which R denotes a radical selected from the group consisting of radicals of the glycols and polyglycols and the monovinyl, monoalkyl, and monoaryl ethers thereof, and R_1, R_2, and R_3 stand for a member of the group consisting of hydrogen and alkyl radicals, the said polymeric ethers being saturated substances practically inert to bromine and stable to dilute aqueous acids and alkalis.

2,104,003

SOOT BLOWER

Johann Schieffer, Oberhausen, Germany, assignor, by mesne assignments, to Diamond Power Specialty Corporation, Detroit, Mich., a corporation of Michigan

Application March 27, 1935, Serial No. 13,290
In Germany March 29, 1934
5 Claims. (Cl. 122—392)

1. In a soot blower, a blower element mounted for axial and rotative movement, means for effecting the axial and rotative movements of the blower element means for preventing rotation of said blower element during axial movement thereof, means providing for rotation of the blower element after a predetermined axial movement thereof and means for limiting the rotative movement of the blower element to bring the blower element into operative relation with respect to the means which prevents rotation of the blower element during the axial movement thereof.

DESIGNS

DECEMBER 28, 1937

107,636

DESIGN FOR A CLIP

Bertha T. Barrett, Brooklyn, and Elizabeth Johnson, New York, N. Y.

Application September 29, 1937, Serial No. 71,864
Term of patent 3½ years

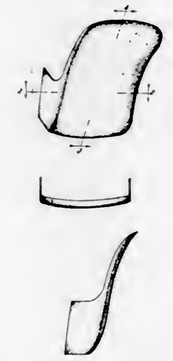
The ornamental design for a clip substantially as shown.

107,637

DESIGN FOR A GOBLET OR SIMILAR ARTICLE

Edgar M. Bottome, Moundsville, W. Va., assignor to Fostoria Glass Company, Moundsville, W. Va., a corporation of West Virginia

Application October 25, 1937, Serial No. 72,403
Term of patent 3½ years



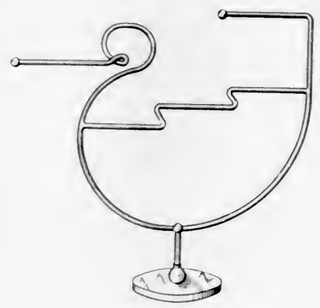
The ornamental design for a goblet or similar article, substantially as shown and described.

107,638

DESIGN FOR A SHEET METAL CHAIR BACK

Irl R. Bromagem, Union City, Ind., assignor to Union City Body Company, Union City, Ind., a corporation of Indiana

Application April 26, 1937, Serial No. 68,979
Term of patent 14 years



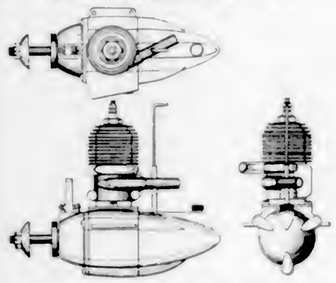
The ornamental design for a sheet metal chair back, as shown.

107,639

DESIGN FOR A DISPLAY STAND

Alice Campbell, New York, N. Y.

Application May 13, 1937, Serial No. 69,335
Term of patent 3½ years

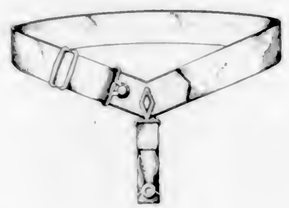


The ornamental design for a display stand as shown.

107,640
DESIGN FOR AN ERASER HOLDING TIP FOR PENCILS
James De Quinzio, Jersey City, N. J., assignor to Joseph Dixon Crucible Company, Jersey City, N. J., a corporation of New Jersey
Application June 30, 1937, Serial No. 70,128
Term of patent 14 years

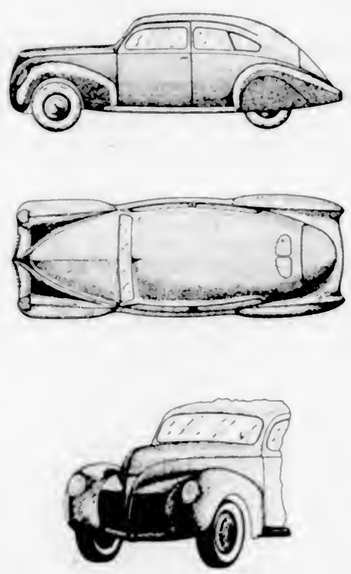
The ornamental design for an eraser holding tip for pencils as shown and described.

107,641
DESIGN FOR AN INTERNAL COMBUSTION ENGINE
John L. Doll and Clifford W. Rogers, Detroit, Mich., assignors to Syncro Devices, Incorporated, Detroit, Mich., a corporation of Michigan
Application July 6, 1937, Serial No. 70,279
Term of patent 3½ years



The ornamental design for an internal combustion engine, as shown.

107,642
DESIGN FOR A SWITCH PLATE
Anton Fazekas, San Francisco, Calif.
Application October 29, 1937, Serial No. 72,520
Term of patent 14 years

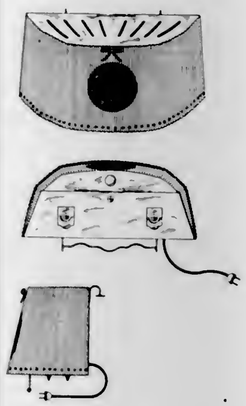


The ornamental design for a switch plate, as shown.

107,643
DESIGN FOR A GARTER
William Govan, Buffalo, N. Y., assignor to Condor Products, Inc., Buffalo, N. Y.
Application May 11, 1937, Serial No. No. 69,287
Term of patent 14 years

The ornamental design for a garter as shown.

107,644
DESIGN FOR AN AUTOMOBILE
Eugene T. Gregorie, Plymouth, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Application April 29, 1937, Serial No. 69,059
Term of patent 14 years

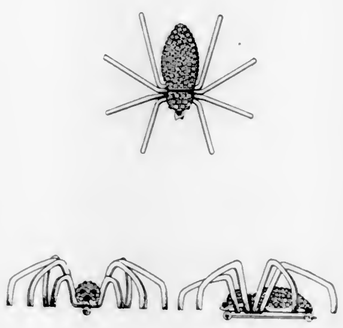


The ornamental design for an automobile, substantially as shown and described.

107,645
DESIGN FOR A TEXTILE FABRIC
Evangeline Guarine, New York, N. Y., assignor, by mesne assignments, to Semaria Bros., Inc., New York, N. Y., a corporation
Application November 15, 1937, Serial No. 72,867
Term of patent 3½ years

The ornamental design for a textile fabric substantially as shown and described.

107,646
DESIGN FOR A COMBINATION LAMP, SHADE, AND RADIO
Joseph J. Herrera, Jr., Los Angeles, Calif.
Application February 9, 1937, Serial No. 67,539
Term of patent 3½ years



The ornamental design for a combination lamp, shade, and radio substantially as shown.

107,647
DESIGN FOR A COMBINED TWIN BED RADIO AND LAMP
Joseph J. Herrera, Jr., Los Angeles, Calif.
Application February 9, 1937, Serial No. 67,540
Term of patent 3½ years

The ornamental design for a combined twin bed radio and lamp, substantially as shown and described.

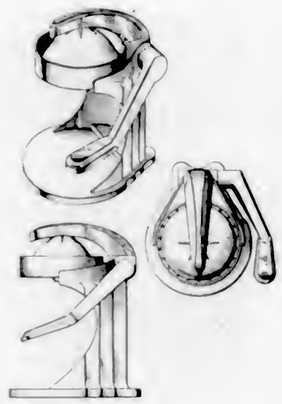
107,648
DESIGN FOR A BROOCH PIN
Adolph Katz, New York, N. Y.
Application November 10, 1937, Serial No. 72,747
Term of patent 3½ years

The ornamental design for a brooch pin substantially as shown.

107,649
DESIGN FOR A JEWELRY SETTING OR SIMILAR ARTICLE
Henry R. Kiepe, Newark, N. J., assignor to Baker & Company, Inc., Newark, N. J., a corporation of New Jersey
Application November 9, 1937, Serial No. 72,720
Term of patent 14 years

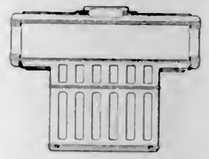
The ornamental design for a jewelry setting or similar article, as shown.

107,650
DESIGN FOR A JEWELRY SETTING OR SIMILAR ARTICLE
Henry R. Kiepe, Newark, N. J., assignor to Baker & Company, Inc., Newark, N. J., a corporation of New Jersey
Application November 9, 1937, Serial No. 72,721
Term of patent 14 years



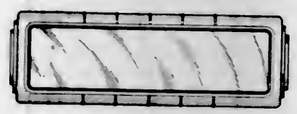
The ornamental design for a jewelry setting or similar article, as shown.

107,651
DESIGN FOR A TEXTILE FABRIC
Adolph H. Klein, New York, N. Y.
Application November 20, 1937, Serial No. 73,048
Term of patent 3½ years



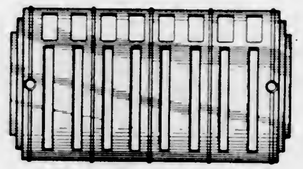
The ornamental design for a textile fabric, substantially as shown.

107,652
DESIGN FOR A JUICE EXTRACTOR
Joseph M. Majewski, Jr., Kansas City, Mo., assignor to Foster L. Talge, Kansas City, Mo., doing business as Rival Manufacturing Company
Application October 18, 1937, Serial No. 72,287
Term of patent 14 years



The ornamental design for a juice extractor, substantially as shown.

107,653
DESIGN FOR AN ESCUTCHEON PLATE FOR RADIO RECEIVERS
Richard C. Marholz, Chicago, Ill., assignor to Belmont Radio Corporation, Chicago, Ill., a corporation of Illinois
Application October 7, 1937, Serial No. 72,051
Term of patent 7 years

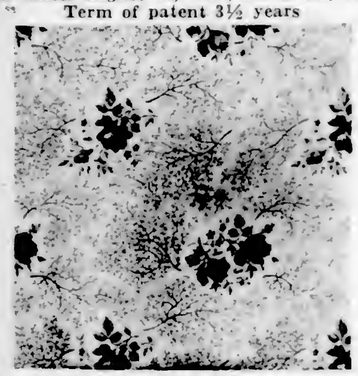


The ornamental design for an escutcheon plate for radio receivers, as shown.

107,654
DESIGN FOR A COMBINED ESCUTCHEON PLATE AND CRYSTAL FOR A DIAL FOR A RADIO RECEIVER
Richard C. Marholz, Chicago, Ill., assignor to Belmont Radio Corporation, Chicago, Ill., a corporation of Illinois
Application October 20, 1937, Serial No. 72,341
Term of patent 7 years

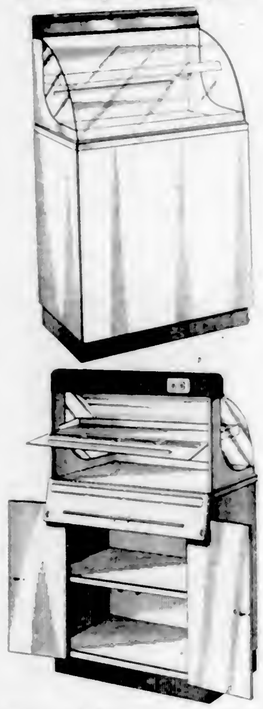
The ornamental design for a combined escutcheon plate and crystal for a dial for a radio receiver, as shown.

107,655
DESIGN FOR AN ESCUTCHEON PLATE FOR A LEVER TUNING DEVICE FOR A RADIO RECEIVER
Richard C. Marholz, Chicago, Ill., assignor to Belmont Radio Corporation, Chicago, Ill., a corporation of Illinois
Application October 25, 1937, Serial No. 72,410
Term of patent 7 years



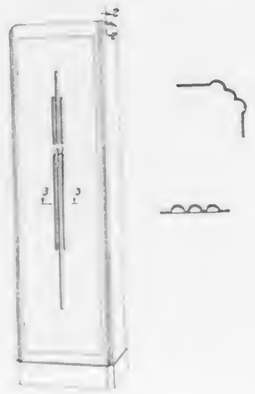
The ornamental design for an escutcheon plate for a lever tuning device for a radio receiver, as shown.

107,656
DESIGN FOR A TEXTILE FABRIC
Sterling B. McDonald, Chicago, Ill., assignor to Massachusetts Mohair Plush Company, Boston, Mass., a corporation of Massachusetts
Application November 16, 1937, Serial No. 72,925
Term of patent 7 years



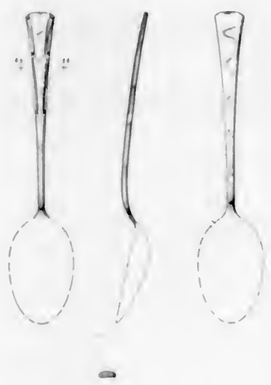
The ornamental design for a textile fabric, substantially as shown.

107,657
DESIGN FOR A TEXTILE FABRIC
Marcel Mey, Paris, France, assignor to Marshall Field & Company, Chicago, Ill., a corporation of Illinois
Application August 23, 1937, Serial No. 71,288
Term of patent 3½ years



The ornamental design for a textile fabric as shown.

107,658
DESIGN FOR A DISPLAY CASE
Franklin J. Petzke, Minneapolis, Minn., assignor to Johnson Nut Company, Minneapolis, Minn.
Application October 22, 1937, Serial No. 72,373
Term of patent 3½ years

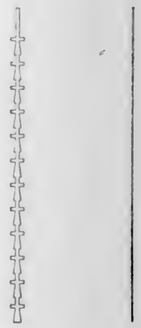


The ornamental design for a display case as shown.

107,659
DESIGN FOR A STORAGE CABINET OR SIMILAR ARTICLE
Milton Price, Chicago, Ill., assignor to Arterest Manufacturing Co., Chicago, Ill., a corporation of Illinois
Application October 20, 1937, Serial No. 72,342
Term of patent 3½ years

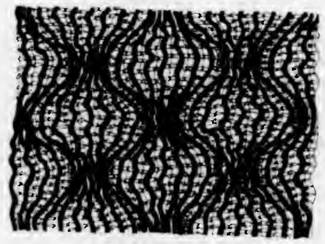
The ornamental design for a storage cabinet or similar article, substantially as shown.

107,660
DESIGN FOR A SPOON OR OTHER ARTICLE OF FLATWARE
James Russell Price, Providence, R. I., assignor to Gorham Manufacturing Company, Providence, R. I., a corporation of Rhode Island
Application October 30, 1937, Serial No. 72,531
Term of patent 14 years



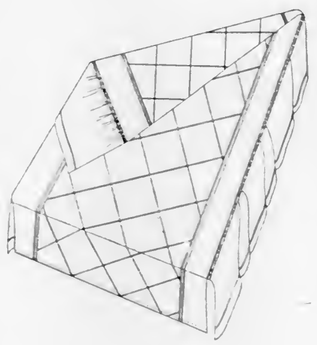
The ornamental design for a spoon or other article of flatware, substantially as shown.

107,661
DESIGN FOR A TINSEL ORNAMENT FOR CHRISTMAS TREES
Lambert L. Raymond, Minneapolis, Minn.
Application May 1, 1936, Serial No. 62,392
Term of patent 14 years



The ornamental design for a tinsel ornament for Christmas trees, as shown.

107,662
DESIGN FOR A TINSEL ORNAMENT FOR CHRISTMAS TREES
Lambert L. Raymond, Minneapolis, Minn.
Application May 1, 1936, Serial No. 62,395
Term of patent 14 years

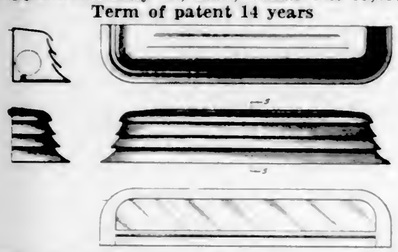


The ornamental design for a tinsel ornament for Christmas trees as shown.

107,663
DESIGN FOR A CORDED KNIT LACE FABRIC
Samuel Saftlas, New York, N. Y., assignor to Selig Kaplan and Julius Kaplan, co-partners doing business under firm name and style of Pennant Knitting Mills, Brooklyn, N. Y.
Application October 15, 1936, Serial No. 65,308
Term of patent 3½ years

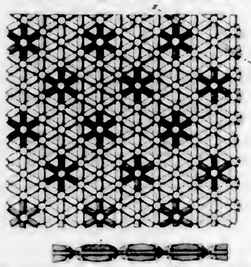
The ornamental design for a corded knit lace fabric substantially as shown and described.

107,664
DESIGN FOR A BEDSPREAD OR SIMILAR ARTICLE
Joseph Shurin, Roxbury, Mass.
Application September 11, 1936, Serial No. 64,818
Term of patent 3½ years



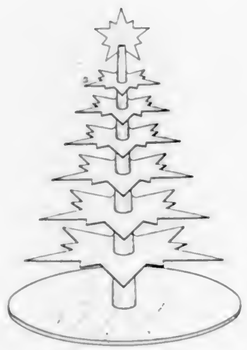
The ornamental design for a bedspread or similar article as shown.

107,665
DESIGN FOR A PENDANT
Joseph F. Stedman, Brooklyn, N. Y.
Application July 10, 1937, Serial No. 70,358
Term of patent 14 years



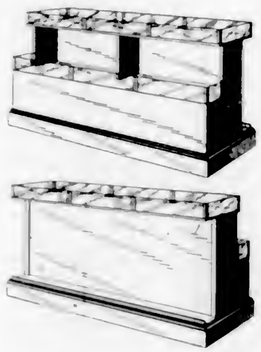
The ornamental design for a pendant, as shown.

107,666
DESIGN FOR A LIGHTING FIXTURE OR SIMILAR ARTICLE
Lemuel L. Stewart, Chicago, Ill., assignor to The Adlake Company, a corporation of Illinois
Application May 10, 1937, Serial No. 69,259
Term of patent 14 years



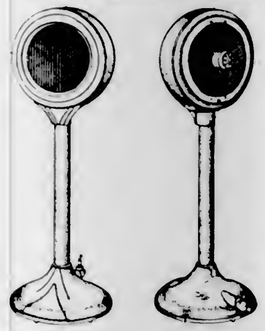
The ornamental design for a lighting fixture or similar article substantially as shown.

107,667
DESIGN FOR OPENWORK BEAD FABRIC OR SIMILAR ARTICLE
Max Tannenbaum, New York, N. Y.
Application November 19, 1937, Serial No. 73,030
Term of patent 3½ years



The ornamental design for openwork bead fabric or similar article substantially as shown and described.

107,668
DESIGN FOR A MINIATURE CHRISTMAS TREE
Sidney C. Wadsworth and Fred Bell, Lake Forest, Ill.
Application September 8, 1937, Serial No. 71,504
Term of patent 7 years



The ornamental design for a miniature Christmas tree, as shown.

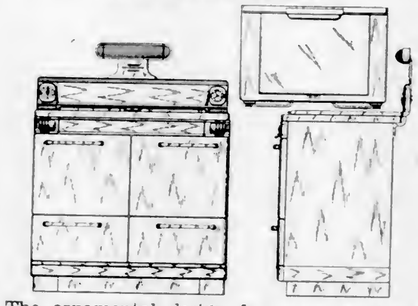
107,669
DESIGN FOR A DISPLAY STAND
Carl D. Wilke, Beatrice, Nebr.
Application October 16, 1937, Serial No. 72,240
Term of patent 7 years

The ornamental design for a display stand, as shown.

107,670
DESIGN FOR AN AIR CONDITIONING UNIT
John G. Zummach, Racine, Wis., assignor to Hexcel Radiator Company, Racine, Wis., a corporation of Wisconsin
Application April 29, 1937, Serial No. 69,036
Term of patent 3½ years

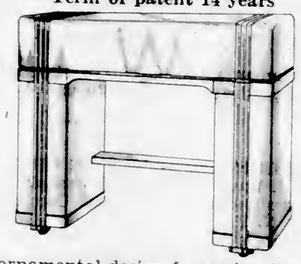
The ornamental design for an air conditioning unit, as shown.

107,671
DESIGN FOR A COIN OPERATED BILLIARD TABLE
Joseph C. Allen, Birmingham, Ala.
Application November 1, 1937, Serial No. 72,544
Term of patent 7 years



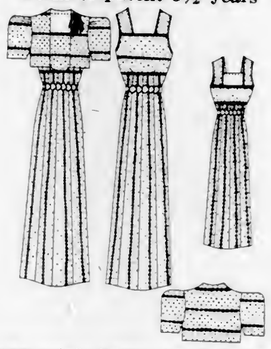
The ornamental design for a coin operated billiard table, as shown.

107,672
DESIGN FOR A DOLL OR SIMILAR ARTICLE
Virginia Stowe Austin, Los Angeles, Calif.
Application February 15, 1937, Serial No. 67,661
Term of patent 14 years



The ornamental design for a doll or similar article, as shown.

107,673
DESIGN FOR A GAS RANGE
Joseph Becvar, Wickliffe, Ohio, assignor to The Cleveland Cooperative Stove Company, Cleveland, Ohio, a corporation of Ohio
Application March 15, 1937, Serial No. 68,178
Term of patent 14 years



The ornamental design for a gas range, as shown.

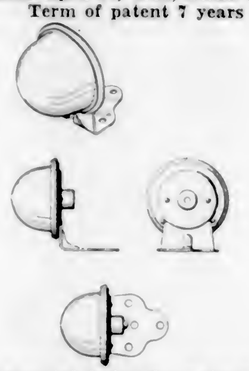
107,674
DESIGN FOR AN IRONING MACHINE CABINET
John A. Castricone, Peoria, Ill.
Application July 13, 1936, Serial No. 63,820
Term of patent 14 years

The ornamental design for an ironing machine cabinet, as shown, and described.

107,675
DESIGN FOR A DRESS ENSEMBLE
Tora Coleman, New York, N. Y.
Application November 19, 1937, Serial No. 73,019
Term of patent 3½ years

The ornamental design for a dress ensemble substantially as shown.

107,676
DESIGN FOR A SLIPPER OR SIMILAR ARTICLE
Robert S. Cook, Fayetteville, N. Y.
Application October 7, 1937, Serial No. 72,052
Term of patent 14 years

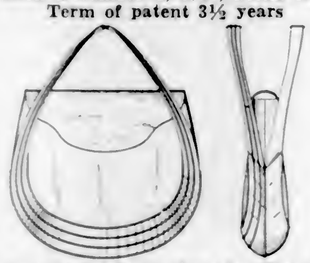


The ornamental design for a slipper or similar article, substantially as shown.

107,677
DESIGN FOR AN OFFICE CHAIR
Kenneth F. Davis and John J. Josephs, Buffalo, N. Y., assignors to The Sikes Company, Inc., Buffalo, N. Y.
Application October 27, 1937, Serial No. 72,471
Term of patent 3½ years

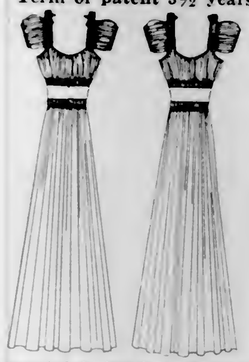
The ornamental design for an office chair as shown.

107,678
DESIGN FOR A SIGNAL LAMP UNIT
Harold B. Donley, Columbus, Ohio, assignor to Columbus Metal Products Inc., Columbus, Ohio, a corporation of Ohio
Application April 17, 1936, Serial No. 62,179
Term of patent 7 years



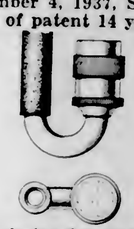
The ornamental design for a signal lamp unit, as shown and described.

107,679
DESIGN FOR A DRESS
Jack Frank, New York, N. Y.
Application November 19, 1937, Serial No. 73,031
Term of patent 3½ years



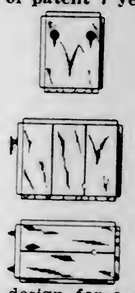
The ornamental design for a dress, substantially as shown.

107,680
DESIGN FOR A HANDBAG
Samuel R. Goldsmith, New York, N. Y.
Application December 1, 1937, Serial No. 73,292
Term of patent 3½ years



The ornamental design for a handbag substantially as shown.

107,681
DESIGN FOR A DRESS
Jack Greenman, New York, N. Y.
Application November 30, 1937, Serial No. 73,270
Term of patent 3½ years

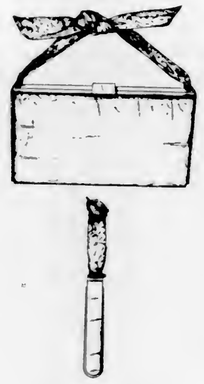


The ornamental design for a dress substantially as shown.

107,682
DESIGN FOR AN AUTOMOTIVE RADIATOR SEALING AND PRESSURE RELIEF VALVE OR THE LIKE
Arthur F. Grigg, Metuchen, and John E. Zeller, Montclair, N. J.
Application December 4, 1937, Serial No. 73,380
Term of patent 14 years

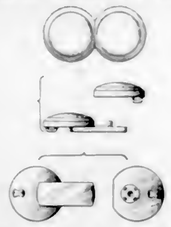
The ornamental design for an automotive radiator sealing and pressure relief valve or the like substantially as shown and described.

107,683
DESIGN FOR A CASING FOR FURNACES OR THE LIKE
George D. Hauser, Utica, N. Y., assignor to Utica Products Incorporated, Utica, N. Y., a corporation of New York
Application April 28, 1937, Serial No. 69,019
Term of patent 7 years



The ornamental design for a casing for furnaces or the like, as shown.

107,684
DESIGN FOR A BALLOON
Elmer E. Krueger, Chicago, Ill., assignor to Lee-Tex Rubber Products Corporation, Chicago, Ill., a corporation of Delaware
Application July 3, 1937, Serial No. 70,256
Term of patent 7 years

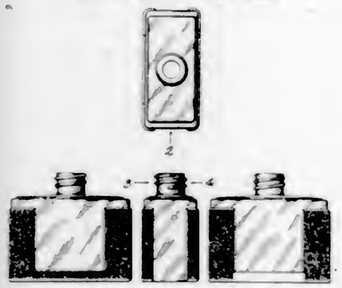


The ornamental design for a balloon, as shown and described.

107,685
DESIGN FOR A HANDBAG
David Lewis, New York, N. Y., assignor to Helena Rubinstein Inc., New York, N. Y., a corporation of New York
Application June 26, 1937, Serial No. 70,064
Term of patent 3½ years

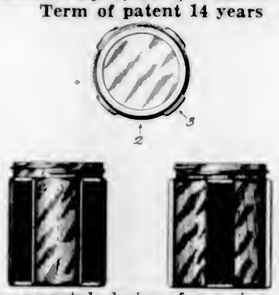
The ornamental design for a handbag as shown and described.

107,686
DESIGN FOR A BUTTON
Julius Lichter, Lawrence, N. Y.
Application October 9, 1937, Serial No. 72,097
Term of patent 3½ years



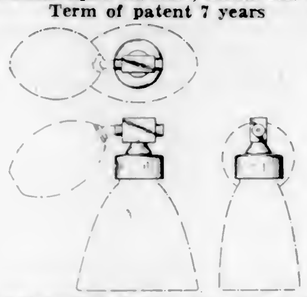
The ornamental design for a button, as shown and described.

107,687
DESIGN FOR A COMBINED WATCH AND MIRROR WITH HOLDER THEREFOR
Joseph Lipschutz and Harry C. Ruger, Brooklyn, N. Y.
Application June 24, 1937, Serial No. 70,046
Term of patent 7 years



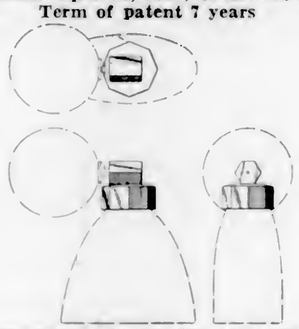
The ornamental design for a combined watch and mirror with holder therefor, as shown and described.

107,688
DESIGN FOR A BOTTLE OR SIMILAR ARTICLE
Philip G. Lloyd, Jackson Heights, N. Y., assignor to Carr-Lowrey Glass Co., Baltimore, Md.
Application July 9, 1937, Serial No. 70,330
Term of patent 14 years



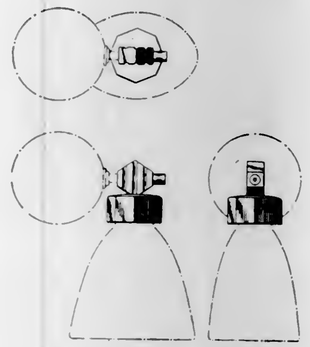
The ornamental design for a bottle or similar article, as shown.

107,689
DESIGN FOR A JAR OR SIMILAR ARTICLE
Philip G. Lloyd, Jackson Heights, N. Y., assignor to Carr-Lowrey Glass Co., Baltimore, Md.
Application July 9, 1937, Serial No. 70,331
Term of patent 14 years



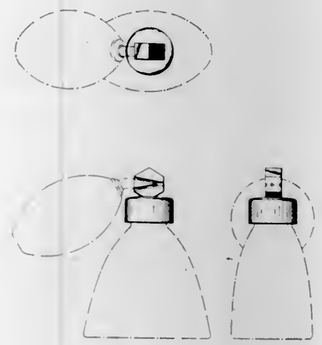
The ornamental design for a jar or similar article, as shown.

107,690
DESIGN FOR AN ATOMIZER
Frederick W. Lohse, Attleboro, Mass., assignor to T. J. Holmes Company, Inc., Norton, Mass., a corporation of Massachusetts
Application April 13, 1937, Serial No. 68,718
Term of patent 7 years



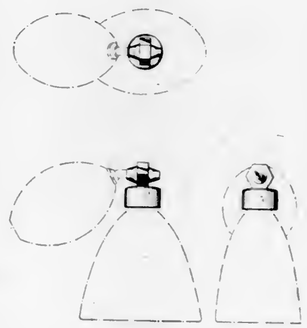
The ornamental design for an atomizer, as shown and described.

107,691
DESIGN FOR AN ATOMIZER
Frederick W. Lohse, Attleboro, Mass., assignor to T. J. Holmes Company, Inc., Norton, Mass., a corporation of Massachusetts
Application April 13, 1937, Serial No. 68,719
Term of patent 7 years



The ornamental design for an atomizer, as shown and described.

107,692
DESIGN FOR AN ATOMIZER
Frederick W. Lohse, Attleboro, Mass., assignor to T. J. Holmes Company, Inc., Norton, Mass., a corporation of Massachusetts
Application April 13, 1937, Serial No. 68,722
Term of patent 7 years

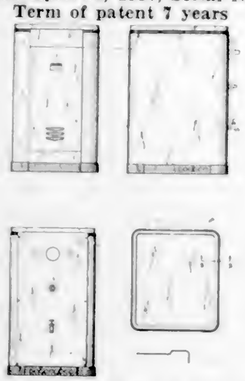


The ornamental design for an atomizer as shown and described.

107,693
DESIGN FOR AN ATOMIZER
Frederick W. Lohse, Attleboro, Mass., assignor to T. J. Holmes Company, Inc., Norton, Mass., a corporation of Massachusetts
Application April 13, 1937, Serial No. 68,723
Term of patent 7 years

The ornamental design for an atomizer as shown and described.

107,694
DESIGN FOR AN ATOMIZER
Frederick W. Lohse, Attleboro, Mass., assignor to T. J. Holmes Company, Inc., Norton, Mass., a corporation of Massachusetts
Application April 13, 1937, Serial No. 68,724
Term of patent 7 years



The ornamental design for an atomizer as shown and described.

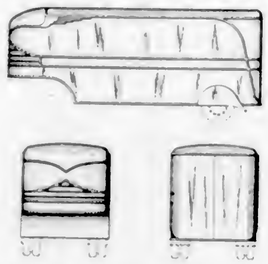
107,695
DESIGN FOR A TEXTILE FABRIC
Marcel Mey, Paris, France, assignor to Marshall Field & Company, Chicago, Ill., a corporation of Illinois
Application August 23, 1937, Serial No. 71,285
Term of patent 3½ years

The ornamental design for a textile fabric, as shown.

107,696
DESIGN FOR A WATER HEATER
Clarence H. Morrow, Shaker Heights, Ohio, assignor to The Hotstream Heater Company, Cleveland, Ohio, a corporation of Ohio
Application April 30, 1937, Serial No. 69,079
Term of patent 7 years

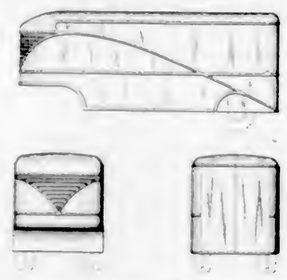
The ornamental design for a water heater, as shown and described.

107,697
DESIGN FOR A BRIDGE FOR AN OPHTHALMIC MOUNTING
George E. Nerney, Attleboro, Mass., assignor to Bay State Optical Company, Attleboro, Mass., a corporation of Maine
Application November 20, 1937, Serial No. 73,066
Term of patent 3½ years



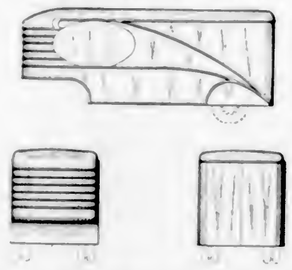
The ornamental design for a bridge for an ophthalmic mounting, substantially as shown.

107,698
DESIGN FOR A BRIDGE FOR AN OPHTHALMIC MOUNTING
George E. Nerney, Attleboro, Mass., assignor to Bay State Optical Company, Attleboro, Mass., a corporation of Maine
Application November 20, 1937, Serial No. 73,067
Term of patent 3½ years



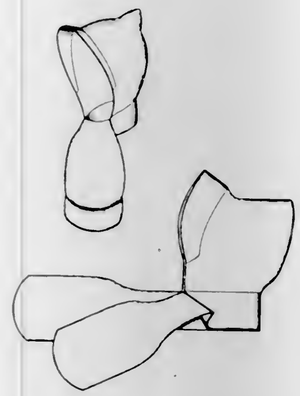
The ornamental design for a bridge for an ophthalmic mounting, substantially as shown.

107,699
DESIGN FOR A TRAILER VEHICLE
Frederick M. Reid, Detroit, Mich., assignor to Fruehauf Trailer Company, Detroit, Mich., a corporation of Michigan
Application November 1, 1937, Serial No. 72,569
Term of patent 3½ years



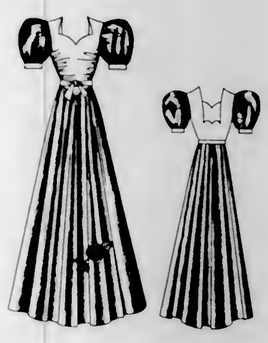
The ornamental design for a trailer vehicle as shown.

107,700
DESIGN FOR A TRAILER VEHICLE
Frederick M. Reid, Detroit, Mich., assignor to Fruehauf Trailer Company, Detroit, Mich., a corporation of Michigan
Application November 1, 1937, Serial No. 72,570
Term of patent 3½ years



The ornamental design for a trailer vehicle as shown.

107,701
DESIGN FOR A TRAILER VEHICLE
Frederick M. Reid, Detroit, Mich., assignor to Fruehauf Trailer Company, Detroit, Mich., a corporation of Michigan
Application November 1, 1937, Serial No. 72,571
Term of patent 3½ years



The ornamental design for a trailer vehicle as shown.

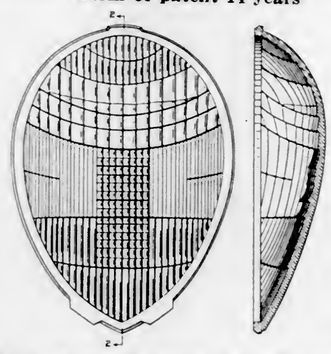
107,702
DESIGN FOR A KNITTED HOOD AND SCARF ASSEMBLY
Samuel Rosenberg, Milwaukee, Wis.
Application November 22, 1937, Serial No. 73,103
Term of patent 7 years

The ornamental design for a knitted hood and scarf assembly, as shown.

107,703
DESIGN FOR A DRESS
Maxwell A. Rudolph, New York, N. Y.
Application November 19, 1937, Serial No. 73,023
Term of patent 3½ years

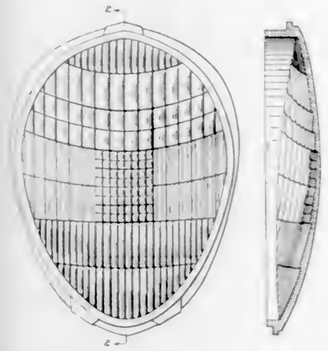
The ornamental design for a dress substantially as shown.

107,704
DESIGN FOR A LIPSTICK HOLDER
Elsa Schiaparelli, Paris, France
Application November 17, 1937, Serial No. 72,952
Term of patent 14 years



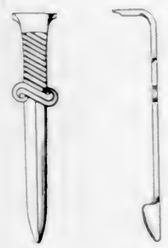
The ornamental design for a lipstick holder as shown and described.

107,705
DESIGN FOR A GRILLE OR SIMILAR ARTICLE
Herbert Smith, Clinton, and Melcher Gustaf Werme, Worcester, Mass., assignors to Wickwire Spencer Steel Company, New York, N. Y., a corporation of Delaware
Application July 28, 1937, Serial No. 70,706
Term of patent 14 years



The ornamental design for a grille or similar article as shown.

107,706
DESIGN FOR AN AUTOMOBILE HEADLIGHT LENS
Maurice A. Smith, Jeannette, Pa.
Application September 29, 1937, Serial No. 71,859
Term of patent 14 years

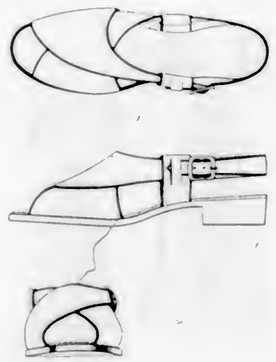


The ornamental design for an automobile headlight lens, as shown.

107,707
DESIGN FOR AN AUTOMOBILE HEADLIGHT LENS
Maurice A. Smith, Jeannette, Pa.
Application September 24, 1937, Serial No. 71,766
Term of patent 14 years

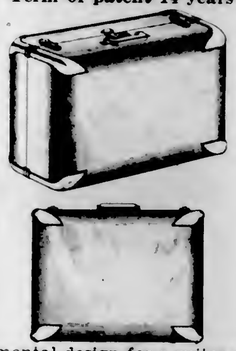
The ornamental design for an automobile headlight lens, as shown.

107,708
DESIGN FOR A FOUNTAIN PEN AND PENCIL CLIP
Paul M. Ressinger, Chicago, Ill., and Ivan D. Tefft, Janesville, Wis., assignors to The Parker Pen Company, Janesville, Wis., a corporation of Wisconsin
Application March 18, 1937, Serial No. 68,266
Term of patent 14 years



The ornamental design for a fountain pen and pencil clip, substantially as shown and described.

107,709
DESIGN FOR AN ATOMIZER
Robert P. Vuillemenot, New York, N. Y., assignor to The De Vilbiss Company, Toledo, Ohio, a corporation of Ohio
Application November 17, 1937, Serial No. 72,960
Term of patent 3½ years



The ornamental design for an atomizer, substantially as shown and described.

107,710
DESIGN FOR A SHOE
